**Suspension**, cefuroxime (as axetil) 125 mg/5 mL when reconstituted with water, net price 70 mL (tutti-frutti-flavoured) = £5.20. Label: 9, 21

**Excipients** include aspartame (section 9.4.1), sucrose 3.1 g/5 mL

**5.1.2.2 Carbapenems**

The carbapenems are beta-lactam antibacterials with a broad-spectrum of activity which includes many Gram-positive and Gram-negative bacteria, and anaerobes; **imipenem**, **meropenem**, and **doripenem** have good activity against *Pseudomonas aeruginosa*. The carbapenems are not active against methicillin-resistant *Staphylococcus aureus* and *Enterococcus faecium*.

Imipenem and meropenem are used for the treatment of severe hospital-acquired infections and polymicrobial infections including septicaemia, hospital-acquired pneumonia, intra-abdominal infections, skin and soft-tissue infections, and complicated urinary-tract infections. Doripenem is an alternative for hospital-acquired pneumonia, complicated intra-abdominal infections, and complicated urinary-tract infections.

**Ertapenem** is licensed for treating abdominal and gynaecological infections and for community-acquired pneumonia, but it is not active against atypical respiratory pathogens and it has limited activity against penicillin-resistant pneumococci. It is also licensed for treating foot infections of the skin and soft tissue in patients with diabetes. Unlike the other carbapenems, ertapenem is not active against *Pseudomonas* or against *Acinetobacter* spp.

Imipenem is partially inactivated in the kidney by enzymatic activity and is therefore administered in combination with **cilastatin**, a specific enzyme inhibitor, which blocks its renal metabolism. Meropenem, doripenem,

and ertapenem are stable to the renal enzyme which inactivates imipenem and therefore can be given without cilastatin.

Side-effects of imipenem with cilastatin are similar to those of other beta-lactam antibiotics; neurotoxicity has been observed at very high dosage, in renal failure, or in patients with CNS disease. Ertapenem has been associated with seizures uncommonly. Meropenem has less seizure-inducing potential and can be used to treat central nervous system infection.

## DORIPENEM

**Indications** hospital-acquired pneumonia; complicated intra-abdominal infections; complicated urinary-tract infections

**Cautions** sensitivity to beta-lactam antibacterials (avoid if history of immediate hypersensitivity reaction, see also p. 332); **interactions:** Appendix 1 (doripenem)

**Renal impairment** 250 mg every 8 hours if eGFR 30–50 mL/minute/1.73 m<sup>2</sup>; 250 mg every 12 hours if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** manufacturer advises avoid unless essential—no information available

**Breast-feeding** manufacturer advises use only if potential benefit outweighs risk—present in milk in animal studies

**Side-effects** nausea, diarrhoea; headache; phlebitis, pruritus, rash; *less commonly* antibiotic-associated colitis, thrombocytopenia, neutropenia; also reported, toxic epidermal necrolysis, and Stevens-Johnson syndrome

### Dose

• By intravenous infusion, **ADULT** over 18 years, 500 mg every 8 hours; max. duration of treatment 14 days

**Doribax**® (Janssen-Cilag) ▼ (POM)

**Intravenous infusion**, powder for reconstitution, doripenem (as monohydrate), net price 500-mg vial = £14.52

The *Scottish Medicines Consortium* (p. 4) has advised (February 2009) that doripenem (*Doribax*®) is not recommended for use within NHS Scotland for the treatment of complicated urinary-tract infections.

## ERTAPENEM

**Indications** abdominal infections; acute gynaecological infections; community-acquired pneumonia; diabetic foot infections of the skin and soft-tissue; prophylaxis for colorectal surgery

**Cautions** sensitivity to beta-lactam antibacterials (avoid if history of immediate hypersensitivity reaction, see also p. 332); elderly, CNS disorders—risk of seizures; **interactions:** Appendix 1 (ertapenem)

**Renal impairment** risk of seizures; max. 500 mg daily if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk

**Breast-feeding** present in milk—manufacturer advises avoid

**Side-effects** diarrhoea, nausea, vomiting, headache, injection-site reactions, rash (also reported with eosinophilia and systemic symptoms), pruritus, raised platelet count; *less commonly* dry mouth, taste disturbances, dyspepsia, abdominal pain, anorexia, constipation, melana, antibiotic-associated colitis, bradycardia, hypotension, chest pain, oedema, pharyngeal discomfort, dyspnoea, dizziness, sleep distur-

bances, confusion, asthenia, seizures, raised glucose, petechiae; *rarely* dysphagia, cholecystitis, liver disorder (including jaundice), arrhythmia, increase in blood pressure, syncope, nasal congestion, cough, wheezing, anxiety, depression, agitation, tremor, pelvic peritonitis, renal impairment, muscle cramp, scleral disorder, blood disorders (including neutropenia, thrombocytopenia, haemorrhage), hypoglycaemia, electrolyte disturbances; also reported hallucinations, dyskinesia

### Dose

• By intravenous infusion, **ADULT** and **ADOLESCENT** over 13 years, 1 g once daily; **CHILD** 3 months–13 years, 15 mg/kg every 12 hours (max. 1 g daily)

Surgical prophylaxis, colorectal surgery, **ADULT** over 18 years, 1 g completed within 1 hour before surgery

**Invanz**® (MSD) (POM)

**Intravenous infusion**, powder for reconstitution, ertapenem (as sodium salt), net price 1-g vial = £31.65  
**Electrolytes** Na<sup>+</sup> 6 mmol/1-g vial

## IMIPENEM WITH CILASTATIN

**Indications** aerobic and anaerobic Gram-positive and Gram-negative infections; surgical prophylaxis; hospital-acquired septicaemia (Table 1, section 5.1); not indicated for CNS infections

**Cautions** sensitivity to beta-lactam antibacterials (avoid if history of immediate hypersensitivity reaction, see also p. 332); CNS disorders (e.g. epilepsy); **interactions:** Appendix 1 (imipenem with cilastatin)

**Renal impairment** risk of CNS side-effects; reduce dose if eGFR less than 70 mL/minute/1.73 m<sup>2</sup>—consult product literature

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk (toxicity in animal studies)

**Breast-feeding** present in milk but unlikely to be absorbed (however, manufacturer advises avoid)

**Side-effects** nausea, vomiting, diarrhoea (antibiotic-associated colitis reported), taste disturbances, tooth or tongue discoloration, hearing loss; blood disorders, positive Coombs' test; allergic reactions (with rash, pruritus, urticaria, Stevens-Johnson syndrome, fever, anaphylactic reactions, rarely toxic epidermal necrolysis, exfoliative dermatitis); myoclonic activity, convulsions, confusion and mental disturbances reported; slight increases in liver enzymes and bilirubin reported, rarely hepatitis; increases in serum creatinine and blood urea; red coloration of urine in children reported; local reactions: erythema, pain and induration, and thrombophlebitis

### Dose

• By intravenous infusion, in terms of imipenem, 1–2 g daily (in 3–4 divided doses); less sensitive organisms, up to 50 mg/kg daily (max. 4 g daily) in 3–4 divided doses; **CHILD** 3 months and older, 60 mg/kg (max. 2 g) daily in 4 divided doses; over 40 kg, adult dose  
Surgical prophylaxis, 1 g up to 30 minutes before the procedure, repeated after 3 hours, supplemented in high risk (e.g. colorectal) surgery by doses of 500 mg 8 and 16 hours after initial dose

**Primaxin**® (MSD) (POM)

**Intravenous infusion**, powder for reconstitution, imipenem (as monohydrate) 500 mg with cilastatin (as sodium salt) 500 mg, net price per vial = £12.00  
**Electrolytes** Na<sup>+</sup> 1.72 mmol/vial

## MEROPENEM

**Indications** aerobic and anaerobic Gram-positive and Gram-negative infections (see notes above); hospital-acquired septicaemia (Table 1, section 5.1)

**Cautions** sensitivity to beta-lactam antibacterials (avoid if history of immediate hypersensitivity reaction, see also p. 332); **interactions:** Appendix 1 (meropenem)

**Hepatic impairment** monitor liver function

**Renal impairment** use normal dose every 12 hours if eGFR 26–50 mL/minute/1.73 m<sup>2</sup>; use half normal dose every 12 hours if eGFR 10–25 mL/minute/1.73 m<sup>2</sup>; use half normal dose every 24 hours if eGFR less than 10 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk—no information available

**Breast-feeding** unlikely to be absorbed (however, manufacturer advises avoid unless potential benefit justifies potential risk)

**Side-effects** nausea, vomiting, diarrhoea (antibiotic-associated colitis reported), abdominal pain, disturbances in liver function tests, headache, thrombocytopenia, rash, pruritus; *less commonly* paraesthesia, eosinophilia, thrombocytopenia, leucopenia; *rarely* convulsions; also reported haemolytic anaemia, positive Coombs' test, Stevens-Johnson syndrome, toxic epidermal necrolysis

## Dose

- By intravenous injection over 5 minutes or by intravenous infusion, 0.5–1 g every 8 hours; **CHILD** 3 months–12 years 10–20 mg/kg every 8 hours, body-weight over 50 kg, adult dose
- Exacerbations of chronic lower respiratory-tract infection in cystic fibrosis, meningitis, by intravenous infusion, 2 g every 8 hours; **CHILD** 3 months–12 years 40 mg/kg every 8 hours, body-weight over 50 kg, adult dose

**Meronem**® (AstraZeneca) (POM)

**Injection**, powder for reconstitution, meropenem (as trihydrate), net price 500-mg vial = £8.60; 1-g vial = £17.19

**Electrolytes** Na<sup>+</sup> 3.9 mmol/g

## 5.1.2.3 Other beta-lactam antibiotics

**Aztreonam** is a monocyclic beta-lactam ('monobactam') antibiotic with an antibacterial spectrum limited to Gram-negative aerobic bacteria including *Pseudomonas aeruginosa*, *Neisseria meningitidis*, and *Haemophilus influenzae*; it should not be used alone for 'blind' treatment since it is not active against Gram-positive organisms. Aztreonam is also effective against *Neisseria gonorrhoeae* (but not against concurrent chlamydial infection). Side-effects are similar to those of the other beta-lactams although aztreonam may be less likely to cause hypersensitivity in penicillin-sensitive patients.

Aztreonam may be administered by nebuliser for the treatment of chronic *Ps. aeruginosa* infection in cystic fibrosis.

## AZTREONAM

**Indications** Gram-negative infections including *Pseudomonas aeruginosa*, *Haemophilus influenzae*, and *Neisseria meningitidis*

**Cautions** hypersensitivity to beta-lactam antibiotics;

**interactions:** Appendix 1 (aztreonam)

**Specific cautions for inhaled treatment** Other inhaled drugs should be administered before aztreonam; a bronchodilator should be administered before each dose

**Contra-indications** aztreonam hypersensitivity

**Hepatic impairment** use injection with caution and monitor liver function

**Renal impairment** if eGFR 10–30 mL/minute/1.73 m<sup>2</sup>, usual initial dose of injection, then half normal dose; if eGFR less than 10 mL/minute/1.73 m<sup>2</sup>, usual initial dose of injection, then one-quarter normal dose

**Pregnancy** no information available; manufacturer of injection advises avoid; manufacturer of powder for nebuliser solution advises avoid unless essential

**Breast-feeding** amount in milk probably too small to be harmful

## Side-effects

**Specific side-effects for parenteral treatment** Nausea, vomiting, diarrhoea, abdominal cramps; mouth ulcers, altered taste; jaundice and hepatitis; flushing; hypersensitivity reactions; blood disorders (including thrombocytopenia and neutropenia); rashes, injection-site reactions; rarely hypotension, seizures, asthenia, confusion, dizziness, headache, halitosis, and breast tenderness; very rarely antibiotic-associated colitis, gastro-intestinal bleeding, and toxic epidermal necrolysis

**Specific side-effects for inhaled treatment** Wheezing, bronchospasm, cough; pyrexia; rash; rhinorrhoea, pharyngolaryngeal pain

## Dose

- By deep intramuscular injection or by intravenous injection over 3–5 minutes or by intravenous infusion, 1 g every 8 hours or 2 g every 12 hours; 2 g every 6–8 hours for severe infections (including systemic *Pseudomonas aeruginosa* and lung infections in cystic fibrosis); single doses over 1 g intravenous route only
- Urinary-tract infections, 0.5–1 g every 8–12 hours
- **CHILD** over 1 week, by intravenous injection or infusion, 30 mg/kg every 6–8 hours increased in severe infections for child of 2 years or older to 50 mg/kg every 6–8 hours; max. 8 g daily
- Gonorrhoea, cystitis, by intramuscular injection, 1 g as a single dose
- Chronic pulmonary *Pseudomonas aeruginosa* infection in patients with cystic fibrosis, by inhalation of nebulised solution, **ADULT** over 18 years, 75 mg 3 times daily (at least 4 hours apart) for 28 days; if additional courses required, a minimum of 28 days without aztreonam nebuliser solution recommended between courses

## Parenteral

**Azactam**® (Squibb) (POM)

**Injection**, powder for reconstitution, aztreonam, net price 1-g vial = £9.40; 2-g vial = £18.82

## Inhalation

**Cayston**® (Gilead) (POM)

**Powder for nebuliser solution**, aztreonam (as lysine), net price 84 × 75 mg vials (with solvent and nebuliser handset) = £2566.50

## 5.1.3 Tetracyclines

The tetracyclines are broad-spectrum antibiotics whose value has decreased owing to increasing bacterial resistance. They remain, however, the treatment of choice

for infections caused by chlamydia (trachoma, psittacosis, salpingitis, urethritis, and lymphogranuloma venereum), rickettsia (including Q-fever), brucella (doxycycline with either streptomycin or rifampicin), and the spirochaete, *Borrelia burgdorferi* (Lyme disease—see section 5.1.1.3). They are also used in respiratory and genital mycoplasma infections, in acne, in destructive (refractory) periodontal disease, in exacerbations of chronic bronchitis (because of their activity against *Haemophilus influenzae*), and for leptospirosis in penicillin hypersensitivity (as an alternative to erythromycin).

For the role of tetracyclines in the management of methicillin-resistant *Staphylococcus aureus* (MRSA) infection, see p. 334.

Microbiologically, there is little to choose between the various tetracyclines, the only exception being **minocycline** which has a broader spectrum; it is active against *Neisseria meningitidis* and has been used for meningococcal prophylaxis but is no longer recommended because of side-effects including dizziness and vertigo (see section 5.1, table 2 for current recommendations). Compared to other tetracyclines, minocycline is associated with a greater risk of lupus-erythematosus-like syndrome. Minocycline sometimes causes irreversible pigmentation.

**Oral infections** In adults, tetracyclines can be effective against oral anaerobes but the development of resistance (especially by oral streptococci) has reduced their usefulness for the treatment of acute oral infections; they may still have a role in the treatment of destructive (refractory) forms of periodontal disease. Doxycycline has a longer duration of action than tetracycline or oxytetracycline and need only be given once daily; it is reported to be more active against anaerobes than some other tetracyclines.

For the use of doxycycline in the treatment of recurrent aphthous ulceration, oral herpes, or as an adjunct to gingival scaling and root planing for periodontitis, see section 12.3.1 and section 12.3.2.

**Cautions** Tetracyclines may increase muscle weakness in patients with myasthenia gravis, and exacerbate systemic lupus erythematosus. Antacids, and aluminium, calcium, iron, magnesium and zinc salts decrease the absorption of tetracyclines; milk also reduces the absorption of demeclocycline, oxytetracycline, and tetracycline. Other **interactions**: Appendix 1 (tetracyclines).

**Contra-indications** Deposition of tetracyclines in growing bone and teeth (by binding to calcium) causes staining and occasionally dental hypoplasia, and they should **not** be given to children under 12 years, or to pregnant or breast-feeding women. However, doxycycline may be used in children for treatment and post-exposure prophylaxis of anthrax when an alternative antibacterial cannot be given [unlicensed indication]. Tetracyclines should not be given to patients with acute porphyria (section 9.8.2).

**Hepatic impairment** Tetracyclines should be avoided or used with caution in patients with hepatic impairment. Tetracyclines should also be used with caution in those receiving potentially hepatotoxic drugs.

**Renal impairment** With the exception of **doxycycline** and **minocycline**, the tetracyclines may exacerbate

renal failure and should **not** be given to patients with renal impairment.

**Pregnancy** Tetracyclines should **not** be given to pregnant women. Effects on skeletal development have been documented when tetracyclines have been used in the first trimester of pregnancy in *animal* studies. Administration during the second or third trimester may cause discoloration of the child's teeth, and maternal hepatotoxicity has been reported with large parenteral doses.

**Breast-feeding** Tetracyclines should **not** be given to women who are breast-feeding (although absorption and therefore discoloration of teeth in the infant is probably usually prevented by chelation with calcium in milk).

**Side-effects** Side-effects of the tetracyclines include nausea, vomiting, diarrhoea (antibiotic-associated colitis reported occasionally), dysphagia, and oesophageal irritation. Other rare side-effects include hepatotoxicity, pancreatitis, blood disorders, photosensitivity (particularly with demeclocycline), and hypersensitivity reactions (including rash, exfoliative dermatitis, Stevens-Johnson syndrome, urticaria, angioedema, anaphylaxis, pericarditis). Headache and visual disturbances may indicate benign intracranial hypertension (discontinue treatment); bulging fontanelles have been reported in infants.

## TETRACYCLINE

**Indications** see notes above; acne vulgaris, rosacea (section 13.6)

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above; max. 1 g daily in divided doses

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; also acute renal failure, skin discoloration

### Dose

- 250 mg every 6 hours, increased in severe infections to 500 mg every 6–8 hours
- Acne, see section 13.6.2
- Non-gonococcal urethritis, 500 mg every 6 hours for 7–14 days (21 days if failure or relapse after first course)

**Counselling** Tablets should be swallowed whole with plenty of fluid while sitting or standing

**Tetracycline** (Non-proprietary) <sup>(PMM)</sup>

Tablets, coated, tetracycline hydrochloride 250 mg, net price 28-tab pack = £13.67. Label: 7, 9, 23, counselling, posture

**Dental prescribing on NHS** Tetracycline Tablets may be prescribed

## DEMECLOCYCLINE HYDROCHLORIDE

**Indications** see notes above; also inappropriate secretion of antidiuretic hormone, section 6.5.2

**Cautions** see notes above, but photosensitivity more common (avoid exposure to sunlight or sun lamps)

**Contra-indications** see notes above

**Hepatic impairment** see notes above; max. 1 g daily in divided doses

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; also reversible nephrogenic diabetes insipidus, acute renal failure

#### Dose

- 150 mg every 6 hours *or* 300 mg every 12 hours

**Ledermycin**<sup>®</sup> (Goldshield) (POM)

**Capsules**, red, demeclocycline hydrochloride 150 mg, net price 28-cap pack = £16.02. Label: 7, 9, 11, 23

## DOXYCYCLINE

**Indications** see notes above; chronic prostatitis; sinusitis, syphilis, pelvic inflammatory disease (Table 1, section 5.1); treatment and prophylaxis of anthrax [unlicensed indication]; malaria treatment and prophylaxis (section 5.4.1); recurrent aphthous ulceration, adjunct to gingival scaling and root planing for periodontitis (section 12.3.1); oral herpes simplex (section 12.3.2); rosacea, acne vulgaris (section 13.6)

**Cautions** see notes above; alcohol dependence; photosensitivity reported (avoid exposure to sunlight or sun lamps)

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** use with caution (avoid excessive doses)

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; also anorexia, dry mouth, flushing, anxiety, and tinnitus

#### Dose

- 200 mg on first day, then 100 mg daily; severe infections (including refractory urinary-tract infections), 200 mg daily
- Early syphilis, 100 mg twice daily for 14 days; late latent syphilis, 100 mg twice daily for 28 days; neurosyphilis, 200 mg twice daily for 28 days
- Uncomplicated genital chlamydia, non-gonococcal urethritis, 100 mg twice daily for 7 days (14 days in pelvic inflammatory disease, see also Table 1, section 5.1)
- Lyme disease (see also section 5.1.1.3), 100 mg twice daily for 10–14 days (28 days in Lyme arthritis)
- Anthrax (treatment or post-exposure prophylaxis; see also section 5.1.12), 100 mg twice daily; **CHILD** (only if alternative antibacterial cannot be given) [unlicensed dose] 5 mg/kg daily in 2 divided doses (max. 200 mg daily)

**Counselling** Capsules should be swallowed whole with plenty of fluid during meals while sitting or standing

**Note** Doxycycline doses in BNF may differ from those in product literature

**Doxycycline** (Non-proprietary) (POM)

**Capsules**, doxycycline (as hyclate) 50 mg, net price 28-cap pack = £1.79; 100 mg, 8-cap pack = £1.16.

Label: 6, 9, 11, 27, counselling, posture

**Brands include** *Doxylar*<sup>®</sup>

**Dental prescribing on NHS** Doxycycline Capsules 100 mg may be prescribed

**Vibramycin-D**<sup>®</sup> (Pfizer) (POM)

**Dispersible tablets**, yellow, scored, doxycycline 100 mg, net price 8-tab pack = £4.91. Label: 6, 9, 11, 13

**Dental prescribing on NHS** May be prescribed as Dispersible Doxycycline Tablets

## Modified-release

**Efracea**<sup>®</sup> (Galderma) (POM)

**Capsules**, m/r, beige, doxycycline (as monohydrate) 40 mg, net price 56-cap pack = £29.78. Label: 6, 11, 27, counselling, posture

**Dose** papulopustular, facial rosacea (without ocular involvement), 40 mg daily in the morning for 16 weeks; consider discontinuing treatment if no response after 6 weeks

## LYMECYCLINE

**Indications** see notes above

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above

#### Dose

- 408 mg every 12 hours, increased to 1.224–1.632 g daily in severe infections
- Acne, 408 mg daily for at least 8 weeks

**Tetralysal 300**<sup>®</sup> (Galderma) (POM)

**Capsules**, red/yellow, lymecycline 408 mg (= tetracycline 300 mg), net price 28-cap pack = £7.77, 56-cap pack = £14.97. Label: 6, 9

## MINOCYCLINE

**Indications** see notes above; meningococcal carrier state; acne vulgaris (section 13.6.2)

**Cautions** see notes above; if treatment continued for longer than 6 months, monitor every 3 months for hepatotoxicity, pigmentation and for systemic lupus erythematosus—discontinue if these develop or if pre-existing systemic lupus erythematosus worsens

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** use with caution (avoid excessive doses)

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; also dizziness and vertigo (more common in women); *rarely* anorexia, tinnitus, impaired hearing, hyperaesthesia, paraesthesia, acute renal failure, pigmentation (sometimes irreversible), and alopecia; *very rarely* systemic lupus erythematosus, discoloration of conjunctiva, tears, and sweat

#### Dose

- 100 mg twice daily
- Acne, see section 13.6.2 and under preparations, below
- Prophylaxis of asymptomatic meningococcal carrier state (but no longer recommended, see notes above), 100 mg twice daily for 5 days usually followed by rifampicin

**Counselling** Tablets or capsules should be swallowed whole with plenty of fluid while sitting or standing

**Minocycline** (Non-proprietary) (POM)

**Capsules**, minocycline (as hydrochloride) 50 mg, net price 56-cap pack = £15.27; 100 mg, 28-cap pack = £13.09. Label: 6, 9, counselling, posture

**Brands include** *Akemin*<sup>®</sup>

Tablets, minocycline (as hydrochloride) 50 mg, net price 28-tab pack = £4.93, 100 mg, 28-tab pack = £9.52. Label: 6, 9, counselling, posture

#### Modified release

#### Minocycline m/r preparations <sup>(POM)</sup>

**Capsules**, m/r, minocycline (as hydrochloride) 100 mg, net price 56-cap pack = £20.08. Label: 6, 25  
**Brands include** *Acanamino*<sup>®</sup> MR, *Minocin MR*<sup>®</sup>, *Sebomin MR*<sup>®</sup>  
**Dose** acne, 100 mg daily

## OXYTETRACYCLINE

**Indications** see notes above; acne vulgaris, rosacea (section 13.6)

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above

#### Dose

- 250–500 mg every 6 hours
- Acne, see section 13.6.2

#### Oxytetracycline (Non-proprietary) <sup>(POM)</sup>

Tablets, coated, oxytetracycline dihydrate 250 mg, net price 28-tab pack = £1.28. Label: 7, 9, 23  
**Brands include** *Oxymycin*<sup>®</sup>  
**Dental prescribing on NHS** Oxytetracycline Tablets may be prescribed

## Tigecycline

**Tigecycline** is a glycylcycline antibacterial structurally related to the tetracyclines; side-effects similar to those of the tetracyclines can potentially occur. Tigecycline is active against Gram-positive and Gram-negative bacteria, including tetracycline-resistant organisms, and some anaerobes. It is also active against methicillin-resistant *Staphylococcus aureus* and vancomycin-resistant enterococci, but *Pseudomonas aeruginosa* and many strains of *Proteus spp* are resistant to tigecycline. Tigecycline should be reserved for the treatment of complicated skin and soft-tissue infections and complicated abdominal infections caused by multiple-antibacterial resistant organisms; however, it is not recommended for the treatment of foot infections in patients with diabetes.

## TIGECYCLINE

**Indications** complicated intra-abdominal infections; complicated skin and soft-tissue infections, but not diabetic foot infections

**Cautions** cholestasis; **interactions:** Appendix 1 (tigecycline)

**Contra-indications** hypersensitivity to tetracyclines

**Hepatic impairment** initially 100 mg then 25 mg every 12 hours in severe impairment

**Pregnancy** see under Tetracyclines, p. 347

**Breast-feeding** manufacturer advises caution—present in milk in *animal* studies

**Side-effects** see notes above; also nausea, vomiting, abdominal pain, dyspepsia, diarrhoea, anorexia, bilirubinaemia, dizziness, headache, prolonged prothrombin time, prolonged activated partial

thromboplastin time, rash, pruritus, and injection-site reactions; *less commonly* pancreatitis, cholestatic jaundice, and hypoproteinaemia; also reported, antibiotic-associated colitis, hepatic failure, and thrombocytopenia

#### Dose

- **By intravenous infusion**, **ADULT** over 18 years, initially 100 mg, then 50 mg every 12 hours for 5–14 days

#### Tygacil<sup>®</sup> (Wyeth) <sup>(POM)</sup>

**Intravenous infusion**, powder for reconstitution, tigecycline, net price 50-mg vial = £32.31

## 5.1.4 Aminoglycosides

These include amikacin, gentamicin, neomycin, streptomycin, and tobramycin. All are bactericidal and active against some Gram-positive and many Gram-negative organisms. Amikacin, gentamicin, and tobramycin are also active against *Pseudomonas aeruginosa*; streptomycin is active against *Mycobacterium tuberculosis* and is now almost entirely reserved for tuberculosis (section 5.1.9).

The aminoglycosides are not absorbed from the gut (although there is a risk of absorption in inflammatory bowel disease and liver failure) and must therefore be given by injection for systemic infections.

Most side-effects of this group of antibiotics are dose-related therefore care must be taken with dosage and whenever possible treatment should not exceed 7 days. The important side-effects are ototoxicity, and nephrotoxicity; they occur most commonly in the elderly and in patients with renal failure.

Aminoglycosides may impair neuromuscular transmission and should not be given to patients with myasthenia gravis; large doses given during surgery have been responsible for a transient myasthenic syndrome in patients with normal neuromuscular function.

Aminoglycosides should preferably not be given with potentially ototoxic diuretics (e.g. furosemide); if concurrent use is unavoidable administration of the aminoglycoside and of the diuretic should be separated by as long a period as practicable.

**Renal impairment** Excretion of aminoglycosides is principally via the kidney and accumulation occurs in renal impairment. Ototoxicity and nephrotoxicity occur commonly in patients with renal failure. If there is impairment of renal function, the interval between doses must be increased; if the renal impairment is severe, the dose itself should be reduced as well. Serum-aminoglycoside concentrations **must** be monitored in patients with renal impairment, see Serum Concentrations below; renal, auditory, and vestibular function should also be monitored. A once-daily, high-dose regimen of an aminoglycoside should be avoided in patients with a creatinine clearance less than 20 mL/minute.

**Once daily dosage** *Once daily administration* of aminoglycosides is more convenient, provides adequate serum concentrations, and in many cases has largely superseded *multiple daily dose regimens* (given in 2–3 divided doses during the 24 hours). Local guidelines on dosage and serum concentrations should be consulted. A once-daily, high-dose regimen of an aminoglycoside

should be avoided in patients with endocarditis, burns of more than 20% of the total body surface area, or creatinine clearance less than 20 mL/minute.

**Serum concentrations** Serum concentration monitoring avoids both excessive and subtherapeutic concentrations thus preventing toxicity and ensuring efficacy. In patients with normal renal function, aminoglycoside concentrations should be measured after 3 or 4 doses of a multiple daily dose regimen; patients with renal impairment may require earlier and more frequent measurement of aminoglycoside concentration.

For multiple daily dose regimens, blood samples should be taken approximately 1 hour after intramuscular or intravenous administration ('peak' concentration) and also just before the next dose ('trough' concentration). If the pre-dose ('trough') concentration is high, the interval between doses must be increased. If the post-dose ('peak') concentration is high, the dose must be decreased. For once daily dose regimens, consult local guidelines on serum concentration monitoring.

Serum-aminoglycoside concentrations should be measured in all patients and **must** be determined in infants, in the elderly, in obesity, and in cystic fibrosis, or if high doses are being given, or if there is renal impairment.

**Endocarditis** Gentamicin is used in combination with other antibiotics for the treatment of bacterial endocarditis (Table 1, section 5.1). Serum-gentamicin concentration should be determined twice each week (more often in renal impairment). **Streptomycin** may be used as an alternative in gentamicin-resistant enterococcal endocarditis.

**Gentamicin** is the aminoglycoside of choice in the UK and is used widely for the treatment of serious infections. It has a broad spectrum but is inactive against anaerobes and has poor activity against haemolytic streptococci and pneumococci. When used for the 'blind' therapy of undiagnosed serious infections it is usually given in conjunction with a penicillin or metronidazole (or both). Gentamicin is used together with another antibiotic for the treatment of endocarditis (see above and Table 1, section 5.1).

Loading and maintenance doses of gentamicin may be calculated on the basis of the patient's weight and renal function (e.g. using a nomogram); adjustments are then made according to serum-gentamicin concentrations. High doses are occasionally indicated for serious infections, especially in the neonate, in the patient with cystic fibrosis, or in the immunocompromised patient. Whenever possible treatment should not exceed 7 days.

**Amikacin** is more stable than gentamicin to enzyme inactivation. Amikacin is used in the treatment of serious infections caused by gentamicin-resistant Gram-negative bacilli.

**Tobramycin** has similar activity to gentamicin. It is slightly more active against *Ps. aeruginosa* but shows less activity against certain other Gram-negative bacteria. Tobramycin may be administered by nebuliser on a cyclical basis (28 days of tobramycin followed by a 28-day tobramycin-free interval) for the treatment of chronic pulmonary *Ps. aeruginosa* infection in cystic fibrosis; however, resistance may develop and some patients do not respond to treatment.

**Neomycin** is too toxic for parenteral administration and can only be used for infections of the skin or mucous membranes or to reduce the bacterial population of the colon prior to bowel surgery or in hepatic failure. Oral administration may lead to malabsorption. Small amounts of neomycin may be absorbed from the gut in patients with hepatic failure and, as these patients may also be uraemic, cumulation may occur with resultant ototoxicity.

**Pregnancy** There is a risk of auditory or vestibular nerve damage when aminoglycosides are used in the second and third trimesters of pregnancy. The risk is greatest with streptomycin (section 5.1.9). The risk is probably very small with gentamicin and tobramycin, but their use should be avoided unless essential (if given, serum-aminoglycoside concentration monitoring is essential).

## GENTAMICIN

**Indications** septicaemia and neonatal sepsis; meningitis and other CNS infections; biliary-tract infection, acute pyelonephritis or prostatitis, endocarditis (see notes above); pneumonia in hospital patients, adjunct in listerial meningitis (Table 1, section 5.1); eye (section 11.3.1); ear (section 12.1.1)

**Cautions** neonates, infants and elderly (adjust dose and monitor renal, auditory and vestibular function together with serum gentamicin concentrations); avoid prolonged use; conditions characterised by muscular weakness; see also notes above; **interactions:** Appendix 1 (aminoglycosides)

**Contra-indications** myasthenia gravis

**Renal impairment** see notes above

**Pregnancy** see notes above

**Side-effects** vestibular and auditory damage, nephrotoxicity; rarely, hypomagnesaemia on prolonged therapy, antibiotic-associated colitis, stomatitis; also reported, nausea, vomiting, rash, blood disorders; see also notes above

### Dose

To avoid excessive dosage in obese patients, use ideal weight for height to calculate dose and monitor serum-gentamicin concentration closely

- Multiple daily dose regimen, **by intramuscular or by slow intravenous injection** over at least 3 minutes or **by intravenous infusion**, 3–5 mg/kg daily (in divided doses every 8 hours), see also notes above; **CHILD** under 18 years see *BNF for Children*  
Endocarditis (in combination with other antibiotics, see Table 1, section 5.1), **ADULT** 1 mg/kg every 8 hours; **CHILD** under 18 years see *BNF for Children*
  - Once daily dose regimen (see notes above and also consult local guidelines), **by intravenous infusion**, initially 5–7 mg/kg, then adjust according to serum-gentamicin concentration; **CHILD** under 18 years see *BNF for Children*
  - **By intrathecal injection**, seek specialist advice, 1 mg daily (increased if necessary to 5 mg daily); only preservative-free, intrathecal preparation should be used; **CHILD** under 18 years see *BNF for Children*
- Note** For multiple daily dose regimen, one-hour ('peak') serum concentration should be 5–10 mg/litre (3–5 mg/litre for endocarditis); pre-dose ('trough') concentration should be less than 2 mg/litre (less than 1 mg/litre for endocarditis). For once-daily dose regimen, consult local guidelines on monitoring serum-gentamicin concentration

**Gentamicin** (Non-proprietary) (POM)

**Injection**, gentamicin (as sulphate), net price 40 mg/mL, 1-mL amp = £1.40, 2-mL amp = £1.54, 2-mL vial = £1.48

**Paediatric injection**, gentamicin (as sulphate) 10 mg/mL, net price 2-mL vial = £1.80

**Intrathecal injection**, gentamicin (as sulphate) 5 mg/mL, net price 1-mL amp = 74p

**Intravenous infusion**, gentamicin (as sulphate) 1 mg/mL in sodium chloride intravenous infusion 0.9%, net price 80-mL (80 mg) bottle = £1.95; 3 mg/mL, 80-mL (240 mg) bottle = £5.95, 120-mL (360 mg) bottle = £8.45

**Cidomycin**<sup>®</sup> (Sanofi-Aventis) (POM)

**Injection**, gentamicin (as sulphate) 40 mg/mL. Net price 2-mL amp or vial = £1.48

**Genticin**<sup>®</sup> (Amdipharm) (POM)

**Injection**, gentamicin (as sulphate) 40 mg/mL. Net price 2-mL amp = £1.40

**Isotonic Gentamicin Injection** (Baxter) (POM)

**Intravenous infusion**, gentamicin (as sulphate) 800 micrograms/mL in sodium chloride intravenous infusion 0.9%. Net price 100-mL (80-mg) *Viaflex*<sup>®</sup> bag = £1.61

**Electrolytes** Na<sup>+</sup> 15.4 mmol/100-mL bag

**AMIKACIN**

**Indications** serious Gram-negative infections resistant to gentamicin

**Cautions** see under Gentamicin; **interactions:** Appendix 1 (aminoglycosides)

**Contra-indications** see under Gentamicin

**Renal impairment** see notes above

**Pregnancy** see notes above

**Side-effects** see under Gentamicin

**Dose**

To avoid excessive dosage in obese patients, use ideal weight for height to calculate dose and monitor serum-amikacin concentration closely

- **By intramuscular or by slow intravenous injection or by infusion**, 15 mg/kg daily in 2 divided doses, increased to 22.5 mg/kg daily in 3 divided doses in severe infections; max. 1.5 g daily for up to 10 days (max. cumulative dose 15 g); **CHILD** under 18 years see *BNF for Children*

**Note** One-hour ('peak') serum concentration should not exceed 30 mg/litre; pre-dose ('trough') concentration should be less than 10 mg/litre

**Amikacin** (Non-proprietary) (POM)

**Injection**, amikacin (as sulphate) 250 mg/mL. Net price 2-mL vial = £10.14

**Electrolytes** Na<sup>+</sup> 0.56 mmol/500-mg vial

**Amikin**<sup>®</sup> (Bristol-Myers Squibb) (POM)

**Injection**, amikacin (as sulphate) 50 mg/mL. Net price 2-mL vial = £2.07

**Electrolytes** Na<sup>+</sup> < 0.5 mmol/vial

**NEOMYCIN SULPHATE**

**Indications** bowel sterilisation before surgery, see also notes above

**Cautions** see under Gentamicin but too toxic for systemic use, see notes above; **interactions:** Appendix 1 (aminoglycosides)

**Contra-indications** see under Gentamicin; intestinal obstruction

**Hepatic impairment** absorbed from gastro-intestinal tract in liver disease—increased risk of ototoxicity

**Renal impairment** avoid; ototoxic; nephrotoxic

**Pregnancy** see notes above

**Side-effects** see under Gentamicin but poorly absorbed on oral administration; increased salivation, stomatitis, impaired intestinal absorption with steatorrhoea and diarrhoea

**Dose**

- **By mouth**, pre-operative bowel sterilisation, 1 g every hour for 4 hours, then 1 g every 4 hours for 2–3 days  
Hepatic coma, up to 4 g daily in divided doses usually for 5–7 days

**Neomycin** (Non-proprietary) (POM)

**Tablets**, neomycin sulphate 500 mg. Net price 100 = £20.65

**Brands include** *Nivemycin*<sup>®</sup>

**TOBRAMYCIN**

**Indications** see under Gentamicin and notes above

**Cautions** see under Gentamicin; **interactions:**

Appendix 1 (aminoglycosides)

**Specific cautions for inhaled treatment** Other inhaled drugs should be administered before tobramycin; monitor for bronchospasm with initial dose, measure peak flow before and after nebulisation—if bronchospasm occurs, repeat test using bronchodilator; monitor renal function before treatment and then annually; severe haemoptysis

**Contra-indications** see under Gentamicin

**Renal impairment** see notes above

**Pregnancy** see notes above

**Side-effects** see under Gentamicin; *on inhalation*, mouth ulcers, taste disturbances, voice alteration, cough, bronchospasm (see Cautions)

**Dose**

To avoid excessive dosage in obese patients, use ideal weight for height to calculate parenteral dose and monitor serum-tobramycin concentration closely

- **By intramuscular injection or by slow intravenous injection or by intravenous infusion**, 3 mg/kg daily in divided doses every 8 hours, see also notes above; in severe infections up to 5 mg/kg daily in divided doses every 6–8 hours (reduced to 3 mg/kg as soon as clinically indicated); **CHILD** under 18 years see *BNF for Children*
  - Urinary-tract infection, **by intramuscular injection**, 2–3 mg/kg daily as a single dose
- Note** One-hour ('peak') serum concentration should not exceed 10 mg/litre; pre-dose ('trough') concentration should be less than 2 mg/litre
- Chronic pulmonary *Pseudomonas aeruginosa* infection in patients with cystic fibrosis, **by inhalation of nebulised solution**, **ADULT** and **CHILD** over 6 years, 300 mg every 12 hours for 28 days, subsequent courses repeated after 28-day interval without tobramycin nebuliser solution

**Parenteral****Tobramycin** (Non-proprietary) (POM)

**Injection**, tobramycin (as sulphate) 40 mg/mL, net price 1-mL (40-mg) vial = £4.00, 2-mL (80-mg) vial = £4.16, 6-mL (240-mg) vial = £19.20

**Inhalation****Bramitob**<sup>®</sup> (Chiesi) (POM)

**Nebuliser solution**, tobramycin 75 mg/mL, net price 56 × 4-mL (300-mg) unit = £1187.00

**Tobi®** (Novartis) <sup>(POM)</sup>

**Nebuliser solution**, tobramycin 60 mg/mL, net price 56 × 5-mL (300-mg) unit = £1187.20

## 5.1.5 Macrolides

**Erythromycin** has an antibacterial spectrum that is similar but not identical to that of penicillin; it is thus an alternative in penicillin-allergic patients.

Indications for erythromycin include respiratory infections, whooping cough, legionnaires' disease, and campylobacter enteritis. It is active against many penicillin-resistant staphylococci but some are now also resistant to erythromycin; it has poor activity against *Haemophilus influenzae*. Erythromycin is also active against chlamydia and mycoplasmas.

Erythromycin causes nausea, vomiting, and diarrhoea in some patients; in mild to moderate infections this can be avoided by giving a lower dose (250 mg 4 times daily) but if a more serious infection, such as Legionella pneumonia, is suspected higher doses are needed.

**Azithromycin** is a macrolide with slightly less activity than erythromycin against Gram-positive bacteria but enhanced activity against some Gram-negative organisms including *H. influenzae*. Plasma concentrations are very low but tissue concentrations are much higher. It has a long tissue half-life and once daily dosage is recommended. Azithromycin is also used in the treatment of trachoma [unlicensed indication] (section 11.3.1).

**Clarithromycin** is an erythromycin derivative with slightly greater activity than the parent compound. Tissue concentrations are higher than with erythromycin. It is given twice daily.

For the role of erythromycin, azithromycin, and clarithromycin in the treatment of Lyme disease, see section 5.1.1.3

**Spiramycin** is also a macrolide (section 5.4.7).

**Oral infections** Clarithromycin or erythromycin is an alternative for oral infections in penicillin-allergic patients or where a beta-lactamase producing organism is involved. However, many organisms are now resistant to macrolides or rapidly develop resistance; their use should therefore be limited to short courses. Metronidazole (section 5.1.11) may be preferred as an alternative to a penicillin.

**Cautions** Macrolides should be used with caution in patients with a predisposition to QT interval prolongation (including electrolyte disturbances and concomitant use of drugs that prolong the QT interval).

**Side-effects** Nausea, vomiting, abdominal discomfort, and diarrhoea are the most common side-effects of the macrolides, but they are mild and less frequent with azithromycin and clarithromycin than with erythromycin. Hepatotoxicity (including cholestatic jaundice) and rash occur less frequently. Other side-effects reported rarely or very rarely include pancreatitis, antibiotic-associated colitis, QT interval prolongation, arrhythmias, generally reversible hearing loss (sometimes with tinnitus) after large doses, Stevens-Johnson syndrome, and toxic epidermal necrolysis. Intravenous infusion may cause local tenderness and phlebitis.

## AZITHROMYCIN

**Indications** respiratory-tract infections; otitis media; skin and soft-tissue infections; uncomplicated genital chlamydial infections and non-gonococcal urethritis (Table 1, section 5.1); mild or moderate typhoid due to multiple-antibacterial-resistant organisms [unlicensed indication]; Lyme disease (see also section 5.1.1.3 [unlicensed indication]); prophylaxis of group A streptococcal infection (Table 2, section 5.1)

**Cautions** see notes above; **interactions:** Appendix 1 (macrolides)

**Hepatic impairment** manufacturers advise avoid in severe liver disease—no information available

**Renal impairment** use with caution if eGFR less than 10 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** manufacturers advise use only if adequate alternatives not available

**Breast-feeding** present in milk; use only if no suitable alternatives

**Side-effects** see notes above; also anorexia, dyspepsia, flatulence, dizziness, headache, drowsiness, convulsions, arthralgia, and disturbances in taste and smell; rarely constipation, syncope, insomnia, agitation, anxiety, asthenia, paraesthesia, hyperactivity, thrombocytopenia, haemolytic anaemia, interstitial nephritis, acute renal failure, photosensitivity, tooth and tongue discoloration

### Dose

- 500 mg once daily for 3 days or 500 mg on first day then 250 mg once daily for 4 days; **CHILD** over 6 months 10 mg/kg once daily for 3 days; or body-weight 15–25 kg, 200 mg once daily for 3 days; body-weight 26–35 kg, 300 mg once daily for 3 days; body-weight 36–45 kg, 400 mg once daily for 3 days
- Uncomplicated genital chlamydial infections and non-gonococcal urethritis, 1 g as a single dose
- Lyme disease (see also section 5.1.1.3), typhoid [unlicensed indications], 500 mg once daily for 7–10 days (7 days in typhoid)

**Azithromycin** (Non-proprietary) <sup>(POM)</sup>

**Capsules**, azithromycin (as dihydrate) 250 mg, net price 4-cap pack = £9.82, 6-cap pack = £14.73. Label: 5, 9, 23

**Tablets**, azithromycin (as monohydrate hemi-ethanolate) 250 mg, net price 4-tab pack = £9.83; 500 mg, 3-tab pack = £6.75. Label: 5, 9

**Note** Azithromycin tablets can be sold to the public for the treatment of confirmed, asymptomatic *Chlamydia trachomatis* genital infection in those over 16 years of age, and for the epidemiological treatment of their sexual partners, subject to max. single dose of 1 g, max. daily dose 1 g, and a pack size of 1 g

**Oral suspension**, azithromycin (as monohydrate) 200 mg/5 mL when reconstituted with water, net price 15-mL pack = £5.86, 30-mL pack = £11.04. Label: 5, 9

**Dental prescribing on NHS** May be prescribed as Azithromycin Oral Suspension 200 mg/5 mL

**Zithromax®** (Pfizer) <sup>(POM)</sup>

**Capsules**, azithromycin (as dihydrate) 250 mg, net price 4-cap pack = £7.16, 6-cap pack = £10.74. Label: 5, 9, 23

**Oral suspension**, cherry/banana-flavoured, azithromycin (as dihydrate) 200 mg/5 mL when reconstituted with water. Net price 15-mL pack = £4.06, 22.5-mL pack = £6.10, 30-mL pack = £11.04. Label: 5, 9

## CLARITHROMYCIN

**Indications** respiratory-tract infections, mild to moderate skin and soft-tissue infections, otitis media; Lyme disease (see also section 5.1.1.3); *Helicobacter pylori* eradication (section 1.3)

**Cautions** see notes above; **interactions:** Appendix 1 (macrolides)

**Hepatic impairment** hepatic dysfunction including jaundice reported

**Renal impairment** use half normal dose if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>; avoid *Klaricid XL*® if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk

**Breast-feeding** manufacturer advises avoid unless potential benefit outweighs risk—present in milk

**Side-effects** see notes above; also tooth and tongue discoloration, smell and taste disturbances, stomatitis, glossitis, and headache; *less commonly* arthralgia and myalgia; *rarely* tinnitus; *very rarely* dizziness, insomnia, nightmares, anxiety, confusion, psychosis, paraesthesia, convulsions, hypoglycaemia, renal failure, interstitial nephritis, leucopenia, and thrombocytopenia

### Dose

- **By mouth, ADULT and CHILD** over 12 years, 250 mg every 12 hours for 7 days, increased in pneumonia or severe infections to 500 mg every 12 hours for up to 14 days (see also Table 1, section 5.1); **CHILD** body-weight under 8 kg, 7.5 mg/kg twice daily; 8–11 kg, 62.5 mg twice daily; 12–19 kg, 125 mg twice daily; 20–29 kg, 187.5 mg twice daily; 30–40 kg, 250 mg twice daily  
Lyme disease (see also section 5.1.1.3), **ADULT and CHILD** over 12 years, 500 mg every 12 hours for 14–21 days (unlicensed duration); **CHILD** 1 month–12 years see *BNF for Children*
- **By intravenous infusion** into larger proximal vein, **ADULT and CHILD** over 12 years, 500 mg twice daily; **CHILD** 1 month–12 years see *BNF for Children*

### Clarithromycin (Non-proprietary) (Pom)

**Tablets**, clarithromycin 250 mg, net price 14-tab pack = £3.17; 500 mg, 14-tab pack = £4.10. Label: 9  
**Dental prescribing on NHS** Clarithromycin Tablets may be prescribed

**Oral suspension**, clarithromycin for reconstitution with water 125 mg/5 mL, net price 70 mL = £6.18; 250 mg/5 mL, 70 mL = £12.36. Label: 9

**Dental prescribing on NHS** Clarithromycin Oral Suspension may be prescribed

**Intravenous infusion**, powder for reconstitution, clarithromycin, net price 500-mg vial = £10.31

### Klaricid® (Abbott) (Pom)

**Tablets**, both yellow, f/c, clarithromycin 250 mg, net price 14-tab pack = £6.30; 500 mg, 14-tab pack = £10.17, 20-tab pack = £14.54. Label: 9

**Paediatric suspension**, clarithromycin for reconstitution with water 125 mg/5 mL, net price 70 mL = £4.73, 100 mL = £8.14; 250 mg/5 mL, 70 mL = £9.46. Label: 9

**Granules**, clarithromycin 250 mg/sachet, net price 14-sachet pack = £11.68. Label: 9, 13

**Intravenous infusion**, powder for reconstitution, clarithromycin. Net price 500-mg vial = £9.45  
**Electrolytes** Na<sup>+</sup> < 0.5 mmol/500-mg vial

### Klaricid XL® (Abbott) (Pom)

**Tablets**, m/r, yellow, clarithromycin 500 mg, net price 7-tab pack = £6.46, 14-tab pack = £12.71. Label: 9, 21, 25

**Dose** 500 mg once daily (doubled in severe infections) for 7–14 days

## ERYTHROMYCIN

**Indications** susceptible infections in patients with penicillin hypersensitivity; oral infections (see notes above); campylobacter enteritis, syphilis, non-gonococcal urethritis, respiratory-tract infections (including Legionella infection), skin infections (Table 1, section 5.1); chronic prostatitis; prophylaxis of diphtheria, group A streptococcal infection, and whooping cough (Table 2, section 5.1); acne vulgaris and rosacea (section 13.6)

**Cautions** see notes above; neonate under 2 weeks (risk of hypertrophic pyloric stenosis); avoid in acute porphyria (section 9.8.2); **interactions:** Appendix 1 (macrolides)

**Hepatic impairment** may cause idiosyncratic hepatotoxicity

**Renal impairment** max. 1.5 g daily in severe renal impairment (ototoxicity)

**Pregnancy** not known to be harmful

**Breast-feeding** only small amounts in milk—not known to be harmful

**Side-effects** see notes above; also myasthenia-like syndrome

### Dose

- **By mouth, ADULT and CHILD** over 8 years, 250–500 mg every 6 hours or 0.5–1 g every 12 hours (see notes above); up to 4 g daily in divided doses in severe infections; **NEONATE** 12.5 mg/kg every 6 hours; **CHILD** 1 month–2 years 125 mg every 6 hours, 2–8 years 250 mg every 6 hours, doses doubled for severe infections  
Early syphilis, 500 mg 4 times daily for 14 days  
Uncomplicated genital chlamydia, non-gonococcal urethritis, 500 mg twice daily for 14 days  
Lyme disease (see also section 5.1.1.3), 500 mg 4 times daily for 14–21 days
- **By intravenous infusion, ADULT and CHILD** severe infections, 12.5 mg/kg every 6 hours; mild infections (when oral treatment not possible), 6.25 mg/kg every 6 hours; **NEONATE** see *BNF for Children*

### Erythromycin (Non-proprietary) (Pom)

**Capsules**, enclosing e/c microgranules, erythromycin 250 mg, net price 28-cap pack = £15.00. Label: 5, 9, 25  
**Brands include** *Tiloryth*®

**Tablets**, e/c, erythromycin 250 mg, net price 28 = £1.54. Label: 5, 9, 25

**Dental prescribing on NHS** Erythromycin Tablets e/c may be prescribed

### Erythromycin Ethyl Succinate (Non-proprietary) (Pom)

**Oral suspension**, erythromycin (as ethyl succinate) for reconstitution with water 125 mg/5 mL, net price 100 mL = £1.99; 250 mg/5 mL, 100 mL = £2.64; 500 mg/5 mL, 100 mL = £4.31. Label: 9

**Note** Sugar-free versions are available and can be ordered by specifying 'sugar-free' on the prescription

**Brands include** *Primacine*®

**Dental prescribing on NHS** Erythromycin Ethyl Succinate Oral Suspension may be prescribed

**Erythromycin Lactobionate** (Non-proprietary) (POM)

**Intravenous infusion**, powder for reconstitution, erythromycin (as lactobionate), net price 1-g vial = £9.98

**Erymax**<sup>®</sup> (Cephalon) (POM)

**Capsules**, opaque orange/clear orange, enclosing orange and white e/c pellets, erythromycin 250 mg, net price 28-cap pack = £5.61, 112-cap pack = £22.44. Label: 5, 9, 25

**Dose** 1 capsule every 6 hours or 2 capsules every 12 hours; acne, 1 capsule twice daily for 1 month then 1 capsule daily

**Erythrocin**<sup>®</sup> (Amdipharm) (POM)

**Tablets**, both f/c, erythromycin (as stearate), 250 mg, net price 100 = £18.20; 500 mg, 100 = £36.40. Label: 9

**Dental prescribing on NHS** May be prescribed as Erythromycin Stearate Tablets

**Erythroped**<sup>®</sup> (Amdipharm) (POM)

**Suspension SF**, sugar-free, banana-flavoured, erythromycin (as ethyl succinate) for reconstitution with water, 125 mg/5 mL (*Suspension PI SF*), net price 140 mL = £3.06; 250 mg/5 mL, 140 mL = £5.95; 500 mg/5 mL (*Suspension SF Forte*), 140 mL = £10.56. Label: 9

**Erythroped A**<sup>®</sup> (Amdipharm) (POM)

**Tablets**, yellow, f/c, erythromycin 500 mg (as ethyl succinate). Net price 28-tab pack = £10.78. Label: 9

**Dental prescribing on NHS** May be prescribed as Erythromycin Ethyl Succinate Tablets

**Telithromycin**

The ketolide **telithromycin** is a derivative of erythromycin. The antibacterial spectrum of telithromycin is similar to that of macrolides and it is also active against penicillin- and erythromycin-resistant *Streptococcus pneumoniae*. Telithromycin should only be used to treat beta-haemolytic streptococcal pharyngitis and tonsillitis, sinusitis, community-acquired pneumonia, and exacerbations of chronic bronchitis if caused by organisms resistant to beta-lactam antibiotics and other macrolides, or if conventional treatment is contra-indicated.

**TELITHROMYCIN**

**Indications** see notes above

**Cautions** coronary heart disease, ventricular arrhythmias, bradycardia, hypokalaemia, hypomagnesaemia—risk of QT interval prolongation; concomitant administration of drugs that prolong QT-interval; avoid in acute porphyria (section 9.8.2); **interactions:** Appendix 1 (telithromycin)

**Hepatic disorders** Patients should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, abdominal pain, jaundice, or dark urine develop

**Driving** Visual disturbances or transient loss of consciousness may affect performance of skilled tasks (e.g. driving); effects may occur after the first dose. Administration at bedtime may reduce these side-effects. Patients should be advised not to drive or operate machinery if affected

**Contra-indications** myasthenia gravis; history of telithromycin-associated hepatitis or jaundice; prolongation of QT interval; congenital or family history of QT interval prolongation (if not excluded by ECG)

**Hepatic impairment** manufacturer advises caution; see also Hepatic Disorders above

**Renal impairment** manufacturer advises avoid if possible if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>—if no alternative, use alternating daily doses of 800 mg and 400 mg, starting with 800 mg dose

**Pregnancy** toxicity in *animal* studies—manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** manufacturer advises avoid—present in milk in *animal* studies

**Side-effects** diarrhoea, nausea, vomiting, flatulence, abdominal pain, taste disturbances; dizziness, headache; *less commonly* constipation, stomatitis, anorexia, hepatitis, flushing, palpitations, drowsiness, insomnia, nervousness, eosinophilia, blurred vision, rash, urticaria, and pruritus; *rarely* cholestatic jaundice, arrhythmias, hypotension, transient loss of consciousness, paraesthesia, and diplopia; *very rarely* antibiotic-associated colitis, altered sense of smell, muscle cramp, erythema multiforme; also reported pancreatitis, confusion, hallucinations and arthralgia

**Dose**

- 800 mg once daily for 5 days for sinusitis or exacerbation of chronic bronchitis or for 7–10 days in community-acquired pneumonia; **CHILD** under 18 years safety and efficacy not established
- Tonsillitis or pharyngitis caused by *Streptococcus pyogenes*, **ADULT** and **CHILD** over 12 years, 800 mg once daily for 5 days

**Ketek**<sup>®</sup> (Sanofi-Aventis) ▼ (POM)

**Tablets**, orange, f/c, telithromycin 400 mg, net price 10-tab pack = £18.56. Label: 9, counselling, driving, hepatic disorders

**5.1.6 Clindamycin**

Clindamycin is active against Gram-positive cocci, including streptococci and penicillin-resistant staphylococci, and also against many anaerobes, especially *Bacteroides fragilis*. It is well concentrated in bone and excreted in bile and urine.

Clindamycin is recommended for staphylococcal joint and bone infections such as osteomyelitis, and intra-abdominal sepsis; it is an alternative to macrolides for erysipelas or cellulitis in penicillin-allergic patients. Clindamycin can also be used for infections associated with methicillin-resistant *Staphylococcus aureus* (MRSA) in bronchiectasis, bone and joint infections, and skin and soft-tissue infections.

Clindamycin has been associated with antibiotic-associated colitis (section 1.5), which may be fatal; it is most common in middle-aged and elderly women, especially following an operation. Although antibiotic-associated colitis can occur with most antibacterials, it occurs more frequently with clindamycin. Patients should therefore discontinue treatment immediately if diarrhoea develops.

**Oral infections** Clindamycin should not be used routinely for the treatment of oral infections because it may be no more effective than penicillins against anaerobes and there may be cross-resistance with erythromycin-resistant bacteria. Clindamycin can be used for the treatment of dentoalveolar abscess that has not responded to penicillin or to metronidazole.

## CLINDAMYCIN

**Indications** see notes above; staphylococcal bone and joint infections, peritonitis; falciparum malaria (section 5.4.1)

**Cautions** discontinue immediately if diarrhoea or colitis develops; monitor liver and renal function if treatment exceeds 10 days, and in neonates and infants; avoid rapid intravenous administration; avoid in acute porphyria (section 9.8.2); **interactions:** Appendix 1 (clindamycin)

**Contra-indications** diarrhoeal states; avoid injections containing benzyl alcohol in neonates (see under preparations below)

**Pregnancy** not known to be harmful

**Breast-feeding** amount probably too small to be harmful but bloody diarrhoea reported in 1 infant

**Side-effects** diarrhoea (discontinue treatment), abdominal discomfort, oesophagitis, oesophageal ulcers, taste disturbances, nausea, vomiting, antibiotic-associated colitis; jaundice; leucopenia, eosinophilia, and thrombocytopenia reported; polyarthritis reported; rash, pruritus, urticaria, anaphylactoid reactions, Stevens-Johnson syndrome, toxic epidermal necrolysis, exfoliative and vesiculobullous dermatitis reported; pain, induration, and abscess after intramuscular injection; thrombophlebitis after intravenous injection

### Dose

- **By mouth**, 150–300 mg every 6 hours; up to 450 mg every 6 hours in severe infections; **CHILD**, 3–6 mg/kg every 6 hours
- **Counselling** Patients should discontinue immediately and contact doctor if diarrhoea develops; capsules should be swallowed with a glass of water.
- **By deep intramuscular injection or by intravenous infusion**, 0.6–2.7 g daily (in 2–4 divided doses); life-threatening infection, up to 4.8 g daily; single doses above 600 mg by intravenous infusion only; single doses by intravenous infusion not to exceed 1.2 g; **CHILD** over 1 month, 15–40 mg/kg daily in 3–4 divided doses; severe infections, at least 300 mg daily regardless of weight

### Clindamycin (Non-proprietary) (POM)

**Capsules**, clindamycin (as hydrochloride) 150 mg, net price 24-cap pack = £11.75. Label: 9, 27, counselling, see above (diarrhoea)

**Dental prescribing on NHS** Clindamycin Capsules may be prescribed

### Dalacin C<sup>®</sup> (Pharmacia) (POM)

**Capsules**, clindamycin (as hydrochloride) 75 mg (green/white), net price 24-cap pack = £7.45; 150 mg (white), 24-cap pack = £13.72. Label: 9, 27, counselling, see above (diarrhoea)

**Dental prescribing on NHS** May be prescribed as Clindamycin Capsules

**Injection**, clindamycin (as phosphate) 150 mg/mL, net price 2-mL amp = £6.20; 4-mL amp = £12.35

**Excipients** include benzyl alcohol (avoid in neonates, see Excipients, p. 2)

## 5.1.7 Some other antibacterials

Antibacterials discussed in this section include chloramphenicol, fusidic acid, glycopeptide antibiotics (vancomycin and teicoplanin), linezolid, and the polymyxin, colistin.

## Chloramphenicol

**Chloramphenicol** is a potent broad-spectrum antibiotic; however, it is associated with serious haematological side-effects when given systemically and should therefore be reserved for the treatment of life-threatening infections, particularly those caused by *Haemophilus influenzae*, and also for typhoid fever.

Chloramphenicol eye drops (section 11.3.1) and chloramphenicol ear drops (section 12.1.1) are also available.

## CHLORAMPHENICOL

**Indications** see notes above

**Cautions** avoid repeated courses and prolonged treatment; blood counts required before and periodically during treatment; monitor plasma-chloramphenicol concentration in neonates (see below); **interactions:** Appendix 1 (chloramphenicol)

**Contra-indications** acute porphyria (section 9.8.2)

**Hepatic impairment** avoid if possible—increased risk of bone-marrow depression; reduce dose and monitor plasma-chloramphenicol concentration

**Renal impairment** avoid in severe renal impairment unless no alternative; dose-related depression of haematopoiesis

**Pregnancy** manufacturer advises avoid; neonatal 'grey syndrome' if used in third trimester

**Breast-feeding** manufacturer advises avoid; use another antibiotic; may cause bone-marrow toxicity in infant; concentration in milk usually insufficient to cause 'grey syndrome'

**Side-effects** blood disorders including reversible and irreversible aplastic anaemia (with reports of resulting leukaemia), peripheral neuritis, optic neuritis, headache, depression, urticaria, erythema multiforme, nausea, vomiting, diarrhoea, stomatitis, glossitis, dry mouth; nocturnal haemoglobinuria reported; grey syndrome (abdominal distension, pallid cyanosis, circulatory collapse) may follow excessive doses in neonates with immature hepatic metabolism

### Dose

- **By mouth or by intravenous injection or infusion**, 12.5 mg/kg every 6 hours (exceptionally, can be doubled for severe infections such as septicaemia and meningitis, providing high doses reduced as soon as clinically indicated); **CHILD** over 1 month, haemophilus epiglottitis and pyogenic meningitis, 12.5–25 mg/kg every 6 hours (high dosages decreased as soon as clinically indicated); **NEONATE** under 2 weeks, 12.5 mg/kg twice daily; 2 weeks–1 month, 12.5 mg/kg 2–4 times daily

**Note** Plasma concentration monitoring required in neonates and preferred in those under 4 years of age, in the elderly, and in hepatic impairment; recommended peak plasma concentration (approx. 2 hours after administration by mouth, intravenous injection or infusion) 10–25 mg/litre; pre-dose ('trough') concentration should not exceed 15 mg/litre

### Chloramphenicol (Non-proprietary) (POM)

**Capsules**, chloramphenicol 250 mg. Net price 60 = £377.00

### Kemicetine<sup>®</sup> (Pharmacia) (POM)

**Injection**, powder for reconstitution, chloramphenicol (as sodium succinate). Net price 1-g vial = £1.39

**Electrolytes** Na<sup>+</sup> 3.14 mmol/g

## Fusidic acid

**Fusidic acid** and its salts are narrow-spectrum antibiotics. The only indication for their use is in infections caused by penicillin-resistant staphylococci, especially osteomyelitis, as they are well concentrated in bone; they are also used for staphylococcal endocarditis. A second antistaphylococcal antibiotic is usually required to prevent emergence of resistance.

### SODIUM FUSIDATE

**Indications** penicillin-resistant staphylococcal infection including osteomyelitis; staphylococcal endocarditis in combination with other antibacterials (Table 1, section 5.1)

**Cautions** monitor liver function with high doses or prolonged therapy; elimination may be reduced in biliary disease or biliary obstruction; **interactions:** Appendix 1 (fusidic acid)

**Hepatic impairment** impaired biliary excretion; possibly increased risk of hepatotoxicity; avoid or reduce dose; monitor liver function

**Pregnancy** not known to be harmful; manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** present in milk—manufacturer advises caution

**Side-effects** nausea, vomiting, reversible jaundice, especially after high dosage or rapid infusion (withdraw therapy if persistent); rarely hypersensitivity reactions, acute renal failure (usually with jaundice), blood disorders

#### Dose

• See under Preparations, below

**Sodium fusidate** (LEO) (PmH)

**Intravenous infusion**, powder for reconstitution, sodium fusidate 500 mg (= fusidic acid 480 mg), with buffer, net price per vial (with diluent) = £70.04

**Electrolytes** Na<sup>+</sup> 3.1 mmol/vial when reconstituted with buffer

**Dose** as sodium fusidate, by intravenous infusion, **ADULT** over 50 kg, 500 mg 3 times daily; **ADULT** under 50 kg and **CHILD**, 6–7 mg/kg 3 times daily

**Fucidin**<sup>®</sup> (LEO) (PmH)

**Tablets, f/c**, sodium fusidate 250 mg, net price 10-tab pack = £6.02. Label: 9

**Dose** as sodium fusidate, 500 mg every 8 hours, doubled for severe infections

Skin infection, as sodium fusidate, 250 mg every 12 hours for 5–10 days

**Suspension**, off-white, banana- and orange-flavoured, fusidic acid 250 mg/5 mL, net price 50 mL = £6.73. Label: 9, 21

**Dose** as fusidic acid, **ADULT** 750 mg every 8 hours; **CHILD** up to 1 year 50 mg/kg daily (in 3 divided doses), 1–5 years 250 mg every 8 hours, 5–12 years 500 mg every 8 hours

**Note** Fusidic acid is incompletely absorbed and doses recommended for suspension are proportionately higher than those for sodium fusidate tablets

## Vancomycin and teicoplanin

The glycopeptide antibiotics vancomycin and teicoplanin have bactericidal activity against aerobic and anaerobic Gram-positive bacteria including multi-resistant staphylococci. However, there are reports of *Staphylococcus aureus* with reduced susceptibility to glycopeptides. There are increasing reports of glycopeptide-resistant enterococci.

**Vancomycin** is used by the intravenous route in the treatment of endocarditis and other serious infections caused by Gram-positive cocci. It has a long duration of action and can therefore be given every 12 hours. Vancomycin (added to dialysis fluid) is also used in the treatment of peritonitis associated with peritoneal dialysis [unlicensed route] (Table 1 section 5.1).

Vancomycin given by mouth for 10–14 days is effective in the treatment of *Clostridium difficile* infection (see also section 1.5); low doses are considered adequate (higher dose may be considered if the infection fails to respond or it is life threatening). Vancomycin should not be given by mouth for systemic infections since it is not significantly absorbed.

**Teicoplanin** is similar to vancomycin but has a significantly longer duration of action allowing once-daily administration. Unlike vancomycin, teicoplanin can be given by intramuscular as well as by intravenous injection; it is not given by mouth.

### VANCOMYCIN

**Indications** see notes above

**Cautions** avoid rapid infusion (risk of anaphylactoid reactions, see Side-effects); rotate infusion sites; elderly; avoid if history of deafness; all patients require plasma-vancomycin measurement (after 3 or 4 doses if renal function normal, earlier if renal impairment), blood counts, urinalysis, and renal function tests; monitor auditory function in elderly or if renal impairment; teicoplanin sensitivity; systemic absorption may follow oral administration especially in inflammatory bowel disorders or following multiple doses; **interactions:** Appendix 1 (vancomycin)

**Renal impairment** reduce dose—monitor plasma-vancomycin concentration and renal function regularly; see also Cautions above

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk—plasma-vancomycin concentration monitoring essential to reduce risk of fetal toxicity

**Breast-feeding** present in milk—significant absorption following oral administration unlikely

**Side-effects** after parenteral administration: nephrotoxicity including renal failure and interstitial nephritis; ototoxicity (discontinue if tinnitus occurs); blood disorders including neutropenia (usually after 1 week or cumulative dose of 25 g), rarely agranulocytosis and thrombocytopenia; nausea; chills, fever; eosinophilia, anaphylaxis, rashes (including exfoliative dermatitis, Stevens-Johnson syndrome, toxic epidermal necrolysis, and vasculitis); phlebitis (irritant to tissue); on rapid infusion, severe hypotension (including shock and cardiac arrest), wheezing, dyspnoea, urticaria, pruritus, flushing of the upper body ('red man' syndrome), pain and muscle spasm of back and chest

#### Dose

• **By mouth**, *Clostridium difficile* infection, (see also notes above), **ADULT** and **CHILD** over 12 years, 125 mg every 6 hours for 10–14 days (increased up to 500 mg every 6 hours if infection fails to respond or is life-threatening); **CHILD** 1 month–5 years, 5 mg/kg every 6 hours for 10–14 days (increased up to 10 mg/kg every 6 hours if infection fails to respond or is life-threatening); 5–12 years, half adult dose

- By intravenous infusion, 1–1.5 g every 12 hours; **ELDERLY** over 65 years, 500 mg every 12 hours or 1 g once daily; **CHILD** over 1 month, 15 mg/kg every 8 hours (max. 2 g daily)

**Note** Plasma concentration monitoring required (see Cautions above); pre-dose ('trough') concentration should be 10–15 mg/litre (15–20 mg/litre for less sensitive strains of methicillin-resistant *Staphylococcus aureus*)

- Surgical prophylaxis, by intravenous infusion, **ADULT** over 18 years, 1 g

**Note** Vancomycin doses in BNF may differ from those in product literature

#### Vancomycin (Non-proprietary) <sup>(POM)</sup>

**Capsules**, vancomycin (as hydrochloride) 125 mg, net price 28-cap pack = £132.47; 250 mg, 28-cap pack = £132.47. Label: 9

**Injection**, powder for reconstitution, vancomycin (as hydrochloride), for use as an infusion, net price 500-mg vial = £7.25; 1-g vial = £14.50

**Note** Can be used to prepare solution for oral administration

#### Vancocin® (Flynn) <sup>(POM)</sup>

**Matrigel capsules**, vancomycin (as hydrochloride) 125 mg, net price 28-cap pack = £88.31. Label: 9

**Injection**, powder for reconstitution, vancomycin (as hydrochloride), for use as an infusion, net price 500-mg vial = £8.05; 1-g vial = £16.11

**Note** Can be used to prepare solution for oral administration

## TEICOPLANIN

**Indications** potentially serious Gram-positive infections including endocarditis, dialysis-associated peritonitis, and serious infections due to *Staphylococcus aureus*; prophylaxis in orthopaedic surgery at risk of infection with Gram-positive organisms

**Cautions** vancomycin sensitivity; blood counts and liver and kidney function tests required; monitor plasma-teicoplanin concentration if severe sepsis or burns, deep-seated staphylococcal infection (including bone and joint infection), endocarditis, renal impairment, in elderly, and in intravenous drug abusers; monitor renal and auditory function during prolonged treatment in renal impairment or if other nephrotoxic or neurotoxic drugs given; **interactions:** Appendix 1 (teicoplanin)

**Renal impairment** on day 4 use half normal dose if eGFR is 40–60 mL/minute/1.73 m<sup>2</sup> and use one-third normal dose if eGFR is less than 40 mL/minute/1.73 m<sup>2</sup>; see also Cautions above

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** no information available

**Side-effects** rash, pruritus; less commonly nausea, vomiting, diarrhoea, bronchospasm, dizziness, headache, fever, leucopenia, thrombocytopenia, eosinophilia, tinnitus, mild hearing loss, vestibular disorders, thrombophlebitis; also reported renal failure, exfoliative dermatitis, Stevens-Johnson syndrome, toxic epidermal necrolysis

#### Dose

- By intravenous injection or infusion, **ADULT** body-weight under 70 kg, initially 400 mg every 12 hours for 3 doses, subsequently 400 mg once daily (subsequent doses can alternatively be given by intramuscular injection); body-weight over 70 kg, initially 6 mg/kg every 12 hours for 3 doses, then 6 mg/kg once daily; higher doses may be required in severe infection (including burns, septicaemia, septic arthritis, and osteomyelitis), consult product literature

- **CHILD** over 2 months by intravenous injection or infusion, initially 10 mg/kg (max. 400 mg) every 12 hours for 3 doses, subsequently 6 mg/kg (max. 200 mg) once daily (severe infections or in neutropenia, 10 mg/kg (max. 400 mg) once daily); subsequent doses can be given by intramuscular injection (but intravenous administration preferred in children); **NEONATE** by intravenous infusion, initially a single dose of 16 mg/kg, subsequently 8 mg/kg once daily
- Streptococcal endocarditis (in combination with another antibacterial if necessary, see Table 1, section 5.1), by intravenous injection or infusion, **ADULT** initially 6 mg/kg every 12 hours for 3 doses, then 6 mg/kg once daily
- Enterococcal endocarditis (in combination with another antibacterial, see Table 1, section 5.1), by intravenous injection or infusion, **ADULT** initially 10 mg/kg every 12 hours for 3 doses, then 10 mg/kg once daily

- Surgical prophylaxis, **ADULT**, by intravenous injection, 400 mg up to 30 minutes before the procedure; open fractures, by intravenous infusion, 800 mg up to 30 minutes before skeletal stabilisation and definitive soft-tissue closure

**Note** Plasma-teicoplanin concentration is not measured routinely because a relationship between plasma concentration and toxicity has not been established. However, the plasma-teicoplanin concentration can be used to optimise treatment in some patients (see Cautions). Pre-dose ('trough') concentrations should be greater than 10 mg/litre (greater than 15–20 mg/litre in endocarditis; greater than 20 mg/litre in deep-seated infection such as bone and joint infection), but less than 60 mg/litre. Teicoplanin doses in BNF may differ from those in product literature

#### Targocid® (Sanofi-Aventis) <sup>(POM)</sup>

**Injection**, powder for reconstitution, teicoplanin, net price 200-mg vial (with diluent) = £3.57; 400-mg vial (with diluent) = £6.10

**Electrolytes** Na<sup>+</sup> < 0.5 mmol/200- and 400-mg vial

## Daptomycin

**Daptomycin** is a lipopeptide antibacterial with a spectrum of activity similar to vancomycin but its efficacy against enterococci has not been established. Daptomycin should be reserved for complicated skin and soft-tissue infections caused by resistant Gram-positive bacteria including methicillin-resistant *Staphylococcus aureus* (MRSA). It needs to be given with other antibacterials for mixed infections involving Gram-negative bacteria and some anaerobes.

The *Scottish Medicines Consortium* (p. 4) has advised (February 2008) that daptomycin (*Cubicin*®) is accepted for restricted use within NHS Scotland for the treatment of MRSA bacteraemia associated with right-sided endocarditis or with complicated skin and soft-tissue infections.

## DAPTOMYCIN

**Indications** see under Dose

**Cautions** interference with assay for prothrombin time and INR—take blood sample immediately before daptomycin dose; **interactions:** Appendix 1 (daptomycin)

**Muscle effects** Myalgia, muscle weakness, and myositis may occur uncommonly; rhabdomyolysis is very rare. Monitor creatine kinase before treatment and then weekly during treatment (more frequently if creatine kinase elevated more than 5 times upper limit of normal before treatment, or if receiving another drug known to cause myopathy (preferably avoid concomitant use), or if eGFR less than 30 mL/

minute/1.73 m<sup>2</sup>). If unexplained muscle pain, tenderness, weakness, or cramps develop during treatment, measure creatine kinase every 2 days; discontinue if unexplained muscular symptoms and creatine kinase elevated markedly

**Hepatic impairment** manufacturer advises caution in severe hepatic impairment—no information available

**Renal impairment** see Muscle Effects above; also monitor renal function if eGFR less than 80 mL/minute/1.73 m<sup>2</sup>; use normal dose every 48 hours if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk—no information available

**Breast-feeding** manufacturer advises avoid

**Side-effects** nausea, vomiting, abdominal pain, flatulence, diarrhoea (antibiotic-associated colitis reported), constipation, hypertension, hypotension, headache, anxiety, insomnia, dizziness, asthenia, anaemia, arthralgia, rash, pruritus, injection-site reactions; *less commonly* dyspepsia, anorexia, taste disturbance, glossitis, flushing, arrhythmias, tremor, paraesthesia, hyperglycaemia, renal failure, eosinophilia, thrombocytopenia, electrolyte disturbances, muscle effects (see Cautions); *rarely* jaundice; also reported syncope, wheezing, pulmonary eosinophilia, peripheral neuropathy

#### Dose

- By slow intravenous injection over 2 minutes or by intravenous infusion, complicated skin and soft-tissue infections caused by Gram-positive bacteria. **ADULT** over 18 years, 4 mg/kg once daily; increased to 6 mg/kg once daily if associated with *Staphylococcus aureus* bacteraemia

Right-sided endocarditis caused by *Staphylococcus aureus*, **ADULT** over 18 years, 6 mg/kg once daily

**Cubicin**<sup>®</sup> (Novartis) ▼ PMI

**Intravenous infusion**, powder for reconstitution, daptomycin, net price 350-mg vial = £62.00; 500-mg vial = £88.57

## Linezolid

Linezolid, an oxazolidinone antibacterial, is active against Gram-positive bacteria including methicillin-resistant *Staphylococcus aureus* (MRSA), and vancomycin-resistant enterococci. Resistance to linezolid can develop with prolonged treatment or if the dose is less than that recommended. Linezolid is an option if a glycopeptide, such as vancomycin, cannot be used to treat pneumonia or severe skin and soft-tissue infections caused by MRSA. Linezolid is **not** active against Gram-negative organisms and must be given with other antibacterials if the infection also involves Gram-negative organisms (the combination should be used for mixed skin and soft tissue infections only when other treatments are not available). A higher incidence of blood disorders and optic neuropathy have been reported in patients receiving linezolid for more than the maximum recommended duration of 28 days.

### LINEZOLID

**Indications** pneumonia, complicated skin and soft-tissue infections caused by Gram-positive bacteria (initiated under expert supervision)

**Cautions** monitor full blood count (including platelet count) weekly (see also Blood disorders below); history of seizures; unless close observation and blood-

pressure monitoring possible, avoid in uncontrolled hypertension, pheochromocytoma, carcinoid tumour, thyrotoxicosis, bipolar depression, schizophrenia, or acute confusional states; **interactions:** Appendix 1 (MAOIs)

#### Blood disorders

Haematopoietic disorders (including thrombocytopenia, anaemia, leucopenia, and pancytopenia) have been reported in patients receiving linezolid. It is recommended that full blood counts are monitored weekly. Close monitoring is recommended in patients who:

- receive treatment for more than 10–14 days;
- have pre-existing myelosuppression;
- are receiving drugs that may have adverse effects on haemoglobin, blood counts, or platelet function;
- have severe renal impairment.

If significant myelosuppression occurs, treatment should be stopped unless it is considered essential, in which case intensive monitoring of blood counts and appropriate management should be implemented.

#### CHM advice (optic neuropathy)

Severe optic neuropathy may occur rarely, particularly if linezolid is used for longer than 28 days. The CHM recommends that:

- patients should be warned to report symptoms of visual impairment (including blurred vision, visual field defect, changes in visual acuity and colour vision) immediately;
- patients experiencing new visual symptoms (regardless of treatment duration) should be evaluated promptly, and referred to an ophthalmologist if necessary;
- visual function should be monitored regularly if treatment is required for longer than 28 days.

**Monoamine oxidase inhibition** Linezolid is a reversible, non-selective monoamine oxidase inhibitor (MAOI). Patients should avoid consuming large amounts of tyramine-rich foods (such as mature cheese, yeast extracts, undistilled alcoholic beverages, and fermented soybean products). In addition, linezolid should not be given with another MAOI or within 2 weeks of stopping another MAOI. Unless close observation and blood-pressure monitoring is possible, avoid in those receiving SSRIs, 5HT<sub>2</sub> agonists ('triptans'), tricyclic antidepressants, sympathomimetics, dopaminergics, buspirone, pethidine and possibly other opioid analgesics. For other interactions see Appendix 1 (MAOIs)

**Contra-indications** see Monoamine Oxidase Inhibition above

**Hepatic impairment** in severe hepatic impairment manufacturer advises use only if potential benefit outweighs risk

**Renal impairment** manufacturer advises metabolites may accumulate if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>; see also Blood Disorders, above

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk—no information available

**Breast-feeding** manufacturer advises avoid—present in milk in animal studies

**Side-effects** diarrhoea (antibiotic-associated colitis reported), nausea, vomiting, taste disturbances, headache; *less commonly* thirst, dry mouth, glossitis, stomatitis, tongue discoloration, abdominal pain, dyspepsia, gastritis, constipation, pancreatitis, hypertension, fever, fatigue, dizziness, insomnia, hypoaesthesia, paraesthesia, tinnitus, polyuria, leucopenia, thrombocytopenia, eosinophilia, electrolyte disturbances, blurred vision, rash, pruritus, diaphoresis, injection-site reactions; *rarely* tachycardia, transient ischaemic attacks, renal failure; also reported tooth discoloration, convulsions, lactic acidosis, pancytopenia, anaemia, Stevens-Johnson syndrome,

toxic epidermal necrolysis; peripheral and optic neuropathy reported on prolonged therapy (see also CHM advice above)

### Dose

- **By mouth**, 600 mg every 12 hours usually for 10–14 days (max. duration of treatment 28 days); **CHILD** [unlicensed] 1 week–12 years, 10 mg/kg every 8 hours; 12–18 years, adult dose
- **By intravenous infusion** over 30–120 minutes, 600 mg every 12 hours; **CHILD** [unlicensed] 1 week–12 years, 10 mg/kg every 8 hours; 12–18 years, adult dose

### Zyvox® (Pharmacia) ▼ (PoM)

**Tablets**, f/c, linezolid 600 mg, net price 10-tab pack = £445.00. Label: 9, 10, patient information leaflet

**Suspension**, yellow, linezolid 100 mg/5 mL when reconstituted with water, net price 150 mL (orange-flavoured) = £222.50. Label: 9, 10 patient information leaflet

**Excipients** include aspartame 20 mg/5 mL (section 9.4.1)

**Intravenous infusion**, linezolid 2 mg/mL, net price 300-mL *Excel*® bag = £44.50

**Excipients** include Na<sup>+</sup> 5 mmol/300-mL bag, glucose 13.71 g/300-mL bag

## Polymyxins

The polymyxin antibiotic, **colistin**, is active against Gram-negative organisms including *Pseudomonas aeruginosa*, *Acinetobacter baumannii*, and *Klebsiella pneumoniae*. It is **not** absorbed by mouth and thus needs to be given by injection for a systemic effect. Intravenous administration of colistin should be reserved for Gram-negative infections resistant to other antibacterials; its major adverse effects are dose-related neurotoxicity and nephrotoxicity.

Colistin is used by mouth in bowel sterilisation regimens in neutropenic patients (usually with nystatin); it is **not** recommended for gastro-intestinal infections. It is also given by inhalation of a nebulised solution as an adjunct to standard antibacterial therapy in patients with cystic fibrosis.

Both colistin and polymyxin B are included in some preparations for topical application.

## COLISTIN

**Indications** see notes above

**Cautions** acute porphyria (section 9.8.2); risk of bronchospasm on inhalation—may be prevented or treated with a selective beta<sub>2</sub> agonist; **interactions:** Appendix 1 (polymyxins)

**Contra-indications** myasthenia gravis

**Renal impairment** monitor plasma-colistin concentration; reduce dose during parenteral treatment—consult product literature

**Pregnancy** avoid—possible risk of fetal toxicity especially in second and third trimesters

**Breast-feeding** present in milk but poorly absorbed from gut; manufacturers advise avoid (or use only if potential benefit outweighs risk)

**Side-effects** neurotoxicity reported especially with excessive doses (including apnoea, perioral and peripheral paraesthesia, vertigo, headache, muscle weakness; rarely vasomotor instability, slurred speech, confusion, psychosis, visual disturbances); nephrotoxicity; hypersensitivity reactions including rash; injection-site reactions; inhalation may cause sore throat, sore mouth, cough, bronchospasm

### Dose

- **By mouth**, bowel sterilisation, 1.5–3 million units every 8 hours
- **By slow intravenous injection** into a totally implantable venous access device, **or by intravenous infusion** (but see notes above), **ADULT** and **CHILD** body-weight under 60 kg, 50 000–75 000 units/kg daily in 3 divided doses; body-weight over 60 kg, 1–2 million units every 8 hours  
**Note** Plasma concentration monitoring required in renal impairment; recommended 'peak' plasma-colistin concentration (approx. 30 minutes after intravenous injection or infusion) 10–15 mg/litre (125–200 units/mL)
- **By inhalation of nebulised solution**, **ADULT** and **CHILD** over 2 years, 1–2 million units every 12 hours; **CHILD** under 2 years, 0.5–1 million units every 12 hours

### Colomycin® (Forest) (PoM)

**Tablets**, scored, colistin sulphate 1.5 million units. Net price 50 = £58.28

**Syrup**, colistin sulphate 250 000 units/5 mL when reconstituted with water. Net price 80 mL = £3.48

**Injection**, powder for reconstitution, colistimethate sodium (colistin sulphomethate sodium). Net price 1 million-unit vial = £1.68; 2 million-unit vial = £3.09

**Electrolytes** (before reconstitution) Na<sup>+</sup> < 0.5 mmol/1 million-unit and 2 million-unit vial

**Note** *Colomycin*® Injection (dissolved in physiological saline) may be used for nebulisation

### Promixin® (Profile) (PoM)

**Powder for nebuliser solution**, colistimethate sodium (colistin sulphomethate sodium), net price 1 million-unit vial = £4.60

**Injection**, powder for reconstitution, colistimethate sodium (colistin sulphomethate sodium), net price 1 million unit-vial = £2.30

**Electrolytes** (before reconstitution) Na<sup>+</sup> < 0.5 mmol/1 million-unit vial

## 5.1.8 Sulfonamides and trimethoprim

The importance of the sulfonamides has decreased as a result of increasing bacterial resistance and their replacement by antibacterials which are generally more active and less toxic.

Sulfamethoxazole and trimethoprim are used in combination (as **co-trimoxazole**) because of their synergistic activity. However, co-trimoxazole is associated with rare but serious side-effects (e.g. Stevens-Johnson syndrome and blood dyscrasias, notably bone marrow depression and agranulocytosis) especially in the elderly (see Restrictions on the use of Co-trimoxazole below)

### Restrictions on the use of co-trimoxazole

Co-trimoxazole should be limited to the role of drug of choice in *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia; it is also indicated for toxoplasmosis and nocardiosis. It should now only be considered for use in *acute exacerbations of chronic bronchitis and infections of the urinary tract* when there is good bacteriological evidence of sensitivity to co-trimoxazole and good reason to prefer this combination to a single antibacterial; similarly it should only be used in *acute otitis media in children* when there is good reason to prefer it.

**Trimethoprim** can be used alone for urinary- and respiratory-tract infections and for prostatitis, shigellosis,

and invasive salmonella infections. Trimethoprim has side-effects similar to co-trimoxazole but they are less severe and occur less frequently.

For *topical preparations* of sulfonamides used in the treatment of burns see section 13.10.1.1.

## CO-TRIMOXAZOLE

A mixture of trimethoprim and sulfamethoxazole (sulphamethoxazole) in the proportions of 1 part to 5 parts

**Indications** see restrictions above

**Cautions** maintain adequate fluid intake; avoid in blood disorders (unless under specialist supervision); monitor blood counts on prolonged treatment; discontinue immediately if blood disorders or rash develop; predisposition to folate deficiency or hyperkalaemia; elderly (see Restrictions on the use of Co-trimoxazole above); asthma; G6PD deficiency (section 9.1.5); avoid in infants under 6 weeks (except for treatment or prophylaxis of pneumocystis pneumonia); **interactions:** Appendix 1 (trimethoprim, sulfamethoxazole)

**Contra-indications** acute porphyria (section 9.8.2)

**Hepatic impairment** manufacturer advises avoid in severe liver disease

**Renal impairment** use half normal dose if eGFR 15–30 mL/minute/1.73 m<sup>2</sup>; avoid if eGFR less than 15 mL/minute/1.73 m<sup>2</sup> and if plasma-sulfamethoxazole concentration cannot be monitored

**Pregnancy** teratogenic risk in first trimester (trimethoprim a folate antagonist). Neonatal haemolysis and methaemoglobinaemia in third trimester; fear of increased risk of kernicterus in neonates appears to be unfounded

**Breast-feeding** small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants (due to sulfamethoxazole)

**Side-effects** nausea, diarrhoea; headache; hyperkalaemia; rash (very rarely including Stevens-Johnson syndrome, toxic epidermal necrolysis, photosensitivity)—discontinue immediately; *less commonly* vomiting; *very rarely* glossitis, stomatitis, anorexia, liver damage (including jaundice and hepatic necrosis), pancreatitis, antibiotic-associated colitis, myocarditis, cough and shortness of breath, pulmonary infiltrates, aseptic meningitis, depression, convulsions, peripheral neuropathy, ataxia, tinnitus, vertigo, hallucinations, hypoglycaemia, blood disorders (including leucopenia, thrombocytopenia, megaloblastic anaemia, eosinophilia), hyponatraemia, renal disorders including interstitial nephritis, arthralgia, myalgia, vasculitis, systemic lupus erythematosus and uveitis; rhabdomyolysis reported in HIV-infected patients

### Dose

- **By mouth**, 960 mg every 12 hours; **CHILD**, every 12 hours, 6 weeks–5 months, 120 mg; 6 months–5 years, 240 mg; 6–12 years, 480 mg
- **By intravenous infusion**, 960 mg every 12 hours increased to 1.44 g every 12 hours in severe infections; **CHILD** 36 mg/kg daily in 2 divided doses increased to 54 mg/kg daily in severe infections
- Treatment of *Pneumocystis jirovecii* (*Pneumocystis carinii*) infections (undertaken where facilities for appropriate monitoring available—consult microbiologist and product literature), **by mouth** or **by intravenous infusion**, **ADULT** and **CHILD** over 4 weeks, 120 mg/kg daily in 2–4 divided doses for 14–21 days

- Prophylaxis of *Pneumocystis jirovecii* (*Pneumocystis carinii*) infections, **by mouth**, 960 mg once daily (may be reduced to 480 mg once daily to improve tolerance) or 960 mg on alternate days (3 times a week) or 960 mg twice daily on alternate days (3 times a week); **CHILD** 6 weeks–5 months, 120 mg twice daily on 3 consecutive or alternate days per week or on 7 days per week; 6 months–5 years, 240 mg; 6–12 years, 480 mg
- Note** 480 mg of co-trimoxazole consists of sulfamethoxazole 400 mg and trimethoprim 80 mg

**Co-trimoxazole** (Non-proprietary) (PoM)

**Tablets**, co-trimoxazole 480 mg, net price 28-tab pack = £18.99, 960 mg, 100 = £23.46. Label: 9

**Brands include** Fectrim®, Fectrim® Forte

**Paediatric oral suspension**, co-trimoxazole 240 mg/5 mL, net price 100 mL = £1.12. Label: 9

**Oral suspension**, co-trimoxazole 480 mg/5 mL. Net price 100 mL = £4.41. Label: 9

**Seprin®** (Aspen) (PoM)

**Tablets**, co-trimoxazole 480 mg, net price 100-tab pack = £15.52. Label: 9

**Forte tablets**, scored, co-trimoxazole 960 mg, net price 100-tab pack = £23.46. Label: 9

**Adult suspension**, co-trimoxazole 480 mg/5 mL, net price 100 mL (vanilla-flavoured) = £4.41. Label: 9

**Paediatric suspension**, sugar-free, co-trimoxazole 240 mg/5 mL, net price 100 mL (banana- and vanilla-flavoured) = £2.45. Label: 9

**Intravenous infusion**, co-trimoxazole 96 mg/mL. To be diluted before use. Net price 5-mL amp = £1.78

**Electrolytes** Na<sup>+</sup> 1.7 mmol/5 mL

**Excipients** include alcohol 13.2%, propylene glycol, sulphites

## SULFADIAZINE

(Sulphadiazine)

**Indications** prevention of rheumatic fever recurrence, toxoplasmosis [unlicensed]—see section 5.4.7

**Cautions** see under Co-trimoxazole; **interactions:** Appendix 1 (sulfonamides)

**Contra-indications** see under Co-trimoxazole

**Hepatic impairment** use with caution in mild to moderate impairment; avoid in severe impairment

**Renal impairment** use with caution in mild to moderate impairment; avoid in severe impairment; high risk of crystalluria

**Pregnancy** neonatal haemolysis and methaemoglobinaemia in third trimester; fear of increased risk of kernicterus in neonates appears to be unfounded

**Breast-feeding** small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants

**Side-effects** see under Co-trimoxazole; also hypothyroidism, benign intracranial hypertension, optic neuropathy

### Dose

- Prevention of rheumatic fever, **by mouth**, 1 g daily (500 mg daily for patients less than 30 kg)

**Sulfadiazine** (Non-proprietary) (PoM)

**Tablets**, sulfadiazine 500 mg, net price 56-tab pack = £37.50. Label: 9, 27

## TRIMETHOPRIM

**Indications** urinary-tract infections, acute and chronic bronchitis; pneumocystis pneumonia (section 5.4.8)

**Cautions** predisposition to folate deficiency; elderly; manufacturer recommends blood counts on long-

term therapy (but evidence of practical value unsatisfactory); neonates (specialist supervision required); acute porphyria (section 9.8.2); **interactions:** Appendix 1 (trimethoprim)

**Blood disorders** On long-term treatment, patients and their carers should be told how to recognise signs of blood disorders and advised to seek immediate medical attention if symptoms such as fever, sore throat, rash, mouth ulcers, purpura, bruising or bleeding develop

**Contra-indications** blood dyscrasias

**Renal impairment** use half normal dose after 3 days if eGFR 15–30 mL/minute/1.73 m<sup>2</sup>; use half normal dose if eGFR less than 15 mL/minute/1.73 m<sup>2</sup> (monitor plasma-trimethoprim concentration if eGFR less than 10 mL/minute/1.73 m<sup>2</sup>)

**Pregnancy** teratogenic risk in first trimester (folate antagonist); manufacturers advise avoid

**Breast-feeding** present in milk—short-term use not known to be harmful

**Side-effects** gastro-intestinal disturbances including nausea and vomiting, pruritus, rashes, hyperkalaemia, depression of haematopoiesis; rarely erythema multiforme, toxic epidermal necrolysis, photosensitivity and other allergic reactions including angioedema and anaphylaxis; aseptic meningitis and uveitis reported

#### Dose

- Acute infections, 200 mg every 12 hours; **CHILD** 1 month–12 years, 4 mg/kg (max. 200 mg) every 12 hours; or 6 weeks–6 months 25 mg every 12 hours, 6 months–6 years 50 mg every 12 hours, 6–12 years 100 mg every 12 hours
- Prophylaxis, 100 mg at night; **CHILD** under 12 years, 2 mg/kg (max. 100 mg) at night

**Trimethoprim** (Non-proprietary) (POM)

**Tablets**, trimethoprim 100 mg, net price 28 = 94p; 200 mg, 14-tab pack = 91p. Label: 9

**Brands include** *Trimopan*<sup>®</sup>

**Suspension**, trimethoprim 50 mg/5 mL, net price 100 mL = £2.37. Label: 9

## 5.1.9 Antituberculosis drugs

Tuberculosis is treated in two phases—an *initial phase* using 4 drugs and a *continuation phase* using 2 drugs in fully sensitive cases. Treatment requires specialised knowledge, particularly where the disease involves resistant organisms or non-respiratory organs.

The regimens given below are recommended for the treatment of tuberculosis in the UK; variations occur in other countries. Either the unsupervised regimen or the supervised regimen described below should be used; the two regimens should **not** be used concurrently.

**Initial phase** The concurrent use of 4 drugs during the initial phase is designed to reduce the bacterial population as rapidly as possible and to prevent the emergence of drug-resistant bacteria. The drugs are best given as combination preparations unless one of the components cannot be given because of resistance or intolerance. The treatment of choice for the initial phase is the daily use of isoniazid, rifampicin, pyrazinamide and ethambutol. Treatment should be started without waiting for culture results if clinical features or histology results are consistent with tuberculosis; treatment should be continued even if initial culture results are negative. The initial phase drugs should be continued for 2 months. Where a positive culture for *M. tuberculosis* has been

obtained, but susceptibility results are not available after 2 months, treatment with rifampicin, isoniazid, pyrazinamide and ethambutol should be continued until full susceptibility is confirmed, even if this is for longer than 2 months.

Streptomycin is rarely used in the UK but it may be used in the initial phase of treatment if resistance to isoniazid has been established before therapy is commenced.

**Continuation phase** After the initial phase, treatment is continued for a further 4 months with isoniazid and rifampicin (preferably given as a combination preparation). Longer treatment is necessary for meningitis, direct spinal cord involvement, and for resistant organisms which may also require modification of the regimen.

**Unsupervised treatment** The following regimen should be used for patients who are likely to take antituberculous drugs reliably **without supervision**. Patients who are unlikely to comply with daily administration of antituberculous drugs should be treated with the regimen described under Supervised Treatment.

*Recommended dosage for standard unsupervised 6-month treatment*

**Rifater**<sup>®</sup> [rifampicin, isoniazid, and pyrazinamide] (for 2-month initial phase only)

**ADULT** body-weight under 40 kg 3 tablets daily; body-weight 40–49 kg 4 tablets daily; body-weight 50–64 kg 5 tablets daily; body-weight over 65 kg 6 tablets daily

**Ethambutol** (for 2-month initial phase only)

**ADULT AND CHILD** 15 mg/kg daily

**Rifinah**<sup>®</sup> [rifampicin and isoniazid] (for 4-month continuation phase following initial treatment with *Rifater*<sup>®</sup>)

**ADULT** body-weight under 50 kg 3 tablets daily of *Rifinah*<sup>®</sup> 150/100; body-weight 50 kg and over, 2 tablets daily of *Rifinah*<sup>®</sup> 300/150

or (if combination preparations not appropriate):

**Isoniazid** (for 2-month initial and 4-month continuation phases)

**ADULT** 300 mg daily; **CHILD** 10 mg/kg (max. 300 mg) daily

**Rifampicin** (for 2-month initial and 4-month continuation phases)

**ADULT** body-weight under 50 kg 450 mg daily; body-weight 50 kg and over, 600 mg daily; **CHILD** 10 mg/kg daily (max. 450 mg daily if body-weight under 50 kg; max. 600 mg daily if body-weight 50 kg and over)

**Pyrazinamide** (for 2-month initial phase only)

**ADULT** body-weight under 50 kg 1.5 g daily; body-weight 50 kg and over, 2 g daily; **CHILD** 35 mg/kg daily (max. 1.5 g daily if body-weight under 50 kg; max. 2 g daily if body-weight 50 kg and over)

**Ethambutol** (for 2-month initial phase only)

**ADULT AND CHILD** 15 mg/kg daily

**Pregnancy** The standard regimen (above) may be used during pregnancy. Streptomycin should not be given in pregnancy.

**Breast-feeding** The standard regimen (above) may be used during breast-feeding

**Children** Children are given isoniazid, rifampicin, pyrazinamide, and ethambutol for the first 2 months followed by isoniazid and rifampicin during the next 4 months. However, care is needed in young children receiving ethambutol because of the difficulty in testing eyesight and in obtaining reports of visual symptoms (see below).

**Supervised treatment** Drug administration needs to be **fully supervised** (directly observed therapy, DOT) in patients who cannot comply reliably with the treatment regimen. These patients are given isoniazid, rifampicin, pyrazinamide and ethambutol (or streptomycin) 3 times a week under supervision for the first 2 months followed by isoniazid and rifampicin 3 times a week for a further 4 months.

*Recommended dosage for intermittent supervised 6-month treatment*

**Isoniazid** (for 2-month initial and 4-month continuation phases)

ADULT AND CHILD 15 mg/kg (max. 900 mg) 3 times a week

**Rifampicin** (for 2-month initial and 4-month continuation phases)

ADULT 600–900 mg 3 times a week; CHILD 15 mg/kg (max. 900 mg) 3 times a week

**Pyrazinamide** (for 2-month initial phase only)

ADULT body-weight under 50 kg 2 g 3 times a week; body-weight 50 kg and over, 2.5 g 3 times a week; CHILD 50 mg/kg 3 times a week (max. 2 g 3 times a week if body-weight under 50 kg; max. 2.5 g 3 times a week if body-weight 50 kg and over)

**Ethambutol** (for 2-month initial phase only)

ADULT AND CHILD 30 mg/kg 3 times a week

**Immunocompromised patients** Multi-resistant *Mycobacterium tuberculosis* may be present in immunocompromised patients. The organism should always be cultured to confirm its type and drug sensitivity. Confirmed *M. tuberculosis* infection sensitive to first-line drugs should be treated with a standard 6-month regimen; after completing treatment, patients should be closely monitored. The regimen may need to be modified if infection is caused by resistant organisms, and specialist advice is needed.

Specialist advice should be sought about tuberculosis treatment or chemoprophylaxis in a HIV-positive individual; care is required in choosing the regimen and in avoiding potentially serious interactions. Starting antiretroviral treatment in the first 2 months of anti-tuberculosis treatment increases the risk of immune reconstitution syndrome.

Infection may also be caused by other mycobacteria e.g. *M. avium* complex in which case specialist advice on management is needed.

**Corticosteroids** In meningeal or pericardial tuberculosis, a corticosteroid should be started at the same time as antituberculosis therapy.

**Prevention of tuberculosis** Some individuals may develop tuberculosis owing to reactivation of previously latent disease. Chemoprophylaxis may be required in those who have evidence of latent tuberculosis and are receiving treatment with immunosuppressants (including cytotoxics and possibly long-term treatment with systemic corticosteroids). In these cases, chemoprophylaxis involves use of either isoniazid alone for 6 months or of isoniazid and rifampicin for 3 months, see Table 2, section 5.1; longer chemoprophylaxis is not recommended.

For prevention of tuberculosis in susceptible close contacts or those who have become tuberculin-positive, see Table 2, section 5.1. For advice on immunisation against tuberculosis, see section 14.4

**Monitoring** Since isoniazid, rifampicin and pyrazinamide are associated with liver toxicity, *hepatic function* should be checked before treatment with these drugs. Those with pre-existing liver disease or alcohol dependence should have frequent checks particularly in the first 2 months. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment. In view of the need to comply fully with antituberculous treatment on the one hand and to guard against serious liver damage on the other, patients and their carers should be informed carefully how to recognise signs of liver disorders and advised to discontinue treatment and seek **immediate** medical attention should symptoms of liver disease occur.

*Renal function* should be checked before treatment with antituberculous drugs and appropriate dosage adjustments made. Streptomycin or ethambutol should preferably be avoided in patients with renal impairment, but if used, the dose should be reduced and the plasma-drug concentration monitored.

*Visual acuity* should be tested before ethambutol is used (see below).

Major causes of treatment failure are incorrect prescribing by the physician and inadequate compliance by the patient. Monthly tablet counts and urine examination (rifampicin imparts an orange-red coloration) may be useful indicators of compliance with treatment. Avoid both excessive and inadequate dosage. Treatment should be supervised by a specialist physician.

**Isoniazid** is cheap and highly effective. Like rifampicin it should always be included in any antituberculous regimen unless there is a specific contra-indication. Its only common side-effect is peripheral neuropathy which is more likely to occur where there are pre-existing risk factors such as diabetes, alcohol dependence, chronic renal failure, malnutrition and HIV infection. In these circumstances pyridoxine 10 mg daily (or 20 mg daily if suitable product not available) (section 9.6.2) should be given prophylactically from the start of treatment. Other side-effects such as hepatitis (important: see Monitoring above) and psychosis are rare.

**Rifampicin**, a rifamycin, is a key component of any antituberculous regimen. Like isoniazid it should always be included unless there is a specific contra-indication.

During the first two months ('initial phase') of rifampicin administration transient disturbance of liver function with elevated serum transaminases is common but generally does not require interruption of treatment. Occasionally more serious liver toxicity requires a change of treatment particularly in those with pre-existing liver disease (important: see Monitoring above).

On intermittent treatment six toxicity syndromes have been recognised—influenza-like, abdominal, and respiratory symptoms, shock, renal failure, and thrombocytopenic purpura—and can occur in 20 to 30% of patients.

Rifampicin induces hepatic enzymes which accelerate the metabolism of several drugs including oestrogens, corticosteroids, phenytoin, sulfonyleureas, and anticoagulants; **interactions:** Appendix 1 (rifamycins). **Important:** the effectiveness of hormonal contraceptives is

reduced and alternative family planning advice should be offered (section 7.3.1).

**Rifabutin**, another rifamycin, is indicated for *prophylaxis* against *M. avium* complex infections in patients with a low CD4 count; it is also licensed for the *treatment* of non-tuberculous mycobacterial disease and pulmonary tuberculosis. **Important:** as with rifampicin it induces hepatic enzymes and the effectiveness of hormonal contraceptives is reduced requiring alternative family planning methods.

**Pyrazinamide** [unlicensed] is a bactericidal drug only active against intracellular dividing forms of *Mycobacterium tuberculosis*; it exerts its main effect only in the first two or three months. It is particularly useful in tuberculous meningitis because of good meningeal penetration. It is not active against *M. bovis*. Serious liver toxicity may occasionally occur (important: see Monitoring above).

**Ethambutol** is included in a treatment regimen if isoniazid resistance is suspected; it can be omitted if the risk of resistance is low.

Side-effects of ethambutol are largely confined to visual disturbances in the form of loss of acuity, colour blindness, and restriction of visual fields. These toxic effects are more common where excessive dosage is used or if the patient's renal function is impaired. The earliest features of ocular toxicity are subjective and patients should be advised to discontinue therapy immediately if they develop deterioration in vision and promptly seek further advice. Early discontinuation of the drug is almost always followed by recovery of eyesight. Patients who cannot understand warnings about visual side-effects should, if possible, be given an alternative drug. In particular, ethambutol should be used with caution in children until they are at least 5 years old and capable of reporting symptomatic visual changes accurately.

Visual acuity should be tested by Snellen chart before treatment with ethambutol.

**Streptomycin** [unlicensed] is now rarely used in the UK except for resistant organisms. It is given intramuscularly in a dose of 15 mg/kg (max. 1 g) daily; the dose is reduced in those under 50 kg, those over 40 years or those with renal impairment. Plasma-drug concentration should be measured in patients with impaired renal function in whom streptomycin must be used with great care. Side-effects increase after a cumulative dose of 100 g, which should only be exceeded in exceptional circumstances.

Drug-resistant tuberculosis should be treated by a specialist physician with experience in such cases, and where appropriate facilities for infection-control exist. Second-line drugs available for infections caused by resistant organisms, or when first-line drugs cause unacceptable side-effects, include amikacin, capreomycin, cycloserine, newer macrolides (e.g. azithromycin and clarithromycin), moxifloxacin and prothionamide (prothionamide; no longer on UK market).

## CAPREOMYCIN

**Indications** in combination with other drugs, tuberculosis resistant to first-line drugs

**Cautions** auditory impairment; monitor renal, hepatic, auditory, and vestibular function and electrolytes; **interactions:** Appendix 1 (capreomycin)

**Hepatic impairment** use with caution

**Renal impairment** reduce dose—consult product literature; nephrotoxic; ototoxic

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk—teratogenic in *animal* studies

**Breast-feeding** manufacturer advises caution—no information available

**Side-effects** hypersensitivity reactions including urticaria and rashes; leucocytosis or leucopenia, rarely thrombocytopenia; changes in liver function tests; nephrotoxicity, electrolyte disturbances; hearing loss with tinnitus and vertigo; neuromuscular block after large doses, pain and induration at injection site

### Dose

- By deep intramuscular injection, 1 g daily (not more than 20 mg/kg) for 2–4 months, then 1 g 2–3 times each week

**Capreomycin** (King) (P<sub>M</sub>)

**Injection**, powder for reconstitution, capreomycin sulphate 1 million units (= capreomycin approx. 1 g). Net price per vial = £25.18

## CYCLOSERINE

**Indications** in combination with other drugs, tuberculosis resistant to first-line drugs

**Cautions** monitor haematological, renal, and hepatic function; **interactions:** Appendix 1 (cycloserine)

**Contra-indications** epilepsy, depression, severe anxiety, psychotic states, alcohol dependence, acute porphyria (section 9.8.2)

**Renal impairment** reduce dose and monitor blood-cycloserine concentration; avoid in severe impairment

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk—crosses the placenta

**Breast-feeding** amount too small to be harmful

**Side-effects** mainly neurological, including headache, dizziness, vertigo, drowsiness, tremor, convulsions, confusion, psychosis, depression (discontinue or reduce dose if symptoms of CNS toxicity); rashes, allergic dermatitis (discontinue or reduce dose); megaloblastic anaemia; changes in liver function tests; heart failure at high doses reported

### Dose

- Initially 250 mg every 12 hours for 2 weeks increased according to blood concentration and response to max. 500 mg every 12 hours; **CHILD** 2–18 years see *BNF for Children*

**Note** Blood concentration monitoring required especially in renal impairment or if dose exceeds 500 mg daily or if signs of toxicity; blood concentration should not exceed 30 mg/litre

**Cycloserine** (King) (P<sub>M</sub>)

**Capsules**, red/grey cycloserine 250 mg, net price 100-cap pack = £333.80. Label: 2, 8

## ETHAMBUTOL HYDROCHLORIDE

**Indications** tuberculosis, in combination with other drugs

**Cautions** elderly; test visual acuity before treatment and warn patients to report visual changes—see Monitoring in notes above; young children (see notes above)—routine ophthalmological monitoring recommended

- Contra-indications** optic neuritis, poor vision
- Renal impairment** reduce dose; if creatinine clearance less than 30 mL/minute, monitor plasma-ethambutol concentration; optic nerve damage
- Pregnancy** not known to be harmful; see also p. 361
- Breast-feeding** amount too small to be harmful; see also p. 361
- Side-effects** optic neuritis, red/green colour blindness, peripheral neuritis, rarely rash, pruritus, urticaria, thrombocytopenia

**Dose**

- See notes above

**Note** 'Peak' concentration (2–2.5 hours after dose) should be 2–6 mg/litre (7–22 micromol/litre); 'trough' (pre-dose) concentration should be less than 1 mg/litre (4 micromol/litre); see Cautions above; for advice on laboratory assay of ethambutol contact the Poisons Unit at New Cross Hospital (Tel (020) 7771 5360)

**Ethambutol** (Non-proprietary) (Pom)

**Tablets**, ethambutol hydrochloride 100 mg, net price 56-tab pack = £12.00; 400 mg, 56-tab pack = £44.18. Label: 8

**ISONIAZID**

**Indications** tuberculosis, in combination with other drugs; prophylaxis—Table 2, section 5.1

**Cautions** see Monitoring in notes above; also slow acetylator status (increased risk of side-effects); epilepsy; history of psychosis; alcohol dependence, malnutrition, diabetes mellitus, HIV infection (risk of peripheral neuritis); acute porphyria (section 9.8.2); **interactions:** Appendix 1 (isoniazid)

**Hepatic disorders** Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop

**Contra-indications** drug-induced liver disease

**Hepatic impairment** use with caution; monitor liver function regularly and particularly frequently in first 2 months; see also Hepatic Disorders above

**Renal impairment** max. 200 mg daily if eGFR less than 10 mL/minute/1.73 m<sup>2</sup>; peripheral neuropathy

**Pregnancy** not known to be harmful; see also p. 361

**Breast-feeding** monitor infant for possible toxicity; theoretical risk of convulsions and neuropathy; prophylactic pyridoxine advisable in mother and infant; see also p. 361

**Side-effects** nausea, vomiting, constipation, dry mouth; peripheral neuritis with high doses (pyridoxine prophylaxis, see notes above), optic neuritis, convulsions, psychotic episodes, vertigo; hypersensitivity reactions including fever, Stevens-Johnson syndrome, purpura; blood disorders including agranulocytosis, haemolytic anaemia, aplastic anaemia; hepatitis (especially over age of 35 years); pancreatitis; interstitial pneumonitis; systemic lupus erythematosus-like syndrome, pellagra, hyperreflexia, difficulty with micturition, hyperglycaemia, and gynaecomastia reported; hearing loss and tinnitus (in patients with end-stage renal impairment); when used with tyramine or histamine rich foods, tachycardia, palpitation, hypotension, flushing, headache, dizziness, and sweating also reported

**Dose**

- By mouth or by intramuscular or intravenous injection, see notes above

**Isoniazid** (Non-proprietary) (Pom)

**Tablets**, isoniazid 50 mg, net price 56-tab pack = £11.10; 100 mg, 28-tab pack = £11.30. Label: 8, 22

**Elixir** (BPC), isoniazid 50 mg, citric acid monohydrate 12.5 mg, sodium citrate 60 mg, concentrated anise water 0.05 mL, compound tartrazine solution 0.05 mL, glycerol 1 mL, double-strength chloroform water 2 mL, water to 5 mL. Label: 8, 22

Available from 'special-order' manufacturers or specialist importing companies, see p. 988

**Injection**, isoniazid 25 mg/mL, net price 2-mL amp = £11.04

**PYRAZINAMIDE**

**Indications** tuberculosis in combination with other drugs [unlicensed]

**Cautions** see Monitoring in notes above; also diabetes; gout (avoid in acute attack); **interactions:** Appendix 1 (pyrazinamide)

**Hepatic disorders** Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop

**Contra-indications** acute porphyria (section 9.8.2)

**Hepatic impairment** monitor hepatic function—idiosyncratic hepatotoxicity more common; avoid in severe hepatic impairment; see also Hepatic Disorders above

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk; see also p. 361

**Breast-feeding** amount too small to be harmful; see also p. 361

**Side-effects** hepatotoxicity including fever, anorexia, hepatomegaly, splenomegaly, jaundice, liver failure; nausea, vomiting, flushing, dysuria, arthralgia, sideroblastic anaemia, thrombocytopenia, rash and occasionally photosensitivity

**Dose**

- See notes above

**Pyrazinamide** (Non-proprietary) (Pom)

**Tablets**, scored, pyrazinamide 500 mg. Label: 8  
Available from 'special order' manufacturers or specialist-importing companies, see p. 988

**RIFABUTIN**

**Indications** see under Dose

**Cautions** see under Rifampicin; acute porphyria (section 9.8.2)

**Hepatic impairment** reduce dose in severe impairment

**Renal impairment** use half normal dose if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** manufacturer advises avoid—no information available

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** nausea, vomiting; leucopenia, thrombocytopenia, anaemia, rarely haemolysis; raised liver enzymes, jaundice, rarely hepatitis; uveitis following high doses or administration with drugs which raise plasma concentration—see also **interactions:** Appendix 1 (rifamycins); arthralgia, myalgia, influenza-like syndrome, dyspnoea; also hypersensitivity reactions including fever, rash, eosinophilia, bron-

chospasm, shock; skin, urine, saliva and other body secretions coloured orange-red; asymptomatic corneal opacities reported with long-term use

### Dose

- Prophylaxis of *Mycobacterium avium* complex infections in immunosuppressed patients with low CD4 count (see product literature), 300 mg daily as a single dose
- Treatment of non-tuberculous mycobacterial disease, in combination with other drugs, 450–600 mg daily as a single dose for up to 6 months after cultures negative
- Treatment of pulmonary tuberculosis, in combination with other drugs, 150–450 mg daily as a single dose for at least 6 months
- **CHILD** not recommended

### Mycobutin® (Pharmacia) (POM)

**Capsules**, red-brown, rifabutin 150 mg. Net price 30-cap pack = £90.38. Label: 8, 14, counselling, lenses, see under Rifampicin

## RIFAMPICIN

**Indications** see under Dose

**Cautions** see Monitoring in notes above; also liver function tests and blood counts in hepatic disorders, alcohol dependence, and on prolonged therapy, see also below; acute porphyria (section 9.8.2); **important:** advise patients on hormonal contraceptives to use additional means (see also section 7.3.1); discolors soft contact lenses; see also notes above; **interactions:** Appendix 1 (rifamycins)

**Note** If treatment interrupted re-introduce with low dosage and increase gradually; discontinue permanently if serious side-effects develop

**Hepatic disorders** Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop

**Contra-indications** jaundice

**Hepatic impairment** impaired elimination; monitor liver function; avoid or do not exceed 8 mg/kg daily; see also Cautions above

**Renal impairment** use with caution if dose above 600 mg daily

**Pregnancy** manufacturers advise very high doses teratogenic in *animal* studies in first trimester; risk of neonatal bleeding may be increased in third trimester; see also p. 361

**Breast-feeding** amount too small to be harmful; see also p. 361

**Side-effects** gastro-intestinal symptoms including anorexia, nausea, vomiting, diarrhoea (antibiotic-associated colitis reported); headache, drowsiness; those occurring mainly on intermittent therapy include influenza-like symptoms (with chills, fever, dizziness, bone pain), respiratory symptoms (including shortness of breath), collapse and shock, haemolytic anaemia, thrombocytopenic purpura, disseminated intravascular coagulation, and acute renal failure; alterations of liver function, jaundice; flushing, urticaria, and rashes; other side-effects reported include oedema, psychoses, adrenal insufficiency, muscular weakness and myopathy, exfoliative dermatitis, toxic epidermal necrolysis, Stevens-Johnson syndrome, pemphigoid reactions, leucopenia, eosinophilia, menstrual disturbances; urine, saliva,

and other body secretions coloured orange-red; thrombophlebitis reported if infusion used for prolonged period

### Dose

- Brucellosis, legionnaires' disease, endocarditis and serious staphylococcal infections, in combination with other drugs, **by mouth or by intravenous infusion**, 0.6–1.2 g daily (in 2–4 divided doses)
- Tuberculosis, in combination with other drugs, see notes above
- Leprosy, section 5.1.10
- Prophylaxis of meningococcal meningitis and *Haemophilus influenzae* (type b) infection, section 5.1, table 2

### Rifampicin (Non-proprietary) (POM)

**Capsules**, rifampicin 150 mg, net price 100 = £20.82; 300 mg, 100 = £46.21. Label: 8, 14, 22, counselling, see lenses above

### Rifadin® (Sanofi-Aventis) (POM)

**Capsules**, rifampicin 150 mg (blue/red), net price 100-cap pack = £18.32; 300 mg (red), 100-cap pack = £36.63. Label: 8, 14, 22, counselling, see lenses above

**Syrup**, red, rifampicin 100 mg/5 mL (raspberry-flavoured), net price 120 mL = £3.56. Label: 8, 14, 22, counselling, see lenses above

**Intravenous infusion**, powder for reconstitution, rifampicin, net price 600-mg vial (with solvent) = £7.67 **Electrolytes** Na<sup>+</sup> < 0.5 mmol/vial

### Rimactane® (Sandoz) (POM)

**Capsules**, rifampicin 150 mg (red), net price 60-cap pack = £11.35; 300 mg (red/brown), 60-cap pack = £22.69. Label: 8, 14, 22, counselling, see lenses above

### Combined preparations

#### Rifater® (Sanofi-Aventis) (POM)

**Tablets**, pink, s/c, rifampicin 120 mg, isoniazid 50 mg, pyrazinamide 300 mg, net price 100-tab pack = £21.95. Label: 8, 14, 22, counselling, see lenses above

**Dose** initial treatment of pulmonary tuberculosis, patients up to 40 kg 3 tablets daily preferably before breakfast, 40–49 kg 4 tablets daily, 50–64 kg 5 tablets daily, 65 kg or more, 6 tablets daily; not suitable for use in children

#### Rifinah® 150/100 (Sanofi-Aventis) (POM)

**Tablets**, pink, s/c, rifampicin 150 mg, isoniazid 100 mg, net price 84-tab pack = £15.91. Label: 8, 14, 22, counselling, see lenses above

**Dose** **ADULT** under 50 kg, 3 tablets daily, preferably before breakfast

**Note** Some stock packaged as *Rifinah 150* or *Rifinah 100/150*

#### Rifinah® 300/150 (Sanofi-Aventis) (POM)

**Tablets**, orange, s/c, rifampicin 300 mg, isoniazid 150 mg, net price 56-tab pack = £21.02. Label: 8, 14, 22, counselling, see lenses above

**Dose** **ADULT** 50 kg and over, 2 tablets daily, preferably before breakfast

**Note** Some stock packaged as *Rifinah 300* or *Rifinah 150/300*

## STREPTOMYCIN

**Indications** tuberculosis, in combination with other drugs; adjunct to doxycycline in brucellosis; enterococcal endocarditis (Table 1, section 5.1)

**Cautions** see under Aminoglycosides, section 5.1.4; **interactions:** Appendix 1 (aminoglycosides)

**Contra-indications** see under Aminoglycosides, section 5.1.4

**Renal impairment** see under Aminoglycosides, section 5.1.4

**Pregnancy** see under Aminoglycosides, section 5.1.4

**Side-effects** see under Aminoglycosides, section 5.1.4; also hypersensitivity reactions, paraesthesia of mouth

#### Dose

- By deep intramuscular injection, tuberculosis [unlicensed], see notes above; brucellosis, expert advice essential

**Note** One-hour ('peak') concentration should be 15–40 mg/litre; pre-dose ('trough') concentration should be less than 5 mg/litre (less than 1 mg/litre in renal impairment or in those over 50 years)

**Streptomycin Sulphate** (Non-proprietary) <sup>(POM)</sup>

**Injection**, powder for reconstitution, streptomycin (as sulphate), net price 1-g vial = £8.25

Available as an unlicensed preparation from UCB Pharma

and it should **never** be used in women of child-bearing potential (significant teratogenic risk—for CSM guidance on prescribing, see *Current Problems in Pharmacovigilance* 1994; 20, 8). Increased doses of clofazimine 100 mg 3 times daily for the first month with subsequent reductions, are also useful but may take 4–6 weeks to attain full effect.

*Paucibacillary leprosy (2-drug regimen)*

Rifampicin 600 mg once-monthly, supervised (450 mg for those weighing less than 35 kg)

Dapsone 100 mg daily, self-administered (50 mg daily or 1–2 mg/kg daily for adults weighing less than 35 kg)

Paucibacillary leprosy should be treated for 6 months. If treatment is interrupted the regimen should be recommenced where it was left off to complete the full course.

Neither the multibacillary nor the paucibacillary antileprosy regimen is sufficient to treat tuberculosis.

### 5.1.10 Antileprotic drugs

Advice from a member of the Panel of Leprosy Opinion is essential for the treatment of leprosy (Hansen's disease). Details of the Panel can be obtained from the Department of Health telephone (020) 7972 4480.

The World Health Organization has made recommendations to overcome the problem of dapsone resistance and to prevent the emergence of resistance to other antileprotic drugs. Drugs recommended are **dapsone**, **rifampicin** (section 5.1.9), and **clofazimine**. Other drugs with significant activity against *Mycobacterium leprae* include ofloxacin, minocycline and clarithromycin, but none of these are as active as rifampicin; at present they should be reserved as second-line drugs for leprosy.

A three-drug regimen is recommended for *multibacillary leprosy* (lepromatous, borderline-lepromatous, and borderline leprosy) and a two-drug regimen for *paucibacillary leprosy* (borderline-tuberculoid, tuberculoid, and indeterminate). The following regimens are widely used throughout the world (with minor local variations):

*Multibacillary leprosy (3-drug regimen)*

Rifampicin 600 mg once-monthly, supervised (450 mg for adults weighing less than 35 kg)

Dapsone 100 mg daily, self-administered (50 mg daily or 1–2 mg/kg daily for adults weighing less than 35 kg)

Clofazimine 300 mg once-monthly, supervised, and 50 mg daily (or 100 mg on alternate days), self-administered

Multibacillary leprosy should be treated for at least 2 years. Treatment should be continued unchanged during both type I (reversal) or type II (erythema nodosum leprosum) reactions. During reversal reactions neuritic pain or weakness can herald the rapid onset of permanent nerve damage. Treatment with prednisolone (initially 40–60 mg daily) should be instituted at once. Mild type II reactions may respond to aspirin. Severe type II reactions may require corticosteroids; thalidomide [unlicensed] is also useful in men and post-menopausal women who have become corticosteroid dependent, but it should be used under **specialist supervision**

### DAPSONE

**Indications** leprosy, dermatitis herpetiformis;

*Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia (section 5.4.8)

**Cautions** cardiac or pulmonary disease; anaemia (treat severe anaemia before starting); susceptibility to haemolysis including G6PD deficiency (section 9.1.5); avoid in acute porphyria (section 9.8.2); **interactions:** Appendix 1 (dapsone)

**Blood disorders** On long-term treatment, patients and their carers should be told how to recognise signs of blood disorders and advised to seek immediate medical attention if symptoms such as fever, sore throat, rash, mouth ulcers, purpura, bruising or bleeding develop

**Pregnancy** folic acid 5 mg daily should be given to mother throughout pregnancy; neonatal haemolysis and methaemoglobinaemia reported in third trimester

**Breast-feeding** haemolytic anaemia; although significant amount in milk, risk to infant very small unless infant is G6PD deficient

**Side-effects** (dose-related and uncommon at doses used for leprosy), haemolysis, methaemoglobinaemia, neuropathy, allergic dermatitis (rarely including toxic epidermal necrolysis and Stevens-Johnson syndrome), anorexia, nausea, vomiting, tachycardia, headache, insomnia, psychosis, hepatitis, agranulocytosis; dapsone syndrome (rash with fever and eosinophilia)—discontinue immediately (may progress to exfoliative dermatitis, hepatitis, hypoaalbuminaemia, psychosis and death)

#### Dose

- Leprosy, 1–2 mg/kg daily, see notes above
- Dermatitis herpetiformis, see specialist literature

**Dapsone** (Non-proprietary) <sup>(POM)</sup>

**Tablets**, dapsone 50 mg, net price 28-tab pack = £32.53; 100 mg, 28-tab pack = £47.44 Label: 8

### CLOFAZIMINE

**Indications** leprosy

**Cautions** may discolour soft contact lenses; avoid if persistent abdominal pain and diarrhoea

**Hepatic impairment** use with caution

**Renal impairment** use with caution

**Pregnancy** use with caution

**Breast-feeding** may alter colour of milk; skin discoloration of infant

**Side-effects** nausea, vomiting (hospitalise if persistent), abdominal pain; headache, tiredness; brownish-black discoloration of lesions and skin including areas exposed to light; reversible hair discoloration; dry skin; red discoloration of faeces, urine and other body fluids; also rash, pruritus, photosensitivity, acne-like eruptions, anorexia, eosinophilic enteropathy, bowel obstruction, dry eyes, dimmed vision, macular and subepithelial corneal pigmentation; elevation of blood sugar, weight loss, splenic infarction, lymphadenopathy

#### Dose

- Leprosy, see notes above
- Lepromatous lepra reactions, dosage increased to 300 mg daily for max. of 3 months

**Clofazimine** (Non-proprietary) PM

**Capsules**, clofazimine 100 mg. Label: 8, 14, 21  
Available on named-patient basis

### 5.1.11 Metronidazole and tinidazole

**Metronidazole** is an antimicrobial drug with high activity against anaerobic bacteria and protozoa; indications include trichomonal vaginitis (section 5.4.3), bacterial vaginosis (notably *Gardnerella vaginalis* infections), and *Entamoeba histolytica* and *Giardia lamblia* infections (section 5.4.2). It is also used for surgical and gynaecological sepsis in which its activity against colonic anaerobes, especially *Bacteroides fragilis*, is important. Metronidazole by the rectal route is an effective alternative to the intravenous route when oral administration is not possible. Intravenous metronidazole is used for the treatment of established cases of tetanus; diazepam (section 10.2.2) and tetanus immunoglobulin (section 14.5.2) are also used.

Metronidazole by mouth is effective for the treatment of *Clostridium difficile* infection, see also section 1.5; it can be given by intravenous infusion if oral treatment is inappropriate.

Topical metronidazole (section 13.10.1.2) reduces the odour produced by anaerobic bacteria in fungating tumours; it is also used in the management of rosacea (section 13.6).

**Tinidazole** is similar to metronidazole but has a longer duration of action.

**Oral infections** Metronidazole is an alternative to a penicillin for the treatment of many oral infections where the patient is allergic to penicillin or the infection is due to beta-lactamase-producing anaerobes (Table 1, section 5.1). It is the drug of first choice for the treatment of acute necrotising ulcerative gingivitis (Vincent's infection) and pericoronitis; suitable alternatives are amoxicillin (section 5.1.1.3) and erythromycin (section 5.1.5). For these purposes metronidazole in a dose of 200 mg 3 times daily for 3 days is sufficient, but the duration of treatment may need to be longer in pericoronitis. Tinidazole is licensed for the treatment of acute ulcerative gingivitis.

## METRONIDAZOLE

**Indications** anaerobic infections (including dental), see under Dose below; protozoal infections (section 5.4.2); *Helicobacter pylori* eradication (section 1.3); skin (section 13.10.1.2)

**Cautions** disulfiram-like reaction with alcohol; avoid in acute porphyria (section 9.8.2); clinical and laboratory monitoring advised if treatment exceeds 10 days; **interactions:** Appendix 1 (metronidazole)

**Hepatic impairment** in severe liver disease reduce total daily dose to one-third, and give once daily; use with caution in hepatic encephalopathy

**Pregnancy** manufacturer advises avoidance of high-dose regimens

**Breast-feeding** significant amount in milk; manufacturer advises avoid large single doses

**Side-effects** gastro-intestinal disturbances (including nausea and vomiting), taste disturbances, furred tongue, oral mucositis, anorexia; very rarely hepatitis, jaundice, pancreatitis, drowsiness, dizziness, headache, ataxia, psychotic disorders, darkening of urine, thrombocytopenia, pancytopenia, myalgia, arthralgia, visual disturbances, rash, pruritus, and erythema multiforme; on prolonged or intensive therapy peripheral neuropathy, transient epileptiform seizures, and leucopenia

#### Dose

- Anaerobic infections (usually treated for 7 days and for 10–14 days in *Clostridium difficile* infection), **by mouth**, either 400 mg every 8 hours or 500 mg every 8 hours, **CHILD** 1 month–12 years 7.5 mg/kg (max. 400 mg) every 8 hours; **by rectum**, 1 g every 8 hours for 3 days, then 1 g every 12 hours, **CHILD** every 8 hours for 3 days, then every 12 hours, 1 month–1 year 125 mg, 1–5 years 250 mg, 5–10 years 500 mg, over 10 years, adult dose; **by intravenous infusion** over 20 minutes, 500 mg every 8 hours; **CHILD** 7.5 mg/kg (max. 500 mg) every 8 hours
- Leg ulcers and pressure sores, **by mouth**, 400 mg every 8 hours for 7 days
- Bacterial vaginosis, **by mouth**, 400–500 mg twice daily for 5–7 days or 2 g as a single dose
- Pelvic inflammatory disease (see also Table 1, section 5.1), **by mouth**, 400 mg twice daily for 14 days
- Acute ulcerative gingivitis, **by mouth**, 200–250 mg every 8 hours for 3 days; **CHILD** 1–3 years 50 mg every 8 hours for 3 days; 3–7 years 100 mg every 12 hours; 7–10 years 100 mg every 8 hours
- Acute oral infections, **by mouth**, 200 mg every 8 hours for 3–7 days (see also notes above); **CHILD** 1–3 years 50 mg every 8 hours for 3–7 days; 3–7 years 100 mg every 12 hours; 7–10 years 100 mg every 8 hours
- Surgical prophylaxis, **by mouth**, 400–500 mg 2 hours before surgery; up to 3 further doses of 400–500 mg may be given every 8 hours for high-risk procedures; **CHILD** 1 month–12 years 7.5 mg/kg (max. 400 mg) 2 hours before surgery; up to 3 further doses of 7.5 mg/kg may be given every 8 hours for high-risk procedures

**By rectum**, 1 g 2 hours before surgery; up to 3 further doses of 1 g may be given every 8 hours for high-risk procedures; **CHILD** 5–10 years 500 mg 2 hours before surgery; up to 3 further doses of 500 mg may be given every 8 hours for high-risk procedures

**By intravenous infusion** (if rectal administration inappropriate), 500 mg up to 30 minutes before the

procedure; up to 3 further doses of 500 mg may be given every 8 hours for high-risk procedures; **CHILD** 7.5 mg/kg (max. 500 mg) up to 30 minutes before the procedure; up to 3 further doses of 7.5 mg/kg may be given every 8 hours for high-risk procedures

**Note** Metronidazole doses in BNF may differ from those in product literature

### Metronidazole (Non-proprietary) (POM)

**Tablets**, metronidazole 200 mg, net price 21-tab pack = £1.36; 400 mg, 21-tab pack = £1.35. Label: 4, 9, 21, 25, 27

**Brands include** *Vaginyl*<sup>®</sup>

**Dental prescribing on NHS** Metronidazole Tablets may be prescribed

**Tablets**, metronidazole 500 mg, net price 21-tab pack = £29.84. Label: 4, 9, 21, 25, 27

**Dental prescribing on NHS** Metronidazole Tablets may be prescribed

**Suspension**, metronidazole (as benzoate) 200 mg/5 mL. Net price 100 mL = £11.43. Label: 4, 9

**Brands include** *Norzol*<sup>®</sup>

**Dental prescribing on NHS** Metronidazole Oral Suspension may be prescribed

**Intravenous infusion**, metronidazole 5 mg/mL. Net price 20-mL amp = £1.56, 100-mL container = £3.41

### Flagyl<sup>®</sup> (Winthrop) (POM)

**Tablets**, both f/c, ivory, metronidazole 200 mg, net price 21-tab pack = £4.49; 400 mg, 14-tab pack = £6.34. Label: 4, 9, 21, 25, 27

**Suppositories**, metronidazole 500 mg, net price 10 = £15.18; 1 g, 10 = £23.06. Label: 4, 9

### Flagyl S<sup>®</sup> (Winthrop) (POM)

**Suspension**, orange- and lemon-flavoured, metronidazole (as benzoate) 200 mg/5 mL. Net price 100 mL = £11.18. Label: 4, 9

### Metrolyl<sup>®</sup> (Sandoz) (POM)

**Intravenous infusion**, metronidazole 5 mg/mL, net price 100-mL Steriflex<sup>®</sup> bag = £1.22

**Electrolytes** Na<sup>+</sup> 14.53 mmol/100-mL bag

**Suppositories**, metronidazole 500 mg, net price 10 = £12.34; 1 g, 10 = £18.34. Label: 4, 9

## TINIDAZOLE

**Indications** anaerobic infections, see under Dose below; protozoal infections (section 5.4.2); *Helicobacter pylori* eradication (section 1.3)

**Cautions** see under Metronidazole; avoid in acute porphyria (section 9.8.2); **interactions:** Appendix 1 (tinidazole)

**Pregnancy** manufacturer advises avoid in first trimester

**Breast-feeding** present in milk—manufacturer advises avoid breast-feeding during and for 3 days after stopping treatment

**Side-effects** see under Metronidazole

### Dose

- Anaerobic infections, 2 g initially, followed by 1 g daily or 500 mg twice daily, usually for 5–6 days
- Bacterial vaginosis and acute ulcerative gingivitis, a single 2-g dose
- Abdominal surgery prophylaxis, a single 2-g dose approximately 12 hours before surgery

### Fasigyn<sup>®</sup> (Pfizer) (POM)

**Tablets**, f/c, tinidazole 500 mg. Net price 16-tab pack = £11.04. Label: 4, 9, 21, 25

## 5.1.12 Quinolones

**Nalidixic acid** and **norfloxacin** are effective in uncomplicated urinary-tract infections.

**Ciprofloxacin** is active against both Gram-positive and Gram-negative bacteria. It is particularly active against Gram-negative bacteria, including salmonella, shigella, campylobacter, neisseria, and pseudomonas. Ciprofloxacin has only moderate activity against Gram-positive bacteria such as *Streptococcus pneumoniae* and *Enterococcus faecalis*; it should not be used for pneumococcal pneumonia. It is active against chlamydia and some mycobacteria. Most anaerobic organisms are not susceptible. Ciprofloxacin can be used for respiratory tract infections (but not for pneumococcal pneumonia), urinary-tract infections, infections of the gastro-intestinal system (including typhoid fever), bone and joint infections, gonorrhoea and septicaemia caused by sensitive organisms.

**Ofloxacin** is used for urinary-tract infections, lower respiratory-tract infections, gonorrhoea, and non-gonococcal urethritis and cervicitis.

**Levofloxacin** is active against Gram-positive and Gram-negative organisms. It has greater activity against pneumococci than ciprofloxacin. Levofloxacin is licensed for community-acquired pneumonia but it is considered to be **second-line treatment** for this indication.

Although ciprofloxacin, levofloxacin, moxifloxacin, and ofloxacin are licensed for skin and soft-tissue infections, many staphylococci are resistant to the quinolones and their use should be avoided in MRSA infections.

**Moxifloxacin** should be reserved for the treatment of sinusitis, community-acquired pneumonia, exacerbations of chronic bronchitis, or complicated skin and soft-tissue infections which have failed to respond to other antibacterials or for patients who cannot be treated with other antibacterials. It has been associated with life-threatening hepatotoxicity. Moxifloxacin is active against Gram-positive and Gram-negative organisms. It has greater activity against Gram-positive organisms, including pneumococci, than ciprofloxacin. Moxifloxacin is not active against *Pseudomonas aeruginosa* or methicillin-resistant *Staphylococcus aureus* (MRSA).

**Anthrax** *Inhalation* or *gastro-intestinal anthrax* should be treated initially with either **ciprofloxacin** [not licensed for gastro-intestinal anthrax] or **doxycycline** [unlicensed indication] (section 5.1.3) combined with one or two other antibacterials (such as amoxicillin, benzylpenicillin, chloramphenicol, clarithromycin, clindamycin, imipenem with cilastatin, rifampicin [unlicensed indication], and vancomycin). When the condition improves and the sensitivity of the *Bacillus anthracis* strain is known, treatment may be switched to a single antibacterial. Treatment should continue for 60 days because germination may be delayed.

*Cutaneous anthrax* should be treated with either ciprofloxacin [unlicensed indication] or doxycycline [unlicensed indication] (section 5.1.3) for 7 days. Treatment may be switched to amoxicillin (section 5.1.1.3) if the infecting strain is susceptible. Treatment may need to be extended to 60 days if exposure is due to aerosol. A combination of antibacterials for 14 days is recommended for cutaneous anthrax with systemic features, extensive oedema, or lesions of the head or neck.

Ciprofloxacin or doxycycline may be given for *post-exposure prophylaxis*. If exposure is confirmed, anti-

bacterial prophylaxis should continue for 60 days. Anti-bacterial prophylaxis may be switched to amoxicillin after 10–14 days if the strain of *B. anthracis* is susceptible. Vaccination against anthrax (section 14.4) may allow the duration of antibacterial prophylaxis to be shortened.

**Cautions** Quinolones should be used with caution in patients with a history of epilepsy or conditions that predispose to seizures, in G6PD deficiency (section 9.1.5), myasthenia gravis (risk of exacerbation), and in children or adolescents (arthropathy has developed in weight-bearing joints in young *animals*—see below). Exposure to excessive sunlight should be avoided (discontinue if photosensitivity occurs). The CSM has warned that quinolones may induce **convulsions** in patients with or without a history of convulsions; taking NSAIDs at the same time may also induce them. Other **interactions:** Appendix 1 (quinolones).

**Use in children** Quinolones cause arthropathy in the weight-bearing joints of immature *animals* and are therefore generally not recommended in children and growing adolescents. However, the significance of this effect in humans is uncertain and in some specific circumstances short-term use of either ciprofloxacin or nalidixic acid may be justified in children. For further details see *BNF for Children*.

#### Tendon damage

Tendon damage (including rupture) has been reported rarely in patients receiving quinolones. Tendon rupture may occur within 48 hours of starting treatment; cases have also been reported several months after stopping a quinolone. Healthcare professionals are reminded that:

- quinolones are contra-indicated in patients with a history of tendon disorders related to quinolone use;
- patients over 60 years of age are more prone to tendon damage;
- the risk of tendon damage is increased by the concomitant use of corticosteroids;
- if tendinitis is suspected, the quinolone should be discontinued immediately.

**Contra-indications** quinolone hypersensitivity

**Pregnancy** Quinolones should be avoided in pregnancy because they have been shown to cause arthropathy in *animal* studies; safer alternatives are available

**Side-effects** Side-effects of the quinolones include nausea, vomiting, dyspepsia, abdominal pain, diarrhoea (rarely antibiotic-associated colitis), headache, dizziness, rash (very rarely Stevens-Johnson syndrome and toxic epidermal necrolysis). Less frequent side-effects include anorexia, sleep disturbances, asthenia, confusion, anxiety, depression, hallucinations, tremor, blood disorders (including eosinophilia, leucopenia, thrombocytopenia), arthralgia, myalgia, disturbances in vision and taste. Other side-effects reported rarely or very rarely include hepatic dysfunction (including jaundice and hepatitis), hypotension, vasculitis, dyspnoea (more frequent with moxifloxacin), convulsions, psychoses, paraesthesia, renal failure, interstitial nephritis, tendon inflammation and damage (see also Tendon Damage above), photosensitivity, disturbances in hearing and smell. The drug should be **discontinued** if psychiatric, neurological or hypersensitivity reactions (including severe rash) occur.

## CIPROFLOXACIN

**Indications** see notes above and under Dose; eye infections (section 11.3.1)

**Cautions** see notes above; avoid excessive alkalinity of urine and ensure adequate fluid intake (risk of crystalluria); **interactions:** Appendix 1 (quinolones)  
**Driving** May impair performance of skilled tasks (e.g. driving); effects enhanced by alcohol

**Contra-indications** see notes above

**Renal impairment** **by mouth**, 250–500 mg every 12 hours if eGFR 30–60 mL/minute/1.73 m<sup>2</sup> (every 24 hours if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>); **by intravenous infusion** (200 mg over 30 minutes), 200–400 mg every 12 hours if eGFR 30–60 mL/minute/1.73 m<sup>2</sup> (every 24 hours if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>)

**Pregnancy** see notes above

**Breast-feeding** amount too small to be harmful but manufacturer advises avoid

**Side-effects** see notes above; also flatulence, pain and phlebitis at injection site; *rarely* dysphagia, pancreatitis, chest pain, tachycardia, syncope, oedema, hot flushes, abnormal dreams, sweating, hyperglycaemia, and erythema nodosum; *very rarely* movement disorders, tinnitus, and tenosynovitis

#### Dose

- **By mouth**, respiratory-tract infections, 500–750 mg twice daily (750 mg twice daily in pseudomonas lower respiratory-tract infection in cystic fibrosis)  
Urinary-tract infections, 250–750 mg twice daily (250 mg twice daily for 3 days usually adequate for acute uncomplicated cystitis in women)  
Acute or chronic prostatitis, 500 mg twice daily for 28 days  
Gonorrhoea, 500 mg as a single dose  
Most other infections, 500 mg twice daily (increased to 750 mg twice daily in severe or deep-seated infection)  
Surgical prophylaxis [unlicensed], 750 mg 60 minutes before procedure  
Prophylaxis of meningococcal meningitis, Table 2, section 5.1
- **By intravenous infusion** over 60 minutes, 400 mg every 8–12 hours
- Anthrax (treatment and post-exposure prophylaxis, see notes above), **by mouth**, 500 mg twice daily  
**By intravenous infusion** over 60 minutes, 400 mg every 12 hours
- **CHILD** under 18 years see *BNF for Children*

**Ciprofloxacin** (Non-proprietary) (POM)

**Tablets**, ciprofloxacin (as hydrochloride) 100 mg, net price 6-tab pack = £1.42; 250 mg, 10-tab pack = 96p, 20-tab pack = £1.09; 500 mg, 10-tab pack = £1.06, 20-tab pack = £1.22; 750 mg, 10-tab pack = £6.15.  
Label: 7, 9, 25, counselling, driving

**Intravenous infusion**, ciprofloxacin (as lactate) 2 mg/mL, net price 50-mL bottle = £8.00, 100-mL bottle = £15.00, 200-mL bottle = £22.00

**Ciproxin**<sup>®</sup> (Bayer Schering) (POM)

**Tablets**, all f/c, ciprofloxacin (as hydrochloride) 250 mg (scored), 10-tab pack = £6.59; 500 mg (scored), 10-tab pack = £12.49; 750 mg, 10-tab pack = £17.78. Label: 7, 9, 25, counselling, driving

**Suspension**, strawberry-flavoured, ciprofloxacin for reconstitution with diluent provided, 250 mg/5 mL,

net price 100 mL = £16.83. Label: 7, 9, 25, counselling, driving

**Intravenous infusion**, ciprofloxacin (as lactate) 2 mg/mL, in sodium chloride 0.9%, net price 50-mL bottle = £7.61, 100-mL bottle = £15.02, 200-mL bottle = £22.85

**Electrolytes** Na<sup>+</sup> 15.4 mmol/100-mL bottle

## LEVOFLOXACIN

**Indications** see under Dose

**Cautions** see notes above; predisposition to QT interval prolongation (including cardiac disease, congenital long QT syndrome, electrolyte disturbances, concomitant use with other drugs known to prolong QT interval); history of psychiatric illness; **interactions:** Appendix 1 (quinolones)

**Driving** May impair performance of skilled tasks (e.g. driving)

**Contra-indications** see notes above

**Renal impairment** usual initial dose then use half normal dose if eGFR 20–50 mL/minute/1.73 m<sup>2</sup>; consult product literature if eGFR less than 20 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** see notes above

**Breast-feeding** manufacturer advises avoid

**Side-effects** see notes above; also flatulence, constipation; *rarely* tachycardia; *very rarely* pneumonitis, peripheral neuropathy, and hypoglycaemia; also reported, rhabdomyolysis and potentially life-threatening hepatic failure; local reactions and transient hypotension reported with infusion

### Dose

- **By mouth**, acute sinusitis, 500 mg daily for 10–14 days  
Exacerbation of chronic bronchitis, 250–500 mg daily for 7–10 days  
Community-acquired pneumonia, 500 mg once or twice daily for 7–14 days  
Urinary-tract infections, 250 mg daily for 7–10 days (for 3 days in uncomplicated infection)  
Chronic prostatitis, 500 mg once daily for 28 days  
Skin and soft tissue infections, 250 mg daily *or* 500 mg once or twice daily for 7–14 days
- **By intravenous infusion** (over at least 60 minutes for 500 mg), community-acquired pneumonia, 500 mg once or twice daily  
Complicated urinary-tract infections, 250 mg daily, increased in severe infections  
Skin and soft tissue infections, 500 mg twice daily

**Tavanic**<sup>®</sup> (Sanofi-Aventis) (P<sub>M</sub>)

**Tablets**, yellow-red, f/c, scored, levofloxacin 250 mg, net price 5-tab pack = £7.23, 10-tab pack = £14.45; 500 mg, 5-tab pack = £12.93, 10-tab pack = £25.85. Label: 6, 9, 25, counselling, driving

**Intravenous infusion**, levofloxacin 5 mg/mL, net price 100-mL bottle = £26.40

**Electrolytes** Na<sup>+</sup> 15.4 mmol/100-mL bottle

## MOXIFLOXACIN

**Indications** sinusitis, community-acquired pneumonia, exacerbations of chronic bronchitis, or complicated skin and soft-tissue infections which have failed to respond to other antibacterials or for patients who cannot be treated with other antibacterials

**Cautions** see notes above; conditions pre-disposing to arrhythmias, including myocardial ischaemia; **interactions:** Appendix 1 (quinolones)

**Driving** May impair performance of skilled tasks (e.g. driving)

**Contra-indications** see notes above; history of QT-interval prolongation, bradycardia, history of symptomatic arrhythmias, heart failure with reduced left ventricular ejection fraction, electrolyte disturbances, concomitant use with other drugs known to prolong QT-interval

**Hepatic impairment** manufacturer advises avoid in severe impairment

**Pregnancy** see notes above

**Breast-feeding** manufacturer advises avoid—present in milk in *animal* studies

**Side-effects** see notes above; also gastritis, flatulence, constipation, arrhythmias, palpitation, angina, vasodilatation, hyperlipidaemia, and sweating; *rarely* oedema, hypertension, syncope, dysphagia, abnormal dreams, incoordination, amnesia, hyperglycaemia, hyperuricaemia, and stomatitis; *very rarely* rhabdomyolysis and potentially life-threatening hepatic failure; *on intravenous infusion*, pain and phlebitis at injection site

### Dose

- **By mouth**, 400 mg once daily
- **By intravenous infusion** over 60 minutes, community-acquired pneumonia, complicated skin and soft-tissue infections, 400 mg once daily

**Note** Recommended duration of treatment is 7–14 days for community-acquired pneumonia, 5–10 days in exacerbations of chronic bronchitis, 7 days in sinusitis, 7–21 days for complicated skin and soft-tissue infections

**Avelox**<sup>®</sup> (Bayer Schering) ▼ (P<sub>M</sub>)

**Tablets**, red, f/c, moxifloxacin (as hydrochloride)

400 mg, net price 5-tab pack = £12.43. Label: 6, 9, counselling, driving

**Intravenous infusion**, moxifloxacin (as hydrochloride) 1.6 mg/mL, net price 250-mL bottle (400 mg) = £39.95

**Electrolytes** Na<sup>+</sup> 34 mmol/250-mL bottle

## NALIDIXIC ACID

**Indications** urinary-tract infections

**Cautions** see notes above; avoid in acute porphyria (section 9.8.2); false positive urinary glucose (if tested for reducing substances); monitor blood counts, renal and liver function if treatment exceeds 2 weeks; **interactions:** Appendix 1 (quinolones)

**Contra-indications** see notes above

**Hepatic impairment** manufacturer advises caution in liver disease

**Renal impairment** use with caution; avoid if eGFR less than 20 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** see notes above

**Breast-feeding** risk to infant very small but one case of haemolytic anaemia reported

**Side-effects** see notes above; also reported toxic psychosis, increased intracranial pressure, cranial nerve palsy, peripheral neuropathy, and metabolic acidosis

### Dose

- 900 mg every 6 hours for 7 days, reduced in chronic infections to 600 mg every 6 hours; **CHILD** 3 months–18 years see *BNF for Children*

**Nalidixic Acid** (Rosemont) (P<sub>M</sub>)

**Suspension**, pink, nalidixic acid 300 mg/5 mL, net price 150 mL (raspberry- and strawberry-flavoured) = £12.50. Label: 9, 11

**Excipients** include sucrose 450 mg/5 mL

## NORFLOXACIN

**Indications** see under Dose

**Cautions** see notes above; **interactions:** Appendix 1 (quinolones)

**Driving** May impair performance of skilled tasks (e.g. driving)

**Contra-indications** see notes above

**Renal impairment** use 400 mg once daily if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** see notes above

**Breast-feeding** no information available—manufacturer advises avoid

**Side-effects** see notes above; also tinnitus, epiphora; rarely pancreatitis; very rarely arrhythmias; also reported, polyneuropathy and exfoliative dermatitis

### Dose

- 'Lower' urinary-tract infections, 400 mg twice daily for 7–10 days (for 3 days for uncomplicated infections in women)
- Chronic relapsing 'lower' urinary-tract infections, 400 mg twice daily for up to 12 weeks; may be reduced to 400 mg once daily if adequate suppression within first 4 weeks
- Chronic prostatitis, 400 mg twice daily for 28 days

**Norfloxacin** (Non-proprietary) (POM)

**Tablets**, norfloxacin 400 mg, net price 6-tab pack = £2.30, 14-tab pack = £6.20. Label: 7, 9, 23, counselling, driving

**Utinor**<sup>®</sup> (MSD) (POM)

**Tablets**, scored, norfloxacin 400 mg. Net price 7-tab pack = £2.56, 14-tab pack = £5.11. Label: 7, 9, 23, counselling, driving

## OFLOXACIN

**Indications** see under Dose

**Cautions** see notes above; history of psychiatric illness; **interactions:** Appendix 1 (quinolones)

**Driving** May affect performance of skilled tasks (e.g. driving); effects enhanced by alcohol

**Contra-indications** see notes above

**Hepatic impairment** use with caution; elimination may be reduced in severe impairment

**Renal impairment** usual initial dose, then use half normal dose if eGFR 20–50 mL/minute/1.73 m<sup>2</sup>; 100 mg every 24 hours if eGFR less than 20 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** see notes above

**Breast-feeding** amount probably too small to be harmful but manufacturer advises avoid

**Side-effects** see notes above; also eye irritation; rarely arrhythmias, abnormal dreams, hot flushes, hyperhidrosis; very rarely neuropathy, extrapyramidal symptoms; also reported pneumonitis, changes in blood sugar, myopathy, rhabdomyolysis; on intravenous infusion, hypotension and local reactions (including thrombophlebitis)

### Dose

- **By mouth**, urinary-tract infections, 200–400 mg daily preferably in the morning, increased if necessary in upper urinary-tract infections to 400 mg twice daily Acute or chronic prostatitis, 200 mg twice daily for 28 days

Lower respiratory-tract infections, 400 mg daily preferably in the morning, increased if necessary to 400 mg twice daily

Skin and soft-tissue infections, 400 mg twice daily

Uncomplicated gonorrhoea, 400 mg as a single dose  
Uncomplicated genital chlamydial infection, non-gonococcal urethritis, 400 mg daily in single or divided doses for 7 days

Pelvic inflammatory disease (see also section 5.1, table 1), 400 mg twice daily for 14 days

- **By intravenous infusion** (over at least 30 minutes for each 200 mg), complicated urinary-tract infection, 200 mg daily  
Lower respiratory-tract infection, 200 mg twice daily Septicaemia, 200 mg twice daily  
Skin and soft-tissue infections, 400 mg twice daily  
Severe or complicated infections, dose may be increased to 400 mg twice daily

**Ofloxacin** (Non-proprietary) (POM)

**Tablets**, ofloxacin 200 mg, net price 10-tab pack = £8.29; 400 mg, 5-tab pack = £5.71, 10-tab pack = £5.52. Label: 6, 9, 11, counselling, driving

**Tarivid**<sup>®</sup> (Sanofi-Aventis) (POM)

**Tablets**, f/c, scored, ofloxacin 200 mg, net price 10-tab pack = £7.53, 20-tab pack = £15.05; 400 mg (yellow), 5-tab pack = £7.52, 10-tab pack = £14.99. Label: 6, 9, 11, counselling, driving

**Intravenous infusion**, ofloxacin (as hydrochloride) 2 mg/mL, net price 100-mL bottle = £16.16 (hosp. only)

## 5.1.13 Urinary-tract infections

Urinary-tract infection is more common in women than in men; when it occurs in men there is frequently an underlying abnormality of the renal tract. Recurrent episodes of infection are an indication for radiological investigation especially in children in whom untreated pyelonephritis may lead to permanent kidney damage.

*Escherichia coli* is the most common cause of urinary-tract infection; *Staphylococcus saprophyticus* is also common in sexually active young women. Less common causes include *Proteus* and *Klebsiella* spp. *Pseudomonas aeruginosa* infections usually occur in the hospital setting and may be associated with functional or anatomical abnormalities of the renal tract. *Staphylococcus epidermidis* and *Enterococcus faecalis* infection may complicate catheterisation or instrumentation.

A specimen of urine should be collected for culture and sensitivity testing before starting antibacterial therapy;

- in men;
- in pregnant women;
- in children under 3 years of age;
- in patients with suspected upper urinary-tract infection, complicated infection, or recurrent infection;
- if resistant organisms are suspected;
- if urine dipstick testing gives a single positive result for leucocyte esterase or nitrite;
- if clinical symptoms are not consistent with results of dipstick testing.

Treatment should not be delayed while waiting for results. The antibacterial chosen should reflect current local bacterial sensitivity to antibacterials.

*Uncomplicated lower urinary-tract infections* often respond to trimethoprim, nitrofurantoin, amoxicillin, or nalidixic acid given for 7 days (3 days may be

adequate for infections in women; see also Table 1, section 5.1); those caused by fully sensitive bacteria respond to two 3-g doses of amoxicillin (section 5.1.1.3). Widespread bacterial resistance to ampicillin, amoxicillin, and trimethoprim has been reported. Alternatives for resistant organisms include co-amoxiclav (amoxicillin with clavulanic acid), an oral cephalosporin, pivmecillinam, or a quinolone.

Long-term low dose therapy may be required in selected patients to prevent *recurrence of infection*; indications include frequent relapses and significant kidney damage. Trimethoprim, nitrofurantoin and cefalexin have been recommended for long-term therapy.

**Methanamine** (hexamine) should **not** generally be used because it requires an acidic urine for its antimicrobial activity and it is ineffective for upper urinary-tract infections; it may, however, have a role in the prophylaxis and treatment of chronic or recurrent uncomplicated lower urinary-tract infections.

*Acute pyelonephritis* can lead to septicaemia and is treated initially by injection of a broad-spectrum antibacterial such as cefuroxime or a quinolone if the patient is severely ill; gentamicin can also be used.

*Prostatitis* can be difficult to cure and requires treatment for several weeks with an antibacterial which penetrates prostatic tissue such as trimethoprim, or some quinolones.

Where infection is localised and associated with an indwelling *catheter* a bladder instillation is often effective (section 7.4.4).

**Pregnancy** Urinary-tract infection in pregnancy may be asymptomatic and requires prompt treatment to prevent progression to acute pyelonephritis. Penicillins and cephalosporins are suitable for treating urinary-tract infection during pregnancy. Nitrofurantoin may also be used but it should be avoided at term. Sulfonamides, quinolones, and tetracyclines should be avoided during pregnancy; trimethoprim should also preferably be avoided particularly in the first trimester.

**Renal impairment** In renal failure antibacterials normally excreted by the kidney accumulate with resultant toxicity unless the dose is reduced. This applies especially to the aminoglycosides which should be used with great caution; tetracyclines, methanamine, and nitrofurantoin should be avoided altogether.

**Children** Urinary-tract infections in children require prompt antibacterial treatment to minimise the risk of renal scarring. Uncomplicated 'lower' urinary-tract infections in *children over 3 months of age* can be treated with trimethoprim, nitrofurantoin, a first generation cephalosporin (e.g. cefalexin), or amoxicillin for 3 days; children should be reassessed if they continue to be unwell 24–48 hours after the initial assessment. Amoxicillin should only be used if the organism causing the infection is sensitive to it.

Acute pyelonephritis in children over 3 months of age can be treated with a first generation cephalosporin or co-amoxiclav for 7–10 days. If the patient is severely ill, then the infection is best treated initially by injection of a broad-spectrum antibacterial such as cefotaxime or co-amoxiclav; gentamicin is an alternative.

*Children under 3 months of age* should be transferred to hospital and treated initially with intravenous anti-

bacterial drugs such as ampicillin with gentamicin, or cefotaxime alone, until the infection responds; full doses of oral antibacterials are then given for a further period.

Recurrent episodes of infection are an indication for imaging tests. *Antibacterial prophylaxis* with low doses of trimethoprim or nitrofurantoin may be considered for children with recurrent infection, significant urinary-tract anomalies, or significant kidney damage.

## NITROFURANTOIN

**Indications** urinary-tract infections

**Cautions** anaemia; diabetes mellitus; electrolyte imbalance; vitamin B and folate deficiency; pulmonary disease; on long-term therapy, monitor liver function and monitor for pulmonary symptoms, especially in the elderly (discontinue if deterioration in lung function); susceptibility to peripheral neuropathy; false positive urinary glucose (if tested for reducing substances); urine may be coloured yellow or brown; **interactions:** Appendix 1 (nitrofurantoin)

**Contra-indications** infants less than 3 months old, G6PD deficiency (section 9.1.5); acute porphyria (section 9.8.2)

**Hepatic impairment** use with caution; cholestatic jaundice and chronic active hepatitis reported

**Renal impairment** avoid if eGFR less than 60 mL/minute/1.73 m<sup>2</sup>; risk of peripheral neuropathy; ineffective because of inadequate urine concentrations

**Pregnancy** avoid at term—may produce neonatal haemolysis

**Breast-feeding** avoid; only small amounts in milk but could be enough to produce haemolysis in G6PD-deficient infants (section 9.1.5)

**Side-effects** anorexia, nausea, vomiting, and diarrhoea; acute and chronic pulmonary reactions (pulmonary fibrosis reported; possible association with lupus erythematosus-like syndrome); peripheral neuropathy; also reported, hypersensitivity reactions (including angioedema, anaphylaxis, sialadenitis, urticaria, rash and pruritus); rarely, cholestatic jaundice, hepatitis, exfoliative dermatitis, erythema multiforme, pancreatitis, arthralgia, blood disorders (including agranulocytosis, thrombocytopenia, and aplastic anaemia), benign intracranial hypertension, and transient alopecia

### Dose

- Acute uncomplicated infection, 50 mg every 6 hours with food for 7 days (3 days usually adequate in women); **CHILD** over 3 months, 3 mg/kg daily in 4 divided doses
- Severe chronic recurrent infection, 100 mg every 6 hours with food for 7 days (dose reduced or discontinued if severe nausea)
- Prophylaxis (but see Cautions), 50–100 mg at night; **CHILD** over 3 months, 1 mg/kg at night

**Nitrofurantoin** (Non-proprietary) <sup>(Pm)</sup>

**Tablets**, nitrofurantoin 50 mg, net price 28-tab pack = £1.84; 100 mg, 28-tab pack = £4.43. Label: 9, 14, 21

**Oral suspension**, nitrofurantoin 25 mg/5 mL, net price 300 mL = £99.05. Label: 9, 14, 21

**Note** Sugar-free versions are available and can be ordered by specifying 'sugar-free' on the prescription

**Furadantin®** (Goldshield) 

**Tablets**, all yellow, scored, nitrofurantoin 50 mg, net price 100-tab pack = £9.79; 100 mg, 100-tab pack = £18.11. Label: 9, 14, 21

**Macrochantin®** (Goldshield) 

**Capsules**, yellow/white, nitrofurantoin 50 mg (as macrocrystals), net price 30-cap pack = £2.49; 100 mg (yellow/white), 30-cap pack = £4.81. Label: 9, 14, 21

**Modified release****Macrobid®** (Goldshield) 

**Capsules**, m/r, blue/yellow, nitrofurantoin 100 mg (as nitrofurantoin macrocrystals and nitrofurantoin monohydrate), net price 14-cap pack = £4.89.

Label: 9, 14, 21, 25

**Dose** uncomplicated urinary-tract infection, 1 capsule twice daily with food

Genito-urinary surgical prophylaxis, 1 capsule twice daily on day of procedure and for 3 days after

**METHENAMINE HIPPURATE** 

(Hexamine hippurate)

**Indications** prophylaxis and long-term treatment of chronic or recurrent lower urinary-tract infections

**Cautions** avoid concurrent administration with sulfonamides (risk of crystalluria) or urinary alkalinising agents; **interactions:** Appendix 1 (methenamine)

**Contra-indications** severe dehydration, gout, metabolic acidosis

**Hepatic impairment** avoid

**Renal impairment** avoid if eGFR less than 10 mL/minute/1.73 m<sup>2</sup>—risk of hippurate crystalluria

**Pregnancy** use with caution

**Breast-feeding** amount too small to be harmful

**Side-effects** gastro-intestinal disturbances, bladder irritation, rash

**Dose**

- 1 g every 12 hours (may be increased in patients with catheters to 1 g every 8 hours); **CHILD** 6–12 years 500 mg every 12 hours

**Hiprex®** (Meda) 

**Tablets**, scored, methenamine hippurate 1 g, net price 60-tab pack = £6.58. Label: 9

**5.2 Antifungal drugs****Treatment of fungal infections**

The systemic treatment of common fungal infections is outlined below; specialist treatment is required in most forms of systemic or disseminated fungal infections. For local treatment of fungal infections, see section 7.2.2 (genital), section 7.4.4 (bladder), section 11.3.2 (eye), section 12.1.1 (ear), section 12.3.2 (oropharynx), and section 13.10.2 (skin).

**Aspergillosis** Aspergillosis most commonly affects the respiratory tract but in severely immunocompromised patients, invasive forms can affect the heart, brain, and skin. **Voriconazole** (section 5.2.1) is the treatment of choice for aspergillosis; **liposomal amphotericin** (section 5.2.3) is an alternative first-line treatment when voriconazole cannot be used. **Caspofungin** (section 5.2.4), **itraconazole** (section 5.2.1), or **posaconazole** (section 5.2.1) can be used in patients who are refractory to, or intolerant of voriconazole and liposomal amphotericin. Itraconazole is also used for the treatment of chronic pulmonary aspergillosis or as an adjunct in the treatment of allergic bronchopulmonary aspergillosis [unlicensed indication].

**Candidiasis** Many superficial candidal infections including infections of the skin (section 13.10.2) are treated locally; widespread or intractable infection requires systemic antifungal treatment. Vaginal candidiasis (section 7.2.2) may be treated with locally acting antifungals or with fluconazole (section 5.2.1) given by mouth; for resistant organisms, itraconazole (section 5.2.1) can be given by mouth.

**Oropharyngeal candidiasis** generally responds to topical therapy (section 12.3.2); fluconazole is given by mouth for unresponsive infections; it is effective and is reliably absorbed. Itraconazole may be used for fluconazole-resistant infections. Topical therapy may not be adequate in immunocompromised patients and an oral triazole antifungal is preferred.

For *invasive or disseminated candidiasis*, an **echinocandin** (section 5.2.4) can be used. **Fluconazole** (section 5.2.1) is an alternative for *Candida albicans* infection in clinically stable patients who have not received an azole antifungal recently. **Amphotericin** (section 5.2.3) is an alternative when an echinocandin or fluconazole cannot be used, however, amphotericin should be considered for the initial treatment of CNS candidiasis. **Voriconazole** (section 5.2.1) can be used for infections caused by fluconazole-resistant *Candida* spp. when oral therapy is required, or in patients intolerant of amphotericin or an echinocandin. In refractory cases, **flucytosine** (section 5.2.5) can be used with intravenous amphotericin.

**Cryptococcosis** Cryptococcosis is uncommon but infection in the immunocompromised, especially in HIV-positive patients, can be life-threatening; cryptococcal meningitis is the most common form of fungal meningitis. The treatment of choice in cryptococcal meningitis is **amphotericin** (section 5.2.3) by intravenous infusion and **flucytosine** (section 5.2.5) by intravenous infusion for 2 weeks, followed by **fluconazole** (section 5.2.1) by mouth for 8 weeks or until cultures are negative. In cryptococcosis, **fluconazole** is sometimes given alone as an alternative in HIV-positive patients with mild, localised infections or in those who cannot tolerate amphotericin. Following successful treatment, fluconazole can be used for prophylaxis against relapse until immunity recovers.

**Histoplasmosis** Histoplasmosis is rare in temperate climates; it can be life-threatening, particularly in HIV-infected persons. **Itraconazole** (section 5.2.1) can be used for the treatment of immunocompetent patients with indolent non-meningeal infection, including chronic pulmonary histoplasmosis. **Amphotericin** (section 5.2.3) by intravenous infusion is preferred in patients with fulminant or severe infections. Following successful treatment, itraconazole can be used for prophylaxis against relapse until immunity recovers.

**Skin and nail infections** Mild localised fungal infections of the skin (including tinea corporis, tinea cruris, and tinea pedis) respond to topical therapy (section

13.10.2). Systemic therapy is appropriate if topical therapy fails, if many areas are affected, or if the site of infection is difficult to treat such as in infections of the nails (onychomycosis) and of the scalp (tinea capitis). Oral imidazole or triazole antifungals (particularly **itraconazole**) and **terbinafine** are used more frequently than griseofulvin because they have a broader spectrum of activity and require a shorter duration of treatment.

*Tinea capitis* is treated systemically; additional topical application of an antifungal (section 13.10.2) may reduce transmission. **Griseofulvin** (section 5.2.5) is used for tinea capitis in adults and children; it is effective against infections caused by *Trichophyton tonsurans* and *Microsporum* spp. **Terbinafine** (section 5.2.5) is used for tinea capitis caused by *T. tonsurans* [unlicensed indication]. The role of terbinafine in the management of *Microsporum* infections is uncertain.

*Pityriasis versicolor* (section 13.10.2) may be treated with **itraconazole** (section 5.2.1) by mouth if topical therapy is ineffective; **fluconazole** (section 5.2.1) by mouth is an alternative. Oral **terbinafine** is not effective for pityriasis versicolor.

Antifungal treatment may not be necessary in asymptomatic patients with tinea infection of the nails. If treatment is necessary, a systemic antifungal is more effective than topical therapy. **Terbinafine** (section 5.2.5) and **itraconazole** (section 5.2.1) have largely replaced griseofulvin for the systemic treatment of *onychomycosis*, particularly of the toenail; terbinafine is considered to be the drug of choice. Itraconazole can be administered as intermittent 'pulse' therapy. For the role of topical antifungals in the treatment of onychomycosis, see section 13.10.2.

**Immunocompromised patients** Immunocompromised patients are at particular risk of fungal infections and may receive antifungal drugs prophylactically; oral triazole antifungals are the drugs of choice for prophylaxis. **Fluconazole** (section 5.2.1) is more reliably absorbed than **itraconazole** (section 5.2.1), but fluconazole is not effective against *Aspergillus* spp. Itraconazole is preferred in patients at risk of invasive aspergillosis. **Posaconazole** (section 5.2.1) can be used for prophylaxis in patients who are undergoing haematopoietic stem cell transplantation or receiving chemotherapy for acute myeloid leukaemia and myelodysplastic syndrome, if they are intolerant of fluconazole or itraconazole. **Micafungin** (section 5.2.4) can be used for prophylaxis of candidiasis in patients undergoing haematopoietic stem cell transplantation when fluconazole, itraconazole or posaconazole cannot be used.

**Amphotericin** (section 5.2.3) by intravenous infusion or **casposungin** (section 5.2.4) is used for the empirical treatment of serious fungal infections; casposungin is not effective against fungal infections of the CNS.

## 5.2.1 Triazole antifungals

For the role of triazole antifungal drugs in the prevention and systemic treatment of fungal infections, see p. 373.

**Fluconazole** is very well absorbed after oral administration. It also achieves good penetration into the cerebrospinal fluid to treat fungal meningitis. Fluconazole is excreted largely unchanged in the urine and can be used to treat candiduria.

**Itraconazole** is active against a wide range of dermatophytes. Itraconazole capsules require an acid environment in the stomach for optimal absorption.

Itraconazole has been associated with liver damage and should be avoided or used with caution in patients with liver disease; fluconazole is less frequently associated with hepatotoxicity.

**Posaconazole** is licensed for the treatment of invasive fungal infections unresponsive to conventional treatment.

**Voriconazole** is a broad-spectrum antifungal drug which is licensed for use in life-threatening infections.

## FLUCONAZOLE

**Indications** see under Dose

**Cautions** concomitant use with hepatotoxic drugs, monitor liver function with high doses or extended courses—discontinue if signs or symptoms of hepatic disease (risk of hepatic necrosis); susceptibility to QT interval prolongation; **interactions:** Appendix 1 (antifungals, triazole)

**Contra-indications** acute porphyria (section 9.8.2)

**Hepatic impairment** toxicity with related drugs

**Renal impairment** usual initial dose then halve subsequent doses if eGFR less than 50 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** manufacturer advises avoid—multiple congenital abnormalities reported with long-term high doses

**Breast-feeding** present in milk but amount probably too small to be harmful

**Side-effects** nausea, abdominal discomfort, diarrhoea, flatulence, headache, rash (discontinue treatment or monitor closely if infection invasive or systemic); less frequently dyspepsia, vomiting, taste disturbance, hepatic disorders, hypersensitivity reactions, anaphylaxis, dizziness, seizures, alopecia, pruritus, toxic epidermal necrolysis, Stevens-Johnson syndrome (severe cutaneous reactions more likely in AIDS patients), hyperlipidaemia, leucopenia, thrombocytopenia, and hypokalaemia reported

### Dose

- Vaginal candidiasis (see also Recurrent Vulvovaginal Candidiasis, section 7.2.2) and candidal balanitis, **ADULT** and **CHILD** over 16 years, **by mouth**, a single dose of 150 mg
- Mucosal candidiasis (except genital), **by mouth**, 50 mg daily (100 mg daily in unusually difficult infections) given for 7–14 days in oropharyngeal candidiasis (max. 14 days except in severely immunocompromised patients); for 14 days in atrophic oral candidiasis associated with dentures; for 14–30 days in other mucosal infections (e.g. oesophagitis, candiduria, non-invasive bronchopulmonary infections); **CHILD by mouth** or **by intravenous infusion**, 3–6 mg/kg on first day then 3 mg/kg daily (every 72 hours in **NEONATE** up to 2 weeks old, every 48 hours in neonate 2–4 weeks old)
- Tinea pedis, corporis, cruris, pityriasis versicolor, and dermal candidiasis, **by mouth**, 50 mg daily for 2–4 weeks (for up to 6 weeks in tinea pedis); max. duration of treatment 6 weeks
- Invasive candidal infections (including candidaemia and disseminated candidiasis) and cryptococcal

infections (including meningitis), **by mouth** or **intravenous infusion**, 400 mg on first day then 200–400 mg daily; max. 800 mg daily in severe infections [unlicensed dose]; treatment continued according to response (at least 8 weeks for cryptococcal meningitis); **CHILD** 6–12 mg/kg daily (every 72 hours in **NEONATE** up to 2 weeks old, every 48 hours in **NEONATE** 2–4 weeks old); max. 800 mg daily [unlicensed dose]

- Prevention of relapse of cryptococcal meningitis in HIV-infected patients after completion of primary therapy, **by mouth** or **by intravenous infusion**, 200 mg daily
- Prevention of fungal infections in immunocompromised patients, **by mouth** or **by intravenous infusion**, 50–400 mg daily adjusted according to risk; 400 mg daily if high risk of systemic infections e.g. following bone-marrow transplantation; commence treatment before anticipated onset of neutropenia and continue for 7 days after neutrophil count in desirable range; **CHILD** according to extent and duration of neutropenia, 3–12 mg/kg daily (every 72 hours in **NEONATE** up to 2 weeks old, every 48 hours in **NEONATE** 2–4 weeks old); max. 400 mg daily

#### Fluconazole (Non-proprietary) <sup>(POM)</sup>

<sup>1</sup>**Capsules**, fluconazole 50 mg, net price 7-cap pack = £1.14; 150 mg, single-capsule pack = 98p; 200 mg, 7-cap pack = £5.04. Label: 9, (50 and 200 mg)

**Dental prescribing on NHS** Fluconazole Capsules 50 mg may be prescribed

**Intravenous infusion**, fluconazole 2 mg/mL, net price 25-mL bottle = £7.31; 100-mL bottle = £29.27; 100-mL infusion bag = £27.82

#### Diflucan<sup>®</sup> (Pfizer) <sup>(POM)</sup>

<sup>1</sup>**Capsules**, fluconazole 50 mg (blue/white), net price 7-cap pack = £16.61; 150 mg (blue), single-capsule pack = £7.12; 200 mg (purple/white), 7-cap pack = £66.42. Label: 9, (50 and 200 mg)

**Oral suspension**, orange-flavoured, fluconazole for reconstitution with water, 50 mg/5 mL, net price 35 mL = £16.61; 200 mg/5 mL, 35 mL = £66.42. Label: 9

**Dental prescribing on NHS** May be prescribed as Fluconazole Oral Suspension 50 mg/5 mL

**Intravenous infusion**, fluconazole 2 mg/mL in sodium chloride intravenous infusion 0.9%, net price 25-mL bottle = £7.32; 100-mL bottle = £29.28

**Electrolytes** Na<sup>+</sup> 15 mmol/100-mL bottle

## ITRACONAZOLE

**Indications** see under Dose

**Cautions** absorption reduced in AIDS and neutropenia (monitor plasma-itraconazole concentration and increase dose if necessary); susceptibility to congestive heart failure (see also Heart Failure, below);

**interactions:** Appendix 1 (antifungals, triazole)

**Hepatotoxicity** Potentially life-threatening hepatotoxicity reported very rarely—discontinue if signs of hepatitis develop. Avoid or use with caution if history of hepatotoxicity with other drugs or in active liver disease. Monitor liver function if treatment continues for longer than one month, if receiving other hepatotoxic drugs, if history of hepatotoxicity with other drugs, or in hepatic impairment

**Counseling** Patients should be told how to recognise signs of liver disorder and advised to seek prompt medical atten-

tion if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain or dark urine develop

#### Heart failure

Following reports of heart failure, caution is advised when prescribing itraconazole to patients at high risk of heart failure. Those at risk include:

- patients receiving high doses and longer treatment courses;
- older patients and those with cardiac disease;
- patients receiving treatment with negative inotropic drugs, e.g. calcium channel blockers.

Itraconazole should be avoided in patients with ventricular dysfunction or a history of heart failure unless the infection is serious.

**Contra-indications** acute porphyria (section 9.8.2)

**Hepatic impairment** use only if potential benefit outweighs risk of hepatotoxicity (see Hepatotoxicity above); dose reduction may be necessary

**Renal impairment** risk of congestive heart failure; bioavailability of oral formulations possibly reduced; use intravenous infusion with caution if eGFR 30–80 mL/minute/1.73 m<sup>2</sup>; avoid intravenous infusion if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** manufacturer advises use only in life-threatening situations (toxicity at high doses in *animal* studies); ensure effective contraception during treatment and until the next menstrual period following end of treatment

**Breast-feeding** small amounts present in milk—may accumulate; manufacturer advises avoid

**Side-effects** nausea, abdominal pain, rash; *less commonly* vomiting, dyspepsia, taste disturbances, flatulence, diarrhoea, constipation, oedema, headache, dizziness, paraesthesia (discontinue treatment if neuropathy), menstrual disorder, and alopecia; *rarely* pancreatitis, hypoaesthesia, urinary frequency, leucopenia, visual disturbances, and tinnitus; also reported, heart failure (see Cautions above), hypertriglyceridaemia, hepatitis (see Hepatotoxicity above), erectile dysfunction, thrombocytopenia, hypokalaemia, myalgia, arthralgia, photosensitivity, toxic epidermal necrolysis, and Stevens–Johnson syndrome; *with intravenous injection* hypertension and hyperglycaemia

#### Dose

- **By mouth**, oropharyngeal candidiasis, see under *Sporanox*<sup>®</sup> oral liquid below  
Vulvovaginal candidiasis, (see also Recurrent Vulvovaginal Candidiasis, section 7.2.2) 200 mg twice daily for 1 day  
Pityriasis versicolor, 200 mg once daily for 7 days  
Tinea corporis and tinea cruris, *either* 100 mg once daily for 15 days *or* 200 mg once daily for 7 days  
Tinea pedis and tinea manuum, *either* 100 mg once daily for 30 days *or* 200 mg twice daily for 7 days  
Onychomycosis, *either* 200 mg once daily for 3 months *or* course ('pulse') of 200 mg twice daily for 7 days, subsequent courses repeated after 21-day interval; fingernails 2 courses, toenails 3 courses  
Histoplasmosis, 200 mg 3 times daily for 3 days, then 200 mg once or twice daily  
Systemic aspergillosis, candidiasis and cryptococcosis including cryptococcal meningitis where other antifungal drugs inappropriate or ineffective, 200 mg once daily (candidiasis 100–200 mg once daily) increased in invasive or disseminated disease and in cryptococcal meningitis to 200 mg twice daily

1. Capsules can be sold to the public for vaginal candidiasis and associated candidal balanitis in those aged 16–60 years, in a container or packaging containing not more than 150 mg and labelled to show a max. dose of 150 mg

Maintenance in HIV-infected patients to prevent relapse of underlying fungal infection and prophylaxis in neutropenia when standard therapy inappropriate, 200 mg once daily, increased to 200 mg twice daily if low plasma-itraconazole concentration (see Cautions) Prophylaxis in patients with haematological malignancy or undergoing bone-marrow transplant, see under *Sporanox*<sup>®</sup> oral liquid below

- **By intravenous infusion**, systemic aspergillosis, candidiasis and cryptococcosis including cryptococcal meningitis where other antifungal drugs inappropriate or ineffective, histoplasmosis, 200 mg every 12 hours for 2 days, then 200 mg once daily for max. 12 days
  - **CHILD** under 18 years see *BNF for Children*
- Note** Itraconazole doses in BNF may differ from those in product literature

#### Itraconazole (Non-proprietary) (POM)

**Capsules**, enclosing coated beads, itraconazole 100 mg, net price 15-cap pack = £7.21. Label: 5, 9, 21, 25, counselling, hepatotoxicity

#### Sporanox<sup>®</sup> (Janssen-Cilag) (POM)

**Capsules**, blue/pink, enclosing coated beads, itraconazole 100 mg, net price 4-cap pack = £3.67; 15-cap pack = £13.77; 28-cap pack (*Sporanox*<sup>®</sup>-Pulse) = £25.72; 60-cap pack = £55.10. Label: 5, 9, 21, 25, counselling, hepatotoxicity

**Oral liquid**, sugar-free, cherry-flavoured, itraconazole 10 mg/mL, net price 150 mL (with 10-mL measuring cup) = £45.80. Label: 9, 23, counselling, administration, hepatotoxicity

**Dose** oral or oesophageal candidiasis in HIV-positive or other immunocompromised patients, 20 mL (2 measuring cups) daily in 1–2 divided doses for 1 week (continue for another week if no response)

Fluconazole-resistant oral or oesophageal candidiasis, 10–20 mL (1–2 measuring cups) twice daily for 2 weeks (continue for another 2 weeks if no response; the higher dose should not be used for longer than 2 weeks if no signs of improvement)

Prophylaxis of deep fungal infections (when standard therapy is inappropriate) in patients with haematological malignancy or undergoing bone-marrow transplantation who are expected to become neutropenic, 5 mg/kg daily in 2 divided doses; starting before transplantation or before chemotherapy (taking care to avoid interaction with cytotoxic drugs) and continued until neutrophil count recovers; **CHILD** and **ELDERLY** safety and efficacy not established

**Counselling** Do not take with food; swish around mouth and swallow, do not rinse afterwards

**Concentrate for intravenous infusion**, itraconazole 10 mg/mL. For dilution before use. Net price 25-mL amp (with infusion bag and filter) = £62.58  
**Excipients** include propylene glycol

## POSACONAZOLE

**Indications** invasive aspergillosis (see notes above); fusariosis either unresponsive to, or in patients intolerant of, amphotericin; chromoblastomycosis and mycetoma either unresponsive to, or in patients intolerant of, itraconazole; coccidioidomycosis either unresponsive to, or in patients intolerant of, amphotericin, itraconazole, or fluconazole; see also under Dose

**Cautions** cardiomyopathy, bradycardia, symptomatic arrhythmias, history of QT interval prolongation, concomitant use with other drugs known to cause QT-interval prolongation; monitor electrolytes (including potassium, magnesium, and calcium) before and

during therapy, monitor liver function; **interactions:** Appendix 1 (antifungals, triazole)

**Contra-indications** acute porphyria (section 9.8.2)

**Hepatic impairment** monitor liver function; manufacturer advises caution

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk and recommends effective contraception during treatment; toxicity in *animal* studies

**Breast-feeding** manufacturer advises avoid—present in milk in *animal* studies

**Side-effects** gastro-intestinal disturbances (including nausea, vomiting, abdominal pain, diarrhoea, dyspepsia, and flatulence); dizziness, headache, paraesthesia, drowsiness, fatigue, fever, anorexia; blood disorders (including anaemia, neutropenia, and thrombocytopenia), electrolyte disturbances; dry mouth; rash; *less commonly* pancreatitis, hepatic disorders, arrhythmias, palpitation, changes in blood pressure, oedema, convulsions, neuropathy, tremor, hyperglycaemia, menstrual disorders, renal failure, musculoskeletal pain, visual disturbances, mouth ulcers, and alopecia; *rarely* ileus, cardiac failure, myocardial infarction, stroke, thrombosis, syncope, pneumonitis, psychosis, depression, encephalopathy, adrenal insufficiency, breast pain, hearing impairment, and Stevens-Johnson syndrome

#### Dose

- 400 mg twice daily with food or if food not tolerated, 200 mg 4 times daily
- Oropharyngeal candidiasis (severe infection or in immunocompromised patients only), 200 mg with food on first day, then 100 mg once daily with food for 13 days
- Prophylaxis of invasive fungal infections in patients undergoing bone-marrow transplantation or receiving chemotherapy for acute myeloid leukaemia and myelodysplastic syndrome who are expected to become neutropenic, and who are intolerant of fluconazole or itraconazole, 200 mg 3 times daily with food, starting before transplantation or before chemotherapy and continued until neutrophil count recovers
- **CHILD** under 18 years not recommended

#### Noxafil<sup>®</sup> (Schering-Plough) (POM)

**Suspension**, posaconazole 200 mg/5 mL, net price 105 mL (cherry-flavoured) = £491.20. Label: 3, 9, 21

## VORICONAZOLE

**Indications** invasive aspergillosis; serious infections caused by *Scedosporium* spp., *Fusarium* spp., or invasive fluconazole-resistant *Candida* spp. (including *C. krusei*)

**Cautions** electrolyte disturbances, cardiomyopathy, bradycardia, symptomatic arrhythmias, history of QT interval prolongation, concomitant use with other drugs that prolong QT interval; avoid exposure to sunlight; patients at risk of pancreatitis; monitor liver function before treatment and during treatment; haematological malignancy (increased risk of hepatic reactions); monitor renal function; **interactions:** Appendix 1 (antifungals, triazole)

**Contra-indications** acute porphyria (section 9.8.2)

**Hepatic impairment** in mild to moderate hepatic cirrhosis use usual initial dose then halve subsequent

doses; no information available for severe hepatic cirrhosis—manufacturer advises use only if potential benefit outweighs risk

**Renal impairment** intravenous vehicle may accumulate if eGFR less than 50 mL/minute/1.73 m<sup>2</sup>—use intravenous infusion only if potential benefit outweighs risk, and monitor renal function; alternatively, use tablets or oral suspension (no dose adjustment required)

**Pregnancy** toxicity in *animal* studies—manufacturer advises avoid unless potential benefit outweighs risk; effective contraception required during treatment

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** nausea, vomiting, abdominal pain, diarrhoea, jaundice, oedema, hypotension, chest pain, respiratory distress syndrome, sinusitis, headache, dizziness, asthenia, anxiety, depression, confusion, agitation, hallucinations, paraesthesia, tremor, influenza-like symptoms, hypoglycaemia, haematuria, blood disorders (including anaemia, thrombocytopenia, leucopenia, pancytopenia), acute renal failure, hypokalaemia, visual disturbances (including altered perception, blurred vision, and photophobia), rash, pruritus, photosensitivity, alopecia, cheilitis, injection-site reactions; *less commonly* dyspepsia, duodenitis, cholecystitis, pancreatitis, hepatitis, constipation, arrhythmias (including QT interval prolongation), syncope, raised serum cholesterol, hypersensitivity reactions (including flushing), ataxia, nystagmus, hypoesthesia, adrenocortical insufficiency, arthritis, blepharitis, optic neuritis, scleritis, glossitis, gingivitis, psoriasis, Stevens-Johnson syndrome; *rarely* pseudomembranous colitis, taste disturbances (more common with oral suspension), convulsions, insomnia, tinnitus, hearing disturbances, extrapyramidal effects, hypertension, hypothyroidism, hyperthyroidism, discoid lupus erythematosus, toxic epidermal necrolysis, pseudoporphyria, retinal haemorrhage, optic atrophy; also reported squamous cell carcinoma of skin (particularly in presence of phototoxicity or in the immunosuppressed)

### Dose

- **By mouth, ADULT** and **CHILD** over 12 years, body-weight over 40 kg, 400 mg every 12 hours for 2 doses then 200 mg every 12 hours, increased if necessary to 300 mg every 12 hours; body-weight under 40 kg, 200 mg every 12 hours for 2 doses then 100 mg every 12 hours, increased if necessary to 150 mg every 12 hours; **CHILD** 2–12 years, (oral suspension recommended) 200 mg every 12 hours
- **By intravenous infusion**, 6 mg/kg every 12 hours for 2 doses, then 4 mg/kg every 12 hours (reduced to 3 mg/kg every 12 hours if not tolerated) for max. 6 months; **CHILD** 2–18 years see *BNF for Children*

**Vfend**® (Pfizer) 

**Tablets**, f/c, voriconazole 50 mg, net price 28-tablet pack = £275.68; 200 mg, 28-tab pack = £1102.74. Label: 9, 11, 23

**Oral suspension**, voriconazole 200 mg/5 mL when reconstituted with water, net price 75 mL (orange-flavoured) = £551.37. Label: 9, 11, 23

**Intravenous infusion**, powder for reconstitution, voriconazole, net price 200-mg vial = £77.14

**Excipients** include sulphobutylether beta cyclodextrin sodium (risk of accumulation in renal impairment)

**Electrolytes** Na<sup>+</sup> 9.47 mmol/vial

## 5.2.2 Imidazole antifungals

The imidazole antifungals include clotrimazole, econazole, ketoconazole, and tioconazole. They are used for the local treatment of vaginal candidiasis (section 7.2.2) and for dermatophyte infections (section 13.10.2).

**Ketoconazole** is better absorbed by mouth than other imidazoles. However, its use is restricted because it is associated with fatal hepatotoxicity (see below).

**Miconazole** (section 12.3.2) can be used locally for oral infections; it is also effective in intestinal infections. Systemic absorption may follow use of miconazole oral gel and may result in significant drug interactions.

### KETOCONAZOLE

**Indications** dermatophytoses and *Malassezia* folliculitis *either* resistant to fluconazole, terbinafine, or itraconazole *or* in patients intolerant of these antifungals; chronic mucocutaneous, cutaneous, and oropharyngeal candidiasis *either* resistant to fluconazole *or* itraconazole *or* in patients intolerant of these antifungals

**Cautions** predisposition to adrenocortical insufficiency; **interactions:** Appendix 1 (antifungals, imidazole)

**Hepatotoxicity** Potentially life-threatening hepatotoxicity reported very rarely; risk of hepatotoxicity greater if given for longer than 10 days. Monitor liver function before treatment, then on weeks 2 and 4 of treatment, then every month. Avoid *or* use with caution if abnormal liver function tests (avoid in active liver disease) *or* if history of hepatotoxicity with other drugs.

**Counselling** Patients should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain, jaundice, *or* dark urine develop

**Contra-indications** acute porphyria (section 9.8.2)

**Hepatic impairment** avoid; see also Hepatotoxicity above

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk (teratogenicity in *animal* studies)

**Breast-feeding** manufacturer advises avoid

**Side-effects** nausea, vomiting, abdominal pain; pruritus; *less commonly* diarrhoea, headache, dizziness, drowsiness, and rash; also reported fatal liver damage (see Hepatotoxicity above), dyspepsia, raised intracranial pressure, paraesthesia, adrenocortical insufficiency, erectile dysfunction, menstrual disorders, azoospermia (with high doses), gynaecomastia, thrombocytopenia, photophobia, photosensitivity, and alopecia

### Dose

- 200 mg once daily, increased if response inadequate to 400 mg once daily; continued until symptoms have cleared and cultures negative, but see Cautions (max. duration of treatment 4 weeks for *Malassezia* infection); **CHILD** body-weight 15–30 kg, 100 mg once daily; body-weight over 30 kg, adult dose

**Nizoral**® (Janssen-Cilag) 

**Tablets**, scored, ketoconazole 200 mg. Net price 30-tab pack = £14.02. Label: 5, 9, 21, counselling, hepatotoxicity

## 5.2.3 Polyene antifungals

The polyene antifungals include amphotericin and nystatin; neither drug is absorbed when given by mouth. Nystatin is used for oral, oropharyngeal, and perioral infections by local application in the mouth (section 12.3.2). Nystatin is also used for *Candida albicans* infection of the skin (section 13.10.2).

**Amphotericin** by intravenous infusion is used for the treatment of systemic fungal infections and is active against most fungi and yeasts. It is highly protein bound and penetrates poorly into body fluids and tissues. When given parenterally amphotericin is toxic and side-effects are common. Lipid formulations of amphotericin (*Abelcet*® and *AmBisome*®) are significantly less toxic and are recommended when the conventional formulation of amphotericin is contra-indicated because of toxicity, especially nephrotoxicity or when response to conventional amphotericin is inadequate; lipid formulations are more expensive. For the role of amphotericin in the systemic treatment of fungal infections, see p. 373.

### AMPHOTERICIN (Amphotericin B)

**Indications** See under Dose

**Cautions** when given parenterally, toxicity common (close supervision necessary and test dose required; see Anaphylaxis below); hepatic and renal function tests, blood counts, and plasma electrolyte (including plasma-potassium and magnesium concentration) monitoring required; corticosteroids (avoid except to control reactions); avoid rapid infusion (risk of arrhythmias); **interactions:** Appendix 1 (amphotericin) **Anaphylaxis** Anaphylaxis occurs rarely with any intravenous amphotericin product and a test dose is advisable before the first infusion; the patient should be carefully observed for at least 30 minutes after the test dose. Prophylactic antipyretics or hydrocortisone should only be used in patients who have previously experienced acute adverse reactions (in whom continued treatment with amphotericin is essential)

**Renal impairment** use only if no alternative; nephrotoxicity may be reduced with use of lipid formulation

**Pregnancy** not known to be harmful but manufacturers advise avoid unless potential benefit outweighs risk

**Breast-feeding** no information available

**Side-effects** when given parenterally, anorexia, nausea and vomiting, diarrhoea, epigastric pain; febrile reactions, headache, muscle and joint pain; anaemia; disturbances in renal function (including hypokalaemia and hypomagnesaemia) and renal toxicity; also cardiovascular toxicity (including arrhythmias, blood pressure changes), blood disorders, neurological disorders (including hearing loss, diplopia, convulsions, peripheral neuropathy, encephalopathy), abnormal liver function (discontinue treatment), rash, anaphylactoid reactions (see Anaphylaxis, above); pain and thrombophlebitis at injection site

#### Dose

- By intravenous infusion, see preparations

**Note** Different preparations of intravenous amphotericin vary in their pharmacodynamics, pharmacokinetics, dosage, and administration; these preparations should not be considered interchangeable. To avoid confusion, prescribers should specify the brand to be dispensed.

#### Fungizone® (Squibb) (PoM)

**Intravenous infusion**, powder for reconstitution, amphotericin (as sodium deoxycholate complex), net price 50-mg vial = £3.88

**Electrolytes** Na<sup>+</sup> < 0.5 mmol/vial

**Dose** by intravenous infusion, systemic fungal infections, initial test dose of 1 mg over 20–30 minutes then 250 micrograms/kg daily, gradually increased over 2–4 days, if tolerated, to 1 mg/kg daily; max. (severe infection) 1.5 mg/kg daily or on alternate days; **CHILD** under 18 years see *BNF for Children*

**Note** Prolonged treatment usually necessary; if interrupted for longer than 7 days recommence at 250 micrograms/kg daily and increase gradually

#### ▲ Lipid formulations

#### Abelcet® (Cephalon) (PoM)

**Intravenous infusion**, amphotericin 5 mg/mL as lipid complex with L- $\alpha$ -dimyristoylphosphatidylcholine and L- $\alpha$ -dimyristoylphosphatidylglycerol, net price 20-mL vial = £77.43 (hosp. only)

**Electrolytes** Na<sup>+</sup> 3.12 mmol/vial

**Dose** by intravenous infusion, severe invasive candidiasis; severe systemic fungal infections in patients not responding to conventional amphotericin or to other antifungal drugs or where toxicity or renal impairment precludes conventional amphotericin, including invasive aspergillosis, cryptococcal meningitis and disseminated cryptococcosis in HIV patients, initial test dose 1 mg over 15 minutes then 5 mg/kg once daily for at least 14 days; **CHILD** under 18 years see *BNF for Children*

#### AmBisome® (Gilead) (PoM)

**Intravenous infusion**, powder for reconstitution, amphotericin 50 mg encapsulated in liposomes, net price 50-mg vial = £96.69

**Electrolytes** Na<sup>+</sup> < 0.5 mmol/vial

**Excipients** include sucrose 900 mg/vial

**Dose** by intravenous infusion, severe systemic or deep mycoses where toxicity (particularly nephrotoxicity) precludes use of conventional amphotericin, aspergillosis, initial test dose 1 mg over 10 minutes then 3 mg/kg once daily; max. 5 mg/kg once daily (unlicensed dose); **CHILD** under 18 years see *BNF for Children*

Suspected or proven infection in febrile neutropenic patients unresponsive to broad-spectrum antibacterials, initial test dose 1 mg over 10 minutes then 3 mg/kg once daily until afebrile for 3 consecutive days; max. period of treatment 42 days; max. 5 mg/kg once daily (unlicensed dose); **CHILD** under 18 years see *BNF for Children*

Visceral leishmaniasis, see section 5.4.5 and product literature

## 5.2.4 Echinocandin antifungals

The echinocandin antifungals include **anidulafungin**, **caspofungin** and **micafungin**. They are only active against *Aspergillus* spp. and *Candida* spp.; however, anidulafungin and micafungin are not used for the treatment of aspergillosis. Echinocandins are not effective against fungal infections of the CNS. For the role of echinocandin antifungals in the prevention and systemic treatment of fungal infections, see p. 373.

### ANIDULAFUNGIN

**Indications** invasive candidiasis (see notes above)

**Pregnancy** manufacturer advises avoid—no information available

**Breast-feeding** manufacturer advises avoid unless potential benefit outweighs risk—present in milk in animal studies

**Side-effects** diarrhoea, nausea, vomiting, flushing, convulsion, headache, coagulopathy, hypokalaemia, raised serum creatinine, rash, pruritus; *less commonly* abdominal pain, cholestasis, hypertension, hyper-

glycaemia, urticaria, injection-site pain; also reported, hypotension, dyspnoea, bronchospasm, hepatitis

#### Dose

- By **intravenous infusion**, **ADULT** over 18 years, 200 mg on first day then 100 mg once daily

**Ecalta**<sup>®</sup> (Pfizer) ▼ (POM)

**Intravenous infusion**, powder for reconstitution, anidulafungin, net-price 100-mg vial = £299.99

## CASPOFUNGIN

**Indications** invasive aspergillosis (see notes above); invasive candidiasis (see notes above); empirical treatment of systemic fungal infections in patients with neutropenia

**Cautions** interactions: Appendix 1 (casposfungin)

**Hepatic impairment** 70 mg on first day then 35 mg once daily in moderate impairment; no information available for severe impairment

**Pregnancy** manufacturer advises avoid unless essential—toxicity in *animal* studies

**Breast-feeding** present in milk in *animal* studies—manufacturer advises avoid

**Side-effects** nausea, diarrhoea, vomiting; dyspnoea; headache; hypokalaemia; arthralgia; rash, pruritus, sweating, injection-site reactions; *less commonly* abdominal pain, dyspepsia, dry mouth, dysphagia, taste disturbances, anorexia, constipation, flatulence, cholestasis, hepatic dysfunction, ascites, palpitation, arrhythmia, chest pain, heart failure, thrombophlebitis, flushing, hypotension, hypertension, bronchospasm, cough, dizziness, fatigue, paraesthesia, hypoaesthesia, sleep disturbances, tremor, anxiety, disorientation, hyperglycaemia, renal failure, hypomagnesaemia, hypocalcaemia, metabolic acidosis, anaemia, thrombocytopenia, leucopenia, myalgia, muscular weakness, blurred vision, and erythema multiforme; also reported, adult respiratory distress syndrome and anaphylaxis

#### Dose

- By **intravenous infusion**, 70 mg on first day then 50 mg once daily (70 mg once daily if body-weight over 80 kg); **CHILD** under 18 years see *BNF for Children*

**Candidas**<sup>®</sup> (MSD) ▼ (POM)

**Intravenous infusion**, powder for reconstitution, casposfungin (as acetate), net price 50-mg vial = £327.67; 70-mg vial = £416.78

## MICAFUNGIN

**Indications** see under Dose

**Cautions** monitor renal function; **interactions:**

Appendix 1 (micafungin)

**Hepatotoxicity** Potentially life-threatening hepatotoxicity reported. Monitor liver function—discontinue if significant and persistent abnormalities in liver function tests develop. Use with caution in hepatic impairment (avoid if severe) or if receiving other hepatotoxic drugs. Risk of hepatic side-effects greater in children under 1 year of age

**Hepatic impairment** use with caution in mild to moderate impairment; avoid in severe impairment; see also Hepatotoxicity above

**Renal impairment** use with caution; renal function may deteriorate

**Pregnancy** manufacturer advises avoid unless essential—toxicity in *animal* studies

**Breast-feeding** manufacturer advises use only if potential benefit outweighs risk—present in milk in *animal* studies

**Side-effects** nausea, vomiting, diarrhoea, abdominal pain; headache, fever; hypokalaemia, hypomagnesaemia, hypocalcaemia, leucopenia, anaemia; rash, phlebitis; *less commonly* dyspepsia, constipation, hepatomegaly, hepatitis and cholestasis (see also Hepatotoxicity above), taste disturbances, anorexia, tachycardia, palpitation, bradycardia, blood pressure changes, flushing, dyspnoea, sleep disturbances, anxiety, confusion, dizziness, tremor, pancytopenia, thrombocytopenia, eosinophilia, hyponatraemia, hypophosphataemia, hyperkalaemia, hyperhidrosis, and pruritus; *rarely* haemolytic anaemia; also reported renal failure (more frequent in children)

#### Dose

- By **intravenous infusion**, invasive candidiasis, **ADULT** body-weight over 40 kg, 100 mg once daily (increased to 200 mg daily if inadequate response) for at least 14 days; body-weight under 40 kg, 2 mg/kg once daily (increased to 4 mg/kg daily if inadequate response) for at least 14 days; **CHILD** under 18 years see *BNF for Children*

Oesophageal candidiasis, **ADULT** body-weight over 40 kg, 150 mg once daily; body-weight under 40 kg, 3 mg/kg once daily; **CHILD** 16–18 years see *BNF for Children*

Prophylaxis of candidiasis in patients undergoing bone-marrow transplantation or who are expected to become neutropenic for over 10 days, **ADULT** body-weight over 40 kg, 50 mg once daily; body-weight under 40 kg, 1 mg/kg once daily; continue for at least 7 days after neutrophil count in desirable range; **CHILD** under 18 years see *BNF for Children*

**Mycamine**<sup>®</sup> (Astellas) ▼ (POM)

**Intravenous infusion**, powder for reconstitution, micafungin (as sodium), net price 50-mg vial = £196.08; 100-mg vial = £341.00

## 5.2.5 Other antifungals

**Flucytosine** is used with amphotericin in a synergistic combination. Bone marrow depression can occur which limits its use, particularly in AIDS patients; weekly blood counts are necessary during prolonged therapy. Resistance to flucytosine can develop during therapy and sensitivity testing is essential before and during treatment. For the role of flucytosine in the treatment of systemic candidiasis and cryptococcal meningitis, see p. 373.

**Griseofulvin** is effective for widespread or intractable dermatophyte infections but has been superseded by newer antifungals, particularly for nail infections. It is the drug of choice for trichophyton infections in children. Duration of therapy is dependent on the site of the infection and may extend to a number of months. For the role of griseofulvin in the treatment of tinea capitis, see p. 373.

**Terbinafine** is the drug of choice for fungal nail infections and is also used for ringworm infections where oral treatment is considered appropriate (see p. 373).

## FLUCYTOSINE

**Indications** systemic yeast and fungal infections; adjunct to amphotericin in cryptococcal meningitis (see Cryptococcosis, p. 373), adjunct to amphotericin in severe systemic candidiasis and in other severe or long-standing infections

**Cautions** elderly; blood disorders; liver- and kidney-function tests and blood counts required (weekly in blood disorders); **interactions:** Appendix 1 (flucytosine)

**Renal impairment** liver- and kidney-function tests and blood counts required weekly; use 50 mg/kg every 12 hours if creatinine clearance 20–40 mL/minute; use 50 mg/kg every 24 hours if creatinine clearance 10–20 mL/minute; use initial dose of 50 mg/kg if creatinine clearance less than 10 mL/minute and then adjust dose according to plasma-flucytosine concentration

**Pregnancy** teratogenic in animal studies; manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** manufacturer advises avoid

**Side-effects** nausea, vomiting, diarrhoea, rashes; less frequently cardiotoxicity, confusion, hallucinations, convulsions, headache, sedation, vertigo, alterations in liver function tests (hepatitis and hepatic necrosis reported), and toxic epidermal necrolysis; blood disorders including thrombocytopenia, leucopenia, and aplastic anaemia reported

### Dose

- By intravenous infusion over 20–40 minutes, 200 mg/kg daily in 4 divided doses usually for not more than 7 days; extremely sensitive organisms, 100–150 mg/kg daily may be sufficient; **CHILD** under 18 years see *BNF for Children*

Cryptococcal meningitis (adjunct to amphotericin, see Cryptococcosis, p. 373) 100 mg/kg daily in 4 divided doses for 2 weeks [unlicensed duration]; **CHILD** under 18 years see *BNF for Children*

**Note** For plasma concentration monitoring, blood should be taken shortly before starting the next infusion; plasma concentration for optimum response 25–50 mg/litre (200–400 micromol/litre)—should not be allowed to exceed 80 mg/litre (620 micromol/litre)

**Ancotil®** (Meda) (POM)

Intravenous infusion, flucytosine 10 mg/mL, net price 250-mL infusion bottle = £30.33 (hosp. only)  
Electrolytes Na<sup>+</sup> 34.5 mmol/250-mL bottle

**Note** Flucytosine tablets [unlicensed] may be available from 'special-order' manufacturers or specialist-importing companies, see p. 988

## GRISEOFULVIN

**Indications** dermatophyte infections of the skin, scalp, hair and nails where topical therapy has failed or is inappropriate

**Cautions interactions:** Appendix 1 (griseofulvin)

**Driving** May impair performance of skilled tasks (e.g. driving); effects of alcohol enhanced

**Contra-indications** severe liver disease; systemic lupus erythematosus (risk of exacerbation); acute porphyria (section 9.8.2)

**Hepatic impairment** avoid in severe liver disease

**Pregnancy** avoid (fetotoxicity and teratogenicity in animals); effective contraception required during and for at least 1 month after administration to women (**important:** effectiveness of oral contraceptives may

be reduced, additional contraceptive precautions e.g. barrier method, required); also men should avoid fathering a child during and for at least 6 months after administration

**Breast-feeding** avoid—no information available

**Side-effects** nausea, vomiting, diarrhoea; headache; also reported, abdominal pain, dyspepsia, hepatotoxicity, glossitis, taste disturbances, sleep disturbances, dizziness, fatigue, confusion, agitation, depression, impaired coordination and hearing, peripheral neuropathy, menstrual disturbances, renal failure, leucopenia, systemic lupus erythematosus, rash (including rarely erythema multiforme, toxic epidermal necrolysis), and photosensitivity

### Dose

- Dermatophyte infections, 500 mg once daily or in divided doses; in severe infection dose may be doubled, reducing when response occurs; **CHILD** under 50 kg, 10 mg/kg once daily or in divided doses
- Tinea capitis caused by *Trichophyton tonsurans*, 1 g once daily or in divided doses; **CHILD** under 50 kg, 15–20 mg/kg once daily or in divided doses

**Note** Griseofulvin doses in BNF may differ from those in product literature

**Griseofulvin** (Non-proprietary) (POM)

Tablets, griseofulvin 125 mg, net price 100 = £34.86; 500 mg, 100 = £90.34. Label: 9, 21, counselling, driving

**Fulsovin®** (Kappin) (POM)

Oral suspension, griseofulvin 125 mg/5 mL, net price 100 mL (peppermint-flavoured) = £59.90. Label: 9, 21, counselling, driving

## TERBINAFINE

**Indications** dermatophyte infections of the nails, ringworm infections (including tinea pedis, cruris, and corporis) where oral therapy appropriate (due to site, severity or extent)

**Cautions** psoriasis (risk of exacerbation); autoimmune disease (risk of lupus-erythematosus-like effect); **interactions:** Appendix 1 (terbinafine)

**Hepatic impairment** manufacturer advises avoid—elimination reduced

**Renal impairment** use half normal dose if eGFR less than 50 mL/minute/1.73 m<sup>2</sup> and no suitable alternative available

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk—no information available

**Breast-feeding** avoid—present in milk

**Side-effects** abdominal discomfort, anorexia, nausea, diarrhoea; headache; rash and urticaria occasionally with arthralgia or myalgia; *less commonly* taste disturbance; *rarely* liver toxicity (including jaundice, cholestasis and hepatitis)—discontinue treatment, angioedema, dizziness, malaise, paraesthesia, hypoaesthesia, photosensitivity, serious skin reactions (including Stevens-Johnson syndrome and toxic epidermal necrolysis)—discontinue treatment if progressive skin rash; *very rarely* psychiatric disturbances, blood disorders (including leucopenia and thrombocytopenia), lupus erythematosus-like effect, and exacerbation of psoriasis

### Dose

- By mouth, 250 mg daily usually for 2–6 weeks in tinea pedis, 2–4 weeks in tinea cruris, 4 weeks in tinea corporis, 6 weeks–3 months in nail infections (occa-

sionally longer in toenail infections); **CHILD** [unlicensed] usually for 4 weeks, tinea capitis, over 1 year, body-weight 10–20 kg, 62.5 mg once daily; body-weight 20–40 kg, 125 mg once daily; body-weight over 40 kg, 250 mg once daily

**Terbinafine** (Non-proprietary) (POM)

**Tablets**, terbinafine (as hydrochloride) 250 mg, net price 14-tab pack = £2.33, 28-tab pack = £3.02. Label: 9

**Lamisil®** (Novartis) (POM)

**Tablets**, off-white, scored, terbinafine (as hydrochloride) 250 mg, net price 14-tab pack = £21.30, 28-tab pack = £41.09. Label: 9

## 5.3 Antiviral drugs

- 5.3.1 HIV infection
- 5.3.2 Herpesvirus infections
- 5.3.3 Viral hepatitis
- 5.3.4 Influenza
- 5.3.5 Respiratory syncytial virus

The majority of virus infections resolve spontaneously in immunocompetent subjects. A number of specific treatments for viral infections are available, particularly for the immunocompromised. This section includes notes on herpes simplex and varicella-zoster, human immunodeficiency virus, cytomegalovirus, respiratory syncytial virus, viral hepatitis and influenza.

### 5.3.1 HIV infection

There is no cure for infection caused by the human immunodeficiency virus (HIV) but a number of drugs slow or halt disease progression. Drugs for HIV infection (antiretrovirals) may be associated with serious side-effects. Although antiretrovirals increase life expectancy considerably and decrease the risk of complications associated with premature ageing, mortality and morbidity remain slightly higher than in uninfected individuals. Treatment should be undertaken only by those experienced in their use.

**Principles of treatment** Treatment is aimed at reducing the plasma viral load as much as possible and for as long as possible; it should be started before the immune system is irreversibly damaged. The need for early drug treatment should, however, be balanced against the risk of toxicity. Commitment to treatment and strict adherence over many years are required; the regimen chosen should take into account convenience and patient tolerance. The development of drug resistance is reduced by using a combination of drugs; such combinations should have synergistic or additive activity while ensuring that their toxicity is not additive. It is recommended that viral sensitivity to antiretroviral drugs is established before starting treatment or before switching drugs if the infection is not responding.

**Initiation of treatment** The optimum time for initiating antiretroviral treatment depends primarily on the

CD4 cell count; the plasma viral load and clinical symptoms may also help. The timing and choice of treatment should also take account of the possible effects of antiretroviral drugs on factors such as the risk of cardiovascular events. Treatment includes a combination of drugs known as 'highly active antiretroviral therapy'. Treatment is initiated with 2 nucleoside reverse transcriptase inhibitors and a non-nucleoside reverse transcriptase inhibitor; the regimens of choice contain *either* tenofovir, emtricitabine, and efavirenz *or* abacavir, lamivudine, and efavirenz. Regimens containing 2 nucleoside reverse transcriptase inhibitors and a boosted protease inhibitor are reserved for patients with resistance to first-line regimens, women wishing to become pregnant, or patients with psychiatric illness. Patients who require treatment for both HIV and chronic hepatitis B should be treated with antivirals active against both diseases (section 5.3.3).

**Switching therapy** Deterioration of the condition (including clinical and virological changes) may require a change in therapy. The choice of an alternative regimen depends on factors such as the response to previous treatment, tolerance and the possibility of cross-resistance.

**Pregnancy** Treatment of HIV infection in pregnancy aims to reduce the risk of toxicity to the fetus (although the teratogenic potential of most antiretroviral drugs is unknown), to minimise the viral load and disease progression in the mother, and to prevent transmission of infection to the neonate. **All treatment options require careful assessment by a specialist.** Zidovudine monotherapy reduces transmission of infection to the neonate. However, combination antiretroviral therapy maximises the chance of preventing transmission and represents optimal therapy for the mother. Combination antiretroviral therapy may be associated with a greater risk of preterm delivery.

**Breast-feeding** Breast-feeding by HIV-positive mothers may cause HIV infection in the infant and should be avoided.

**Children** HIV disease in children has a different natural progression to adults. Children infected with HIV should be managed within a formal paediatric HIV clinical network by specialists with access to guidelines and information on antiretroviral drugs for children.

**Post-exposure prophylaxis** Prophylaxis with antiretroviral drugs [unlicensed indication] may be appropriate following exposure to HIV-contaminated material. Immediate expert advice should be sought in such cases; national guidelines on post-exposure prophylaxis for healthcare workers have been developed (by the Chief Medical Officer's Expert Advisory Group on AIDS, [www.dh.gov.uk](http://www.dh.gov.uk)) and local ones may also be available. Antiretrovirals for prophylaxis are chosen on the basis of efficacy and potential for toxicity. Prompt prophylaxis with antiretroviral drugs [unlicensed indication] is also appropriate following potential sexual exposure to HIV; recommendations have been developed by the British Association for Sexual Health and HIV, [www.bashh.org](http://www.bashh.org)

**Drugs for HIV infection** Zidovudine, a nucleoside reverse transcriptase inhibitor (or 'nucleoside analogue'), was the first anti-HIV drug to be introduced.

Other nucleoside reverse transcriptase inhibitors include **abacavir**, **didanosine**, **emtricitabine**, **lamivudine**, **stavudine**, and **tenofovir**.

The protease inhibitors include **atazanavir**, **darunavir**, **fosamprenavir** (a pro-drug of amprenavir), **indinavir**, **lopinavir**, **nelfinavir**, **ritonavir**, **saquinavir**, and **tipranavir**. Ritonavir in low doses boosts the activity of atazanavir, darunavir, fosamprenavir, indinavir, lopinavir, saquinavir, and tipranavir increasing the persistence of plasma concentrations of these drugs; at such a low dose, ritonavir has no intrinsic antiviral activity. A combination of lopinavir with low-dose ritonavir is available. The protease inhibitors are metabolised by cytochrome P450 enzyme systems and therefore have a significant potential for drug interactions. Protease inhibitors are associated with lipodystrophy and metabolic effects (see below).

The non-nucleoside reverse transcriptase inhibitors **efavirenz**, **etravirine**, and **nevirapine** are active against the subtype HIV-1 but not HIV-2, a subtype that is rare in the UK. These drugs may interact with a number of drugs metabolised in the liver. Nevirapine is associated with a high incidence of rash (including Stevens-Johnson syndrome) and occasionally fatal hepatitis. Rash is also associated with efavirenz and etravirine but it is usually milder. Psychiatric or CNS disturbances are common with efavirenz. CNS disturbances are often self-limiting and can be reduced by taking the dose at bedtime (especially in the first 2–4 weeks of treatment). Efavirenz has also been associated with an increased plasma cholesterol concentration. Etravirine is used in regimens containing a boosted protease inhibitor for HIV infection resistant to other non-nucleoside reverse transcriptase inhibitors and protease inhibitors.

**Enfuvirtide**, which inhibits the fusion of HIV to the host cell, is licensed for managing infection that has failed to respond to a regimen of other antiretroviral drugs; enfuvirtide should be combined with other potentially active antiretroviral drugs.

**Maraviroc** is an antagonist of the CCR5 chemokine receptor. It is licensed for patients exclusively infected with CCR5-tropic HIV. The *Scottish Medicines Consortium* (p. 4) has advised (March 2008) that maraviroc (*Celsentr<sup>®</sup>*) is **not** recommended for use within NHS Scotland.

**Raltegravir** is an inhibitor of HIV integrase. It is licensed for the treatment of HIV infection in combination with other antiretroviral drugs. The *Scottish Medicines Consortium* (p. 4) has advised (April 2010) that raltegravir (*Isentress<sup>®</sup>*) is accepted for restricted use within NHS Scotland for the treatment of HIV infection when non-nucleoside reverse transcriptase inhibitors or protease inhibitors cannot be used because of intolerance, drug interactions, or resistance.

**Immune reconstitution syndrome** Improvement in immune function as a result of antiretroviral treatment may provoke a marked inflammatory reaction against residual opportunistic organisms.

**Lipodystrophy syndrome** Metabolic effects associated with antiretroviral treatment include *fat redistribution*, *insulin resistance*, and *dyslipidaemia*; collectively these have been termed *lipodystrophy syndrome*. The usual risk factors for cardiovascular disease should be taken into account before starting

antiretroviral therapy and patients should be advised about lifestyle changes to reduce their cardiovascular risk. Plasma lipids and blood glucose should be measured before starting antiretroviral therapy, after 3–6 months of treatment, and then annually.

Fat redistribution (with loss of subcutaneous fat, increased abdominal fat, 'buffalo hump' and breast enlargement) is associated with regimens containing protease inhibitors and nucleoside reverse transcriptase inhibitors. Stavudine (especially in combination with didanosine), and to a lesser extent zidovudine, are associated with a higher risk of lipatrophy and should be used only if alternative regimens are not suitable.

Dyslipidaemia is associated with antiretroviral treatment, particularly with protease inhibitors. Protease inhibitors and some nucleoside reverse transcriptase inhibitors are associated with insulin resistance and hyperglycaemia. Of the protease inhibitors, atazanavir and darunavir may be less likely to cause dyslipidaemia, while saquinavir and atazanavir may be less likely to impair glucose tolerance.

**Osteonecrosis** Osteonecrosis has been reported in patients with advanced HIV disease or following long-term exposure to combination antiretroviral therapy.

## Nucleoside reverse transcriptase inhibitors

### Cautions

**Lactic acidosis** Life-threatening lactic acidosis associated with hepatomegaly and hepatic steatosis has been reported with nucleoside reverse transcriptase inhibitors. They should be used with caution in patients (particularly obese women) with hepatomegaly, hepatitis (especially hepatitis C treated with interferon alpha and ribavirin), liver-enzyme abnormalities and with other risk factors for liver disease and hepatic steatosis (including alcohol abuse). Treatment with the nucleoside reverse transcriptase inhibitor should be **discontinued** in case of symptomatic hyperlactataemia, lactic acidosis, progressive hepatomegaly or rapid deterioration of liver function. Stavudine, especially with didanosine, is associated with a higher risk of lactic acidosis and should be used only if alternative regimens are not suitable.

**Hepatic impairment** Nucleoside reverse transcriptase inhibitors should be used with caution in patients with chronic hepatitis B or C (greater risk of hepatic side-effects); see also Lactic acidosis above.

**Pregnancy** see p. 381

**Breast-feeding** see p. 381

**Side-effects** Side-effects of the nucleoside reverse transcriptase inhibitors include gastro-intestinal disturbances (such as nausea, vomiting, abdominal pain, flatulence and diarrhoea), anorexia, pancreatitis, liver damage (see also Lactic Acidosis, above), dyspnoea, cough, headache, insomnia, dizziness, fatigue, blood disorders (including anaemia, neutropenia, and thrombocytopenia), myalgia, arthralgia, rash, urticaria, and fever. See notes above for metabolic effects and lipodystrophy (Lipodystrophy Syndrome), and Osteonecrosis.

## ABACAVIR

**Indications** HIV infection in combination with other antiretroviral drugs

**Cautions** see notes above; also test for HLA-B\*5701 allele before treatment or if restarting treatment and HLA-B\*5701 status not known—increased risk of hypersensitivity reaction in presence of HLA-B\*5701 allele; HIV load greater than 100 000 copies/mL; patients at high risk of cardiovascular disease (especially if 10-year cardiovascular risk greater than 20%); **interactions:** Appendix 1 (abacavir)

**Hypersensitivity reactions** Life-threatening hypersensitivity reactions reported—characterised by fever or rash and possibly nausea, vomiting, diarrhoea, abdominal pain, dyspnoea, cough, lethargy, malaise, headache, and myalgia; less frequently mouth ulceration, oedema, hypotension, sore throat, acute respiratory distress syndrome, anaphylaxis, paraesthesia, arthralgia, conjunctivitis, lymphadenopathy, lymphocytopenia and renal failure; rarely myolysis; laboratory abnormalities may include raised liver function tests (see Lactic Acidosis p. 382) and creatine kinase; symptoms usually appear in the first 6 weeks, but may occur at any time; monitor for symptoms every 2 weeks for 2 months; discontinue immediately if any symptom of hypersensitivity develops and do not rechallenge (risk of more severe hypersensitivity reaction); discontinue if hypersensitivity cannot be ruled out, even when other diagnoses possible—if rechallenge necessary it must be carried out in hospital setting; if abacavir is stopped for any reason other than hypersensitivity, exclude hypersensitivity reaction as the cause and rechallenge only if medical assistance is readily available; care needed with concomitant use of drugs which cause skin toxicity

**Counselling** Patients should be told the importance of regular dosing (intermittent therapy may increase the risk of sensitisation), how to recognise signs of hypersensitivity, and advised to seek immediate medical attention if symptoms develop or before re-starting treatment; patients should be advised to keep Alert Card with them at all times

**Hepatic impairment** see notes above; also avoid in moderate impairment unless essential; avoid in severe impairment

**Renal impairment** manufacturer advises avoid in end-stage renal disease; avoid *Kivexa*<sup>®</sup> or *Trizivir*<sup>®</sup> if eGFR less than 50 mL/minute/1.73 m<sup>2</sup> (consult product literature)

**Pregnancy** manufacturer advises avoid (toxicity in animal studies); see also p. 381

**Breast-feeding** see p. 381

**Side-effects** see notes above; also hypersensitivity reactions (see above); very rarely Stevens-Johnson syndrome and toxic epidermal necrolysis; rash and gastro-intestinal disturbances more common in children

### Dose

- 600 mg daily in 1–2 divided doses; **CHILD** 3 months–12 years, 8 mg/kg every 12 hours (max. 600 mg daily) or body-weight 14–21 kg, 150 mg every 12 hours; body-weight 21–30 kg, 150 mg in the morning and 300 mg in the evening; body-weight over 30 kg, 300 mg every 12 hours

### Ziagen<sup>®</sup> (ViiV) (POM)

**Tablets**, yellow, f/c, scored, abacavir (as sulphate) 300 mg, net price 60-tab pack = £208.95. Counselling, hypersensitivity reactions

**Oral solution**, sugar-free, banana and strawberry flavoured, abacavir (as sulphate) 20 mg/mL, net price 240-mL = £55.72. Counselling, hypersensitivity reactions

### With lamivudine

For **cautions**, **contra-indications** and **side-effects** see under individual drugs

### Kivexa<sup>®</sup> (ViiV) (POM)

**Tablets**, orange, f/c, abacavir (as sulphate) 600 mg, lamivudine 300 mg, net price 30-tab pack = £352.25. Counselling, hypersensitivity reactions

**Dose** **ADULT** and **CHILD** over 12 years, body-weight over 40 kg, 1 tablet once daily

### With lamivudine and zidovudine

**Note** For patients stabilised (for 6–8 weeks) on the individual components in the same proportions. For **cautions**, **contra-indications** and **side-effects** see under individual drugs

### Trizivir<sup>®</sup> (ViiV) (POM)

**Tablets**, blue-green, f/c, abacavir (as sulphate) 300 mg, lamivudine 150 mg, zidovudine 300 mg, net price 60-tab pack = £509.06. Counselling, hypersensitivity reactions

**Dose** **ADULT** over 18 years, 1 tablet twice daily

## DIDANOSINE

(ddl, DDI)

**Indications** HIV infection in combination with other antiretroviral drugs

**Cautions** see notes above; also history of pancreatitis (preferably avoid, otherwise extreme caution, see also below); peripheral neuropathy or hyperuricaemia (see under Side-effects); ophthalmological examination (including visual acuity, colour vision, and dilated fundus examination) recommended annually or if visual changes occur; **interactions:** Appendix 1 (didanosine)

**Pancreatitis** Suspend treatment if serum lipase raised (even if asymptomatic) or if symptoms of pancreatitis develop; discontinue if pancreatitis confirmed. Whenever possible avoid concomitant treatment with other drugs known to cause pancreatic toxicity (e.g. intravenous pentamidine isetionate); monitor closely if concomitant therapy unavoidable. Since significant elevations of triglycerides cause pancreatitis monitor closely if elevated

**Hepatic impairment** see notes above; also insufficient information but monitor for toxicity

**Renal impairment** reduce dose if eGFR less than 60 mL/minute/1.73 m<sup>2</sup>; consult product literature

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** see p. 381

**Side-effects** see notes above; also pancreatitis (see also under Cautions), liver failure, anaphylactic reactions, peripheral neuropathy (switch to another antiretroviral if peripheral neuropathy develops), diabetes mellitus, hypoglycaemia, acute renal failure, rhabdomyolysis, dry eyes, retinal and optic nerve changes, dry mouth, parotid gland enlargement, sialadenitis, alopecia, hyperuricaemia (suspend if raised significantly)

### Dose

- **ADULT** under 60 kg 250 mg daily in 1–2 divided doses, 60 kg and over 400 mg daily in 1–2 divided doses; **CHILD** over 3 months (under 6 years *Videx*<sup>®</sup> tablets only), 240 mg/m<sup>2</sup> daily (180 mg/m<sup>2</sup> daily in combination with zidovudine) in 1–2 divided doses

**Videx®** (Bristol-Myers Squibb) (POM)

**Tablets**, with calcium and magnesium antacids, didanosine 25 mg, net price 60-tab pack = £25.06. Label: 23, counselling, administration, see below  
**Excipients** include aspartame equivalent to phenylalanine 36.5 mg per tablet (section 9.4.1)

**Note** Antacids in formulation may affect absorption of other drugs—see **Interactions**: Appendix 1 (antacids)

**Counselling** To ensure sufficient antacid, each dose to be taken as at least 2 tablets (**CHILD** under 1 year 1 tablet) chewed thoroughly, crushed or dispersed in water; clear apple juice may be added for flavouring; tablets to be taken 2 hours after lopinavir with ritonavir capsules and oral solution or atazanavir with ritonavir

**Videx® EC capsules**, enclosing e/c granules, didanosine 125 mg, net price 30-cap pack = £48.18; 200 mg, 30-cap pack = £77.09; 250 mg, 30-cap pack = £96.37; 400 mg, 30-cap pack = £154.19. Label: 25, counselling, administration, see below

**Counselling** Capsules to be taken at least 2 hours before or 2 hours after food

**EMTRICITABINE**

(FTC)

**Indications** HIV infection in combination with other antiretroviral drugs

**Cautions** see notes above; also on discontinuation, monitor patients with hepatitis B (risk of exacerbation of hepatitis); **interactions**: Appendix 1 (emtricitabine)

**Hepatic impairment** see notes above and Cautions above

**Renal impairment** reduce dose if eGFR less than 50 mL/minute/1.73 m<sup>2</sup>; consult product literature

**Pregnancy** no information available—manufacturer advises use only if essential

**Breast-feeding** see p. 381

**Side-effects** see notes above; also abnormal dreams, pruritus, and hyperpigmentation

**Dose**

- See preparations

**Emtriva®** (Gilead) (POM)

**Capsules**, white/blue, emtricitabine 200 mg, net price 30-cap pack = £163.50

**Dose** **ADULT** and **CHILD** body-weight over 33 kg, 200 mg once daily

**Oral solution**, orange, emtricitabine 10 mg/mL, net price 170-mL pack (candy-flavoured) = £46.50

**Dose** **ADULT** and **CHILD** body-weight over 33 kg, 240 mg once daily; **CHILD** 4 months–18 years, body-weight under 33 kg, 6 mg/kg once daily

**Electrolytes** Na<sup>+</sup> 460 micromol/mL

**Note** 240 mg oral solution = 200 mg capsule; where appropriate the capsule may be used instead of the oral solution

▲ **With tenofovir**

See under Tenofovir

▲ **With efavirenz and tenofovir**

See under Tenofovir

**LAMIVUDINE**

(3TC)

**Indications** see preparations below

**Cautions** see notes above; **interactions**: Appendix 1 (lamivudine)

**Chronic Hepatitis B** Recurrent hepatitis in patients with chronic hepatitis B may occur on discontinuation of lami-

vudine. When treating chronic hepatitis B with lamivudine, monitor liver function tests every 3 months, and viral and serological markers of hepatitis B every 3–6 months, more frequently in patients with advanced liver disease or following transplantation (monitoring to continue for at least 1 year after discontinuation)

**Hepatic impairment** see notes above and Cautions above

**Renal impairment** reduce dose if eGFR less than 50 mL/minute/1.73 m<sup>2</sup>; consult product literature

**Pregnancy** see p. 381

**Breast-feeding** can be used with caution in women infected with chronic hepatitis B alone, providing adequate measures are taken to prevent hepatitis B infection in infants; for women infected with HIV, see p. 381

**Side-effects** see notes above; also peripheral neuropathy, muscle disorders including rhabdomyolysis, nasal symptoms, alopecia

**Dose**

- See preparations below

**Epiriv®** (ViiV) (POM)

**Tablets**, f/c, lamivudine 150 mg (scored, white), net price 60-tab pack = £143.32; 300 mg (grey), 30-tab pack = £157.51

**Oral solution**, banana- and strawberry-flavoured, lamivudine 50 mg/5 mL, net price 240-mL pack = £39.01

**Excipients** include sucrose 1 g/5 mL

**Dose** HIV infection in combination with other antiretroviral drugs, 150 mg every 12 hours or 300 mg once daily; **CHILD** 3 months–12 years, 4 mg/kg (max. 150 mg) every 12 hours or body-weight 14–21 kg, 75 mg twice daily; body-weight 21–30 kg, 75 mg in the morning and 150 mg in the evening; body-weight over 30 kg, 150 mg twice daily

**Zeffix®** (ViiV) (POM)

**Tablets**, brown, f/c, lamivudine 100 mg, net price 28-tab pack = £78.09

**Oral solution**, banana and strawberry flavoured, lamivudine 25 mg/5 mL, net price 240-mL pack = £22.79

**Excipients** include sucrose 1 g/5 mL

**Dose** chronic hepatitis B infection *either* with compensated liver disease (with evidence of viral replication and histology of active liver inflammation or fibrosis) when first-line treatments cannot be used, *or* (in combination with another antiviral drug without cross-resistance to lamivudine) with decompensated liver disease, 100 mg daily; **CHILD** [unlicensed indication] 2–11 years, 3 mg/kg once daily (max. 100 mg daily); 12–17 years, adult dose

**Note** Patients receiving lamivudine for concomitant HIV infection should continue to receive lamivudine in a dose appropriate for HIV infection

▲ **With abacavir**

See under Abacavir

▲ **With zidovudine**

See under Zidovudine

▲ **With abacavir and zidovudine**

See under Abacavir

**STAVUDINE**

(d4T)

**Indications** HIV infection in combination with other antiretroviral drugs

**Cautions** see notes above; also history of peripheral neuropathy (see under Side-effects); history of pan-

creatitis or concomitant use with other drugs associated with pancreatitis; **interactions:** Appendix 1 (stavudine)

**Hepatic impairment** see notes above

**Renal impairment** use half normal dose every 12 hours if eGFR 25–50 mL/minute/1.73 m<sup>2</sup>; use half normal dose every 24 hours if eGFR less than 25 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** see p. 381

**Side-effects** see notes above; also peripheral neuropathy (switch to another antiretroviral if peripheral neuropathy develops), abnormal dreams, cognitive dysfunction, drowsiness, depression, pruritus; *less commonly* anxiety, gynaecomastia

#### Dose

- **ADULT** under 60 kg, 30 mg every 12 hours preferably at least 1 hour before food; 60 kg and over, 40 mg every 12 hours; **NEONATE** under 2 weeks, 500 micrograms/kg every 12 hours; **CHILD** over 2 weeks, body-weight under 30 kg, 1 mg/kg every 12 hours; body-weight 30 kg and over, adult dose

**Zerit**<sup>®</sup> (Bristol-Myers Squibb) (Pom)

**Capsules**, stavudine 20 mg (brown), net price 56-cap pack = £139.46; 30 mg (light orange/dark orange), 56-cap pack = £146.25; 40 mg (dark orange), 56-cap pack = £150.66 (all hosp. only)

**Oral solution**, cherry-flavoured, stavudine for reconstitution with water, 1 mg/mL, net price 200 mL = £22.94

## TENOFOVIR DISOPROXIL

**Indications** HIV infection in combination with other antiretroviral drugs; chronic hepatitis B infection with either compensated liver disease (with evidence of viral replication, and histologically documented active liver inflammation or fibrosis) or decompensated liver disease

**Cautions** see notes above; also test renal function and serum phosphate before treatment, then every 4 weeks (more frequently if at increased risk of renal impairment) for 1 year and then every 3 months, interrupt treatment if renal function deteriorates or serum phosphate decreases; concomitant or recent use of nephrotoxic drugs; on discontinuation, monitor patients with hepatitis B (risk of exacerbation of hepatitis); **interactions:** Appendix 1 (tenofovir)

**Hepatic impairment** see notes above and Cautions above

**Renal impairment** monitor renal function—interrupt treatment if further deterioration; 245 mg every 2 days if eGFR 30–50 mL/minute/1.73 m<sup>2</sup>; 245 mg every 3–4 days if eGFR 10–30 mL/minute/1.73 m<sup>2</sup>; avoid *Atripla*<sup>®</sup> if eGFR less than 50 mL/minute/1.73 m<sup>2</sup>; use normal dose of *Truvada*<sup>®</sup> every 2 days if eGFR 30–50 mL/minute/1.73 m<sup>2</sup>; avoid *Truvada*<sup>®</sup> if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** no information available—manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** see p. 381

**Side-effects** see notes above; hypophosphataemia; rarely renal failure, proximal renal tubulopathy, nephrogenic diabetes insipidus; also reported reduced bone density

#### Dose

- **ADULT** over 18 years, 245 mg once daily

**Viread**<sup>®</sup> (Gilead) (Pom)

**Tablets**, f/c, blue, tenofovir disoproxil (as fumarate) 245 mg, net price 30-tab pack = £255.00. Label: 21, counselling, administration

**Counselling** Patients with swallowing difficulties may disperse tablet in half a glass of water, orange juice, or grape juice (but bitter taste)

#### ▲ With emtricitabine

For **cautions**, **contra-indications**, and **side-effects** see under individual drugs

**Truvada**<sup>®</sup> (Gilead) (Pom)

**Tablets**, blue, f/c, tenofovir disoproxil (as fumarate) 245 mg, emtricitabine 200 mg, net price 30-tab pack = £418.50. Label: 21, counselling, administration

**Counselling** Patients with swallowing difficulties may disperse tablet in half a glass of water, orange juice, or grape juice (but bitter taste)

**Dose** HIV infection in combination with other antiretroviral drugs, **ADULT** over 18 years, 1 tablet once daily

#### ▲ With efavirenz and emtricitabine

For **cautions**, **contra-indications**, and **side-effects** see under individual drugs

**Atripla**<sup>®</sup> (Gilead) (Pom)

**Tablets**, pink, f/c, efavirenz 600 mg, emtricitabine 200 mg, tenofovir disoproxil (as fumarate) 245 mg, net price 30-tab pack = £626.90. Label: 23, 25

**Dose** HIV infection stabilised on antiretroviral therapy for more than 3 months, **ADULT** over 18 years, 1 tablet once daily

## ZIDOVUDINE

(Azidothymidine, AZT)

**Note** The abbreviation AZT which is sometimes used for zidovudine has also been used for another drug

**Indications** HIV infection in combination with other antiretroviral drugs; prevention of maternal-fetal HIV transmission (see notes above under Pregnancy and Breast-feeding)

**Cautions** see notes above; also haematological toxicity particularly with high dose and advanced disease—monitor full blood count after 4 weeks of treatment, then every 3 months; vitamin B<sub>12</sub> deficiency (increased risk of neutropenia); if anaemia or myelosuppression occur, reduce dose or interrupt treatment according to product literature, or consider other treatment; elderly; **interactions:** Appendix 1 (zidovudine)

**Contra-indications** abnormally low neutrophil counts or haemoglobin concentration (consult product literature); neonates with hyperbilirubinaemia requiring treatment other than phototherapy, or with raised transaminase (consult product literature); acute porphyria (section 9.8.2)

**Hepatic impairment** see notes above; also accumulation may occur

**Renal impairment** reduce oral dose to 300–400 mg daily in divided doses or intravenous dose to 1 mg/kg 3–4 times daily if eGFR is less than 10 mL/minute/1.73 m<sup>2</sup>; avoid *Combivir*<sup>®</sup> if eGFR less than 50 mL/minute/1.73 m<sup>2</sup> (consult product literature)

**Pregnancy** limited information available; manufacturer advises use only if clearly indicated; see also p. 381

**Breast-feeding** see p. 381

**Side-effects** see notes above; also anaemia (may require transfusion), taste disturbance, chest pain, influenza-like symptoms, paraesthesia, neuropathy, convulsions, dizziness, drowsiness, anxiety, depression, loss of mental acuity, myopathy, gynaecomastia, urinary frequency, sweating, pruritus, pigmentation of nails, skin and oral mucosa

#### Dose

- By mouth, **ADULT** and **CHILD** body-weight over 30 kg, 250–300 mg twice daily; **CHILD** body-weight 4–9 kg, 12 mg/kg twice daily; body-weight 9–30 kg, 9 mg/kg twice daily or body-weight 8–14 kg, 100 mg twice daily; body-weight 14–21 kg, 100 mg in the morning and 200 mg in the evening; body-weight 21–28 kg, 200 mg twice daily; body-weight 28–30 kg, 200–250 mg twice daily
- Prevention of maternal-fetal HIV transmission, seek specialist advice (combination therapy preferred)
- Patients temporarily unable to take zidovudine by mouth, by **intravenous infusion** over 1 hour, 0.8–1 mg/kg every 4 hours (approximating to 1.2–1.5 mg/kg every 4 hours by mouth) usually for not more than 2 weeks; **CHILD** 3 months–12 years, 60–80 mg/m<sup>2</sup> every 6 hours (approximating to 9–12 mg/kg twice daily by mouth)

**Zidovudine** (Non-proprietary) <sup>(POM)</sup>

**Capsules**, zidovudine 100 mg, net price 60-cap pack = £50.17; 250 mg, 60-cap pack = £125.44

**Retrovir**<sup>®</sup> (ViiV) <sup>(POM)</sup>

**Capsules**, zidovudine 100 mg (white/blue band), net price 100-cap pack = £104.54; 250 mg (blue/white/dark blue band), 40-cap pack = £104.54

**Oral solution**, sugar-free, strawberry-flavoured, zidovudine 50 mg/5 mL, net price 200-mL pack with 10-mL oral syringe = £20.91

**Injection**, zidovudine 10 mg/mL. For dilution and use as an intravenous infusion. Net price 20-mL vial = £10.50

#### ▲ With lamivudine

For **cautions**, **contra-indications**, and **side-effects** see under individual drugs

**Combivir**<sup>®</sup> (ViiV) <sup>(POM)</sup>

**Tablets**, f/c, scored, zidovudine 300 mg, lamivudine 150 mg, net price 60-tab pack = £300.12

**Dose** **ADULT** and **CHILD** body-weight over 30 kg, 1 tablet twice daily; **CHILD** body-weight 14–21 kg, half a tablet twice daily; body-weight 21–30 kg, half a tablet in the morning and one tablet in the evening

**Note** Tablets may be crushed and mixed with semi-solid food or liquid just before administration

#### ▲ With abacavir and lamivudine

See under Abacavir

## Protease inhibitors

**Cautions** Protease inhibitors are associated with hyperglycaemia and should be used with caution in diabetes (see Lipodystrophy Syndrome, p. 382). Caution is also needed in patients with haemophilia who may be at increased risk of bleeding.

**Contra-indications** Protease inhibitors should not be given to patients with acute porphyria (but see section 9.8.2).

**Hepatic impairment** Protease inhibitors should be used with caution in patients with chronic hepatitis B or C (increased risk of hepatic side-effects)

**Pregnancy** See p. 381

**Breast-feeding** See p. 381

**Side-effects** Side-effects of the protease inhibitors include gastro-intestinal disturbances (including diarrhoea, nausea, vomiting, abdominal pain, flatulence), anorexia, hepatic dysfunction, pancreatitis; blood disorders including anaemia, neutropenia, and thrombocytopenia; sleep disturbances, fatigue, headache, dizziness, paraesthesia, myalgia, myositis, rhabdomyolysis; taste disturbances; rash, pruritus, Stevens-Johnson syndrome, hypersensitivity reactions including anaphylaxis; see also notes above for lipodystrophy and metabolic effects (Lipodystrophy Syndrome), and Osteonecrosis.

## ATAZANAVIR

**Indications** HIV infection in combination with other antiretroviral drugs

**Cautions** see notes above; also concomitant use with drugs that prolong PR interval; cardiac conduction disorders; predisposition to QT interval prolongation (including electrolyte disturbances, concomitant use of drugs that prolong QT interval); **interactions**: Appendix 1 (atazanavir)

**Contra-indications** see notes above

**Hepatic impairment** see notes above; also manufacturer advises caution in mild impairment; avoid in moderate to severe impairment

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk; theoretical risk of hyperbilirubinaemia in neonate if used at term

**Breast-feeding** see p. 381

**Side-effects** see notes above; also AV block (in children); *less commonly* mouth ulcers, dry mouth, hypertension, syncope, chest pain, dyspnoea, peripheral neuropathy, abnormal dreams, amnesia, disorientation, depression, anxiety, weight changes, increased appetite, gynaecomastia, nephrolithiasis, urinary frequency, haematuria, proteinuria, arthralgia, and alopecia; *rarely* hepatosplenomegaly, oedema, palpitation, and abnormal gait; also reported, cholelithiasis, cholecystitis, and torsade de pointes

#### Dose

- With low-dose ritonavir, 300 mg once daily; **CHILD** over 6 years, body-weight 15–20 kg, 150 mg once daily; body-weight 20–40 kg, 200 mg once daily; body-weight over 40 kg, adult dose

**Reyataz**<sup>®</sup> (Bristol-Myers Squibb) ▼ <sup>(POM)</sup>

**Capsules**, atazanavir (as sulphate) 150 mg (dark blue/light blue), net price 60-cap pack = £303.38; 200 mg (dark blue), 60-cap pack = £303.38; 300 mg (red/blue), 30-cap pack = £303.38. Label: 5, 21

## DARUNAVIR

**Indications** HIV infection in combination with other antiretroviral drugs

**Cautions** see notes above; also sulfonamide sensitivity; monitor liver function before and during treatment; **interactions**: Appendix 1 (darunavir)

**Rash** Mild to moderate rash occurs commonly, usually within the first 4 weeks of therapy and resolves without

stopping treatment. Severe skin rash (including Stevens-Johnson syndrome and toxic epidermal necrolysis) occurs less frequently and may be accompanied by fever, malaise, arthralgia, myalgia, oral lesions, conjunctivitis, hepatitis, or eosinophilia; treatment should be stopped if severe rash develops

**Contra-indications** see notes above

**Hepatic impairment** see notes above; also manufacturer advises caution in mild to moderate impairment; avoid in severe impairment—no information available

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk—no information available

**Breast-feeding** see p. 381

**Side-effects** see notes above; also haematemesis, myocardial infarction, angina, QT interval prolongation, syncope, bradycardia, tachycardia, palpitation, hypertension, flushing, peripheral oedema, dyspnoea, cough, peripheral neuropathy, anxiety, confusion, memory impairment, depression, abnormal dreams, convulsions, increased appetite, weight changes, pyrexia, hypothyroidism, osteoporosis, gynaecomastia, erectile dysfunction, reduced libido, dysuria, polyuria, nephrolithiasis, renal failure, arthralgia, visual disturbances, dry eyes, conjunctival hyperaemia, rhinorrhoea, throat irritation, dry mouth, stomatitis, nail discoloration, acne, seborrhoeic dermatitis, eczema, increased sweating, alopecia

#### Dose

- With low-dose ritonavir, **ADULT** and **CHILD** over 6 years, body-weight over 40 kg, previously treated with antiretroviral therapy, 600 mg twice daily; **CHILD** over 6 years, previously treated with antiretroviral therapy, body-weight 20–30 kg, 375 mg twice daily; body-weight 30–40 kg, 450 mg twice daily
- With low-dose ritonavir, **ADULT** over 18 years not previously treated with antiretroviral therapy, 800 mg once daily

**Missed dose** If a dose is more than 6 hours late on the twice daily regimen (or more than 12 hours late on the once daily regimen), the missed dose should not be taken and the next dose should be taken at the normal time

**Prezista®** (Janssen-Cilag) ▼ (P<sub>M</sub>)

**Tablets**, f/c, darunavir (as ethanolate) 75 mg (white), net price 480-tab pack = £446.70; 150 mg (white), 240-tab pack = £446.70; 400 mg (light orange), 60-tab pack = £297.80; 600 mg (orange), 60-tab pack = £446.70. Label: 21

## FOSAMPRENAVIR

Note Fosamprenavir is a pro-drug of amprenavir

**Indications** HIV infection in combination with other antiretroviral drugs

**Cautions** see notes above; **interactions:** Appendix 1 (fosamprenavir)

**Rash** Rash may occur, usually in the second week of therapy; discontinue permanently if severe rash with systemic or allergic symptoms or mucosal involvement; if rash mild or moderate, may continue without interruption—usually resolves within 2 weeks and may respond to antihistamines

**Contra-indications** see notes above

**Hepatic impairment** see notes above; also manufacturer advises caution in mild impairment; reduce dose to 450 mg twice daily in moderate impairment; reduce dose to 300 mg twice daily in severe impairment

**Pregnancy** toxicity in *animal* studies; manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** see p. 381

**Side-effects** see notes above; also reported, rash including rarely Stevens-Johnson syndrome (see also Rash above)

#### Dose

- With low-dose ritonavir, **ADULT** and **CHILD** over 6 years, body-weight over 39 kg, 700 mg twice daily; **CHILD** over 6 years, body-weight 25–39 kg, 18 mg/kg twice daily
- Note** 700 mg fosamprenavir is equivalent to approx. 600 mg amprenavir

**Telzir®** (ViiV) (P<sub>M</sub>)

**Tablets**, f/c, pink, fosamprenavir (as calcium) 700 mg, net price 60-tab pack = £258.97

**Oral suspension**, fosamprenavir (as calcium) 50 mg/mL, net price 225-mL pack (grape-bubblegum-and-peppermint-flavoured) (with 10-mL oral syringe) = £69.06. Counselling, administration

**Counselling** In adults, oral suspension should be taken on an empty stomach; in children under 18 years, oral suspension should be taken with food

## INDINAVIR

**Indications** HIV infection in combination with nucleoside reverse transcriptase inhibitors

**Cautions** see notes above; also ensure adequate hydration (risk of nephrolithiasis especially in children); patients at risk of nephrolithiasis (monitor for nephrolithiasis); patients at high risk of cardiovascular disease (especially if 10-year cardiovascular risk greater than 20%); **interactions:** Appendix 1 (indinavir)

**Contra-indications** see notes above

**Hepatic impairment** see notes above; also increased risk of nephrolithiasis; reduce dose in mild to moderate impairment; not studied in severe impairment

**Renal impairment** use with caution; monitor for nephrolithiasis

**Pregnancy** toxicity in *animal* studies; manufacturer advises use only if potential benefit outweighs risk; theoretical risk of hyperbilirubinaemia and renal stones in neonate if used in term

**Breast-feeding** see p. 381

**Side-effects** see notes above; also reported, dry mouth, hypoaesthesia, dry skin, hyperpigmentation, alopecia, paronychia, interstitial nephritis (with medullary calcification and cortical atrophy in asymptomatic severe leucocyturia), nephrolithiasis (may require interruption or discontinuation; more frequent in children), dysuria, haematuria, crystalluria, proteinuria, pyuria (in children), pyelonephritis; haemolytic anaemia

#### Dose

- **ADULT** over 18 years, seek specialist advice

**Crixivan®** (MSD) (P<sub>M</sub>)

**Capsules**, indinavir (as sulphate), 200 mg, net price 360-cap pack = £226.28; 400 mg, 180-cap pack = £226.28. Label: 27, counselling, administration

**Counselling** Administer 1 hour before or 2 hours after a meal; may be administered with a low-fat light meal; in combination with didanosine tablets, allow 1 hour between each drug (antacids in didanosine tablets reduce absorption of indinavir); in combination with low-dose ritonavir, give with food

**Note** Dispense in original container (contains desiccant)

## LOPINAVIR WITH RITONAVIR

**Indications** HIV infection in combination with other antiretroviral drugs

**Cautions** see notes above; concomitant use with drugs that prolong QT or PR interval; cardiac conduction disorders, structural heart disease; patients at high risk of cardiovascular disease (especially if 10-year cardiovascular risk greater than 20%); pancreatitis (see below); **interactions:** Appendix 1 (lopinavir, ritonavir)

**Pancreatitis** Signs and symptoms suggestive of pancreatitis (including raised serum lipase) should be evaluated—discontinue if pancreatitis diagnosed

**Contra-indications** see notes above

**Hepatic impairment** see notes above; also avoid oral solution due to propylene glycol content; manufacturer advises avoid capsules and tablets in severe impairment

**Renal impairment** avoid oral solution due to propylene glycol content; use tablets with caution in severe impairment

**Pregnancy** avoid oral solution due to high propylene glycol content; manufacturer advises use capsules and tablets only if potential benefit outweighs risk (toxicity in *animal* studies)

**Breast-feeding** see p. 381

**Side-effects** see notes above; also electrolyte disturbances in children; *less commonly* haemorrhagic colitis, weight changes, chest pain, oedema, anxiety, depression, abnormal dreams, peripheral neuropathy, pyrexia, Cushing's syndrome, sexual dysfunction, dehydration, arthralgia, tinnitus, dry mouth, acne, alopecia, and sweating; *rarely* cholecystitis, gastric ulcer, rectal bleeding, myocardial infarction, hypertension, palpitation, AV block, deep vein thrombosis, thrombophlebitis, vasculitis, dyspnoea, cough, appetite changes, agitation, confusion, amnesia, ataxia, hypertonia, extrapyramidal effects, influenza-like symptoms, hypothyroidism, amenorrhoea, menorrhagia, gynaecomastia, nephrolithiasis, nephritis, albuminuria, haematuria, hypercalcaemia, hypophosphataemia, lactic acidosis, hyperuricaemia, visual disturbances, otitis media, dysphagia, mouth ulceration, stomatitis, periodontitis, sialadenitis, eczema, skin discoloration, and nail disorders

## Dose

- See preparations below

**Kaletra**<sup>®</sup> (Abbott) (POM)

**Tablets**, pale yellow, f/c, lopinavir 100 mg, ritonavir 25 mg, net price 60-tab pack = £76.85. Label: 25

**Dose** **CHILD** over 2 years with body-weight under 40 kg and body surface area 0.5–0.9 m<sup>2</sup>, 2 tablets twice daily; body surface area 0.9–1.4 m<sup>2</sup>, 3 tablets twice daily

**Tablets**, yellow, f/c, lopinavir 200 mg, ritonavir 50 mg, net price 120-tab pack = £307.39. Label: 25

**Dose** **ADULT** and **CHILD** with body surface area greater than 1.4 m<sup>2</sup> or body-weight 40 kg and over, 2 tablets twice daily

**Note** Alternatively, in adults with a HIV strain that has less than 3 mutations to protease inhibitors, 4 tablets may be taken once daily

**Oral solution**, lopinavir 400 mg, ritonavir 100 mg/5 mL, net price 5×60-mL packs = £307.39. Label: 21  
**Excipients** include propylene glycol 153 mg/mL (see Excipients, p. 2), alcohol 42%

**Dose** 5 mL twice daily with food; **CHILD** 2–12 years 2.9 mL/m<sup>2</sup> twice daily with food, max. 5 mL twice daily

## NELFINAVIR

**Indications** HIV infection in combination with other antiretroviral drugs

**Cautions** see notes above; **interactions:** Appendix 1 (nelfinavir)

**Contra-indications** see notes above

**Hepatic impairment** see notes above; also manufacturer advises caution

**Renal impairment** manufacturer advises caution

**Pregnancy** no information available—manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** see p. 381

**Side-effects** see notes above; also reported, fever

- 1.25 g twice daily or 750 mg 3 times daily; **CHILD** 3–13 years, initially 50–55 mg/kg twice daily (max. 1.25 g twice daily) or 25–30 mg/kg 3 times daily (max. 750 mg 3 times daily)

**Viracept**<sup>®</sup> (Roche) (POM)

**Tablets**, blue, f/c, nelfinavir (as mesilate) 250 mg, net price 300-tab pack = £257.32. Label: 21

## RITONAVIR

**Indications** HIV infection in combination with other antiretroviral drugs; low doses used to increase effect of some protease inhibitors

**Cautions** see notes above; concomitant use with drugs that prolong PR interval; cardiac conduction disorders, structural heart disease; pancreatitis (see below); **interactions:** Appendix 1 (ritonavir)

**Pancreatitis** Signs and symptoms suggestive of pancreatitis (including raised serum lipase) should be evaluated—discontinue if pancreatitis diagnosed

**Contra-indications** see notes above

**Hepatic impairment** see notes above; also avoid in decompensated liver disease; in severe impairment without decompensation, use 'booster' doses with caution (avoid treatment doses)

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk—no information available

**Breast-feeding** see p. 381

**Side-effects** see notes and Cautions above; also diarrhoea (may impair absorption—close monitoring required), vasodilatation, cough, throat irritation, anxiety, perioral and peripheral paraesthesia, hyperaesthesia, fever, decreased blood thyroxine concentration, electrolyte disturbances, raised uric acid, dry mouth, mouth ulcers, and sweating; *less commonly* increased prothrombin time and dehydration; syncope, postural hypotension, seizures, menorrhagia, and renal failure also reported

## Dose

- Initially 300 mg every 12 hours for 3 days, increased in steps of 100 mg every 12 hours over not longer than 14 days to 600 mg every 12 hours; **CHILD** over 2 years initially 250 mg/m<sup>2</sup> every 12 hours, increased by 50 mg/m<sup>2</sup> at intervals of 2–3 days to 350 mg/m<sup>2</sup> every 12 hours (max. 600 mg every 12 hours)

- Low-dose booster to increase effect of other protease inhibitors, 100–200 mg once or twice daily

**Norvir**<sup>®</sup> (Abbott) (POM)

**Tablets**, f/c, ritonavir 100 mg, net price 30-tab pack = £33.70. Label: 21, 25

**Oral solution**, sugar-free, ritonavir 400 mg/5 mL, net price 5 × 90-mL packs (with measuring cup) = £403.20. Label: 21, counselling, administration

**Counselling** Oral solution contains 43% alcohol; bitter taste can be masked by mixing with chocolate milk; do not mix with water, measuring cup must be dry

## ▲ With lopinavir

See under Lopinavir with Ritonavir

## SAQUINAVIR

**Indications** HIV infection in combination with other antiretroviral drugs

**Cautions** see notes above; monitor ECG before starting treatment and then on day 3 or 4 of treatment—discontinue if QT interval over 480 milliseconds, if QT interval more than 20 milliseconds above baseline, or if prolongation of PR interval; concomitant use of garlic (avoid garlic capsules—reduces plasma-saquinavir concentration); **interactions:** Appendix 1 (saquinavir)

**Counselling** Patients should be told how to recognise signs of arrhythmia and advised to seek medical attention if symptoms such as palpitation or syncope develop

**Contra-indications** see notes above; predisposition to cardiac arrhythmias (including congenital QT prolongation, bradycardia, history of symptomatic arrhythmias, heart failure with reduced left ventricular ejection fraction, electrolyte disturbances, concomitant use of drugs that prolong QT or PR interval); concomitant use of drugs that increase plasma-saquinavir concentration (avoid unless no alternative treatment available)

**Hepatic impairment** see notes above; also manufacturer advises caution in moderate impairment; avoid in decompensated liver disease

**Renal impairment** use with caution if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** see p. 381

**Side-effects** see notes above; also dyspnoea, increased appetite, peripheral neuropathy, convulsions, changes in libido, renal impairment, dry mouth, and alopecia

### Dose

- With low-dose ritonavir, **ADULT** and **ADOLESCENT** over 16 years previously treated with antiretroviral therapy, 1 g every 12 hours
- With low-dose ritonavir, **ADULT** and **ADOLESCENT** over 16 years not previously treated with antiretroviral therapy, 500 mg every 12 hours for 7 days then 1 g every 12 hours

**Invirase**<sup>®</sup> (Roche) (POM)

**Capsules**, brown/green, saquinavir (as mesilate) 200 mg, net price 270-cap pack = £226.14. Label: 21, counselling, arrhythmias

**Tablets**, orange, f/c, saquinavir (as mesilate) 500 mg, net price 120-tab pack = £251.26. Label: 21, counselling, arrhythmias

## TIPRANA VIR

**Indications** HIV infection resistant to other protease inhibitors, in combination with other antiretroviral drugs in patients previously treated with antiretrovirals

**Cautions** see notes above; also patients at risk of increased bleeding from trauma, surgery or other pathological conditions; concomitant use of drugs that increase risk of bleeding; **interactions:** Appendix 1 (tipranavir)

**Hepatotoxicity** Potentially life-threatening hepatotoxicity reported; monitor liver function before treatment then every 2 weeks for 1 month, then every 3 months. Discontinue if signs or symptoms of hepatitis develop or if liver-function abnormality develops (consult product literature)

**Contra-indications** see notes above

**Hepatic impairment** see notes above; also manufacturer advises caution in mild impairment; avoid in moderate or severe impairment—no information available

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk—toxicity in *animal* studies

**Breast-feeding** see p. 381

**Side-effects** see notes above; also dyspnoea, anorexia, peripheral neuropathy, influenza-like symptoms, renal impairment and photosensitivity; *rarely* dehydration

### Dose

- See preparations

**Aptivus**<sup>®</sup> (Boehringer Ingelheim) ▼ (POM)

**Capsules**, pink, tipranavir 250 mg, net price 120-cap pack = £441.00. Label: 5, 21

**Excipients** include ethanol 100 mg per capsule

**Dose** with low-dose ritonavir, **ADULT** and **CHILD** over 12 years, 500 mg twice daily

**Oral Solution**, toffee-and mint-flavoured, tipranavir 100 mg/mL, net price 95-mL pack = £129.65.

Label: 5, 21, counselling, crystallisation

**Excipients** include vitamin E 78 mg/mL

**Dose** with low-dose ritonavir, **CHILD** 2–12 years, 375 mg/m<sup>2</sup> twice daily

**Note** The bioavailability of *Aptivus*<sup>®</sup> oral solution is higher than that of the capsules; the oral solution is **not** interchangeable with the capsules on a milligram-for-milligram basis

**Counselling** Patients should be told to observe the oral solution for crystallisation; the bottle should be replaced if more than a thin layer of crystals form (doses should continue to be taken at the normal time until the bottle is replaced)

## Non-nucleoside reverse transcriptase inhibitors

### EFAVIRENZ

**Indications** HIV infection in combination with other antiretroviral drugs

**Cautions** elderly; history of mental illness or seizures; monitor liver function if receiving other hepatotoxic drugs; **interactions:** Appendix 1 (efavirenz)

**Rash** Rash, usually in the first 2 weeks, is the most common side-effect; discontinue if severe rash with blistering, desquamation, mucosal involvement or fever; if rash mild or moderate, may continue without interruption—usually resolves within 1 month

**Psychiatric disorders** Patients or their carers should be advised to seek immediate medical attention if symptoms such as severe depression, psychosis or suicidal ideation occur

**Contra-indications** acute porphyria (but see section 9.8.2)

**Hepatic impairment** in mild liver disease, monitor for dose related side-effects (e.g. CNS effects) and monitor liver function; avoid in moderate to severe impairment; greater risk of hepatic side-effects in chronic hepatitis B or C

**Renal impairment** manufacturer advises caution in severe renal failure—no information available

**Pregnancy** manufacturer advises avoid (effective contraception required during treatment and for 12 weeks after treatment); use efavirenz only if no alternative available

**Breast-feeding** see p. 381

**Side-effects** rash including Stevens-Johnson syndrome (see Rash above); abdominal pain, diarrhoea, nausea, vomiting; anxiety, depression, sleep disturbances, abnormal dreams, dizziness, headache, fatigue, impaired concentration (administration at bedtime especially in first 2–4 weeks reduces CNS effects); pruritus; *less commonly* pancreatitis, hepatitis, flushing, psychosis, mania, suicidal ideation, amnesia, ataxia, tremor, convulsions, gynaecomastia, blurred vision, tinnitus; *rarely* hepatic failure, photosensitivity; also reported raised serum cholesterol (see Lipodystrophy Syndrome, p. 382); see also Osteonecrosis, p. 382

#### Dose

- See preparations below

#### Sustiva® (Bristol-Myers Squibb) (Pom)

**Capsules**, efavirenz 50 mg (yellow/white), net price 30-cap pack = £16.73; 100 mg (white), 30-cap pack = £33.41; 200 mg (yellow), 90-cap pack = £200.27. Label: 23

**Dose** **ADULT** and **CHILD** over 3 years, body-weight 13–15 kg, 200 mg once daily; body-weight 15–20 kg, 250 mg once daily; body-weight 20–25 kg, 300 mg once daily; body-weight 25–32.5 kg, 350 mg once daily; body-weight 32.5–40 kg, 400 mg once daily; body-weight 40 kg and over, 600 mg once daily

**Tablets, f/c, yellow**, efavirenz 600 mg, net price 30-tab pack = £200.27. Label: 23

**Dose** **ADULT** and **CHILD**, body-weight over 40 kg, 600 mg once daily

**Oral solution**, sugar-free, strawberry and mint flavour, efavirenz 30 mg/mL, net price 180-mL pack = £53.84

**Dose** **ADULT** and **CHILD** over 5 years, body-weight 13–15 kg, 270 mg once daily; body-weight 15–20 kg, 300 mg once daily; body-weight 20–25 kg, 360 mg once daily; body-weight 25–32.5 kg, 450 mg once daily; body-weight 32.5–40 kg, 510 mg once daily; body-weight 40 kg and over, 720 mg once daily; **CHILD** 3–5 years, body-weight 13–15 kg, 360 mg once daily; body-weight 15–20 kg, 390 mg once daily; body-weight 20–25 kg, 450 mg once daily; body-weight 25–32.5 kg, 510 mg once daily

**Note** The bioavailability of *Sustiva*® oral solution is lower than that of the capsules and tablets; the oral solution is **not** interchangeable with either capsules or tablets on a milligram-for-milligram basis

#### ▲ With emtricitabine and tenofovir

See under Tenofovir

## ETRAVIRINE

**Indications** in combination with other antiretroviral drugs (including a boosted protease inhibitor) for HIV infection resistant to other non-nucleoside reverse transcriptase inhibitors and protease inhibitors

**Cautions** **interactions:** Appendix 1 (etravirine)

**Hypersensitivity reactions** Rash, usually in the second week, is the most common side-effect and appears more frequently in women. Life-threatening hypersensitivity reactions reported usually during week 3–6 of treatment and characterised by rash, eosinophilia, and systemic symptoms (including fever, general malaise, myalgia, arthralgia, blistering, oral lesions, conjunctivitis, and hepatitis). Discontinue permanently if hypersensitivity reaction or severe rash develop. If rash mild or moderate (without signs of hypersensitivity reaction), may continue without interruption—usually resolves within 2 weeks

**Counselling** Patients should be told how to recognise hypersensitivity reactions and advised to seek immediate medical attention if hypersensitivity reaction or severe rash develop

**Contra-indications** acute porphyria (but see section 9.8.2)

**Hepatic impairment** manufacturer advises caution in moderate impairment; avoid in severe impairment—no information available; greater risk of hepatic side-effects in chronic hepatitis B or C

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** see p. 381

**Side-effects** rash (including Stevens-Johnson syndrome rarely and toxic epidermal necrolysis very rarely; see also Hypersensitivity Reactions above); gastro-oesophageal reflux, nausea, abdominal pain, flatulence, gastritis; myocardial infarction, hypertension; peripheral neuropathy; diabetes, hyperlipidaemia (see also Lipodystrophy Syndrome, p. 382); renal failure; anaemia; *less commonly* pancreatitis, haematemesis, hepatitis, angina, bronchospasm, drowsiness, malaise, gynaecomastia, blurred vision, dry mouth, and sweating; also reported, haemorrhagic stroke and hypersensitivity reactions; see also Osteonecrosis, p. 382

#### Dose

- **ADULT** over 18 years, 200 mg twice daily after food
- Missed dose** If a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time

#### Intelve® (Janssen-Cilag) ▼ (Pom)

**Tablets**, etravirine 100 mg, net price 120-tab pack = £301.27. Label: 21, counselling, rash and hypersensitivity reactions

**Note** Dispense in original container (contains desiccant). Patients with swallowing difficulties may disperse tablets in a glass of water just before administration

## NEVIRAPINE

**Indications** HIV infection in combination with other antiretroviral drugs

**Cautions** chronic hepatitis B or C, high CD4 cell count, and women (all at greater risk of hepatic side-effects—if plasma HIV-1 RNA detectable, manufacturer advises avoid in women with CD4 cell count greater than 250 cells/mm<sup>3</sup> or in men with CD4 cell count greater than 400 cells/mm<sup>3</sup> unless potential benefit outweighs risk); **interactions:** Appendix 1 (nevirapine)

**Hepatic disease** Potentially life-threatening hepatotoxicity including fatal fulminant hepatitis reported usually in first 6 weeks; close monitoring required during first 18 weeks; monitor liver function before treatment then every 2 weeks for 2 months then after 1 month and then regularly; discontinue permanently if abnormalities in liver function tests accompanied by hypersensitivity reaction (rash, fever, arthralgia, myalgia, lymphadenopathy, hepatitis, renal impairment, eosinophilia, granulocytopenia); suspend if severe abnormalities in liver function tests but no hypersensitivity reaction—discontinue permanently if significant liver function abnormalities recur; monitor patient closely if mild to moderate abnormalities in liver function tests with no hypersensitivity reaction

**Rash** Rash, usually in first 6 weeks, is most common side-effect; incidence reduced if introduced at low dose and dose increased after 14 days; monitor closely for skin reactions during first 18 weeks; discontinue permanently if severe rash or if rash accompanied by blistering, oral lesions, conjunctivitis, facial oedema, general malaise or hypersensitivity reactions; if rash mild or moderate may continue without interruption but dose should not be increased until rash resolves

**Counselling** Patients should be told how to recognise hypersensitivity reactions and advised to discontinue treatment and seek immediate medical attention if severe skin reaction, hypersensitivity reactions, or symptoms of hepatitis develop

**Contra-indications** acute porphyria (but see section 9.8.2); post-exposure prophylaxis

**Hepatic impairment** manufacturer advises caution in moderate impairment; avoid in severe impairment; see also Hepatic Disease, above

**Pregnancy** although manufacturer advises caution, may be appropriate to use if clearly indicated; see also p. 381

**Breast-feeding** see p. 381

**Side-effects** rash including Stevens-Johnson syndrome and rarely, toxic epidermal necrolysis (see also Cautions above); nausea, hepatitis (see also Hepatic Disease above), headache; *less commonly* vomiting, abdominal pain, fatigue, fever, and myalgia; *rarely* diarrhoea, angioedema, anaphylaxis, hypersensitivity reactions (may involve hepatic reactions and rash, see Hepatic Disease above), arthralgia, anaemia, and granulocytopenia (more frequent in children); see also Osteonecrosis, p. 382

#### Dose

- **ADULT** and **CHILD** over 16 years, 200 mg once daily for first 14 days then (if no rash present) 200 mg twice daily; **NEONATE** and **CHILD** under 8 years, 150 mg/m<sup>2</sup> (max. 200 mg) once daily for first 14 days, then (if no rash present) 150 mg/m<sup>2</sup> (max. 200 mg) twice daily *or* 4 mg/kg (max. 200 mg) once daily for first 14 days then (if no rash present) 7 mg/kg (max. 200 mg) twice daily; **CHILD** 8–16 years, 150 mg/m<sup>2</sup> (max. 200 mg) once daily for first 14 days then (if no rash present) 150 mg/m<sup>2</sup> (max. 200 mg) twice daily *or* 4 mg/kg (max. 200 mg) once daily for first 14 days then (if no rash present) 4 mg/kg (max. 200 mg) twice daily
- Note** Duration of once daily dose regimen should not exceed 28 days; if rash not resolved within 28 days, alternative treatment should be sought. If treatment interrupted for more than 7 days, restart using the lower dose for the first 14 days as for new treatment

**Viramune**® (Boehringer Ingelheim) (POM)

**Tablets**, nevirapine 200 mg, net price 14-tab pack = £39.67, 60-tab pack = £170.00. Counselling, hypersensitivity reactions

**Suspension**, nevirapine 50 mg/5 mL, net price 240-mL pack = £50.40. Counselling, hypersensitivity reactions

## Other antiretrovirals

### ENFUVRTIDE

**Indications** HIV infection in combination with other antiretroviral drugs for resistant infection or for patients intolerant to other antiretroviral regimens

#### Cautions

**Hypersensitivity reactions** Hypersensitivity reactions including rash, fever, nausea, vomiting, chills, rigors, low blood pressure, respiratory distress, glomerulonephritis, and raised liver enzymes reported; discontinue immediately if any signs or symptoms of systemic hypersensitivity develop and do not rechallenge

**Counselling** Patients should be told how to recognise signs of hypersensitivity, and advised to discontinue treatment and seek immediate medical attention if symptoms develop

**Hepatic impairment** manufacturer advises caution—no information available; chronic hepatitis B or C (possibly greater risk of hepatic side-effects)

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** see p. 381

**Side-effects** injection-site reactions; pancreatitis, gastro-oesophageal reflux disease, anorexia, weight loss; hypertriglyceridaemia; peripheral neuropathy, asthenia, tremor, anxiety, nightmares, irritability, impaired concentration, vertigo; pneumonia, sinusitis, influenza-like illness; diabetes mellitus; haematuria; renal calculi, lymphadenopathy; myalgia; conjunctivitis; dry skin, acne, erythema, skin papilloma; *less commonly* hypersensitivity reactions (see Cautions); see also Osteonecrosis, p. 382

#### Dose

- **By subcutaneous injection, ADULT** and **ADOLESCENT** over 16 years, 90 mg twice daily; **CHILD** 6–15 years, 2 mg/kg twice daily (max. 90 mg twice daily)

**Fuzeon**® (Roche) (POM)

**Injection**, powder for reconstitution, enfuvirtide 108 mg (= enfuvirtide 90 mg/mL when reconstituted with 1.1 mL Water for Injections), net price 108-mg vial = £18.03 (with solvent, syringe, and alcohol swabs). Counselling, hypersensitivity reactions

### MARAVIROC

**Indications** CCR5-tropic HIV infection in combination with other antiretroviral drugs in patients previously treated with antiretrovirals

**Cautions** cardiovascular disease; chronic hepatitis B or C; **interactions:** Appendix 1 (maraviroc)

**Hepatic impairment** manufacturer advises caution

**Renal impairment** if eGFR less than 80 mL/minute/1.73 m<sup>2</sup>, consult product literature

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk—toxicity in *animal* studies

**Breast-feeding** see p. 381

**Side-effects** nausea, vomiting, abdominal pain, dyspepsia, constipation, diarrhoea; cough; dizziness, paraesthesia, asthenia, sleep disturbances, headache, weight loss; muscle spasms, back pain; taste disturbances; rash, pruritus; *less commonly* pancreatitis, hepatic cirrhosis, rectal bleeding, myocardial infarction, myocardial ischaemia, bronchospasm, seizures, hallucinations, loss of consciousness, polyneuropathy, pancytopenia, neutropenia, lymphadenopathy, renal failure, polyuria, and myositis; see also Osteonecrosis, p. 382

#### Dose

- **ADULT** over 18 years, 300 mg twice daily

**Celsentri**® (ViiV) (POM)

**Tablets**, blue, f/c, maraviroc, 150 mg, net-price 60-tab pack = £519.14; 300 mg, 60-tab pack = £519.14

### RALTEGRAVIR

**Indications** HIV infection in combination with other antiretroviral drugs

**Cautions** risk factors for myopathy or rhabdomyolysis; chronic hepatitis B or C (greater risk of hepatic side-effects); **interactions:** Appendix 1 (raltegravir)

**Hepatic impairment** manufacturer advises caution in severe impairment—no information available

**Pregnancy** manufacturer advises avoid—toxicity in *animal* studies

**Breast-feeding** see p. 381

**Side-effects** diarrhoea, nausea, vomiting, abdominal pain, flatulence, hypertriglyceridaemia, dizziness,

headache, insomnia, abnormal dreams, asthenia, rash (Stevens-Johnson syndrome reported); *less commonly* gastritis, hepatitis, pancreatitis, dry mouth, gastro-oesophageal reflux, taste disturbances, pain on swallowing, peptic ulcer, constipation, rectal bleeding, lipodystrophy (see Lipodystrophy Syndrome, p. 382), palpitation, ventricular extrasystoles, bradycardia, hypertension, flushing, chest pain, oedema, dysphonia, epistaxis, nasal congestion, drowsiness, anxiety, appetite changes, confusion, impaired memory and attention, depression, pyrexia, chills, carpal tunnel syndrome, tremor, peripheral neuropathy, erectile dysfunction, gynaecomastia, menopausal symptoms, osteopenia, renal failure, nocturia, polydipsia, anaemia, thrombocytopenia, neutropenia, arthralgia, myalgia, rhabdomyolysis, visual disturbances, tinnitus, gingivitis, glossitis, acne, pruritus, hyperhidrosis, dry skin, skin papilloma, and alopecia; *also reported* suicidal ideation; see also Osteonecrosis, p. 382

#### Dose

- **ADULT** and **CHILD** over 16 years, 400 mg twice daily

**Isentress®** (MSD) ▼ (P<sub>HM</sub>)

Tablets, pink, f/c, raltegravir (as potassium salt)  
400 mg, net price 60-tab pack = £616.22. Label: 25

## 5.3.2 Herpesvirus infections

### 5.3.2.1 Herpes simplex and varicella-zoster infection

The two most important herpesvirus pathogens are herpes simplex virus (herpesvirus hominis) and varicella-zoster virus.

**Herpes simplex infections** Herpes infection of the mouth and lips and in the eye is generally associated with herpes simplex virus serotype 1 (HSV-1); other areas of the skin may also be infected, especially in immunodeficiency. Genital infection is most often associated with HSV-2 and also HSV-1. Treatment of herpes simplex infection should start as early as possible and usually within 5 days of the appearance of the infection.

In individuals with good immune function, mild infection of the eye (ocular herpes, section 11.3.3) and of the lips (herpes labialis or cold sores, section 13.10.3) is treated with a topical antiviral drug. Primary herpetic gingivostomatitis is managed by changes to diet and with analgesics (section 12.3.2). Severe infection, neonatal herpes infection or infection in immunocompromised individuals requires treatment with a systemic antiviral drug. Primary or recurrent genital herpes simplex infection is treated with an antiviral drug given by mouth. Persistence of a lesion or recurrence in an immunocompromised patient may signal the development of resistance.

Specialist advice should be sought for systemic treatment of herpes simplex infection in pregnancy.

**Varicella-zoster infections** Regardless of immune function and the use of any immunoglobulins, neonates with *chickenpox* should be treated with a parenteral antiviral to reduce the risk of severe disease. Chickenpox in otherwise healthy children between 1 month and

12 years is usually mild and antiviral treatment is not usually required.

Chickenpox is more severe in adolescents and adults than in children; antiviral treatment started within 24 hours of the onset of rash may reduce the duration and severity of symptoms in otherwise healthy adults and adolescents. Antiviral treatment is generally recommended in immunocompromised patients and those at special risk (e.g. because of severe cardiovascular or respiratory disease or chronic skin disorder); in such cases, an antiviral is given for 10 days with at least 7 days of parenteral treatment.

Pregnant women who develop severe chickenpox may be at risk of complications, especially varicella pneumonia. Specialist advice should be sought for the treatment of chickenpox during pregnancy.

Those who have been exposed to chickenpox and are at special risk of complications may require prophylaxis with varicella-zoster immunoglobulin (see under Disease Specific Immunoglobulins, section 14.5.2).

In *herpes zoster* (shingles) systemic antiviral treatment can reduce the severity and duration of pain, reduce complications, and reduce viral shedding. Treatment with the antiviral should be started within 72 hours of the onset of rash and is usually continued for 7–10 days. Immunocompromised patients at high risk of disseminated or severe infection should be treated with a parenteral antiviral drug.

Chronic pain which persists after the rash has healed (postherpetic neuralgia) requires specific management (section 4.7.3).

**Choice** **Aciclovir** is active against herpesviruses but does not eradicate them. Uses of aciclovir include systemic treatment of varicella-zoster and the systemic and topical treatment of herpes simplex infections of the skin (section 13.10.3) and mucous membranes (section 7.2.2). It is used by mouth for severe herpetic stomatitis (see also p. 696). Aciclovir eye ointment (section 11.3.3) is used for herpes simplex infections of the eye; it is combined with systemic treatment for ophthalmic zoster.

**Famciclovir**, a prodrug of penciclovir, is similar to aciclovir and is licensed for use in herpes zoster and genital herpes. Penciclovir itself is used as a cream for herpes simplex labialis (section 13.10.3).

**Valaciclovir** is an ester of aciclovir, licensed for herpes zoster and herpes simplex infections of the skin and mucous membranes (including genital herpes); it is also licensed for preventing cytomegalovirus disease following renal transplantation. Famciclovir or valaciclovir are suitable alternatives to aciclovir for oral lesions associated with herpes zoster. Valaciclovir once daily may reduce the risk of transmitting genital herpes to heterosexual partners—specialist advice should be sought.

**Idoxuridine** (section 13.10.3) has been used topically for treating herpes simplex infections of the skin and external genitalia with variable results. Its value in the treatment of shingles is unclear.

**Foscarnet** (section 5.3.2.2) is used for mucocutaneous herpes simplex virus infection unresponsive to aciclovir in immunocompromised patients; it is toxic and can cause renal impairment.

**Inosine pranobex** has been used by mouth for herpes simplex infections; its effectiveness remains unproven.

## ACICLOVIR (Acyclovir)

**Indications** herpes simplex and varicella-zoster (see also under Dose)

**Cautions** maintain adequate hydration (especially with infusion or high doses, or during renal impairment); elderly (risk of neurological reactions); **interactions:** Appendix 1 (aciclovir)

**Renal impairment** see Cautions above; also risk of neurological reactions increased; use normal intravenous dose every 12 hours if eGFR 25–50 mL/minute/1.73 m<sup>2</sup> (every 24 hours if eGFR 10–25 mL/minute/1.73 m<sup>2</sup>); consult product literature for intravenous dose if eGFR less than 10 mL/minute/1.73 m<sup>2</sup>; for *herpes zoster*, use normal oral dose every 8 hours if eGFR 10–25 mL/minute/1.73 m<sup>2</sup> (every 12 hours if eGFR less than 10 mL/minute/1.73 m<sup>2</sup>); for *herpes simplex*, use normal oral dose every 12 hours if eGFR less than 10 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** not known to be harmful—manufacturers advise use only when potential benefit outweighs risk

**Breast-feeding** significant amount in milk after systemic administration—not known to be harmful but manufacturer advises caution

**Side-effects** nausea, vomiting, abdominal pain, diarrhoea, headache, fatigue, rash, urticaria, pruritus, photosensitivity; *very rarely* hepatitis, jaundice, dyspnoea, neurological reactions (including dizziness, confusion, hallucinations, convulsions, ataxia, dysarthria, and drowsiness), acute renal failure, anaemia, thrombocytopenia and leucopenia; on *intravenous infusion*, severe local inflammation (sometimes leading to ulceration), and *very rarely* agitation, tremors, psychosis and fever

### Dose

• **By mouth**, non-genital herpes simplex, treatment, 200 mg (400 mg in the immunocompromised or if absorption impaired) 5 times daily, usually for 5 days (longer if new lesions appear during treatment or if healing incomplete); **CHILD** 1 month–2 years, half adult dose, over 2 years, adult dose

Genital herpes simplex, treatment of *first episode*, 200 mg 5 times daily or 400 mg 3 times daily usually for 5 days, longer if new lesions appear during treatment or if healing is incomplete (400 mg 5 times daily for 7–10 days in immunocompromised or HIV-positive patients); treatment of *recurrent infection*, 800 mg 3 times daily for 2 days or 200 mg 5 times daily for 5 days or 400 mg 3 times daily for 3–5 days (400 mg 3 times daily for 5–10 days in immunocompromised or HIV-positive patients)

Herpes simplex, suppression, 400 mg twice daily or 200 mg 4 times daily; increased to 400 mg 3 times daily if recurrences occur on standard suppressive therapy or for suppression of genital herpes during late pregnancy (from 36 weeks gestation); therapy interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences

Herpes simplex, prophylaxis in the immunocompromised, 200–400 mg 4 times daily; **CHILD** 1 month–2 years, half adult dose, over 2 years, adult dose  
Varicella and herpes zoster, treatment, 800 mg 5 times daily for 7 days; **CHILD**, varicella, 1 month–2 years 200 mg 4 times daily for 5 days; 2–6 years 400 mg 4 times daily for 5 days; 6–12 years 800 mg 4 times daily for 5 days

Attenuation of chickenpox (if varicella-zoster immunoglobulin not indicated) [unlicensed use], **ADULT** and **CHILD** 40 mg/kg daily in 4 divided doses for 7 days starting 1 week after exposure

- **By intravenous infusion**, treatment of herpes simplex in the immunocompromised, severe initial genital herpes, and varicella-zoster, 5 mg/kg every 8 hours usually for 5 days, doubled to 10 mg/kg every 8 hours in varicella-zoster in the immunocompromised and in simplex encephalitis (usually given for at least 10 days in encephalitis, possibly for 14–21 days); prophylaxis of herpes simplex in the immunocompromised, 5 mg/kg every 8 hours

**Note** To avoid excessive dosage in obese patients, parenteral dose should be calculated on the basis of ideal weight for height

**NEONATE** and **INFANT** up to 3 months, herpes simplex, 20 mg/kg every 8 hours for 14 days (21 days if CNS involvement); varicella-zoster [unlicensed use] 10–20 mg/kg every 8 hours for at least 7 days; **CHILD** 3 months–12 years, herpes simplex or varicella-zoster, 250 mg/m<sup>2</sup> every 8 hours usually for 5 days, doubled to 500 mg/m<sup>2</sup> every 8 hours for varicella-zoster in the immunocompromised and in simplex encephalitis (usually given for at least 10 days in encephalitis, possibly for 14–21 days)

- **By topical application**, see section 13.10.3 (skin) and section 11.3.3 (eye)

**Note** Aciclovir doses in BNF may differ from those in product literature

### Aciclovir (Non-proprietary) (PAM)

**Tablets**, aciclovir 200 mg, net price 25-tab pack = £4.45; 400 mg, 56-tab pack = £8.10; 800 mg, 35-tab pack = £10.21. Label: 9

Brands include *Virovir*<sup>®</sup>

**Dental prescribing on NHS** Aciclovir Tablets 200 mg or 800 mg may be prescribed

**Dispersible tablets**, aciclovir 200 mg, net price 25-tab pack = £2.05; 400 mg, 56-tab pack = £7.24; 800 mg, 35-tab pack = £7.02. Label: 9

**Suspension**, aciclovir 200 mg/5 mL, net price 125 mL = £38.22; 400 mg/5 mL, 100 mL = £41.55. Label: 9

**Note** Sugar-free versions are available and can be ordered by specifying 'sugar-free' on the prescription

**Dental prescribing on NHS** Aciclovir Oral Suspension 200 mg/5 mL may be prescribed

**Intravenous infusion**, powder for reconstitution, aciclovir (as sodium salt), net price 250-mg vial =

£9.13; 500-mg vial = £20.22  
**Electrolytes** Na<sup>+</sup> 1.1 mmol/250-mg vial

**Intravenous infusion**, aciclovir (as sodium salt), 25 mg/mL, net price 10-mL (250-mg) vial = £10.37; 20-mL (500-mg) vial = £19.21; 40-mL (1-g) vial = £40.44

**Electrolytes** Na<sup>+</sup> 1.16 mmol/250-mg vial

### Zovirax<sup>®</sup> (GSK) (PAM)

**Tablets**, all dispersible, f/c, aciclovir 200 mg, net price 25-tab pack = £17.71; 800 mg (scored), *Shingles Treatment Pack*, 35-tab pack = £65.80. Label: 9

**Suspension**, both off-white, sugar-free, aciclovir 200 mg/5 mL (banana-flavoured), net price 125 mL = £29.53; 400 mg/5 mL (*Double Strength Suspension*, orange-flavoured) 100 mL = £33.01. Label: 9

**Intravenous infusion**, powder for reconstitution, aciclovir (as sodium salt), net price 250-mg vial = £9.96; 500-mg vial = £17.72

**Electrolytes** Na<sup>+</sup> 1.1 mmol/250-mg vial

**FAMCICLOVIR**

Note Famciclovir is a pro-drug of penciclovir

**Indications** see under Dose

**Cautions** interactions: Appendix 1 (famciclovir)

**Hepatic impairment** usual dose in well compensated liver disease (information not available on decompensated)

**Renal impairment** reduce dose; consult product literature

**Pregnancy** manufacturers advise avoid unless potential benefit outweighs risk

**Breast-feeding** no information available—present in milk in animal studies

**Side-effects** nausea, vomiting, abdominal pain, diarrhoea; headache, fatigue; sweating, pruritus; rarely confusion; very rarely jaundice, dizziness, drowsiness, hallucinations, thrombocytopenia, rash (including Stevens-Johnson syndrome); also reported, constipation and fever

**Dose**

- Herpes zoster, treatment, 500 mg 3 times daily for 7 days or 750 mg 1–2 times daily for 7 days (in immunocompromised, 500 mg 3 times daily for 10 days)
- Genital herpes, treatment of *first episode*, 250 mg 3 times daily for 5 days, longer if new lesions appear during treatment or if healing incomplete (500 mg twice daily for 5–10 days in immunocompromised or HIV-positive patients); treatment of *recurrent infection*, 125 mg twice daily for 5 days or 1 g twice daily for 1 day (500 mg twice daily for 5–10 days in immunocompromised or HIV-positive patients)
- Genital herpes, suppression, 250 mg twice daily (500 mg twice daily in immunocompromised or HIV-positive patients); therapy interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences
- Non-genital herpes simplex, treatment in the immunocompromised, 500 mg twice daily for 7 days
- **CHILD** not recommended

Note Famciclovir doses in BNF may differ from those in product literature

**Famciclovir** (Non-proprietary) 

Tablets, famciclovir 125 mg, net price 10-tab pack = £34.98; 250 mg, 15-tab pack = £109.49, 21-tab pack = £152.34, 56-tab pack = £408.74; 500 mg, 14-tab pack = £199.57, 30-tab pack = £433.69, 56-tab pack = £831.46; 750 mg, 7-tab pack = £143.05. Label: 9

**Famvir**<sup>®</sup> (Novartis) 

Tablets, all f/c, famciclovir 125 mg, net price 10-tab pack = £37.12; 250 mg, 15-tab pack = £111.35, 21-tab pack = £155.87; 56-tab pack = £415.67; 500 mg, 14-tab pack = £207.86, 30-tab pack = £445.28, 56-tab pack = £831.46; 750 mg, 7-tab pack = £148.79. Label: 9

**INOSINE PRANOBEX** 

(Inosine acedoben dimepranol)

**Indications** see under Dose

**Cautions** history of gout or hyperuricaemia

**Renal impairment** manufacturer advises caution; metabolised to uric acid

**Pregnancy** manufacturer advises avoid

**Side-effects** reversible increase in serum and urinary uric acid; less commonly nausea, vomiting, epigastric discomfort, headache, vertigo, fatigue, arthralgia, rashes and itching; rarely diarrhoea, constipation, anxiety, sleep disturbances, and polyuria

**Dose**

- Mucocutaneous herpes simplex, 1 g 4 times daily for 7–14 days
- Adjunctive treatment of genital warts, 1 g 3 times daily for 14–28 days
- Subacute sclerosing panencephalitis, 50–100 mg/kg daily in 6 divided doses

**Imunovir**<sup>®</sup> (Newport) 

Tablets, scored, inosine pranobex 500 mg, net price 100-tab pack = £39.50. Label: 9

**VALACICLOVIR**

Note Valaciclovir is a pro-drug of aciclovir

**Indications** treatment of herpes zoster; treatment of initial and suppression of recurrent herpes simplex infections of skin and mucous membranes including initial and recurrent genital herpes; reduction of transmission of genital herpes; prevention of cytomegalovirus disease following solid organ transplantation when valganciclovir or ganciclovir cannot be used

**Cautions** see under Aciclovir

**Hepatic impairment** manufacturer advises caution with high doses used for herpes labialis and prevention of cytomegalovirus disease—no information available

**Renal impairment** maintain adequate hydration; for *herpes zoster*, 1 g every 12 hours if eGFR 30–50 mL/minute/1.73 m<sup>2</sup> (1 g every 24 hours if eGFR 10–30 mL/minute/1.73 m<sup>2</sup>; 500 mg every 24 hours if eGFR less than 10 mL/minute/1.73 m<sup>2</sup>); for *treatment of herpes simplex*, 500 mg (1 g in immunocompromised or HIV-positive patients) every 24 hours if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>; for *treatment of herpes labialis*, if eGFR 30–50 mL/minute/1.73 m<sup>2</sup>, initially 1 g, then 1 g 12 hours after initial dose (if eGFR 10–30 mL/minute/1.73 m<sup>2</sup>, initially 500 mg, then 500 mg 12 hours after initial dose; if eGFR less than 10 mL/minute/1.73 m<sup>2</sup>, 500 mg as a single dose); for *suppression of herpes simplex*, 250 mg (500 mg in immunocompromised or HIV-positive patients) every 24 hours if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>; for *reduction of genital herpes transmission*, 250 mg every 24 hours if eGFR less than 15 mL/minute/1.73 m<sup>2</sup>; reduce dose according to eGFR for *cytomegalovirus prophylaxis* following solid organ transplantation (consult product literature)

**Pregnancy** see under Aciclovir

**Breast-feeding** see under Aciclovir

**Side-effects** see under Aciclovir but neurological reactions more frequent with high doses

**Dose**

- Herpes zoster, 1 g 3 times daily for 7 days; **CHILD** 12–18 years see *BNF for Children*
- Herpes simplex, treatment of *first episode*, 500 mg twice daily for 5 days, longer if new lesions appear during treatment or if healing incomplete (1 g twice daily for 10 days in immunocompromised or HIV-

positive patients); treatment of *recurrent infection*, 500 mg twice daily for 3–5 days (1 g twice daily for 5–10 days in immunocompromised or HIV-positive patients); **CHILD** 12–18 years see *BNF for Children*

- Herpes labialis, treatment, **ADULT** and **CHILD** over 12 years, initially 2 g, then 2 g 12 hours after initial dose
- Herpes simplex, suppression, 500 mg daily in 1–2 divided doses (in immunocompromised or HIV positive patients, 500 mg twice daily); therapy interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences; **CHILD** 12–18 years see *BNF for Children*
- Reduction of transmission of genital herpes, seek specialist advice, 500 mg once daily to be taken by the infected partner
- Prevention of cytomegalovirus disease following solid organ transplantation (preferably starting within 72 hours of transplantation), 2 g 4 times daily usually for 90 days; **CHILD** 12–18 years see *BNF for Children*

#### Valaciclovir (Non-proprietary) (POM)

Tablets, valaciclovir 500 mg, net price 10-tab pack = £19.48, 42 tab-pack = £81.64. Label: 9

#### Valtrex® (GSK) (POM)

Tablets, f/c, valaciclovir (as hydrochloride) 250 mg, net price 60-tab pack = £123.28; 500 mg, 10-tab pack = £20.59, 42-tab pack = £86.30. Label: 9

### 5.3.2.2 Cytomegalovirus infection

Recommendations for the optimum maintenance therapy of cytomegalovirus (CMV) infections and the duration of treatment are subject to rapid change.

**Ganciclovir** is related to aciclovir but it is more active against cytomegalovirus; it is also much more toxic than aciclovir and should therefore be prescribed only when the potential benefit outweighs the risks. Ganciclovir is administered by intravenous infusion for the *initial treatment* of CMV infection. Ganciclovir causes profound myelosuppression when given with zidovudine; the two should not normally be given together particularly during initial ganciclovir therapy. The likelihood of ganciclovir resistance increases in patients with a high viral load or in those who receive the drug over a long duration; cross-resistance to cidofovir is common.

**Valaciclovir** (see p. 394) is licensed for prevention of cytomegalovirus disease following renal transplantation.

**Valganciclovir** is an ester of ganciclovir which is licensed for the *initial treatment* and *maintenance treatment* of CMV retinitis in AIDS patients. Valganciclovir is also licensed for preventing CMV disease following solid organ transplantation from a cytomegalovirus-positive donor.

**Foscarnet** is also active against cytomegalovirus; it is toxic and can cause renal impairment.

**Cidofovir** is given in combination with probenecid for CMV retinitis in AIDS patients when ganciclovir and foscarnet are contra-indicated. Cidofovir is nephrotoxic.

For local treatment of CMV retinitis, see section 11.3.3.

## CIDOFOVIR

**Indications** cytomegalovirus retinitis in AIDS patients for whom other drugs are inappropriate

**Cautions** monitor renal function (serum creatinine and urinary protein) and neutrophil count within 24 hours before each dose; co-treatment with probenecid and prior hydration with intravenous fluids necessary to minimise potential nephrotoxicity (see below); diabetes mellitus (increased risk of ocular hypotony); **interactions:** Appendix 1 (cidofovir)

**Nephrotoxicity** Do not initiate treatment in renal impairment (assess creatinine clearance and proteinuria—consult product literature); discontinue treatment and give intravenous fluids if renal function deteriorates—consult product literature

**Ocular disorders** Regular ophthalmological examinations recommended; iritis and uveitis have been reported which may respond to a topical corticosteroid with or without a cycloplegic drug—discontinue cidofovir if no response to topical corticosteroid or if condition worsens, or if iritis or uveitis recurs after successful treatment

**Contra-indications** concomitant administration of potentially nephrotoxic drugs (discontinue potentially nephrotoxic drugs at least 7 days before starting cidofovir)

**Renal impairment** avoid if creatinine clearance less than 55 mL/minute; nephrotoxic

**Pregnancy** avoid (toxicity in *animal studies*); effective contraception required during and for 1 month after treatment; also men should avoid fathering a child during and for 3 months after treatment

**Breast-feeding** manufacturer advises avoid

**Side-effects** nephrotoxicity (see Cautions above); nausea, vomiting, diarrhoea; dyspnoea; headache, fever, asthenia; neutropenia; decreased intra-ocular pressure, iritis, uveitis (see Cautions above); alopecia, rash; *less commonly* Fanconi syndrome; also reported, hearing impairment and pancreatitis

#### Dose

- Initial (induction) treatment, **ADULT** over 18 years, by **intravenous infusion** over 1 hour, 5 mg/kg once weekly for 2 weeks (give probenecid and intravenous fluids with each dose, see below)

- Maintenance treatment, beginning 2 weeks after completion of induction, **ADULT** over 18 years, by **intravenous infusion** over 1 hour, 5 mg/kg once every 2 weeks (give probenecid and intravenous fluids with each dose, see below)

**Probenecid co-treatment** By mouth (preferably after food), probenecid 2 g 3 hours before cidofovir infusion followed by probenecid 1 g at 2 hours and 1 g at 8 hours after the end of cidofovir infusion (total probenecid 4 g); for cautions, contra-indications and side-effects of probenecid see section 10.1.4

**Prior hydration** Sodium chloride 0.9%, by **intravenous infusion**, 1 litre over 1 hour immediately before cidofovir infusion (if tolerated an additional 1 litre may be given over 1–3 hours, starting at the same time as the cidofovir infusion or immediately afterwards)

#### Vistide® (Gilead) (POM)

**Intravenous infusion**, cidofovir 75 mg/mL, net price 5-mL vial = £653.22

**Caution in handling** Cidofovir is toxic and personnel should be adequately protected during handling and administration; if solution comes into contact with skin or mucosa, wash off immediately with water

## GANCICLOVIR

**Indications** life-threatening or sight-threatening cytomegalovirus infections in immunocompromised patients only; prevention of cytomegalovirus disease during immunosuppressive therapy following organ transplantation; local treatment of CMV retinitis (section 11.3.3)

**Cautions** close monitoring of full blood count (severe deterioration may require correction and possibly treatment interruption); history of cytopenia; potential carcinogen and teratogen; radiotherapy; ensure adequate hydration during intravenous administration; vesicant—infuse into vein with adequate flow preferably using plastic cannula; children (possible risk of long-term carcinogenic or reproductive toxicity); **interactions:** Appendix 1 (ganciclovir)

**Contra-indications** hypersensitivity to valganciclovir, ganciclovir, aciclovir, or valaciclovir; abnormally low haemoglobin, neutrophil, or platelet counts (consult product literature)

**Renal impairment** reduce dose if eGFR less than 70 mL/minute/1.73 m<sup>2</sup>; consult product literature

**Pregnancy** avoid—teratogenic risk; ensure effective contraception during treatment and barrier contraception for men during and for at least 90 days after treatment

**Breast-feeding** avoid—no information available

**Side-effects** diarrhoea, nausea, vomiting, dyspepsia, abdominal pain, constipation, flatulence, dysphagia, taste disturbance, hepatic dysfunction; dyspnoea, chest pain, cough; headache, insomnia, convulsions, dizziness, peripheral neuropathy, depression, anxiety, confusion, abnormal thinking, fatigue, weight loss, anorexia; infection, pyrexia, night sweats; anaemia, leucopenia, thrombocytopenia, pancytopenia, renal impairment; myalgia, arthralgia; macular oedema, retinal detachment, vitreous floaters, eye pain; ear pain; dermatitis, pruritus; injection-site reactions; *less commonly* mouth ulcers, pancreatitis, arrhythmias, hypotension, anaphylactic reactions, psychosis, tremor, male infertility, haematuria, disturbances in hearing and vision, and alopecia

### Dose

- **By intravenous infusion**, initially (induction) 5 mg/kg every 12 hours for 14–21 days for treatment or for 7–14 days for prevention; maintenance (for patients at risk of relapse of retinitis) 6 mg/kg daily on 5 days per week or 5 mg/kg daily until adequate recovery of immunity; if retinitis progresses initial induction treatment may be repeated; **CHILD** under 18 years, see *BNF for Children*

**Cymevene**® (Roche) (P<sub>o</sub>M)

**Intravenous infusion**, powder for reconstitution, ganciclovir (as sodium salt). Net price 500-mg vial = £29.77

**Electrolytes** Na<sup>+</sup> 2 mmol/500-mg vial

**Caution in handling** Ganciclovir is toxic and personnel should be adequately protected during handling and administration; if solution comes into contact with skin or mucosa, wash off immediately with soap and water

## FOSCARNET SODIUM

**Indications** cytomegalovirus disease [licensed for cytomegalovirus retinitis in AIDS patients only]; mucocutaneous herpes simplex virus infections

unresponsive to aciclovir in immunocompromised patients

**Cautions** monitor electrolytes, particularly calcium and magnesium; monitor serum creatinine every second day during induction and every week during maintenance; ensure adequate hydration; avoid rapid infusion; **interactions:** Appendix 1 (foscarnet)

**Renal impairment** reduce dose; consult product literature

**Pregnancy** manufacturer advises avoid

**Breast-feeding** avoid—present in milk in *animal* studies

**Side-effects** nausea, vomiting, diarrhoea (occasionally constipation and dyspepsia), abdominal pain, anorexia; changes in blood pressure and ECG; headache, fatigue, mood disturbances (including psychosis), asthenia, paraesthesia, convulsions, tremor, dizziness, and other neurological disorders; rash; impairment of renal function including acute renal failure; hypocalcaemia (sometimes symptomatic) and other electrolyte disturbances; abnormal liver function tests; decreased haemoglobin concentration, leucopenia, granulocytopenia, thrombocytopenia; thrombophlebitis if given undiluted by peripheral vein; genital irritation and ulceration (due to high concentrations excreted in urine); isolated reports of pancreatitis

### Dose

- CMV disease [licensed for CMV retinitis only], **by intravenous infusion**, initially (induction) 60 mg/kg every 8 hours or 90 mg/kg every 12 hours, for 2–3 weeks; maintenance 60 mg/kg daily, increased to 90–120 mg/kg if tolerated; if disease progresses on maintenance dose, repeat induction regimen
  - Mucocutaneous herpes simplex infection, **by intravenous infusion**, 40 mg/kg every 8 hours for 2–3 weeks or until lesions heal
- Note** Foscarnet doses in BNF may differ from those in product literature

**Foscavir**® (Clinigen) (P<sub>o</sub>M)

**Intravenous infusion**, foscarnet sodium hexahydrate 24 mg/mL, net price 250-mL bottle = £34.49

## VALGANCICLOVIR

**Note** Valganciclovir is a pro-drug of ganciclovir

**Indications** induction and maintenance treatment of cytomegalovirus retinitis in AIDS patients; prevention of cytomegalovirus disease following solid organ transplantation from a cytomegalovirus-positive donor.

**Cautions** see under Ganciclovir

**Contra-indications** see under Ganciclovir

**Renal impairment** reduce dose; consult product literature

**Pregnancy** see under Ganciclovir

**Breast-feeding** see under Ganciclovir

**Side-effects** see under Ganciclovir

### Dose

- CMV retinitis, induction, **ADULT** over 18 years, 900 mg twice daily for 21 days then 900 mg once daily; induction regimen may be repeated if retinitis progresses
- Prevention of cytomegalovirus disease following solid organ transplantation (starting within 10 days of

transplantation), **ADULT** over 18 years, 900 mg once daily for 100 days (for 100–200 days following kidney transplantation)

**Note** Oral valganciclovir 900 mg twice daily is equivalent to intravenous ganciclovir 5 mg/kg twice daily

#### Valcyte® (Roche) (P<sub>MI</sub>)

**Tablets**, pink, f/c, valganciclovir (as hydrochloride) 450 mg, net price 60-tab pack = £1081.46. Label: 21

**Oral solution**, tutti-frutti flavoured, valganciclovir (as hydrochloride) 250 mg/5 mL when reconstituted with water, net price 100 mL = £230.32. Label: 21

**Caution in handling** Valganciclovir is a potential teratogen and carcinogen and caution is advised when handling the powder, reconstituted solution, or broken tablets; if these come into contact with skin or mucosa, wash off immediately with water; avoid inhalation of powder

### 5.3.3 Viral hepatitis

Treatment for viral hepatitis should be initiated by a specialist. The management of uncomplicated acute viral hepatitis is largely symptomatic. Early treatment of acute hepatitis C with interferon alfa [unlicensed indication] may reduce the risk of chronic infection. Hepatitis B and hepatitis C viruses are major causes of chronic hepatitis. For details on immunisation against hepatitis A and B infections, see section 14.4 (active immunisation), section 14.5.1 (passive immunisation against hepatitis A), and section 14.5.2 (passive immunisation against hepatitis B).

**Chronic Hepatitis B** **Peginterferon alfa** (section 8.2.4) is an option for the initial treatment of chronic hepatitis B and may be preferable to **interferon alfa**. The use of peginterferon alfa and interferon alfa is limited by a response rate of 30–40% and relapse is frequent. Treatment should be discontinued if no improvement occurs after 4 months. The manufacturers of peginterferon alfa-2a and interferon alfa contraindicate use in decompensated liver disease, but low doses can be used with great caution in these patients. Although interferon alfa is contra-indicated in patients receiving immunosuppressant treatment (or who have received it recently), cautious use of peginterferon alfa-2a may be justified in some cases.

**Entecavir** or **tenofovir disoproxil** (see p. 385) are options for the initial treatment of chronic hepatitis B. If the response is inadequate after 6–9 months of treatment, a change in treatment should be considered. Other drugs that are licensed for the treatment of chronic hepatitis B include **adefovir dipivoxil**, **lamivudine** (see p. 384), or **telbivudine** (but see NICE guidance below).

Entecavir alone, tenofovir disoproxil alone, or a combination of lamivudine with either adefovir dipivoxil or tenofovir disoproxil can be used in patients with decompensated liver disease; entecavir is not licensed for these patients.

If drug-resistant hepatitis B virus emerges during treatment, another antiviral drug with a different resistance profile should be added. Hepatitis B viruses with

reduced susceptibility to lamivudine have emerged following extended therapy. Adefovir or tenofovir can be given with lamivudine in lamivudine-resistant chronic hepatitis B; telbivudine or entecavir should not be used because cross-resistance can occur.

If there is no toxicity or loss in efficacy, treatment with adefovir, entecavir, lamivudine, telbivudine, or tenofovir is usually continued until 6 months after adequate seroconversion has occurred. Treatment is usually continued long-term in patients with decompensated liver disease.

Tenofovir, or a combination of tenofovir with either emtricitabine or lamivudine may be used with other antiretrovirals, as part of 'highly active antiretroviral therapy' (section 5.3.1) in patients who require treatment for both HIV and chronic hepatitis B. If patients infected with both HIV and chronic hepatitis B only require treatment for chronic hepatitis B, they should receive antivirals that are not active against HIV, such as peginterferon alfa or adefovir. Treatment may be continued long-term, even if adequate seroconversion occurs. Management of these patients should be coordinated between HIV and hepatitis specialists.

#### NICE guidance

##### Entecavir and telbivudine for chronic hepatitis B (August 2008)

Entecavir is an option for the treatment of chronic hepatitis B.

Telbivudine is not recommended for the treatment of chronic hepatitis B. Patients currently receiving telbivudine can continue treatment until they and their clinician consider it appropriate to stop.

#### NICE guidance

##### Tenofovir disoproxil for the treatment of chronic hepatitis B (July 2009)

Tenofovir is an option for the treatment of chronic hepatitis B.

**Chronic Hepatitis C** Before starting treatment, the genotype of the infecting hepatitis C virus should be determined and the viral load measured as this may affect the choice and duration of treatment. A combination of **ribavirin** (see p. 400) and **peginterferon alfa** (section 8.2.4) is used for the treatment of chronic hepatitis C (see NICE guidance, below). The combination of ribavirin and interferon alfa is less effective than the combination of peginterferon alfa and ribavirin. Peginterferon alfa alone should be used if ribavirin is contra-indicated or not tolerated. Ribavirin monotherapy is ineffective.

#### NICE guidance

##### Peginterferon alfa and ribavirin for mild chronic hepatitis C (August 2006 and September 2010)

The combination of peginterferon alfa and ribavirin can be used for treating mild chronic hepatitis C in patients over 18 years. Alternatively, treatment can be delayed until the disease has reached a moderate stage ('watchful waiting'). Peginterferon alfa alone can be used if ribavirin is contra-indicated or not tolerated.

**NICE guidance****Peginterferon alfa, interferon alfa, and ribavirin for moderate to severe chronic hepatitis C (January 2004 and September 2010)**

The combination of peginterferon alfa and ribavirin should be used for treating moderate to severe chronic hepatitis C in patients aged over 18 years:

- not previously treated with interferon alfa or peginterferon alfa;
- treated previously with interferon alfa alone or in combination with ribavirin;
- whose condition did not respond to peginterferon alfa alone or to a combination of peginterferon alfa and ribavirin, or responded but subsequently relapsed;
- co-infected with HIV.

Peginterferon alfa alone should be used if ribavirin is contra-indicated or not tolerated. Interferon alfa for either monotherapy or combined therapy should be used only if neutropenia and thrombocytopenia are a particular risk. Patients receiving interferon alfa may be switched to peginterferon alfa.

Full guidance available at [www.nice.org.uk/TA075](http://www.nice.org.uk/TA075).

**ADEFOVIR DIPIVOXIL**

**Indications** chronic hepatitis B infection with either compensated liver disease with evidence of viral replication, and histologically documented active liver inflammation and fibrosis or decompensated liver disease

**Cautions** monitor liver function tests every 3 months, and viral and serological markers for hepatitis B every 3–6 months during treatment (continue monitoring for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation); monitor renal function before treatment then every 3 months, more frequently in renal impairment or in patients receiving nephrotoxic drugs; elderly; discontinue if deterioration in liver function, hepatic steatosis, progressive hepatomegaly or unexplained lactic acidosis

**Renal impairment** 10 mg every 48 hours if eGFR 30–50 mL/minute/1.73 m<sup>2</sup>; 10 mg every 72 hours if eGFR 10–30 mL/minute/1.73 m<sup>2</sup>; no information available if eGFR less than 10 mL/minute/1.73 m<sup>2</sup>; see also Cautions above

**Pregnancy** toxicity in *animal* studies—manufacturer advises use only if potential benefit outweighs risk; effective contraception required during treatment

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** nausea, vomiting, dyspepsia, abdominal pain, flatulence, diarrhoea; asthenia, headache; renal failure; hypophosphataemia; rash and pruritus; also reported pancreatitis

**Dose**

- ADULT over 18 years, 10 mg once daily

**Hepsera**<sup>®</sup> (Gilead) (Pm)

**Tablets**, adefovir dipivoxil 10 mg, net price 30-tab pack = £296.73

**ENTECAVIR**

**Indications** chronic hepatitis B infection with compensated liver disease, evidence of viral replication,

and histologically documented active liver inflammation or fibrosis

**Cautions** monitor liver function tests every 3 months, and viral and serological markers for hepatitis B every 3–6 months during treatment (continue monitoring for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation); HIV infection—risk of HIV resistance in patients not receiving ‘highly active antiretroviral therapy’; lamivudine-resistant chronic hepatitis B—risk of entecavir resistance; discontinue if deterioration in liver function, hepatic steatosis, progressive hepatomegaly or unexplained lactic acidosis

**Renal impairment** reduce dose if eGFR less than 50 mL/minute/1.73 m<sup>2</sup>; consult product literature

**Pregnancy** toxicity in *animal* studies—manufacturer advises use only if potential benefit outweighs risk; effective contraception required during treatment

**Breast-feeding** manufacturer advises avoid—present in milk in *animal* studies

**Side-effects** nausea, vomiting, dyspepsia, diarrhoea, raised serum amylase and lipase, headache, fatigue, dizziness, sleep disturbances; *less commonly* thrombocytopenia, rash, alopecia

**Dose**

- ADULT over 18 years, not previously treated with nucleoside analogues, 500 micrograms once daily
- ADULT over 18 years with lamivudine-resistant chronic hepatitis B (but see notes above), 1 mg once daily; consider other treatment if inadequate response after 6 months

**Counselling** To be taken at least 2 hours before or 2 hours after food

**Baraclude**<sup>®</sup> (Bristol-Myers Squibb) (Pm)

**Tablets**, f/c, entecavir (as monohydrate) 500 micrograms (white), net price 30-tab pack = £363.26; 1 mg (pink), 30-tab pack = £363.26. Counselling, administration

**Oral solution**, entecavir (as monohydrate) 50 micrograms/mL, net price 210-mL pack (orange-flavoured) = £423.80. Counselling, administration

**TELIVUDINE**

**Indications** chronic hepatitis B infection with compensated liver disease, evidence of viral replication, and histologically documented active liver inflammation or fibrosis

**Cautions** monitor liver function tests every 3 months and viral and serological markers of hepatitis B every 3–6 months during treatment (continue monitoring for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation); lamivudine-resistant chronic hepatitis B—risk of telivudine resistance; discontinue if deterioration in liver function, hepatic steatosis, progressive hepatomegaly or unexplained lactic acidosis; **interactions:** Appendix 1 (telivudine)

**Counselling** Patients should be advised to promptly report unexplained muscle pain, tenderness, or weakness, or numbness, tingling or burning sensations

**Renal impairment** 600 mg every 48 hours if eGFR 30–49 mL/minute/1.73 m<sup>2</sup>; 600 mg every 72 hours if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** manufacturer advises avoid—present in milk in *animal* studies

**Side-effects** nausea, diarrhoea, abdominal pain, raised serum amylase and lipase; cough; dizziness, headache, fatigue; rash; *less commonly*; taste disturbance, arthralgia, myalgia, myopathy (discontinue treatment), and peripheral neuropathy; also reported, lactic acidosis and rhabdomyolysis

#### Dose

• **ADULT** and **CHILD** over 16 years, 600 mg once daily

**Sebivo**<sup>®</sup> (Novartis) ▼ (POM)

Tablets, f/c, telbivudine 600 mg, net price 28-tab pack = £290.33. Counselling, muscle effects, peripheral neuropathy

## 5.3.4 Influenza

For advice on immunisation against influenza, see section 14.4.

**Oseltamivir** and **zanamivir** reduce replication of influenza A and B viruses by inhibiting viral neuraminidase. They are most effective for the treatment of influenza if started within a few hours of the onset of symptoms; they are licensed for use within 48 hours (within 36 hours for zanamivir in children) of the first symptoms. In otherwise healthy individuals they reduce the duration of symptoms by about 1–1.5 days. Oseltamivir or zanamivir can reduce the risk of complications from influenza in the elderly and in patients with chronic disease (see also NICE guidance, below).

Oseltamivir and zanamivir are licensed for post-exposure prophylaxis of influenza when influenza is circulating in the community. Oseltamivir should be given within 48 hours of exposure to influenza while zanamivir should be given within 36 hours of exposure to influenza (see also NICE guidance, below). Oseltamivir and zanamivir are also licensed for use in exceptional circumstances (e.g. when vaccination does not cover the infecting strain) to prevent influenza in an epidemic.

There is evidence that some strains of influenza A virus have reduced susceptibility to oseltamivir, but may retain susceptibility to zanamivir.

**Amantadine** is licensed for prophylaxis and treatment of influenza A but it is no longer recommended (see NICE guidance).

Information on pandemic influenza, avian influenza, and swine influenza may be found at [www.hpa.org.uk](http://www.hpa.org.uk)

**Oseltamivir in children under 1 year of age** Data on the use of oseltamivir in children under 1 year of age is limited. Furthermore oseltamivir may be ineffective in neonates because they may not be able to metabolise oseltamivir to its active form. In exceptional circumstances, oseltamivir can be used (under specialist supervision) for the treatment or post-exposure prophylaxis of influenza in children under 1 year of age. The Department of Health has advised (May 2009) that during a pandemic, treatment with oseltamivir can be overseen by healthcare professionals experienced in assessing children.

**Pregnancy and breast-feeding** Although safety data are limited, either oseltamivir or zanamivir can be used in women who are pregnant or breast-feeding when the potential benefit outweighs the risk (e.g. during a pandemic). Zanamivir is the preferred drug during pregnancy; however, oseltamivir is recommended during severe infection or when zanamivir cannot be used.

Oseltamivir is the preferred drug in women who are breast-feeding.

#### NICE guidance

#### Oseltamivir, zanamivir, and amantadine for prophylaxis and treatment of influenza (September 2008 and February 2009)

The drugs described here are not a substitute for vaccination, which remains the most effective way of preventing illness from influenza.

- Amantadine is **not** recommended for prophylaxis or treatment of influenza.
- Oseltamivir *or* zanamivir are **not** recommended for seasonal prophylaxis against influenza.
- When influenza is circulating in the community<sup>1</sup>, either oseltamivir or zanamivir is recommended (in accordance with UK licensing) for post-exposure prophylaxis in at-risk patients who are not effectively protected by influenza vaccine, and who have been in close contact with someone suffering from influenza-like illness in the same household or residential setting. Oseltamivir should be given within 48 hours of exposure to influenza while zanamivir should be given within 36 hours of exposure to influenza.
- When influenza is circulating in the community<sup>1</sup>, either oseltamivir or zanamivir is recommended (in accordance with UK licensing) for the treatment of influenza in at-risk patients who can start treatment within 48 hours (within 36 hours for zanamivir in children) of the onset of symptoms.
- During local outbreaks of influenza-like illness, when there is a high level of certainty that influenza is present, either oseltamivir or zanamivir may be used for post-exposure prophylaxis or treatment in at-risk patients (regardless of influenza vaccination) living in long-term residential or nursing homes.

At risk<sup>2</sup> patients include those aged over 65 years *or* those who have one or more of the following conditions:

- chronic respiratory disease (including asthma and chronic obstructive pulmonary disease);
- chronic heart disease;
- chronic renal disease;
- chronic liver disease;
- chronic neurological disease;
- immunosuppression;
- diabetes mellitus.

This guidance does not cover the circumstances of a pandemic, an impending pandemic, or a widespread epidemic of a new strain of influenza to which there is little or no immunity in the community.

## AMANTADINE HYDROCHLORIDE

**Indications** see under Dose; parkinsonism (section 4.9.1)

**Cautions** section 4.9.1

**Contra-indications** section 4.9.1

1. National surveillance schemes, including those run by the Health Protection Agency, should be used to indicate when influenza is circulating in the community.
2. The Department of Health in England has advised (November 2010) that 'at risk patients' also includes women who are pregnant.

**Renal impairment** section 4.9.1

**Pregnancy** section 4.9.1

**Breast-feeding** section 4.9.1

**Side-effects** section 4.9.1

#### Dose

- Influenza A (see also notes above), **ADULT** and **CHILD** over 10 years, treatment, 100 mg daily for 4–5 days; prophylaxis, 100 mg daily usually for 6 weeks or with influenza vaccination for 2–3 weeks after vaccination

**Lysovir**<sup>®</sup> (Alliance) (POM)

**Capsules**, red-brown, amantadine hydrochloride

100 mg, net price 5-cap pack = £2.40, 14-cap pack = £5.76. Counselling, driving

**Symmetrel**<sup>®</sup> (Alliance) (POM)

Section 4.9.1

## OSELTAMIVIR

**Indications** see notes above

**Renal impairment** for *treatment*, use 75 mg once daily or 30 mg twice daily if eGFR 10–30 mL/minute/1.73 m<sup>2</sup>; for *prevention*, use 75 mg every 48 hours or 30 mg once daily if eGFR 10–30 mL/minute/1.73 m<sup>2</sup>; avoid for *treatment* and *prevention* if eGFR less than 10 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** use only if potential benefit outweighs risk (e.g. during a pandemic); see also p. 399

**Breast-feeding** amount probably too small to be harmful; use only if potential benefit outweighs risk (e.g. during a pandemic); see also p. 399

**Side-effects** nausea, vomiting, abdominal pain, diarrhoea; headache; conjunctivitis; *less commonly* eczema; also reported hepatitis, gastro-intestinal bleeding, arrhythmias, neuropsychiatric disorders (more frequent in children and adolescents), visual disturbances, Stevens-Johnson syndrome, and toxic epidermal necrolysis

#### Dose

- Prevention of influenza, **ADULT** and **CHILD** over 13 years, 75 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic; **CHILD** under 1 month (see notes above), 2 mg/kg once daily for 10 days for post-exposure prophylaxis; 1–3 months (see notes above), 2.5 mg/kg once daily for 10 days for post-exposure prophylaxis; 3 months–1 year (see notes above), 3 mg/kg once daily for 10 days for post-exposure prophylaxis; 1–13 years, body-weight under 15 kg, 30 mg once daily for 10 days for post-exposure prophylaxis (for up to 6 weeks during an epidemic); body-weight 15–23 kg, 45 mg once daily for 10 days for post-exposure prophylaxis (for up to 6 weeks during an epidemic); body-weight 23–40 kg, 60 mg once daily for 10 days for post-exposure prophylaxis (for up to 6 weeks during an epidemic); body-weight over 40 kg, adult dose
  - Treatment of influenza, **ADULT** and **CHILD** over 13 years, 75 mg every 12 hours for 5 days; **CHILD** under 1 month (see notes above), 2 mg/kg every 12 hours for 5 days; 1–3 months (see notes above), 2.5 mg/kg every 12 hours for 5 days; 3 months–1 year (see notes above), 3 mg/kg every 12 hours for 5 days; 1–13 years, body-weight under 15 kg, 30 mg every 12 hours for 5 days, body-weight 15–23 kg, 45 mg every 12 hours for 5 days, body-weight 23–40 kg, 60 mg every 12 hours for 5 days, body-weight over 40 kg, adult dose
- Note** Not licensed for use in children under 1 year of age unless there is a pandemic

**1 Tamiflu**<sup>®</sup> (Roche) (POM)

**Capsules**, oseltamivir (as phosphate) 30 mg (yellow), net price 10-cap pack = £7.71; 45 mg (grey), 10-cap pack = £15.41; 75 mg (grey-yellow), 10-cap pack = £15.41. Label: 9

**Note** If suspension not available, capsules can be opened and the contents mixed with a small amount of sweetened food, such as sugar water or chocolate syrup, just before administration

**Suspension**, sugar-free, tutti-frutti-flavoured, oseltamivir (as phosphate) for reconstitution with water, 60 mg/5 mL, net price 75 mL = £15.41. Label: 9

**Excipients** include sorbitol 1.7 g/5 mL

**Note** Solutions prepared by 'special order' manufacturers may be a different concentration

1. (SLS) except for the treatment and prophylaxis of influenza as indicated in the notes above and NICE guidance; endorse prescription 'SLS'

## ZANAMIVIR

**Indications** see notes above

**Cautions** asthma and chronic pulmonary disease (risk of bronchospasm—short-acting bronchodilator should be available; avoid in severe asthma unless close monitoring possible and appropriate facilities available to treat bronchospasm); uncontrolled chronic illness; other inhaled drugs should be administered before zanamivir

**Pregnancy** use only if potential benefit outweighs risk (e.g. during a pandemic); see also p. 399

**Breast-feeding** amount probably too small to be harmful; use only if potential benefit outweighs risk (e.g. during a pandemic); see also p. 399

**Side-effects** *very rarely*, bronchospasm, respiratory impairment, angioedema, urticaria, and rash; also reported, neuropsychiatric disorders (especially in children and adolescents), Stevens-Johnson syndrome, toxic epidermal necrolysis

#### Dose

- **By inhalation of powder**, post-exposure prophylaxis of influenza, **ADULT** and **CHILD** over 5 years, 10 mg once daily for 10 days
- Prevention of influenza during an epidemic, **ADULT** and **CHILD** over 5 years, 10 mg once daily for up to 28 days
- Treatment of influenza, **ADULT** and **CHILD** over 5 years, 10 mg twice daily for 5 days

**1 Relenza**<sup>®</sup> (GSK) (POM)

**Dry powder for inhalation** disks containing 4 blisters of zanamivir 5 mg/blister, net price 5 disks with *Dis-khaler*<sup>®</sup> device = £16.36

1. (SLS) except for the treatment and prophylaxis of influenza as indicated in the notes above and NICE guidance; endorse prescription 'SLS'

## 5.3.5 Respiratory syncytial virus

**Ribavirin** inhibits a wide range of DNA and RNA viruses. It is licensed for administration by inhalation for the treatment of severe bronchiolitis caused by the respiratory syncytial virus (RSV) in infants, especially when they have other serious diseases. However, there is no evidence that ribavirin produces clinically relevant benefit in RSV bronchiolitis. Ribavirin is given by mouth with peginterferon alfa or interferon alfa for the treatment of chronic hepatitis C infection (see *Viral Hepatitis*, p. 397). Ribavirin is also effective in Lassa fever (unlicensed indication).

**Palivizumab** is a monoclonal antibody licensed for preventing serious lower respiratory-tract disease caused by respiratory syncytial virus in children at high risk of the disease; it should be prescribed under specialist supervision and on the basis of the likelihood of hospitalisation.

Palivizumab is recommended for:

- children under 9 months of age with chronic lung disease (defined as requiring oxygen for at least 28 days from birth) and who were born preterm<sup>1</sup>;
- children under 6 months of age with haemodynamically significant, acyanotic congenital heart disease who were born preterm<sup>1</sup>.

Palivizumab should be considered for:

- children under 2 years of age with severe combined immunodeficiency syndrome;
- children under 1 year of age who require long-term ventilation;
- children 1–2 years of age who require long-term ventilation and have an additional co-morbidity (including cardiac disease or pulmonary hypertension).

## PALIVIZUMAB

**Indications** see notes above

**Cautions** moderate to severe acute infection or febrile illness; thrombocytopenia; serum-palivizumab concentration may be reduced after cardiac surgery

**Contra-indications** hypersensitivity to humanised monoclonal antibodies

**Side-effects** fever, injection-site reactions, nervousness; *less commonly* diarrhoea, vomiting, constipation, haemorrhage, rhinitis, cough, wheeze, pain, drowsiness, asthenia, hyperkinesia, leucopenia, and rash; also reported, apnoea, hypersensitivity reactions (including anaphylaxis), convulsions and thrombocytopenia

### Dose

- **By intramuscular injection** (preferably in anterolateral thigh), 15 mg/kg once a month during season of RSV risk (child undergoing cardiac bypass surgery, 15 mg/kg as soon as stable after surgery, then once a month during season of risk); injection volume over 1 mL should be divided between more than one site

**Synagis**<sup>®</sup> (Abbott) ▼ [Pm]

**Injection**, powder for reconstitution, palivizumab, net price 50-mg vial = £360.40; 100-mg vial = £663.11

## RIBAVIRIN (Ribavirin)

**Indications** severe respiratory syncytial virus bronchiolitis in infants and children; in combination with peginterferon alfa or interferon alfa for chronic hepatitis C in patients without liver decompensation (see also section 5.3.3)

### Cautions

**Specific cautions for inhaled treatment** Maintain standard supportive respiratory and fluid management therapy; monitor electrolytes closely; monitor equipment for precipitation; pregnant women (and those planning pregnancy) should avoid exposure to aerosol

**Specific cautions for oral treatment** Exclude pregnancy before treatment; effective contraception essential during

treatment and for 4 months after treatment in women and for 7 months after treatment in men; routine monthly pregnancy tests recommended; condoms must be used if partner of male patient is pregnant (ribavirin excreted in semen); cardiac disease (assessment including ECG recommended before and during treatment—discontinue if deterioration); gout; determine full blood count, platelets, electrolytes, serum creatinine, liver function tests and uric acid before starting treatment and then on weeks 2 and 4 of treatment, then as indicated clinically—adjust dose if adverse reactions or laboratory abnormalities develop (consult product literature); eye examination recommended before treatment; eye examination also recommended during treatment if pre-existing ophthalmological disorder or if decrease in vision reported—discontinue treatment if ophthalmological disorder deteriorates or if new ophthalmological disorder develops; test thyroid function before treatment and then every 3 months in children; risk of growth retardation in children, the reversibility of which is uncertain—if possible, consider starting treatment after pubertal growth spurt

**Interactions:** Appendix 1 (ribavirin)

### Contra-indications

**Specific contra-indications for oral treatment** Severe cardiac disease, including unstable or uncontrolled cardiac disease in previous 6 months; haemoglobinopathies; severe debilitating medical conditions; autoimmune disease (including autoimmune hepatitis); uncontrolled severe psychiatric condition; history of severe psychiatric condition in children

**Hepatic impairment** no dosage adjustment required; use oral ribavirin with caution in severe hepatic dysfunction or decompensated cirrhosis

**Renal impairment** plasma-ribavirin concentration increased; avoid oral ribavirin unless essential if eGFR less than 50 mL/minute/1.73 m<sup>2</sup>—monitor haemoglobin concentration closely

**Pregnancy** avoid; teratogenicity in *animal* studies; see also Cautions above

**Breast-feeding** avoid—no information available

### Side-effects

**Specific side-effects for inhaled treatment** Worsening respiration, bacterial pneumonia, and pneumothorax reported; rarely non-specific anaemia and haemolysis

**Specific side-effects for oral treatment** Haemolytic anaemia (anaemia may be improved by epoetin); also (in combination with peginterferon alfa or interferon alfa) nausea, vomiting, dyspepsia, abdominal pain, flatulence, constipation, diarrhoea, colitis, chest pain, palpitation, tachycardia, peripheral oedema, changes in blood pressure, syncope, flushing, cough, dyspnoea, headache, dizziness, asthenia, impaired concentration and memory, sleep disturbances, abnormal dreams, anxiety, depression, suicidal ideation (more frequent in children), psychoses, dysphagia, weight loss, dysphonia, paraesthesia, hypoaesthesia, ataxia, hypertonia, influenza-like symptoms, thyroid disorders, hyperglycaemia, menstrual disturbances, breast pain, prostatitis, sexual dysfunction, micturition disorders, leucopenia, thrombocytopenia, lymphadenopathy, dehydration, hypocalcaemia, myalgia, arthralgia, hyperuricaemia, visual disturbances, eye pain, dry eyes, hearing impairment, tinnitus, earache, dry mouth, taste disturbances, mouth ulcers, stomatitis, glossitis, tooth disorder, gingivitis, alopecia, pruritus, dry skin, rash (including very rarely Stevens-Johnson syndrome and toxic epidermal necrolysis), increased sweating, psoriasis, photosensitivity, and acne; *less commonly* pancreatitis, gastro-intestinal bleeding, and hypertriglyceridaemia; *rarely* peptic ulcer, arrhythmias, cardiomyopathy, myocardial infarction, pericarditis, stroke, interstitial pneumonitis, pulmonary embolism, seizures, renal failure, vasculitis, rheumatoid arthritis, systemic lupus erythematosus, sarcoidosis, optic neuropathy, and retinal haemorrhage; *very rarely* aplastic anaemia and peripheral ischaemia; *in children* also growth retardation (including decrease in height and weight), pallor, tachypnoea, hyperkinesia, viremia, and skin discoloration

### Dose

- See preparations below

1. For details of the preterm age groups included in the recommendations, see *Immunisation against Infectious Disease* (2006), available at [www.dh.gov.uk/immunisation](http://www.dh.gov.uk/immunisation)

**Copegus®** (Roche) (POM)

**Tablets**, f/c, ribavirin 200 mg (pink), net price 42-tab pack = £92.50, 112-tab pack = £246.65, 168-tab pack = £369.98; 400 mg (red-brown), 56-tab pack = £246.65. Label: 21

**Dose** chronic hepatitis C (in combination with interferon alfa or peginterferon alfa), **ADULT** over 18 years, body-weight under 75 kg, 400 mg in the morning and 600 mg in the evening; body-weight 75 kg and over, 600 mg twice daily

**Note** Patients with chronic hepatitis C genotype 2 or 3 (not previously treated), or patients infected with HIV and hepatitis C require a lower dose of *Copegus®* (in combination with peginterferon alfa), usual dose 400 mg twice daily

**Rebetol®** (Schering-Plough) (POM)

**Capsules**, ribavirin 200 mg, net price 84-cap pack = £160.69, 140-cap pack = £267.81, 168-cap pack = £321.38. Label: 21

**Oral solution**, ribavirin 200 mg/5 mL, net price 100 mL (bubble-gum-flavoured) = £67.08. Label: 21

**Dose** chronic hepatitis C (in combination with interferon alfa or peginterferon alfa), **ADULT** over 18 years, body-weight under 65 kg, 400 mg twice daily; body-weight 65–81 kg, 400 mg in the morning and 600 mg in the evening; body-weight 81–105 kg, 600 mg twice daily; body-weight over 105 kg, 600 mg in the morning and 800 mg in the evening; **CHILD** 3–18 years, body-weight under 47 kg, 15 mg/kg daily in 2 divided doses; body-weight 47–50 kg, 200 mg in the morning and 400 mg in the evening; body-weight 50–65 kg, 400 mg twice daily; body-weight over 65 kg, as adult

**Virazole®** (Meda) (POM) 

**Inhalation**, ribavirin 6 g for reconstitution with 300 mL water for injections. Net price 3 × 6-g vials = £349.00

**Dose** bronchiolitis, by aerosol inhalation or nebulisation (via small particle aerosol generator) of solution containing 20 mg/mL for 12–18 hours for at least 3 days; max. 7 days

## 5.4 Antiprotozoal drugs

- 5.4.1 Antimalarials
- 5.4.2 Amoebicides
- 5.4.3 Trichomonacides
- 5.4.4 Antigiardial drugs
- 5.4.5 Leishmaniocides
- 5.4.6 Trypanocides
- 5.4.7 Drugs for toxoplasmosis
- 5.4.8 Drugs for pneumocystis pneumonia

### 5.4.1 Antimalarials

Recommendations on the prophylaxis and treatment of malaria reflect guidelines agreed by UK malaria specialists.

The centres listed above should be consulted for advice on special problems.

#### Treatment of malaria

If the infective species is **not known**, or if the infection is **mixed**, initial treatment should be as for *falciparum malaria* with quinine, *Malarone®* (proguanil with atovaquone), or *Riamet®* (artemether with lumefantrine). *Falciparum malaria* can progress rapidly in unprotected individuals and antimalarial treatment should be considered in those with features of severe malaria and possible exposure, even if the initial blood tests for the organism are negative.

#### Falciparum malaria (treatment)

*Falciparum malaria* (malignant malaria) is caused by *Plasmodium falciparum*. In most parts of the world *P. falciparum* is now resistant to chloroquine which should not therefore be given for treatment.

**Quinine**, *Malarone®* (proguanil with atovaquone), or *Riamet®* (artemether with lumefantrine) can be given by *mouth* if the patient can swallow and retain tablets and there are no serious manifestations (e.g. impaired consciousness); quinine should be given by *intravenous infusion* (see below) if the patient is seriously ill or unable to take tablets. Mefloquine is now rarely used for treatment because of concerns about resistance.

**Oral.** The adult dosage regimen for **quinine by mouth** is:

600 mg (of quinine salt<sup>†</sup>) every 8 hours for 5–7 days together with or followed by either **doxycycline** 200 mg once daily for 7 days or **clindamycin** 450 mg every 8 hours for 7 days [unlicensed indication].

If the parasite is likely to be sensitive, **pyrimethamine** 75 mg with **sulfadoxine** 1.5 g as a single dose [unlicensed] may be given (instead of either clindamycin or doxycycline) together with, or after, a course of quinine.

Alternatively, *Malarone®* or *Riamet®* may be given instead of quinine. It is not necessary to give

† Valid for quinine hydrochloride, dihydrochloride, and sulphate; not valid for quinine bisulphate which contains a correspondingly smaller amount of quinine.

doxycycline, clindamycin or pyrimethamine with sulfadoxine after *Malarone*<sup>®</sup> or *Riamet*<sup>®</sup> treatment.

The adult dose of *Malarone*<sup>®</sup> by mouth is:  
4 ('standard') tablets once daily for 3 days.

The dose of *Riamet*<sup>®</sup> by mouth for adult with body-weight over 35 kg is:

4 tablets initially, followed by 5 further doses of 4 tablets each given at 8, 24, 36, 48, and 60 hours (total 24 tablets over 60 hours).

**Parenteral.** If the patient is seriously ill or unable to take tablets, **quinine** should be given by *intravenous infusion* [unlicensed]. The adult dosage regimen for quinine by *infusion* is:

loading dose<sup>1</sup> of 20 mg/kg<sup>2</sup> (up to maximum 1.4 g) of quinine salt<sup>3</sup> infused over 4 hours *then 8 hours after the start of the loading dose*, maintenance dose of 10 mg/kg<sup>4</sup> (up to maximum 700 mg) of quinine salt<sup>3</sup> infused over 4 hours every 8 hours (until patient can swallow tablets to complete the 7-day course *together with or followed by either* doxycycline or clindamycin as above).

Specialist advice should be sought in difficult cases (e.g. very high parasite count, deterioration on optimal doses of quinine, infection acquired in quinine-resistant areas of south east Asia) because intravenous **artesunate** may be available for 'named-patient' use.

## Children

**Oral. Quinine** is well tolerated by children although the salts are bitter. The dosage regimen for quinine by *mouth* for children is:

10 mg/kg (of quinine salt<sup>3</sup>; max. 600 mg) every 8 hours for 7 days *together with or followed by*

**Clindamycin** 7–13 mg/kg (max. 450 mg) every 8 hours for 7 days [unlicensed indication]

*or* in children over 12 years, **doxycycline** 200 mg once daily for 7 days

*or* if the parasite is likely to be sensitive, **pyrimethamine with sulfadoxine** as a single dose [unlicensed]: up to 4 years and body-weight over 5 kg, pyrimethamine 12.5 mg with sulfadoxine 250 mg; 5–6 years, pyrimethamine 25 mg with sulfadoxine 500 mg; 7–9 years, pyrimethamine 37.5 mg with sulfadoxine 750 mg; 10–14 years, pyrimethamine 50 mg with sulfadoxine 1 g; 14–18 years, pyrimethamine 75 mg with sulfadoxine 1.5 g

Alternatively, *Malarone*<sup>®</sup> or *Riamet*<sup>®</sup> may be given instead of quinine; it is not necessary to give clindamycin, doxycycline, or pyrimethamine with sulfadoxine after *Malarone*<sup>®</sup> or *Riamet*<sup>®</sup> treatment. The dose regimen for *Malarone*<sup>®</sup> by *mouth* for children over 40 kg is the same as for adults (see above); the dose

- In intensive care units the loading dose can alternatively be given as quinine salt<sup>3</sup> 7 mg/kg infused over 30 minutes followed immediately by 10 mg/kg over 4 hours then (after 8 hours) maintenance dose as described.
- Important:** the loading dose of 20 mg/kg should not be used if the patient has received quinine or mefloquine during the previous 12 hours.
- Valid for quinine hydrochloride, dihydrochloride, and sulphate; not valid for quinine bisulphate which contains a correspondingly smaller amount of quinine.
- Maintenance dose should be reduced to 5–7 mg/kg of quinine salt<sup>3</sup> in patients with severe renal impairment, severe hepatic impairment, or if parenteral treatment is required for more than 48 hours.

regimen for *Malarone*<sup>®</sup> for smaller children is reduced as follows:

body-weight 5–8 kg, 2 'paediatric' tablets once daily for 3 days; body-weight 9–10 kg, 3 'paediatric' tablets once daily for 3 days; body-weight 11–20 kg, 1 'standard' tablet once daily for 3 days; body-weight 21–30 kg, 2 'standard' tablets once daily for 3 days; body-weight 31–40 kg, 3 'standard' tablets once daily for 3 days.

The dose regimen of *Riamet*<sup>®</sup> by *mouth* for children over 12 years and body-weight over 35 kg is the same as for adults (see above). The dose regimen for *Riamet*<sup>®</sup> for children under 12 years is as follows:

body-weight 5–15 kg 1 tablet initially, followed by 5 further doses of 1 tablet each given at 8, 24, 36, 48, and 60 hours (total 6 tablets over 60 hours); body-weight 15–25 kg 2 tablets initially, followed by 5 further doses of 2 tablets each given at 8, 24, 36, 48, and 60 hours (total 12 tablets over 60 hours); body-weight 25–35 kg 3 tablets initially, followed by 5 further doses of 3 tablets each given at 8, 24, 36, 48, and 60 hours (total 18 tablets over 60 hours)

**Parenteral.** The dose regimen for quinine by *intravenous infusion* for children is calculated on a mg/kg basis as for adults (see above).

**Pregnancy** Falciparum malaria is particularly dangerous in pregnancy, especially in the last trimester. The adult treatment doses of oral and intravenous quinine given above (including the loading dose) can safely be given to pregnant women. Clindamycin 450 mg every 8 hours for 7 days [unlicensed indication] should be given with or after quinine. Doxycycline should be avoided in pregnancy (affects teeth and skeletal development); pyrimethamine with sulfadoxine, *Malarone*<sup>®</sup>, and *Riamet*<sup>®</sup> are also best avoided until more information is available. Specialist advice should be sought in difficult cases (e.g. very high parasite count, deterioration on optimal doses of quinine, infection acquired in quinine-resistant areas of south east Asia) because intravenous artesunate may be available for 'named patient' use.

## Benign malaria (treatment)

Benign malaria is usually caused by *Plasmodium vivax* and less commonly by *P. ovale* and *P. malariae*. **Chloroquine**<sup>5</sup> is the drug of choice for the treatment of benign malaria (but chloroquine-resistant *P. vivax* infection has been reported from Indonesia, New Guinea and some adjacent islands).

The adult dosage regimen for **chloroquine** by *mouth* is:

initial dose of 620 mg of base *then*  
a single dose of 310 mg of base after 6 to 8 hours *then*  
a single dose of 310 mg of base daily for 2 days  
(approximate total cumulative dose of 25 mg/kg of base)

Chloroquine alone is adequate for *P. malariae* infections but in the case of *P. vivax* and *P. ovale*, a **radical**

- For the treatment of chloroquine-resistant benign malaria, *Malarone*<sup>®</sup> [unlicensed indication], quinine, or *Riamet*<sup>®</sup> [unlicensed indication] can be used; as with chloroquine, primaquine should be given for radical cure.

*cure* (to destroy parasites in the liver and thus prevent relapses) is required. This is achieved with **primaquine**<sup>1</sup> [unlicensed] given after chloroquine; in *P. vivax* infection primaquine is given in an adult dosage of 30 mg daily for 14 days and for *P. ovale* infection it is given in an adult dosage of 15 mg daily for 14 days.

**Children** The dosage regimen of chloroquine for benign malaria in children is:

initial dose of 10 mg/kg of base (max. 620 mg) then a single dose of 5 mg/kg of base (max. 310 mg) after 6–8 hours then

a single dose of 5 mg/kg of base (max. 310 mg) daily for 2 days

For a *radical cure*, primaquine<sup>1</sup> [unlicensed] is then given to children over 6 months of age; specialist advice should be sought for children under 6 months of age. In *P. vivax* infection primaquine is given in a dose of 500 micrograms/kg (max. 30 mg) daily for 14 days, and for *P. ovale* infection it is given in a dose of 250 micrograms/kg (max. 15 mg) daily for 14 days.

**Parenteral** If the patient is unable to take oral therapy, quinine can be given by *intravenous infusion* [unlicensed]. The dose (for adults and children) is 10 mg/kg<sup>2</sup> (max. 700 mg) of quinine salt<sup>2</sup> infused over 4 hours every 8 hours, changed to oral chloroquine as soon as the patient's condition permits.

**Pregnancy** The adult treatment doses of chloroquine can be given for benign malaria. In the case of *P. vivax* or *P. ovale*, however, the radical cure with primaquine should be **postponed** until the pregnancy is over; instead chloroquine should be continued at a dose of 310 mg each week during the pregnancy.

## Prophylaxis against malaria

The recommendations on prophylaxis reflect guidelines agreed by UK malaria specialists; the advice is aimed at residents of the UK who travel to endemic areas. The choice of drug for a particular individual should take into account:

- risk of exposure to malaria;
- extent of drug resistance;
- efficacy of the recommended drugs;
- side-effects of the drugs;
- patient-related factors (e.g. age, pregnancy, renal or hepatic impairment, compliance with prophylactic regimen).

**Protection against bites** Prophylaxis is not absolute, and breakthrough infection can occur with any of the drugs recommended. Personal protection against

1. Before starting primaquine, blood should be tested for glucose-6-phosphate dehydrogenase (G6PD) activity since the drug can cause haemolysis in G6PD-deficient patients. Specialist advice should be obtained in G6PD deficiency; in mild G6PD deficiency primaquine in a dose for adults of 45 mg once a week (children 750 micrograms/kg once a week; max. 45 mg once a week) for 8 weeks, has been found useful and without undue harmful effects.
2. Maintenance dose should be reduced to 5–7 mg/kg of quinine salt<sup>3</sup> in patients with severe renal impairment, severe hepatic impairment, or if parenteral treatment is required for more than 48 hours.
3. Valid for quinine hydrochloride, dihydrochloride, and sulphate; not valid for quinine bisulphate which contains a correspondingly smaller amount of quinine.

being bitten is very important. Mosquito nets impregnated with permethrin provide the most effective barrier protection against insects; mats and vaporised insecticides are also useful. Diethyltoluamide (DEET) 20–50% in lotions, sprays, or roll-on formulations is safe and effective when applied to the skin of adults and children over 2 months of age. It can also be used during pregnancy and breast-feeding. The duration of protection varies according to the concentration of DEET and is longest for DEET 50%. Long sleeves and trousers worn after dusk also provide protection.

**Length of prophylaxis** In order to determine tolerance and to establish habit, prophylaxis should generally be started one week (preferably 2–3 weeks in the case of mefloquine) before travel into an endemic area (or if not possible at earliest opportunity up to 1 or 2 days before travel); *Malarone*<sup>®</sup> or doxycycline prophylaxis should be started 1–2 days before travel. Prophylaxis should be continued for **4 weeks after leaving** (except for *Malarone*<sup>®</sup> prophylaxis which should be stopped 1 week after leaving).

In those requiring long-term prophylaxis, chloroquine and proguanil may be used for periods of over 5 years. Mefloquine is licensed for up to 1 year (although it has been used for up to 3 years without undue problems). Doxycycline can be used for up to 2 years. *Malarone*<sup>®</sup> is licensed for use for up to 28 days but can be used for up to 1 year (and possibly longer) with caution. Specialist advice should be sought for long-term prophylaxis.

**Return from malarial region** It is important to be aware that **any illness** that occurs within 1 year and **especially within 3 months of return might be malaria** even if all recommended precautions against malaria were taken. Travellers should be **warned** of this and told that if they develop any illness **particularly within 3 months** of their return they should go **immediately** to a doctor and specifically mention their exposure to malaria.

**Children** Prophylactic doses are based on guidelines agreed by UK malaria experts and may differ from advice in product literature. Weight is a better guide than age. If in doubt telephone centres listed on p. 402.

**Epilepsy** Both chloroquine and mefloquine are unsuitable for malaria prophylaxis in individuals with a history of epilepsy. In areas *without chloroquine resistance* proguanil 200 mg daily alone is recommended; in areas *with chloroquine resistance*, doxycycline or *Malarone*<sup>®</sup> may be considered; the metabolism of doxycycline may be influenced by antiepileptics (see **interactions: Appendix 1** (tetracyclines)).

**Asplenia** Asplenic individuals (or those with severe splenic dysfunction) are at particular risk of severe malaria. If travel to malarious areas is unavoidable, rigorous precautions are required against contracting the disease.

**Renal impairment** Avoidance (or dosage reduction) of proguanil is recommended since it is excreted by the kidneys. *Malarone*<sup>®</sup> should not be used for prophylaxis in patients with estimated glomerular filtration rate less than 30 mL/minute/1.73 m<sup>2</sup>. Chloroquine is only partially excreted by the kidneys and reduction of the dose for prophylaxis is not required except in severe impairment. Mefloquine is considered to be appropriate

to use in renal impairment and does not require dosage reduction. Doxycycline is also considered to be appropriate.

**Pregnancy** Travel to malarious areas should be avoided during pregnancy; if travel is unavoidable, effective prophylaxis must be used. Chloroquine and proguanil can be given in the usual doses during pregnancy, but these drugs are not appropriate for most areas because their effectiveness has declined, particularly in Sub-Saharan Africa; in the case of proguanil, folic acid 5 mg daily should be given. The centres listed on p. 402 should be consulted for advice on prophylaxis in chloroquine-resistant areas. Although the manufacturer advises that mefloquine should not be used during pregnancy, particularly in the first trimester, unless the potential benefit outweighs the risk, studies of mefloquine in pregnancy (including use in the first trimester) indicate that it can be considered for travel to chloroquine-resistant areas. Doxycycline is contra-indicated during pregnancy. *Malarone*<sup>®</sup> should be avoided during pregnancy unless there is no suitable alternative.

**Breast-feeding** Prophylaxis is required in **breast-fed infants**; although antimalarials are present in milk, the amounts are too variable to give reliable protection.

**Anticoagulants** Travellers taking warfarin should begin chemoprophylaxis at least 1 week (2–3 weeks for mefloquine) before departure. The INR should be stable before departure. It should be measured before starting chemoprophylaxis, 7 days after starting, and after completing the course. For prolonged stays, the INR should be checked at regular intervals.

## Specific recommendations

Where a journey requires two regimens, the regimen for the higher risk area should be used for the whole journey. Those travelling to remote or little-visited areas may require expert advice.

Risk may vary in different parts of a country—check under all risk levels

**Important** Settled immigrants (or long-term visitors) to the UK may be unaware that they will have **lost some of their immunity** and also that the areas where they previously lived **may now be malarious**

## North Africa, the Middle East, and Central Asia

**Very low risk** Risk *very low* in Algeria, Egypt (but *low risk* in El Faiyum, see below), Georgia (south-east, July–October), Kyrgyzstan (but *low risk* in south-west, see below), Libya, most tourist areas of Turkey (but *low risk* in Adana and border with Syria, see below), Uzbekistan (extreme south-east only):

chemoprophylaxis not recommended but avoid mosquito bites and consider malaria if fever presents

**Low risk** Risk *low* in Armenia (June–October), Azerbaijan (southern border areas, June–September), Egypt (El Faiyum only, June–October), Iran (northern border with Azerbaijan, May–October; *variable risk* in rural south-east provinces; see below), rural north Iraq (May–November), Kyrgyzstan (south-west, May–October), north border of Syria (May–October), Turkey (plain around Adana and east of there, border with Syria, March–November):

preferably

chloroquine or (if chloroquine not appropriate) proguanil hydrochloride

**Variable risk** Risk *variable* and *chloroquine resistance* present in Afghanistan (below 2000 m, May–November), Iran (rural south-east provinces, March–November, see also *Low Risk* above), Oman (remote rural areas only), Saudi Arabia (south-west and rural areas of western region; no risk in Mecca, Medina, Jeddah, or high-altitude areas of Asir Province), Tajikistan (June–October), Yemen (no risk in Sana'a):

chloroquine + proguanil hydrochloride or (if chloroquine + proguanil not appropriate) doxycycline

## Sub-Saharan Africa

*No chemoprophylaxis recommended* for Cape Verde (some risk on São Tiago) and Mauritius (but avoid mosquito bites and consider malaria if fever presents)

**Very high risk** Risk *very high* (or *locally very high*) and *chloroquine resistance* *very widespread* in Angola, Benin, Botswana (northern half, November–June), Burkina Faso, Burundi, Cameroon, Central African Republic, Chad, Comoros, Congo, Democratic Republic of the Congo (formerly Zaïre), Djibouti, Equatorial Guinea, Eritrea, Ethiopia (below 2000 m; no risk in Addis Ababa), Gabon, Gambia, Ghana, Guinea, Guinea-Bissau, Ivory Coast, Kenya, Liberia, Madagascar, Malawi, Mali, Mauritania (all year in south; July–October in north), Mozambique, Namibia (all year along Kavango and Kunene rivers; November–June in northern third), Niger, Nigeria, Principe, Rwanda, São Tomé, Senegal, Sierra Leone, Somalia, South Africa (low-altitude areas of Mpumalanga and Limpopo Provinces, Kruger National Park, and north-east KwaZulu-Natal as far south as Jozini), Sudan, Swaziland, Tanzania, Togo, Uganda, Zambia, Zimbabwe (all year in Zambezi valley; November–June in other areas below 1200 m; risk negligible in Harare and Bulawayo):

mefloquine or doxycycline or *Malarone*<sup>®</sup>

**Note** In Zimbabwe and neighbouring countries, pyrimethamine with dapsone (also known as *Deltaprim*<sup>®</sup>) prophylaxis is used by local residents (sometimes with chloroquine)—this regimen is not recommended.

## South Asia

**Low risk** Risk low in Bangladesh (but *high risk* in Chittagong Hill Tracts, see below), India (Kerala [southern states], Tamil Nadu, Karnataka, Southern Andhra Pradesh [including Hyderabad], Mumbai, Rajasthan [including Jaipur], Uttar Pradesh [including Agra], Haryana, Uttarakhand, Himachal Pradesh, Jammu, Kashmir, Punjab, Delhi; *variable risk* in other areas, see below; *high risk* in Assam), Sri Lanka (but *variable risk* north of Vavuniya, see below):

chemoprophylaxis not recommended but avoid mosquito bites and consider malaria if fever present

**Variable risk** Risk *variable* and *chloroquine resistance usually moderate* in southern districts of Bhutan, India (*low risk* in some areas, see above; *high risk* in Assam, see below), Nepal (below 1500 m, especially Terai districts; no risk in Kathmandu), Pakistan (below 2000 m), Sri Lanka (north of Vavuniya; *low risk* in other areas, see above):

chloroquine + proguanil hydrochloride or (if chloroquine + proguanil not appropriate) mefloquine or doxycycline or Malarone®

**High risk** Risk *high* and *chloroquine resistance high* in Bangladesh (only in Chittagong Hill Tracts; *low risk* in other areas, see above), India (Assam only; see also *Low Risk* and *Variable Risk* above):

mefloquine or doxycycline or Malarone® or (if mefloquine, doxycycline, or Malarone® not appropriate) chloroquine + proguanil hydrochloride

## South-East Asia

**Very low risk** Risk *very low* in Bali, Brunei, Cambodia (Angkor Wat and Siem Reap, but no risk in Phnom Penh; *substantial risk* in other areas, see below; *great risk* in western provinces, see below), main tourist areas of China (but *substantial risk* in Yunnan and Hainan, see below; *chloroquine prophylaxis* appropriate for other remote areas), Hong Kong, Korea (both North and South), Malaysia (both East and West including Cameron Highlands, but *substantial risk* in Sabah [except Kota Kinabalu], and *variable risk* in deep forests, see below), Singapore, Thailand (**important**: regional risk exists, see under *Great Risk*, below), Vietnam (cities, coast between Ho Chi Minh and Hanoi, and Mekong River until close to Cambodian border; *substantial risk* in other areas, see below):

chemoprophylaxis not recommended but avoid mosquito bites and consider malaria if fever presents

**Variable risk** Risk *variable* and *some chloroquine resistance* in Indonesia (*very low risk* in Bali, and cities but *substantial risk* in Irian Jaya [West Papua] and

Lombok, see below), rural Philippines below 600 m (no risk in cities, Cebu, Bohol, and Catanduanes), deep forests of peninsular Malaysia and Sarawak (but *substantial risk* in Sabah, see below):

chloroquine + proguanil hydrochloride or (if chloroquine + proguanil not appropriate) mefloquine or doxycycline or Malarone®

**Substantial risk** Risk *substantial* and *drug resistance common* in Cambodia (no risk or *very low risk* in some areas, see above; *great risk* in western provinces, see below), China (Yunnan and Hainan; *chloroquine prophylaxis* appropriate for other remote areas; see also *Very Low Risk* above), East Timor, Irian Jaya [West Papua], Laos (no risk in Vientiane), Lombok, Malaysia (Sabah; see also *Very Low Risk* and *Variable Risk* above), Myanmar (formerly Burma; see also *Great Risk* below), Vietnam (*very low risk* in some areas, see above):

mefloquine or doxycycline or Malarone®

**Great risk and drug resistance present** Risk *great* and *widespread chloroquine and mefloquine resistance present* in western provinces of Cambodia (see also *Very Low Risk* and *Substantial Risk* above), borders of Thailand with Cambodia, Laos and Myanmar (*very low risk* in Chang Rai and Kwai Bridge, see above), Myanmar (eastern Shan State):

doxycycline or Malarone®

## Oceania

**Risk** Risk *high* and *chloroquine resistance high* in Papua New Guinea (below 1800 m), Solomon Islands, Vanuatu:

doxycycline or mefloquine or Malarone®

## Central and South America and the Caribbean

**Very low risk** Risk *very low* in Jamaica:

chemoprophylaxis not recommended but avoid mosquito bites and consider malaria if fever presents

**Variable to low risk** Risk *variable to low* in Argentina (rural areas along northern borders only), rural Belize (except Belize district), Costa Rica (Limon Province except Puerto Limon and northern canton of Pocococi), Dominican Republic, El Salvador (Santa Ana province in west), Guatemala (below 1500 m), Haiti, Honduras, Mexico (states of Oaxaca and Chiapas), Nicaragua,

Panama (west of Panama Canal but *variable to high risk* east of Panama Canal, see below), rural Paraguay:

chloroquine or (if chloroquine not appropriate) proguanil hydrochloride

**Variable to high risk** Risk *variable to high* and *chloroquine resistance present* in rural areas of Bolivia (below 2500 m), Ecuador (below 1500 m; no malaria in Galapagos Islands and Guayaquil; see below for Esmeraldas Province), Panama (east of Panama Canal), Peru (rural areas east of the Andes and west of the Amazon basin area below 1500 m; see below for Amazon basin area), Venezuela (north of Orinoco river; *high risk* south of and including Orinoco river and Amazon basin area, see below; Caracas free of malaria):

chloroquine + proguanil hydrochloride or (if chloroquine + proguanil not appropriate) mefloquine or doxycycline or Malarone®

**High risk** Risk *high* and *marked chloroquine resistance* in Bolivia (Amazon basin area; see also *variable to high risk* above), Brazil (throughout 'Legal Amazon' area which includes the Amazon basin area, Mato Grosso and Maranhao only; elsewhere *very low risk*—no chemoprophylaxis), Colombia (most areas below 800 m), Ecuador (Esmeraldas Province; *variable to high risk* in other areas, see above), French Guiana, all interior regions of Guyana, Peru (Amazon basin area), Suriname (except Paramaribo and coast), Venezuela (Amazon basin area, areas south of and including Orinoco river):

mefloquine or doxycycline or Malarone®

### Standby treatment

Travellers visiting remote, malarious areas for prolonged periods should carry standby treatment if they are likely to be more than 24 hours away from medical care. Self-medication should be **avoided** if medical help is accessible.

In order to avoid excessive self-medication, the traveller should be provided with **written instructions** that urgent medical attention should be sought if fever (38°C or more) develops 7 days (or more) after arriving in a malarious area and that self-treatment is indicated if medical help is not available within 24 hours of fever onset.

In view of the continuing emergence of resistant strains and of the different regimens required for different areas expert advice should be sought on the best treatment course for an individual traveller. A drug used for chemoprophylaxis should not be considered for standby treatment for the same traveller.

## Artemether with lumefantrine

Artemether with lumefantrine is licensed for the *treatment of acute uncomplicated falciparum malaria*.

### ARTEMETHER WITH LUMEFANTRINE

**Indications** treatment of acute uncomplicated falciparum malaria; treatment of benign malaria [unlicensed indication]

**Cautions** electrolyte disturbances, concomitant use with other drugs known to cause QT-interval prolongation; monitor patients unable to take food (greater risk of recrudescence); **interactions:** Appendix 1 (artemether with lumefantrine)

**Driving** Dizziness may affect performance of skilled tasks (e.g. driving)

**Contra-indications** history of arrhythmias, of clinically relevant bradycardia, and of congestive heart failure accompanied by reduced left ventricular ejection fraction; family history of sudden death or of congenital QT interval prolongation

**Hepatic impairment** manufacturer advises caution in severe impairment—monitor ECG and plasma-potassium concentration

**Renal impairment** manufacturer advises caution in severe impairment—monitor ECG and plasma potassium concentration

**Pregnancy** toxicity in *animal* studies with artemether; manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** manufacturer advises avoid breast-feeding for at least 1 week after last dose; present in milk in *animal* studies

**Side-effects** abdominal pain, anorexia, diarrhoea, vomiting, nausea; palpitation, prolonged QT interval; cough; headache, dizziness, sleep disturbances, asthenia, paraesthesia; arthralgia, myalgia; pruritus, rash; *less commonly* ataxia, hypoaesthesia, and clonus

#### Dose

- Treatment of malaria, see p. 402

**Riamet®** (Novartis) ▼ (POM)

Tablets, yellow, artemether 20 mg, lumefantrine 120 mg, net price 24-tab pack = £22.50. Label: 21, counselling, driving

**Note** Tablets may be crushed just before administration

## Chloroquine

Chloroquine is used for the *prophylaxis of malaria* in areas of the world where the *risk of chloroquine-resistant falciparum malaria is still low*. It is also used with proguanil when chloroquine-resistant falciparum malaria is present but this regimen may not give optimal protection (see specific recommendations by country, p. 405).

Chloroquine is **no longer recommended** for the *treatment of falciparum malaria* owing to widespread resistance, nor is it recommended if the infective species is *not known* or if the infection is *mixed*; in these cases treatment should be with quinine, Malarone®, or Riamet® (for details, see p. 402). It is still recommended for the *treatment of benign malaria* (for details, see p. 403).

## CHLOROQUINE

**Indications** chemoprophylaxis and treatment of malaria; rheumatoid arthritis and lupus erythematosus (section 10.1.3)

**Cautions** may exacerbate psoriasis; neurological disorders (avoid for prophylaxis if history of epilepsy, see notes above); may aggravate myasthenia gravis; severe gastro-intestinal disorders; G6PD deficiency (see section 9.1.5); ophthalmic examination and long-term therapy, see under Chloroquine, section 10.1.3; avoid concurrent therapy with hepatotoxic drugs—other **interactions**: Appendix 1 (chloroquine and hydroxychloroquine)

**Hepatic impairment** use with caution in moderate to severe impairment

**Renal impairment** manufacturers advise caution; see also Prophylaxis Against Malaria, p. 404

**Pregnancy** benefit of prophylaxis and treatment in malaria outweighs risk; see also Benign Malarials (treatment), p. 404 and Prophylaxis Against Malaria, p. 405

**Breast-feeding** amount in milk probably too small to be harmful; see also Prophylaxis Against Malaria, p. 405

**Side-effects** gastro-intestinal disturbances, headache; also hypotension, convulsions, visual disturbances, depigmentation or loss of hair, skin reactions (rashes, pruritus); rarely, bone-marrow suppression, hypersensitivity reactions such as urticaria and angioedema; other side-effects (not usually associated with malaria prophylaxis or treatment), see under Chloroquine, section 10.1.3; very toxic in **overdosage**—immediate advice from poisons centres essential (see also p. 37)

### Dose

**Note** Doses expressed as chloroquine base

- Prophylaxis of malaria, preferably started 1 week before entering endemic area and continued for 4 weeks after leaving (see notes above), 310 mg once weekly; **INFANT** up to 12 weeks body-weight under 6 kg, 37.5 mg once weekly; 12 weeks–1 year body-weight 6–10 kg, 75 mg once weekly; **CHILD** 1–4 years body-weight 10–16 kg, 112.5 mg once weekly; 4–8 years body-weight 16–25 kg, 150 mg once weekly (or 155 mg once weekly if tablets used); 8–13 years body-weight 25–45 kg, 225 mg once weekly (or 232.5 mg once weekly if tablets used); over 13 years body-weight over 45 kg, adult dose
  - Treatment of benign malaria, see p. 403
- Counselling** Warn travellers about **importance** of avoiding mosquito bites, **importance** of taking prophylaxis regularly, and **importance** of immediate visit to doctor if ill within 1 year and **especially** within 3 months of return. For details, see notes above

**Note** Chloroquine doses in BNF may differ from those in product literature

### <sup>1</sup>Avloclor® (AstraZeneca) (POM)

**Tablets**, scored, chloroquine phosphate 250 mg (≡ chloroquine base 155 mg). Net price 20-tab pack = £1.22. Label: 5, counselling, prophylaxis, see above

1. Can be sold to the public provided it is licensed and labelled for the prophylaxis of malaria. Drugs for malaria prophylaxis not prescribable on the NHS, health authorities may investigate circumstances under which antimalarials are prescribed

### <sup>1</sup>Malarivon® (Wallace Mfg) (POM)

**Syrup**, chloroquine phosphate 80 mg/5 mL (≡ chloroquine base 50 mg/5 mL), net price 75 mL = £8.75. Label: 5, counselling, prophylaxis, see above

### <sup>1</sup>Nivaquine® (Sanofi-Aventis) (POM)

**Syrup**, golden, chloroquine sulphate 68 mg/5 mL (≡ chloroquine base 50 mg/5 mL), net price 100 mL = £4.60. Label: 5, counselling, prophylaxis, see above

### ▲With proguanil

For cautions and side-effects of proguanil see Proguanil; for dose see Chloroquine and Proguanil

### <sup>1</sup>Paludrine/Avloclor® (AstraZeneca)

**Tablets**, travel pack of 14 tablets of chloroquine phosphate 250 mg (≡ chloroquine base 155 mg) and 98 tablets of proguanil hydrochloride 100 mg, net price 112-tab pack = £8.79. Label: 5, 21, counselling, prophylaxis, see above

## Mefloquine

Mefloquine is used for the *prophylaxis of malaria* in areas of the world where there is a *high risk of chloroquine-resistant falciparum malaria* (for details, see specific recommendations by country, p. 405).

Mefloquine is now rarely used for the *treatment of falciparum malaria* because of increased resistance. It is rarely used for the treatment of benign malaria because better tolerated alternatives are available. Mefloquine should not be used for treatment if it has been used for prophylaxis.

## MEFLOQUINE

**Indications** chemoprophylaxis of malaria, treatment of malaria, see notes above

**Cautions** cardiac conduction disorders; epilepsy (avoid for prophylaxis); not recommended in infants under 3 months (5 kg); **interactions**: Appendix 1 (mefloquine)

**Driving** Dizziness or a disturbed sense of balance may affect performance of skilled tasks (e.g. driving); effects may persist for up to 3 weeks

**Contra-indications** hypersensitivity to quinine; avoid for prophylaxis if history of psychiatric disorders (including depression) or convulsions

**Hepatic impairment** avoid for prophylaxis in severe liver disease

**Pregnancy** manufacturer advises adequate contraception during prophylaxis and for 3 months after stopping (teratogenicity in *animal studies*), but see also p. 405

**Breast-feeding** present in milk but risk to infant minimal; see also p. 405

**Side-effects** nausea, vomiting, dyspepsia, abdominal pain, diarrhoea; headache, dizziness, sleep disturbances; *less frequently* anorexia, bradycardia, fatigue, abnormal dreams, fever, tinnitus, and neuropsychiatric reactions (including sensory and motor neuropathies, tremor, ataxia, anxiety, depression, panic attacks, agitation, hallucinations, psychosis, convulsions); *rarely* suicidal ideation; *very rarely* pneumonitis; also reported, circulatory disorders (including hypotension and hypertension), chest pain, tachycardia, palpitation, cardiac conduction disorders, oedema, dyspnoea, encephalopathy, leucopenia,

leucocytosis, thrombocytopenia, muscle weakness, myalgia, arthralgia, visual disturbances, vestibular disorders, rash (including Stevens-Johnson syndrome), pruritus, and alopecia

#### Dose

- Prophylaxis of malaria, preferably started 2½ weeks before entering endemic area and continued for 4 weeks after leaving (see notes above), **ADULT** and **CHILD** body-weight over 45 kg, 250 mg once weekly; body-weight 6–16 kg, 62.5 mg once weekly; body-weight 16–25 kg, 125 mg once weekly; body-weight 25–45 kg, 187.5 mg once weekly
  - Treatment of malaria, see notes above
- Counselling** Inform travellers about adverse reactions of mefloquine and, if they occur, to seek medical advice on alternative antimalarials before the next dose is due. Also warn travellers about **importance** of avoiding mosquito bites, **importance** of taking prophylaxis regularly, and **importance** of immediate visit to doctor if ill within 1 year and **especially** within 3 months of return. For details, see notes above

**Note** Mefloquine doses in BNF may differ from those in product literature

#### <sup>1</sup>Lariam® (Roche) (POM)

**Tablets**, scored, mefloquine (as hydrochloride) 250 mg. Net price 8-tab pack = £14.53. Label: 21, 25, 27, counselling, driving, prophylaxis, see above  
**Note** Tablet may be crushed and mixed with food such as jam or honey just before administration

## Primaquine

Primaquine is used to eliminate the liver stages of *P. vivax* or *P. ovale* following chloroquine treatment (for details, see p. 403).

### PRIMAQUINE

**Indications** adjunct in the treatment of *Plasmodium vivax* and *P. ovale* malaria (eradication of liver stages)

**Cautions** G6PD deficiency (test blood, see under Benign Malarials (treatment), p. 403); systemic diseases associated with granulocytopenia (e.g. rheumatoid arthritis, lupus erythematosus); **interactions:** Appendix 1 (primaquine)

**Pregnancy** risk of neonatal haemolysis and methaemoglobinemia in third trimester; see also p. 404

**Breast-feeding** no information available; theoretical risk of haemolysis in G6PD-deficient infants

**Side-effects** nausea, vomiting, anorexia, abdominal pain; less commonly methaemoglobinemia, haemolytic anaemia especially in G6PD deficiency, leucopenia

#### Dose

- Treatment of benign malarials, see p. 403

**Primaquine** (Non-proprietary)

**Tablets**, primaquine (as phosphate) 7.5 mg or 15 mg Available from 'special-order' manufacturers or specialist-importing companies, see p. 988

## Proguanil

Proguanil is used (usually *with chloroquine*, but occasionally *alone*) for the *prophylaxis of malaria*, (for details, see specific recommendations by country, p. 405).

1. Drugs for malaria prophylaxis not prescribable on the NHS; health authorities may investigate circumstances under which antimalarials prescribed

Proguanil used alone is not suitable for the *treatment of malaria*; however, *Malarone*® (a combination of atovaquone with proguanil) is licensed for the treatment of acute uncomplicated falciparum malaria. *Malarone*® is also used for the *prophylaxis of falciparum malaria* in areas of *widespread mefloquine or chloroquine resistance*. *Malarone*® is also used as an alternative to mefloquine or doxycycline. *Malarone*® is particularly suitable for short trips to highly chloroquine-resistant areas because it needs to be taken only for 7 days after leaving an endemic area.

### PROGUANIL HYDROCHLORIDE

**Indications** chemoprophylaxis of malaria

**Cautions interactions:** Appendix 1 (proguanil)

**Renal impairment** 100 mg once daily if eGFR 20–60 mL/minute/1.73 m<sup>2</sup>; 50 mg on alternate days if eGFR 10–20 mL/minute/1.73 m<sup>2</sup>; 50 mg once weekly if eGFR less than 10 mL/minute/1.73 m<sup>2</sup> (increased risk of haematological toxicity)

**Pregnancy** benefit of prophylaxis in malaria outweighs risk; adequate folate supplements should be given to mother; see also p. 405

**Breast-feeding** amount in milk probably too small to be harmful when used for malaria prophylaxis; see also p. 405

**Side-effects** mild gastric intolerance, diarrhoea, and constipation; occasionally mouth ulcers and stomatitis; *very rarely* cholestasis, vasculitis, skin reactions, and hair loss

#### Dose

- Prophylaxis of malaria, preferably started 1 week before entering endemic area and continued for 4 weeks after leaving (see notes above), 200 mg once daily; **INFANT** up to 12 weeks body-weight under 6 kg, 25 mg once daily; 12 weeks–1 year body-weight 6–10 kg, 50 mg once daily; **CHILD** 1–4 years body-weight 10–16 kg, 75 mg once daily; 4–8 years body-weight 16–25 kg, 100 mg once daily; 8–13 years, body-weight 25–45 kg, 150 mg once daily; over 13 years body-weight over 45 kg, adult dose

**Counselling** Warn travellers about **importance** of avoiding mosquito bites, **importance** of taking prophylaxis regularly, and **importance** of immediate visit to doctor if ill within 1 year and **especially** within 3 months of return. For details, see notes above

**Note** Proguanil doses in BNF may differ from those in product literature.

#### <sup>2</sup>Paludrine® (AstraZeneca)

**Tablets**, scored, proguanil hydrochloride 100 mg. Net price 98-tab pack = £7.43. Label: 21, counselling, prophylaxis, see above

**Note** Tablet may be crushed and mixed with food such as milk, jam, or honey just before administration

#### ▲ With chloroquine

See under Chloroquine

### PROGUANIL HYDROCHLORIDE WITH ATOVAQUONE

**Indications** treatment of acute uncomplicated falciparum malaria and prophylaxis of falciparum malaria, particularly where resistance to other antimalarial

2. Can be sold to the public provided it is licensed and labelled for the prophylaxis of malaria. Drugs for malaria prophylaxis not prescribable on the NHS; health authorities may investigate circumstances under which antimalarials are prescribed

drugs suspected; treatment of benign malaria [unlicensed indication]

**Cautions** diarrhoea or vomiting (reduced absorption of atovaquone); efficacy not evaluated in cerebral or complicated malaria (including hyperparasitaemia, pulmonary oedema or renal failure); **interactions:** see Appendix 1 (proguanil, atovaquone)

**Renal impairment** avoid for malaria prophylaxis (and if possible for malaria treatment) if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** manufacturer advises avoid unless essential

**Breast-feeding** use only if no suitable alternative available; see also p. 405

**Side-effects** abdominal pain, nausea, vomiting, diarrhoea; cough; headache, dizziness, insomnia, abnormal dreams, depression, anorexia, fever, rash, pruritus; *less frequently* stomatitis, palpitation, anxiety, blood disorders, hyponatraemia, and hair loss; also reported, hepatitis, cholestasis, tachycardia, hallucinations, seizures, vasculitis, mouth ulcers, and Stevens-Johnson syndrome

### Dose

• See preparations

**Counselling** Warn travellers about **importance** of avoiding mosquito bites, **importance** of taking prophylaxis regularly, and **importance** of immediate visit to doctor if ill within 1 year and **especially** within 3 months of return. For details, see notes above

### <sup>1</sup>Malarone® (GSK) (POM)

**Tablets** ('standard'), pink, f/c, proguanil hydrochloride 100 mg, atovaquone 250 mg. Net price 12-tab pack = £25.21. Label: 21, counselling, prophylaxis, see above

**Dose** prophylaxis of malaria, started 1–2 days before entering endemic area and continued for 1 week after leaving, **ADULT** and **CHILD** over 40 kg, 1 tablet daily

Treatment of malaria, **ADULT** and **CHILD** body-weight over 40 kg, 4 tablets once daily for 3 days; **CHILD** body-weight 11–21 kg 1 tablet daily for 3 days; body-weight 21–31 kg 2 tablets once daily for 3 days; body-weight 31–40 kg 3 tablets once daily for 3 days

### <sup>1</sup>Malarone® Paediatric (GSK) (POM)

**Paediatric tablets**, pink, f/c proguanil hydrochloride 25 mg, atovaquone 62.5 mg, net price 12-tab pack = £6.26. Label: 21, counselling, prophylaxis, see above

**Dose** prophylaxis of malaria, started 1–2 days before entering endemic area and continued for 1 week after leaving, **CHILD** body-weight 11–21 kg, 1 tablet once daily; body-weight 21–31 kg, 2 tablets once daily; body-weight 31–40 kg, 3 tablets once daily; body-weight over 40 kg use *Malarone®* ('standard') tablets

Treatment of malaria, **CHILD** body-weight 5–9 kg, 2 tablets once daily for 3 days; body-weight 9–11 kg, 3 tablets once daily for 3 days; body-weight 11 kg and over use *Malarone®* ('standard') tablets

**Note** Tablets may be crushed and mixed with food or milky drink just before administration

## Pyrimethamine

Pyrimethamine should not be used alone, but is used with sulfadoxine.

Pyrimethamine with sulfadoxine is not recommended for the *prophylaxis of malaria*, but it can be used in the treatment of *falciparum malaria with (or following) quinine*.

1. Drugs for malaria prophylaxis not prescribable on the NHS; health authorities may investigate circumstances under which antimalarials prescribed

## PYRIMETHAMINE

**Indications** malaria (but used only in combined preparations incorporating sulfadoxine); toxoplasmosis—section 5.4.7

**Cautions** blood counts required with prolonged treatment; history of seizures—avoid large loading doses; **interactions:** Appendix 1 (pyrimethamine)

**Hepatic impairment** manufacturer advises caution

**Renal impairment** manufacturer advises caution

**Pregnancy** theoretical teratogenic risk in *first trimester* (folate antagonist); adequate folate supplements should be given to mother

**Breast-feeding** significant amount in milk—avoid administration of other folate antagonists to infant; avoid breast-feeding during toxoplasmosis treatment

**Side-effects** depression of haematopoiesis with high doses, rashes, insomnia

### Dose

- Malaria, no dose stated because not recommended alone, see Pyrimethamine with Sulfadoxine below
- Toxoplasmosis, section 5.4.7

### Daraprim® (GSK) (POM)

**Tablets**, scored, pyrimethamine 25 mg. Net price 30-tab pack = £2.60

## PYRIMETHAMINE WITH SULFADOXINE

**Indications** adjunct to quinine in treatment of *Plasmodium falciparum* malaria; **not** recommended for prophylaxis

**Cautions** see under Pyrimethamine and under Co-trimoxazole (section 5.1.8); **not** recommended for prophylaxis (severe side-effects on long-term use); **interactions:** Appendix 1 (pyrimethamine, sulfonamides)

**Contra-indications** see under Pyrimethamine and under Co-trimoxazole (section 5.1.8); sulfonamide allergy

**Pregnancy** possible teratogenic risk in *first trimester* (pyrimethamine a folate antagonist); in *third trimester*—risk of neonatal haemolysis and methaemoglobinemia; fear of increased risk of kernicterus in neonates appears to be unfounded; see also p. 403

**Breast-feeding** small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants (due to sulfadoxine)

**Side-effects** see under Pyrimethamine and under Co-trimoxazole (section 5.1.8); pulmonary infiltrates (e.g. eosinophilic or allergic alveolitis) reported—discontinue if cough or shortness of breath

### Dose

- Treatment of falciparum malaria, see p. 402
- Prophylaxis, **not** recommended by UK malaria experts

### Pyrimethamine with sulfadoxine (Non-proprietary)

(POM)

**Tablets**, scored, pyrimethamine 25 mg, sulfadoxine 500 mg, net price 3-tab pack = 74p

**Note** Also known as *Fansidar®*

Available from 'special-order' manufacturers or specialist importing companies, see p. 988

## Quinine

Quinine is not suitable for the *prophylaxis of malaria*.

Quinine is used for the *treatment of falciparum malaria* or if the infective species is *not known* or if the infection is *mixed* (for details see p. 402).

### QUININE

**Indications** falciparum malaria; nocturnal leg cramps, see section 10.2.2

**Cautions** cardiac disease (including atrial fibrillation, conduction defects, heart block), elderly—monitor ECG during parenteral treatment; monitor blood glucose and electrolyte concentration during parenteral treatment; G6PD deficiency (see section 9.1.5); **interactions:** Appendix 1 (quinine)

**Contra-indications** haemoglobinuria, myasthenia gravis, optic neuritis, tinnitus

**Hepatic impairment** for treatment of malaria in severe impairment, reduce parenteral maintenance dose to 5–7 mg/kg of quinine salt

**Renal impairment** for treatment of malaria in severe impairment, reduce parenteral maintenance dose to 5–7 mg/kg of quinine salt

**Pregnancy** high doses are teratogenic in *first trimester*, but in malaria benefit of treatment outweighs risk; see also p. 403

**Breast-feeding** present in milk but not known to be harmful

**Side-effects** cinchonism, including tinnitus, hearing impairment, vertigo, headache, nausea, vomiting, abdominal pain, diarrhoea, visual disturbances (including temporary blindness), confusion; cardiovascular effects (see Cautions); dyspnoea; hypersensitivity reactions including angioedema, rashes, hot and flushed skin; hypoglycaemia (especially after parenteral administration); blood disorders (including thrombocytopenia and intravascular coagulation); acute renal failure; muscle weakness; photosensitivity; very toxic in **overdosage**—immediate advice from poisons centres essential (see also p. 37)

### Dose

- Treatment of malaria, see p. 402

**Note** Quinine (anhydrous base) 100 mg = quinine bisulphate 169 mg = quinine dihydrochloride 122 mg = quinine hydrochloride 122 mg = quinine sulphate 121 mg. Quinine bisulphate 300-mg tablets are available but provide less quinine than 300 mg of the dihydrochloride, hydrochloride, or sulphate

**Quinine Sulphate** (Non-proprietary) (POM)

**Tablets**, coated, quinine sulphate 200 mg, net price 28-tab pack = £2.20; 300 mg, 28-tab pack = £2.12

**Quinine Dihydrochloride** (Non-proprietary) (POM)

**Injection**, quinine dihydrochloride 300 mg/mL. For dilution and use as an infusion. 1- and 2-mL amps Available from 'special-order' manufacturers or specialist importing companies, see p. 988

**Note** Intravenous injection of quinine is so hazardous that it has been superseded by infusion

## Tetracyclines

**Doxycycline** (section 5.1.3) is used for the *prophylaxis of malaria* in areas of *widespread mefloquine or chloroquine resistance*. Doxycycline is also used as an alter-

native to mefloquine or *Malarone*<sup>®</sup> (for details, see specific recommendations by country, p. 405).

**Doxycycline** is also used as an *adjunct to quinine in the treatment of falciparum malaria* (for details see p. 402).

### DOXYCYCLINE

**Indications** prophylaxis of malaria; adjunct to quinine in treatment of *Plasmodium falciparum* malaria; see also section 5.1.3

**Cautions** section 5.1.3

**Contra-indications** section 5.1.3

**Hepatic impairment** section 5.1.3

**Renal impairment** section 5.1.3

**Pregnancy** section 5.1.3

**Breast-feeding** section 5.1.3

**Side-effects** section 5.1.3

### Dose

- Prophylaxis of malaria, started 1–2 days before entering endemic area and continued for 4 weeks after leaving (see notes above). **ADULT** and **CHILD** over 12 years, 100 mg once daily
- Treatment of falciparum malaria, see p. 402

### Preparations

Section 5.1.3

## 5.4.2 Amoebicides

**Metronidazole** is the drug of choice for *acute invasive amoebic dysentery* since it is very effective against vegetative forms of *Entamoeba histolytica* in ulcers; it is given in an adult dose of 800 mg three times daily for 5 days. **Tinidazole** is also effective. Metronidazole and tinidazole are also active against amoebae which may have migrated to the liver. Treatment with metronidazole (or tinidazole) is followed by a 10-day course of diloxanide furoate.

**Diloxanide furoate** is the drug of choice for asymptomatic patients with *E. histolytica* cysts in the faeces; metronidazole and tinidazole are relatively ineffective. Diloxanide furoate is relatively free from toxic effects and the usual course is of 10 days, given alone for chronic infections or following metronidazole or tinidazole treatment.

For *amoebic abscesses* of the liver **metronidazole** is effective; tinidazole is an alternative. Aspiration of the abscess is indicated where it is suspected that it may rupture or where there is no improvement after 72 hours of metronidazole; the aspiration may need to be repeated. Aspiration aids penetration of metronidazole and, for abscesses with more than 100 mL of pus, if carried out in conjunction with drug therapy, may reduce the period of disability.

Diloxanide furoate is not effective against hepatic amoebiasis, but a 10-day course should be given at the completion of metronidazole or tinidazole treatment to destroy any amoebae in the gut.

### DILOXANIDE FUROATE

**Indications** see notes above; chronic amoebiasis and as adjunct to metronidazole or tinidazole in acute amoebiasis

**Pregnancy** manufacturer advises avoid—no information available

**Breast-feeding** manufacturer advises avoid

**Side-effects** flatulence, vomiting, urticaria, pruritus

#### Dose

- 500 mg every 8 hours for 10 days; **CHILD** body-weight over 25 kg, 20 mg/kg daily in 3 divided doses for 10 days; body-weight under 25 kg, see *BNF for Children* See also notes above

**Diloxanide** (Sovereign) (FHM)

Tablets, diloxanide furate 500 mg, net price 30-tablet pack = £93.50. Label: 9

## METRONIDAZOLE

**Indications** see under Dose below; anaerobic infections, section 5.1.11

**Cautions** section 5.1.11

**Hepatic impairment** section 5.1.11

**Pregnancy** section 5.1.11

**Breast-feeding** section 5.1.11

**Side-effects** section 5.1.11

#### Dose

- By mouth, invasive intestinal amoebiasis, extra-intestinal amoebiasis (including liver abscess), 800 mg every 8 hours for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection); **CHILD** 1–3 years 200 mg every 8 hours; 3–7 years 200 mg every 6 hours; 7–10 years 400 mg every 8 hours
- Urogenital trichomoniasis, 200 mg every 8 hours for 7 days or 400–500 mg every 12 hours for 5–7 days, or 2 g as a single dose; **CHILD** 1–3 years 50 mg every 8 hours for 7 days; 3–7 years 100 mg every 12 hours; 7–10 years 100 mg every 8 hours
- Giardiasis, 2 g daily for 3 days or 400 mg 3 times daily for 5 days or 500 mg twice daily for 7–10 days; **CHILD** 1–3 years 500 mg daily for 3 days; 3–7 years 600–800 mg daily; 7–10 years 1 g daily

#### Preparations

Section 5.1.11

## TINIDAZOLE

**Indications** see under Dose below; anaerobic infections, section 5.1.11

**Cautions** section 5.1.11

**Pregnancy** section 5.1.11

**Breast-feeding** section 5.1.11

**Side-effects** section 5.1.11

#### Dose

- Intestinal amoebiasis, 2 g daily for 2–3 days; **CHILD** 50–60 mg/kg daily for 3 days
- Amoebic involvement of liver, 1.5–2 g daily for 3–6 days; **CHILD** 50–60 mg/kg daily for 5 days
- Urogenital trichomoniasis and giardiasis, single 2 g dose; **CHILD** single dose of 50–75 mg/kg (repeated once if necessary)

#### Preparations

Section 5.1.11

## 5.4.3 Trichomonacides

**Metronidazole** (section 5.4.2) is the treatment of choice for *Trichomonas vaginalis* infection. Contact tracing is recommended and sexual contacts should be treated simultaneously. If metronidazole is ineffective, **tinidazole** (section 5.4.2) may be tried.

## 5.4.4 Antigiardial drugs

**Metronidazole** (section 5.4.2) is the treatment of choice for *Giardia lamblia* infections. Alternative treatments are **tinidazole** (section 5.4.2) or **mepacrine hydrochloride**.

## MEPACRINE HYDROCHLORIDE

**Indications** giardiasis; discoid lupus erythematosus (Antimalarials, section 10.1.3)

**Cautions** hepatic impairment, elderly, history of psychosis; avoid in psoriasis; **interactions:** Appendix 1 (mepacrine)

**Side-effects** gastro-intestinal disturbances; dizziness, headache; with large doses nausea, vomiting and occasionally transient acute toxic psychosis and CNS stimulation; on prolonged treatment yellow discoloration of skin and urine, chronic dermatoses (including severe exfoliative dermatitis), hepatitis, aplastic anaemia; also reported blue/black discoloration of palate and nails and corneal deposits with visual disturbances

#### Dose

- Giardiasis [unlicensed], 100 mg every 8 hours for 5–7 days

#### Mepacrine Hydrochloride

Tablets, mepacrine hydrochloride 100 mg. Label: 4, 9, 14, 21

Available from 'special-order' manufacturers or specialist importing companies, see p. 988

## 5.4.5 Leishmaniacides

Cutaneous leishmaniasis frequently heals spontaneously but if skin lesions are extensive or unsightly, treatment is indicated, as it is in visceral leishmaniasis (kala-azar). Leishmaniasis should be treated under specialist supervision.

**Sodium stibogluconate**, an organic pentavalent antimony compound, is used for visceral leishmaniasis. The dose is 20 mg/kg daily (max. 850 mg) by intramuscular or intravenous injection for 28 days in visceral leishmaniasis and for 20 days in cutaneous infection; the dosage varies with different geographical regions and expert advice should be obtained. Some early non-inflamed lesions of cutaneous leishmaniasis can be treated with intralesional injections of sodium stibogluconate under specialist supervision.

**Amphotericin** is used with or after an antimony compound for visceral leishmaniasis unresponsive to the antimonial alone; side-effects may be reduced by using liposomal amphotericin (*AmBisome*®—section 5.2) at a dose of 1–3 mg/kg daily for 10–21 days to a cumulative dose of 21–30 mg/kg or at a dose of 3 mg/kg for 5 consecutive days followed by a single dose of

3 mg/kg 6 days later. *Abelcer*<sup>®</sup>, a lipid formulation of amphotericin is also likely to be effective but less information is available.

**Pentamidine isetonate** (pentamidine isethionate) (section 5.4.8) has been used in antimony-resistant visceral leishmaniasis, but although the initial response is often good, the relapse rate is high; it is associated with serious side-effects. Other treatments include paromomycin [unlicensed] (available from 'special-order' manufacturers or specialist importing companies, see p. 988).

## SODIUM STIBOGLUCONATE

**Indications** leishmaniasis

**Cautions** intravenous injections must be given slowly over 5 minutes (to reduce risk of local thrombosis) and stopped if coughing or substernal pain; mucocutaneous disease (see below); monitor ECG before and during treatment; heart disease (withdraw if conduction disturbances occur); treat intercurrent infection (e.g. pneumonia)

**Mucocutaneous disease** Successful treatment of mucocutaneous leishmaniasis may induce severe inflammation around the lesions (may be life-threatening if pharyngeal or tracheal involvement)—may require corticosteroid

**Hepatic impairment** use with caution

**Renal impairment** avoid in significant impairment

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** amount probably too small to be harmful

**Side-effects** anorexia, nausea, vomiting, abdominal pain, diarrhoea; ECG changes; coughing (see Cautions); headache, lethargy; arthralgia, myalgia; rarely jaundice, flushing, bleeding from nose or gum, substernal pain (see Cautions), vertigo, fever, sweating, and rash; also reported pancreatitis and anaphylaxis; pain and thrombosis on intravenous administration, intramuscular injection also painful

### Dose

- See notes above

**Pentostam**<sup>®</sup> (GSK) (P<sub>o</sub>M)

**Injection**, sodium stibogluconate equivalent to pentavalent antimony 100 mg/mL. Net price 100-mL bottle = £66.43

**Note** Injection should be filtered immediately before administration using a filter of 5 microns or less

## 5.4.6 Trypanocides

The prophylaxis and treatment of trypanosomiasis is difficult and differs according to the strain of organism. Expert advice should therefore be obtained.

### 5.4.7 Drugs for toxoplasmosis

Most infections caused by *Toxoplasma gondii* are self-limiting, and treatment is not necessary. Exceptions are patients with eye involvement (toxoplasma choroïdoretinitis), and those who are immunosuppressed. Toxoplasmic encephalitis is a common complication of AIDS. The treatment of choice is a combination of pyrimethamine and sulfadiazine, given for several weeks (expert advice essential). Pyrimethamine is a folate antagonist, and adverse reactions to this combination are relatively common (folic acid supplements

and weekly blood counts needed). Alternative regimens use combinations of pyrimethamine with clindamycin or clarithromycin or azithromycin. Long-term secondary prophylaxis is required after treatment of toxoplasmosis in immunocompromised patients; prophylaxis should continue until immunity recovers.

If toxoplasmosis is acquired in pregnancy, transplacental infection may lead to severe disease in the fetus. Spiramycin [unlicensed] (available from 'special-order' manufacturers or specialist importing companies, see p. 988) may reduce the risk of transmission of maternal infection to the fetus.

## 5.4.8 Drugs for pneumocystis pneumonia

Pneumonia caused by *Pneumocystis jirovecii* (*Pneumocystis carinii*) occurs in immunosuppressed patients; it is a common cause of pneumonia in AIDS. *Pneumocystis pneumonia* should generally be treated by those experienced in its management. Blood gas measurement is used to assess disease severity.

### Treatment

**Mild to moderate disease** Co-trimoxazole (section 5.1.8) in high dosage is the drug of choice for the treatment of mild to moderate pneumocystis pneumonia.

**Atovaquone** is licensed for the treatment of mild to moderate pneumocystis infection in patients who cannot tolerate co-trimoxazole. A combination of **dapsone** 100 mg daily (section 5.1.10) with **trimethoprim** 5 mg/kg every 6–8 hours (section 5.1.8) is given by mouth for the treatment of mild to moderate disease [unlicensed indication].

A combination of **clindamycin** 600 mg by mouth every 8 hours (section 5.1.6) and **primaquine** 30 mg daily by mouth (section 5.4.1) is used in the treatment of mild to moderate disease [unlicensed indication]; this combination is associated with considerable toxicity.

**Severe disease** Co-trimoxazole (section 5.1.8) in high dosage, given by mouth or by intravenous infusion, is the drug of choice for the treatment of severe pneumocystis pneumonia. **Pentamidine isetonate** given by intravenous infusion is an alternative for patients who cannot tolerate co-trimoxazole, or who have not responded to it. Pentamidine isetonate is a potentially toxic drug that can cause severe hypotension during or immediately after infusion.

Corticosteroid treatment can be lifesaving in those with severe pneumocystis pneumonia (see Adjunctive Therapy below).

**Adjunctive therapy** In moderate to severe infections associated with HIV infection, prednisolone 50–80 mg daily is given by mouth for 5 days (alternatively, hydrocortisone may be given parenterally); the dose is then reduced to complete 21 days of treatment. Corticosteroid treatment should ideally be started at the same time as the anti-pneumocystis therapy and certainly no later than 24–72 hours afterwards. The corticosteroid should be withdrawn before anti-pneumocystis treatment is complete.

## Prophylaxis

Prophylaxis against pneumocystis pneumonia should be given to all patients with a history of the infection. Prophylaxis against pneumocystis pneumonia should also be considered for severely immunocompromised patients. Prophylaxis should continue until immunity recovers sufficiently. It should not be discontinued if the patient has oral candidiasis, continues to lose weight, or is receiving cytotoxic therapy or long-term immunosuppressant therapy.

**Co-trimoxazole** by mouth is the drug of choice for prophylaxis against pneumocystis pneumonia. It is given in a dose of 960 mg daily or 960 mg on alternate days (3 times a week); the dose may be reduced to co-trimoxazole 480 mg daily to improve tolerance.

Inhaled **pentamidine isetonate** is better tolerated than parenteral pentamidine. Intermittent inhalation of pentamidine isetonate is used for prophylaxis against pneumocystis pneumonia in patients unable to tolerate co-trimoxazole. It is effective but patients may be prone to extrapulmonary infection. Alternatively, **dapsone** 100 mg daily (section 5.1.10) can be used. **Atovaquone** 750 mg twice daily has also been used for prophylaxis [unlicensed indication].

intervals, until treatment concluded; patient should be lying down when receiving drug parenterally); hypokalaemia, hypomagnesaemia, coronary heart disease, bradycardia, history of ventricular arrhythmias, concomitant use with other drugs which prolong QT-interval; hypertension or hypotension; hyperglycaemia or hypoglycaemia; leucopenia, thrombocytopenia, or anaemia; carry out laboratory monitoring according to product literature; care required to protect personnel during handling and administration; **interactions:** Appendix 1 (pentamidine isetonate)

**Hepatic impairment** manufacturer advises caution

**Renal impairment** reduce intravenous dose for pneumocystis pneumonia if creatinine clearance less than 10 mL/minute: in *life-threatening infection*, use 4 mg/kg once daily for 7–10 days, then 4 mg/kg on alternate days to complete course of at least 14 doses; in *less severe infection*, use 4 mg/kg on alternate days for at least 14 doses

**Pregnancy** manufacturer advises avoid unless essential

**Breast-feeding** manufacturer advises avoid unless essential—no information available

**Side-effects** severe reactions, sometimes fatal, due to hypotension, hypoglycaemia, pancreatitis, and arrhythmias; also leucopenia, thrombocytopenia, acute renal failure, hypocalcaemia; also reported: azotaemia, abnormal liver-function tests, anaemia, hyperkalaemia, nausea and vomiting, dizziness, syncope, flushing, hyperglycaemia, rash, and taste disturbances; Stevens-Johnson syndrome reported: on inhalation, bronchoconstriction (may be prevented by prior use of bronchodilators), cough, and shortness of breath; discomfort, pain, induration, abscess formation, and muscle necrosis at injection site

### Dose

- Treatment of *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia, **by intravenous infusion**, 4 mg/kg once daily for at least 14 days
  - Prophylaxis of *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia, **by inhalation of nebulised solution** (using suitable equipment—consult product literature), 300 mg every 4 weeks or 150 mg every 2 weeks [unlicensed for primary prevention]
  - Visceral leishmaniasis (kala-azar, section 5.4.5), **by deep intramuscular injection**, 3–4 mg/kg on alternate days to max. total of 10 injections; course may be repeated if necessary
  - Cutaneous leishmaniasis, **by deep intramuscular injection**, 3–4 mg/kg once or twice weekly until condition resolves (but see also section 5.4.5)
  - Trypanosomiasis, **by deep intramuscular injection or intravenous infusion**, 4 mg/kg daily or on alternate days to total of 7–10 injections
- Note** Direct intravenous injection should be avoided whenever possible and **never** given rapidly; intramuscular injections should be deep and preferably given into the buttock

**Pentacarinat**<sup>®</sup> (Sanofi-Aventis) (PmL)

**Injection**, powder for reconstitution, pentamidine isetonate, net price 300-mg vial = £30.45

**Nebuliser solution**, pentamidine isetonate, net price 300-mg bottle = £32.15

**Caution in handling** Pentamidine isetonate is toxic and personnel should be adequately protected during handling and administration—consult product literature

## ATOVAQUONE

**Indications** treatment of mild to moderate *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia in patients intolerant of co-trimoxazole

**Cautions** initial diarrhoea and difficulty in taking with food may reduce absorption (and require alternative therapy); other causes of pulmonary disease should be sought and treated; elderly; **interactions:** Appendix 1 (atovaquone)

**Hepatic impairment** manufacturer advises caution—monitor more closely

**Renal impairment** manufacturer advises caution—monitor more closely

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk—no information available

**Breast-feeding** manufacturer advises avoid

**Side-effects** nausea, diarrhoea, vomiting; headache, insomnia; fever; anaemia, neutropenia, hyponatraemia; rash, pruritus; also reported, Stevens-Johnson syndrome

### Dose

- 750 mg twice daily with food (particularly high fat) for 21 days; **CHILD** not recommended

**Wellvone**<sup>®</sup> (GSK) (PmL)

**Suspension**, sugar-free, atovaquone 750 mg/5 mL, net price 226 mL (tutti-frutti-flavoured) = £405.31. Label: 21

### ▲ With proguanil hydrochloride

See section 5.4.1

## PENTAMIDINE ISETONATE

**Indications** see under Dose (should only be given by specialists)

**Cautions** risk of severe hypotension following administration (monitor blood pressure before starting treatment, during administration, and at regular

## 5.5 Anthelmintics

- 5.5.1 Drugs for threadworms
- 5.5.2 Ascariacides
- 5.5.3 Drugs for tapeworm infections
- 5.5.4 Drugs for hookworms
- 5.5.5 Schistosomicides
- 5.5.6 Filaricides
- 5.5.7 Drugs for cutaneous larva migrans
- 5.5.8 Drugs for strongyloidiasis

Advice on prophylaxis and treatment of helminth infections is available from:

Birmingham	(0121) 424 0357
Scottish Centre for Infection and Environmental Health (registered users of Travax only)	(0141) 300 1100 (weekdays 2–4 p.m. only)
Liverpool	(0151) 708 9393
London	0845 155 5000 (treatment)

### 5.5.1 Drugs for threadworms (pinworms, *Enterobius vermicularis*)

Anthelmintics are effective in threadworm infections, but their use needs to be combined with hygienic measures to break the cycle of auto-infection. All members of the family require treatment.

Adult threadworms do not live for longer than 6 weeks and for development of fresh worms, ova must be swallowed and exposed to the action of digestive juices in the upper intestinal tract. Direct multiplication of worms does not take place in the large bowel. Adult female worms lay ova on the perianal skin which causes pruritus; scratching the area then leads to ova being transmitted on fingers to the mouth, often via food eaten with unwashed hands. Washing hands and scrubbing nails before each meal and after each visit to the toilet is essential. A bath taken immediately after rising will remove ova laid during the night.

**Mebendazole** is the drug of choice for treating threadworm infection in patients of all ages over 2 years. It is given as a single dose; as reinfection is very common, a second dose may be given after 2 weeks.

**Piperazine** is available in combination with sennosides as a single-dose preparation.

### MEBENDAZOLE

**Indications** threadworm, roundworm, whipworm, and hookworm infections

**Cautions interactions:** Appendix 1 (mebendazole)  
**Note** The package insert in the *Vermox*<sup>®</sup> pack includes the statement that it is not suitable for women known to be pregnant or children under 2 years

**Pregnancy** manufacturer advises toxicity in animal studies

**Breast-feeding** amount too small to be harmful but manufacturer advises avoid

**Side-effects** abdominal pain; *less commonly* diarrhoea, flatulence, rash; *very rarely* hepatitis, con-

vulsions, neutropenia, urticaria, alopecia, Stevens-Johnson syndrome, toxic epidermal necrolysis

#### Dose

- Threadworms, **ADULT** and **CHILD** over 2 years, 100 mg as a single dose; if reinfection occurs second dose may be needed after 2 weeks; **CHILD** under 2 years, see *BNF for Children*
- Whipworms, **ADULT** and **CHILD** over 2 years, 100 mg twice daily for 3 days; **CHILD** under 2 years, see *BNF for Children*
- Roundworms—section 5.5.2
- Hookworms—section 5.5.4

#### <sup>1</sup>Mebendazole (Non-proprietary) <sup>(POM)</sup>

Tablets, chewable, mebendazole 100 mg

1. Mebendazole tablets can be sold to the public if supplied for oral use in the treatment of enterobiasis in adults and children over 2 years provided its container or package is labelled to show a max. single dose of 100 mg and it is supplied in a container or package containing not more than 800 mg

#### Vermox<sup>®</sup> (Janssen-Cilag) <sup>(POM)</sup>

Tablets, orange, scored, chewable, mebendazole 100 mg. Net price 6-tab pack = £1.36

Oral suspension, mebendazole 100 mg/5 mL (banana-flavoured). Net price 30 mL = £1.59

### PIPERAZINE

**Indications** threadworm and roundworm infections

**Cautions** epilepsy; packs on sale to the general public carry a warning to avoid in epilepsy, or in liver or kidney disease, and to seek medical advice in pregnancy

**Hepatic impairment** manufacturer advises avoid

**Renal impairment** use with caution; avoid in severe renal impairment; risk of neurotoxicity

**Pregnancy** not known to be harmful but manufacturer advises avoid in first trimester

**Breast-feeding** present in milk—manufacturer advises avoid breast-feeding for 8 hours after dose (express and discard milk during this time)

**Side-effects** nausea, vomiting, colic, diarrhoea, allergic reactions including urticaria, bronchospasm, and rare reports of arthralgia, fever, Stevens-Johnson syndrome and angioedema; rarely dizziness, muscular incoordination ('worm wobble'); drowsiness, nystagmus, vertigo, blurred vision, confusion and clonic contractions in patients with neurological or renal abnormalities

#### Dose

- See under Preparation, below

#### With sennosides

For cautions, contra-indications, side-effects of senna see section 1.6.2

#### Pripsen<sup>®</sup> (Thornton & Ross)

Oral powder, piperazine phosphate 4 g, total sennosides (calculated as sennoside B) 15.3 mg/sachet. Net price two-dose sachet pack = £1.98. Label: 13

**Dose** threadworms, stirred into milk or water, **ADULT** and **CHILD** over 6 years, content of 1 sachet as a single dose (bedtime in adults or morning in children), repeated after 14 days; **INFANT** 3 months–1 year, 1 level 2.5-mL spoonful in the morning, repeated after 14 days; **CHILD** 1–6 years, 1 level 5-mL spoonful in the morning, repeated after 14 days

Roundworms, first dose as for threadworms; repeat at monthly intervals for up to 3 months if reinfection risk

## 5.5.2 Ascaricides (common roundworm infections)

**Mebendazole** (section 5.5.1) is effective against *Ascaris lumbricoides* and is generally considered to be the drug of choice; the usual dose is 100 mg twice daily for 3 days or 500 mg as a single dose [unlicensed single dose].

**Levamisole** [unlicensed] (available from 'special-order' manufacturers or specialist importing companies, see p. 988) is an alternative when mebendazole cannot be used. It is very well tolerated; mild nausea or vomiting has been reported in about 1% of treated patients; it is given as a single dose of 120–150 mg in adults.

**Piperazine** may be given in a single adult dose, see Piperazine, above.

## 5.5.3 Drugs for tapeworm infections

### Taeniacides

**Nicosamide** [unlicensed] (available from 'special-order' manufacturers or specialist importing companies, see p. 988) is the most widely used drug for tapeworm infections and side-effects are limited to occasional gastro-intestinal upset, lightheadedness, and pruritus; it is not effective against larval worms. Fears of developing cysticercosis in *Taenia solium* infections have proved unfounded. All the same, an antiemetic can be given before treatment and a laxative can be given 2 hours after nicosamide.

**Praziquantel** [unlicensed] (available from 'special-order' manufacturers or specialist importing companies, see p. 988) is as effective as nicosamide and is given as a single dose of 5–10 mg/kg after a light breakfast (a single dose of 25 mg/kg for *Hymenolepis nana*).

### Hydatid disease

Cysts caused by *Echinococcus granulosus* grow slowly and asymptomatic patients do not always require treatment. Surgical treatment remains the method of choice in many situations. **Albendazole** [unlicensed] (available from 'special-order' manufacturers or specialist importing companies, see p. 988) is used in conjunction with surgery to reduce the risk of recurrence or as primary treatment in inoperable cases. Alveolar echinococcosis due to *E. multilocularis* is usually fatal if untreated. Surgical removal with albendazole cover is the treatment of choice, but where effective surgery is impossible, repeated cycles of albendazole (for a year or more) may help. Careful monitoring of liver function is particularly important during drug treatment.

## 5.5.4 Drugs for hookworms (ancylostomiasis, necatoriasis)

Hookworms live in the upper small intestine and draw blood from the point of their attachment to their host. An iron-deficiency anaemia may occur and, if present,

effective treatment of the infection requires not only expulsion of the worms but treatment of the anaemia.

**Mebendazole** (section 5.5.1) has a useful broad-spectrum activity, and is effective against hookworms; the usual dose is 100 mg twice daily for 3 days. **Albendazole** [unlicensed] (available from 'special-order' manufacturers or specialist importing companies, see p. 988) given as a single dose of 400 mg, is an alternative.

## 5.5.5 Schistosomicides (bilharziasis)

Adult *Schistosoma haematobium* worms live in the genito-urinary veins and adult *S. mansoni* in those of the colon and mesentery. *S. japonicum* is more widely distributed in veins of the alimentary tract and portal system.

**Praziquantel** [unlicensed] is available from Merck Serono (*Cysticide*®) and is effective against all human schistosomes. The dose is 20 mg/kg followed after 4–6 hours by one further dose of 20 mg/kg (20 mg/kg given 3 times on one day for *S. japonicum* infections). No serious adverse effects have been reported. Of all the available schistosomicides, it has the most attractive combination of effectiveness, broad-spectrum activity, and low toxicity.

Hycanthon, lucanthon, niridazole, oxamniquine, and sodium stibocaptate have now been superseded.

## 5.5.6 Filaricides

**Diethylcarbamazine** [unlicensed] (available from 'special-order' manufacturers or specialist importing companies, see p. 988) is effective against microfilariae and adults of *Loa loa*, *Wuchereria bancrofti*, and *Brugia malayi*. To minimise reactions treatment is commenced with a dose of diethylcarbamazine citrate 1 mg/kg on the first day and increased gradually over 3 days to 6 mg/kg daily in divided doses (up to 9 mg/kg daily in divided doses for *Loa loa*); this dosage is maintained for a further period. Close medical supervision is necessary particularly in the early phase of treatment.

In heavy infections there may be a febrile reaction, and in heavy *Loa loa* infection there is a small risk of encephalopathy. In such cases specialist advice should be sought, and treatment must be given under careful in-patient supervision and stopped at the first sign of cerebral involvement.

**Ivermectin** [unlicensed] (available from 'special-order' manufacturers or specialist importing companies, see p. 988) is very effective in *onchocerciasis* and it is now the drug of choice. A single dose of 150 micrograms/kg by mouth produces a prolonged reduction in microfilarial levels. Retreatment at intervals of 6 to 12 months depending on symptoms must be given until the adult worms die out. Reactions are usually slight and most commonly take the form of temporary aggravation of itching and rash. Diethylcarbamazine or suramin should no longer be used for *onchocerciasis* because of their toxicity.

### 5.5.7 Drugs for cutaneous larva migrans (creeping eruption)

Dog and cat hookworm larvae may enter human skin where they produce slowly extending itching tracks usually on the foot. Single tracks can be treated with topical tiabendazole (no commercial preparation available). Multiple infections respond to **ivermectin**, **albendazole** or **tiabendazole** (thiabendazole) by mouth [all unlicensed] and available from 'special-order' manufacturers or specialist importing companies, see p. 988).

### 5.5.8 Drugs for strongyloidiasis

Adult *Strongyloides stercoralis* live in the gut and produce larvae which penetrate the gut wall and invade the tissues, setting up a cycle of auto-infection. **Ivermectin** [unlicensed] (available from 'special-order' manufacturers or specialist importing companies, see p. 988) in a dose of 200 micrograms/kg daily for 2 days is the treatment of choice for chronic *Strongyloides* infection. **Albendazole** [unlicensed] (available from 'special-order' manufacturers or specialist importing companies, see p. 988) is an alternative given in a dose of 400 mg twice daily for 3 days, repeated after 3 weeks if necessary.

## 6.1 Drugs used in diabetes

<b>6.1.1</b>	<b>Insulins</b>
<b>6.1.2</b>	<b>Antidiabetic drugs</b>
<b>6.1.3</b>	<b>Diabetic ketoacidosis</b>
<b>6.1.4</b>	<b>Treatment of hypoglycaemia</b>
<b>6.1.5</b>	<b>Treatment of diabetic nephropathy and neuropathy</b>
<b>6.1.6</b>	<b>Diagnostic and monitoring devices for diabetes mellitus</b>

Diabetes mellitus occurs because of a lack of insulin or resistance to its action. It is diagnosed by measuring fasting or random blood-glucose concentration (and occasionally by oral glucose tolerance test). Although there are many subtypes, the two principal classes of diabetes are type 1 diabetes and type 2 diabetes.

*Type 1 diabetes*, (formerly referred to as insulin-dependent diabetes mellitus (IDDM)), occurs as a result of a deficiency of insulin following autoimmune destruction of pancreatic beta cells. Patients with type 1 diabetes require administration of insulin.

*Type 2 diabetes*, (formerly referred to as non-insulin-dependent diabetes (NIDDM)), is due to reduced secretion of insulin or to peripheral resistance to the action of insulin or to a combination of both. Although patients may be controlled on diet alone, many also require oral antidiabetic drugs or insulin (or both) to maintain satisfactory control. In overweight individuals, type 2 diabetes may be prevented by losing weight and increasing physical activity; use of the anti-obesity drug orlistat (section 4.5.1) may be considered in obese patients.

**Treatment of diabetes** Treatment of all forms of diabetes should be aimed at alleviating symptoms and minimising the risk of long-term complications (see below); tight control of diabetes is essential.

Diabetes is a strong risk factor for cardiovascular disease (section 2.12). Other risk factors for cardiovascular disease such as smoking (section 4.10.2), hypertension (section 2.5), obesity (section 4.5), and hyperlipidaemia

(section 2.12) should be addressed. Cardiovascular risk in patients with diabetes can be further reduced by the use of an ACE inhibitor (section 2.5.5.1), low-dose aspirin (section 2.9) and a lipid-regulating drug (section 2.12).

**Prevention of diabetic complications** Optimal glycaemic control in both type 1 diabetes and type 2 diabetes reduces, in the long term, the risk of microvascular complications including retinopathy, development of proteinuria and to some extent neuropathy. However, a temporary deterioration in established diabetic retinopathy may occur when normalising blood-glucose concentration. For reference to the use of an ACE inhibitor or an angiotensin-II receptor antagonist in the management of diabetic nephropathy, see section 6.1.5.

A measure of the total glycosylated (or glycated) haemoglobin (HbA<sub>1c</sub>) or a specific fraction (HbA<sub>1c</sub>) provides a good indication of glycaemic control over the previous 2–3 months. Overall it is ideal to aim for an HbA<sub>1c</sub> (glycosylated haemoglobin) concentration of 48–59 mmol/mol (6.5–7.5%) or less (reference range 20–42 mmol/mol or 4–6%) but this cannot always be achieved and for those using insulin there is a significantly increased risk of disabling hypoglycaemia; in those at risk of arterial disease, the aim should be to maintain the HbA<sub>1c</sub> concentration at 48 mmol/mol (6.5%) or less. HbA<sub>1c</sub> should be measured every 3–6 months.

#### Measurement of HbA<sub>1c</sub>

HbA<sub>1c</sub> values currently expressed as a percentage, are aligned to the assay used in the Diabetes Control and Complications Trial (DCCT). A new standard, specific for HbA<sub>1c</sub>, has been created by the International Federation of Clinical Chemistry and Laboratory Medicine (IFCC), which expresses HbA<sub>1c</sub> values in *mmol of glycosylated haemoglobin per mol of haemoglobin*. UK laboratories now express results in both IFCC-standardised units (mmol/mol) and DCCT-aligned units (%). From 1 June 2011, results will only be reported in IFCC-standardised units.

#### Equivalent values

IFCC-HbA <sub>1c</sub> (mmol/mol)	DCCT-HbA <sub>1c</sub> (%)
42	6.0
48	6.5
53	7.0
59	7.5
64	8.0
75	9.0

Laboratory measurement of serum-fructosamine concentration is technically simpler and cheaper than the measurement of HbA<sub>1c</sub> and can be used to assess control over short periods of time, particularly when HbA<sub>1c</sub> monitoring is invalid (e.g. disturbed erythrocyte turnover or abnormal haemoglobin type).

Tight control of blood pressure in hypertensive patients with type 2 diabetes reduces mortality and protects visual acuity (by reducing considerably the risks of maculopathy and retinal photocoagulation) (see also section 2.5).

**Driving** Drivers with diabetes are required to notify the Driver and Vehicle Licensing Agency (DVLA) of their condition if they are treated with insulin or if they are treated with oral antidiabetic drugs and also have complications. Detailed guidance on eligibility to drive is available from the DVLA ([www.dvla.gov.uk/medical.aspx](http://www.dvla.gov.uk/medical.aspx)). Driving is not permitted when hypoglycaemic awareness is impaired or frequent hypoglycaemic episodes occur.

Drivers need to be particularly careful to avoid hypoglycaemia (see also above) and should be warned of the problems. Drivers treated with insulin should normally check their blood-glucose concentration before driving and, on long journeys, at 2-hour intervals; these precautions may also be necessary for drivers taking oral antidiabetic drugs who are at particular risk of hypoglycaemia. Drivers treated with insulin should ensure that a supply of sugar is always available in the vehicle and they should avoid driving if their meal is delayed. If hypoglycaemia occurs, or warning signs develop, the driver should:

- stop the vehicle in a safe place;
- switch off the ignition;
- eat or drink a suitable source of sugar;
- wait until recovery is complete before continuing journey; recovery may take 15 minutes or longer and should preferably be confirmed by checking blood-glucose concentration.

## 6.1.1 Insulins

### 6.1.1.1 Short-acting insulins

### 6.1.1.2 Intermediate- and long-acting insulins

### 6.1.1.3 Hypodermic equipment

Insulin plays a key role in the regulation of carbohydrate, fat, and protein metabolism. It is a polypeptide hormone of complex structure. There are differences in the amino-acid sequence of animal insulins, human insulins and the human insulin analogues. Insulin may be extracted from pork pancreas and purified by crystallisation; it may also be extracted from beef pancreas, but beef insulins are now rarely used. Human sequence insulin may be produced semisynthetically by enzymatic modification of porcine insulin (emp) or biosynthetically by recombinant DNA technology using bacteria (crb, prb) or yeast (pyr).

All insulin preparations are to a greater or lesser extent immunogenic in man but immunological resistance to insulin action is uncommon. Preparations of human sequence insulin should theoretically be less immunogenic, but no real advantage has been shown in trials.

Insulin is inactivated by gastro-intestinal enzymes, and must therefore be given by injection; the subcutaneous route is ideal in most circumstances. Insulin is usually injected into the upper arms, thighs, buttocks, or abdomen; absorption from a limb site may be increased if the limb is used in strenuous exercise after the injection. Generally subcutaneous insulin injections cause few problems; lipodystrophy may occur but can be minimised by using different injection sites in rotation. Local allergic reactions are rare.

Insulin is needed by all patients with ketoacidosis, and it is likely to be needed by most patients with:

- rapid onset of symptoms;
- substantial loss of weight;
- weakness;
- ketonuria;
- a first-degree relative who has type 1 diabetes.

Insulin is required by almost all children with diabetes. It is also needed for type 2 diabetes when other methods have failed to achieve good control, and temporarily in the presence of intercurrent illness or peri-operatively. Pregnant women with type 2 diabetes may be treated with insulin when diet alone fails. For advice on use of oral antidiabetic drugs in the management of diabetes in pregnancy, see section 6.1.2.

**NHS Diabetes guidance**  
**Safe and Effective Use of Insulin in Hospitalised Patients (March 2010)**  
 Available at [www.diabetes.nhs.uk](http://www.diabetes.nhs.uk)

**Management of diabetes with insulin** The aim of treatment is to achieve the best possible control of blood-glucose concentration without making the patient obsessive and to avoid disabling hypoglycaemia; close co-operation is needed between the patient and the medical team because good control reduces the risk of complications.

Insulin preparations can be divided into 3 types:

- those of **short** duration which have a relatively rapid onset of action, namely soluble insulin and the rapid-acting insulin analogues, insulin aspart, insulin glulisine, and insulin lispro (section 6.1.1.1);
- those with an **intermediate** action, e.g. isophane insulin (section 6.1.1.2); and
- those whose action is slower in onset and lasts for **long** periods, e.g. protamine zinc insulin, insulin detemir, and insulin glargine (section 6.1.1.2).

The duration of action of a particular type of insulin varies considerably from one patient to another, and needs to be assessed individually.

Mixtures of insulin preparations may be required and appropriate combinations have to be determined for the individual patient. Treatment should be started with a short-acting insulin (e.g. soluble insulin) or a rapid-acting insulin analogue (e.g. insulin aspart) given before meals with intermediate-acting or long-acting insulin once or twice daily. Alternatively, for those who have difficulty with, or prefer not to use, multiple injection regimens, a mixture of premixed short-acting insulin or rapid acting insulin analogue with an intermediate-acting or long-acting insulin (most commonly in a proportion of 30% soluble insulin and 70% isophane insulin) can be given once or twice daily. The dose of short-acting or rapid-acting insulin (or the proportion of the short-acting soluble insulin component in premixed insulin) can be increased in those with excessive post-prandial hyperglycaemia. The dose of insulin is increased gradually according to the patient's individual requirements, taking care to avoid troublesome hypoglycaemic reactions.

Insulin requirements may be increased by infection, stress, accidental or surgical trauma, and during puberty. Requirements may be decreased in those

with certain endocrine disorders (e.g. Addison's disease, hypopituitarism), or in coeliac disease.

#### Examples of recommended insulin regimens

- Multiple injection regimen: short-acting insulin or rapid-acting insulin analogue, before meals  
 With intermediate-acting or long-acting insulin, once or twice daily;
- Short-acting insulin or rapid-acting insulin analogue mixed with intermediate-acting or long-acting insulin, once or twice daily (before meals);
- Intermediate-acting or long-acting insulin, once or twice daily  
 With or without short-acting insulin or rapid-acting insulin before meals;
- Continuous subcutaneous insulin infusion (see below).

**Hepatic impairment** Insulin requirements may be decreased in patients with hepatic impairment.

**Renal impairment** Insulin requirements may fall in patients with renal impairment and therefore dose reduction may be necessary. The compensatory response to hypoglycaemia is impaired in renal impairment.

**Pregnancy and breast-feeding** During pregnancy and breast-feeding, insulin requirements may alter and doses should be assessed frequently by an experienced diabetes physician. The dose of insulin generally needs to be increased in the second and third trimesters of pregnancy. The short-acting insulin analogues, insulin aspart and insulin lispro, are not known to be harmful, and may be used during pregnancy and lactation. The safety of long-acting insulin analogues in pregnancy has not been established, therefore isophane insulin is recommended where longer-acting insulins are needed.

**Insulin administration** Insulin is generally given by *subcutaneous injection*; the injection site should be rotated to prevent lipodystrophy. Injection devices ('pens') (section 6.1.1.3), which hold the insulin in a cartridge and meter the required dose, are convenient to use. Insulin syringes (for use with needles) are required for insulins not available in cartridge form.

For intensive insulin regimens multiple subcutaneous injections (3 or more times daily) are usually recommended.

Short-acting injectable insulins (soluble insulin, insulin aspart, insulin glulisine, and insulin lispro) can also be given by *continuous subcutaneous infusion* using a portable infusion pump. This device delivers a continuous basal insulin infusion and patient-activated bolus doses at meal times. This technique can be useful for patients who suffer recurrent hypoglycaemia or marked morning rise in blood-glucose concentration despite optimised multiple-injection regimens (see also NICE guidance, below). Patients on subcutaneous insulin infusion must be highly motivated, able to monitor their blood-glucose concentration, and have expert training, advice and supervision from an experienced healthcare team.

**NICE guidance****Continuous subcutaneous insulin infusion for the treatment of diabetes mellitus (type 1) (July 2008)**

Continuous subcutaneous insulin infusion is recommended as an option in adults and children over 12 years with type 1 diabetes:

- who suffer repeated or unpredictable hypoglycaemia, whilst attempting to achieve optimal glycaemic control with multiple-injection regimens, or
- whose glycaemic control remains inadequate ( $HbA_{1c}$  over 8.5%) despite optimised multiple-injection regimens (including the use of long-acting insulin analogues where appropriate).

Continuous subcutaneous insulin infusion is also recommended as an option for children under 12 years with type 1 diabetes for whom multiple-injection regimens are considered impractical or inappropriate. Children on insulin pumps should undergo a trial of multiple-injection therapy between the ages of 12 and 18 years.

Soluble insulin by the *intravenous route* is reserved for urgent treatment, e.g. in diabetic ketoacidosis, and for fine control in serious illness and in the peri-operative period (see under Diabetes and Surgery, below).

**Units** The word 'unit' should not be abbreviated.

**Monitoring** Many patients now monitor their own blood-glucose concentrations (section 6.1.6). Since blood-glucose concentration varies substantially throughout the day, 'normoglycaemia' cannot always be achieved throughout a 24-hour period without causing damaging hypoglycaemia. It is therefore best to recommend that patients should maintain a blood-glucose concentration of between 4 and 9 mmol/litre for most of the time (4–7 mmol/litre before meals and less than 9 mmol/litre after meals), while accepting that on occasions, for brief periods, it will be above these values; strenuous efforts should be made to prevent the blood-glucose concentration from falling below 4 mmol/litre. Patients using multiple injection regimens should understand how to adjust their insulin dose according to their carbohydrate intake. With fixed-dose insulin regimens, the carbohydrate intake needs to be regulated, and should be distributed throughout the day to match the insulin regimen. The intake of energy and of simple and complex carbohydrates should be adequate to allow normal growth and development but obesity must be avoided.

**Hypoglycaemia** Hypoglycaemia is a potential problem with insulin therapy. All patients must be carefully instructed on how to avoid it.

Loss of warning of hypoglycaemia among insulin-treated patients can be a serious hazard, especially for drivers and those in dangerous occupations. Very tight control of diabetes lowers the blood-glucose concentration needed to trigger hypoglycaemic symptoms; an increase in the frequency of hypoglycaemic episodes may reduce the warning symptoms experienced by the patient. Beta-blockers can also blunt hypoglycaemic awareness (and also delay recovery).

To restore the warning signs, episodes of hypoglycaemia must be minimised; this involves appropriate adjust-

ment of insulin type, dose and frequency together with suitable timing and quantity of meals and snacks.

Some patients have reported loss of hypoglycaemia warning after transfer to human insulin. Clinical studies do not confirm that human insulin decreases hypoglycaemia awareness. If a patient believes that human insulin is responsible for the loss of warning it is reasonable to revert to animal insulin and essential to educate the patient about avoiding hypoglycaemia. Great care should be taken to specify whether a human or an animal preparation is required.

Few patients are now treated with beef insulins; when undertaking conversion from beef to human insulin, the total dose should be reduced by about 10% with careful monitoring for the first few days. When changing between pork and human-sequence insulins, a dose change is not usually needed, but careful monitoring is still advised.

**Diabetes and surgery** Perioperative control of blood-glucose concentrations in patients with type 1 diabetes is achieved via an adjustable, continuous, intravenous infusion of insulin. Detailed local protocols should be available to all healthcare professionals involved in the treatment of these patients; in general, the following steps should be followed:

- Give an injection of the patient's usual insulin on the night before the operation;
- Early on the day of the operation, start an intravenous infusion of glucose containing potassium chloride (provided that the patient is not hyperkalaemic) and infuse at a constant rate appropriate to the patient's fluid requirements (usually 125 mL per hour); make up a solution of soluble insulin in sodium chloride 0.9% and infuse intravenously using a syringe pump piggy-backed to the intravenous infusion. Glucose and potassium infusions, and insulin infusions should be made up according to locally agreed protocols;
- The rate of the insulin infusion should be adjusted according to blood-glucose concentration (frequent monitoring necessary) in line with locally agreed protocols. Other factors affecting the rate of infusion include the patient's volume depletion, cardiac function, and age.

Protocols should include specific instructions on how to manage resistant cases (such as patients who are in shock or severely ill or those receiving corticosteroids or sympathomimetics) and those with hypoglycaemia.

If a syringe pump is not available, soluble insulin should be added to the intravenous infusion of glucose and potassium chloride (provided the patient is not hyperkalaemic), and the infusion run at the rate appropriate to the patient's fluid requirements (usually 125 mL per hour) with the insulin dose adjusted according to blood-glucose concentration in line with locally agreed protocols.

Once the patient starts to eat and drink, give subcutaneous insulin before breakfast and stop intravenous insulin 30 minutes later; the dose may need to be 10–20% more than usual if the patient is still in bed or unwell. If the patient was not previously receiving insulin, an appropriate initial dose is 30–40 units daily in four divided doses using soluble insulin before meals and intermediate-acting insulin at bedtime and the dose adjusted from day to day. Patients with hyperglycaemia

often relapse after conversion back to subcutaneous insulin calling for one of the following approaches:

- additional doses of soluble insulin at any of the four injection times (before meals or bedtime) *or*
- temporary addition of intravenous insulin infusion (while continuing the subcutaneous regimen) until blood-glucose concentration is satisfactory *or*
- complete reversion to the intravenous regimen (especially if the patient is unwell).

### 6.1.1.1 Short-acting insulins

**Soluble insulin** is a short-acting form of insulin. For maintenance regimens it is usual to inject it 15 to 30 minutes before meals.

Soluble insulin is the most appropriate form of insulin for use in diabetic emergencies e.g. diabetic ketoacidosis (section 6.1.3) and at the time of surgery. It can be given intravenously and intramuscularly, as well as subcutaneously.

When injected subcutaneously, soluble insulin has a rapid onset of action (30 to 60 minutes), a peak action between 2 and 4 hours, and a duration of action of up to 8 hours.

When injected intravenously, soluble insulin has a very short half-life of only about 5 minutes and its effect disappears within 30 minutes.

The rapid-acting human insulin analogues, **insulin aspart**, **insulin glulisine**, and **insulin lispro** have a faster onset and shorter duration of action than soluble insulin; as a result, compared to soluble insulin, fasting and preprandial blood-glucose concentrations are a little higher, postprandial blood-glucose concentration is a little lower, and hypoglycaemia occurs slightly less frequently. Subcutaneous injection of insulin analogues may be convenient for those who wish to inject shortly before or, when necessary, shortly after a meal. They can also help those susceptible to hypoglycaemia before lunch and those who eat late in the evening and are prone to nocturnal hypoglycaemia. They can also be administered by subcutaneous infusion (see Insulin Administration, above). Insulin aspart and insulin lispro can be administered intravenously and can be used as alternatives to soluble insulin for diabetic emergencies and at the time of surgery.

## INSULIN

(Insulin Injection; Neutral Insulin; Soluble Insulin)

A sterile solution of insulin (i.e. bovine or porcine) or of human insulin; pH 6.6–8.0

**Indications** diabetes mellitus; diabetic ketoacidosis (section 6.1.3)

**Cautions** section 6.1.1; **interactions:** Appendix 1 (antidiabetics)

**Hepatic impairment** section 6.1.1

**Renal impairment** section 6.1.1

**Pregnancy** section 6.1.1

**Breast-feeding** section 6.1.1

**Side-effects** see notes above; transient oedema; local reactions and fat hypertrophy at injection site; *rarely* hypersensitivity reactions including urticaria, rash; overdose causes hypoglycaemia

## Dose

- **By subcutaneous, intramuscular or intravenous injection or intravenous infusion**, according to requirements

### Highly purified animal

**Counselling** Show container to patient and confirm that patient is expecting the version dispensed

**Hypurin® Bovine Neutral** (Wockhardt) <sup>(POM)</sup>

**Injection**, soluble insulin (bovine, highly purified) 100 units/mL. Net price 10-mL vial = £18.48; cartridges (for *Autopen® Classic*) 5 × 3 mL = £27.72

**Hypurin® Porcine Neutral** (Wockhardt) <sup>(POM)</sup>

**Injection**, soluble insulin (porcine, highly purified) 100 units/mL. Net price 10-mL vial = £16.80; cartridges (for *Autopen® Classic*) 5 × 3 mL = £25.20

### Human sequence

**Counselling** Show container to patient and confirm that patient is expecting the version dispensed

**Actrapid®** (Novo Nordisk) <sup>(POM)</sup>

**Injection**, soluble insulin (human, pyr) 100 units/mL. Net price 10-mL vial = £7.48

**Note** Not recommended for use in subcutaneous insulin infusion pumps—may precipitate in catheter or needle

**Humulin S®** (Lilly) <sup>(POM)</sup>

**Injection**, soluble insulin (human, prb) 100 units/mL. Net price 10-mL vial = £15.68; 5 × 3-mL cartridge (for most *Autopen® Classic* or *HumaPen®*) = £19.08

**Insuman® Rapid** (Sanofi-Aventis) <sup>(POM)</sup>

**Injection**, soluble insulin (human, crb) 100 units/mL, net price 5 × 3-mL cartridge (for *ClickSTAR®* and *OptiPen® Pro 1*) = £17.50; 5 × 3-mL *Insuman® Rapid OptiSet®* prefilled disposable injection devices (range 2–40 units, allowing 2-unit dosage adjustment) = £17.50

**Note** Not recommended for use in subcutaneous insulin infusion pumps

### Mixed preparations

See Biphasic Isophane Insulin (section 6.1.1.2)

## INSULIN ASPART

(Recombinant human insulin analogue)

**Indications** diabetes mellitus

**Cautions** section 6.1.1; **interactions:** Appendix 1 (antidiabetics)

**Hepatic impairment** section 6.1.1

**Renal impairment** section 6.1.1

**Pregnancy** section 6.1.1

**Breast-feeding** section 6.1.1

**Side-effects** see under Insulin

## Dose

- **By subcutaneous injection**, **ADULT** and **CHILD** over 2 years, immediately before meals or when necessary shortly after meals, according to requirements
- **By subcutaneous infusion, intravenous injection or intravenous infusion**, **ADULT** and **CHILD** over 2 years, according to requirements

**NovoRapid®** (Novo Nordisk) <sup>(POM)</sup>

**Injection**, insulin aspart (recombinant human insulin analogue) 100 units/mL, net price 10-mL vial = £16.28; *Penfill®* cartridge (for *NovoPen®* devices) 5 × 3-mL = £28.84; 5 × 3-mL *FlexPen®* prefilled

disposable injection devices (range 1–60 units, allowing 1-unit dosage adjustment) = £32.00

**Counselling** Show container to patient and confirm that patient is expecting the version dispensed

## INSULIN GLULISINE

(Recombinant human insulin analogue)

**Indications** diabetes mellitus

**Cautions** section 6.1.1; **interactions:** Appendix 1 (antidiabetics)

**Hepatic impairment** section 6.1.1

**Renal impairment** section 6.1.1

**Pregnancy** section 6.1.1

**Breast-feeding** section 6.1.1

**Side-effects** see under Insulin

### Dose

- By **subcutaneous injection**, **ADULT** and **CHILD** over 6 years, immediately before meals or when necessary shortly after meals, according to requirements
- By **subcutaneous infusion**, or **intravenous infusion** **ADULT** and **CHILD** over 6 years, according to requirements

**Apidra**® (Sanofi-Aventis) (POM)

**Injection**, insulin glulisine (recombinant human insulin analogue) 100 units/mL, net price 10-mL vial = £16.60; 5 × 3-mL cartridge (for *ClikSTAR*®, *OptiPen*® *Pro* 1, and *Autopen*® 24) = £28.30; 5 × 3-mL *OptiClik*® cartridge (for *OptiClik*® *Pen*) = £30.27; 5 × 3-mL *Apidra*® *Optiset*® prefilled disposable injection devices (range 2–40 units, allowing 2-unit dosage adjustment) = £28.30; 5 × 3-mL *Apidra*® *SoloStar*® prefilled disposable injection devices (range 1–80 units, allowing 1-unit dosage adjustment) = £25.00

**Counselling** Show container to patient and confirm that patient is expecting the version dispensed

**Note** The *Scottish Medicines Consortium* (p. 4) has advised (October 2008) that *Apidra*® is accepted for restricted use within NHS Scotland for the treatment of adults and children over 6 years with diabetes mellitus in whom the use of a short-acting insulin analogue is appropriate

## INSULIN LISPRO

(Recombinant human insulin analogue)

**Indications** diabetes mellitus

**Cautions** section 6.1.1; children (use only if benefit likely compared to soluble insulin); **interactions:** Appendix 1 (antidiabetics)

**Hepatic impairment** section 6.1.1

**Renal impairment** section 6.1.1

**Pregnancy** section 6.1.1

**Breast-feeding** section 6.1.1

**Side-effects** see under Insulin

### Dose

- By **subcutaneous injection** shortly before meals or when necessary shortly after meals, according to requirements
- By **subcutaneous infusion**, or **intravenous injection**, or **intravenous infusion**, according to requirements

**Humalog**® (Lilly) (POM)

**Injection**, insulin lispro (recombinant human insulin analogue) 100 units/mL, net price 10-mL vial = £16.61; 5 × 3-mL cartridge (for *Autopen*® *Classic* or *HumaPen*®) = £28.31; 5 × 3-mL *Humalog*®-*Pen* prefilled disposable injection devices (range 1–60 units, allowing 1-unit dosage adjustment) = £29.46;

5 × 3-mL *Humalog*® *KwikPen* prefilled disposable injection devices (range 1–60 units, allowing 1-unit dosage adjustment) = £29.46

**Counselling** Show container to patient and confirm that patient is expecting the version dispensed

### 6.1.1.2 Intermediate- and long-acting insulins

When given by subcutaneous injection, intermediate- and long-acting insulins have an onset of action of approximately 1–2 hours, a maximal effect at 4–12 hours, and a duration of 16–35 hours. Some are given twice daily in conjunction with short-acting (soluble) insulin, and others are given once daily, particularly in elderly patients. Soluble insulin can be mixed with intermediate and long-acting insulins (except insulin detemir and insulin glargine) in the syringe, essentially retaining the properties of the two components, although there may be some blunting of the initial effect of the soluble insulin component (especially on mixing with protamine zinc insulin, see below).

**Isophane insulin** is a suspension of insulin with protamine; it is of particular value for initiation of twice-daily insulin regimens. Patients usually mix isophane with soluble insulin but ready-mixed preparations may be appropriate (**biphasic isophane insulin**, **biphasic insulin aspart**, or **biphasic insulin lispro**).

**Insulin zinc suspension** (30% amorphous, 70% crystalline) has a more prolonged duration of action.

**Protamine zinc insulin** is usually given once daily with short-acting (soluble) insulin. It has the drawback of binding with the soluble insulin when mixed in the same syringe and is now rarely used.

**Insulin glargine** and **insulin detemir** are both long-acting human insulin analogues with a prolonged duration of action; insulin glargine is given once daily and insulin detemir is given once or twice daily. NICE (December 2002) has recommended that insulin glargine should be available as an option for patients with type 1 diabetes.

NICE (May 2009) has recommended that, if insulin is required in patients with type 2 diabetes, insulin detemir or insulin glargine may be considered for those:

- who require assistance with injecting insulin *or*
- whose lifestyle is significantly restricted by recurrent symptomatic hypoglycaemia *or*
- who would otherwise need twice-daily basal insulin injections in combination with oral antidiabetic drugs *or*
- who cannot use the device needed to inject isophane insulin.

## INSULIN DETEMIR

(Recombinant human insulin analogue—long acting)

**Indications** diabetes mellitus

**Cautions** section 6.1.1.1; **interactions:** Appendix 1 (antidiabetics)

**Hepatic impairment** section 6.1.1

**Renal impairment** section 6.1.1

**Pregnancy** section 6.1.1

**Breast-feeding** section 6.1.1

**Side-effects** see under Insulin (section 6.1.1.1)

**Dose**

- By subcutaneous injection, ADULT and CHILD over 6 years, according to requirements

**Levemir®** (Novo Nordisk) (P<sub>M</sub>)

**Injection**, insulin detemir (recombinant human insulin analogue) 100 units/mL, net price 5 × 3-mL cartridge (for *NovoPen®* devices) = £42.00; 5 × 3-mL *FlexPen®* prefilled disposable injection device (range 1–60 units, allowing 1-unit dosage adjustment) = £42.00; 5 × 3-mL *Levemir InnoLet®* prefilled disposable injection devices (range 1–50 units, allowing 1-unit dosage adjustment) = £44.85

**Counselling** Show container to patient and confirm that patient is expecting the version dispensed

## INSULIN GLARGINE

(Recombinant human insulin analogue—long acting)

**Indications** diabetes mellitus

**Cautions** section 6.1.1.1; **interactions:** Appendix 1 (antidiabetics)

**Hepatic impairment** section 6.1.1

**Renal impairment** section 6.1.1

**Pregnancy** section 6.1.1

**Breast-feeding** section 6.1.1

**Side-effects** see under Insulin (section 6.1.1.1)

**Dose**

- By subcutaneous injection, ADULT and CHILD over 6 years, according to requirements

**Lantus®** (Sanofi-Aventis) (P<sub>M</sub>)

**Injection**, insulin glargine (recombinant human insulin analogue) 100 units/mL, net price 10-mL vial = £26.00; 5 × 3-mL cartridge (for *ClikSTAR®*, *OptiPen® Pro 1*, and *Autopen® 24*) = £39.00; 5 × 3-mL *OptiClik®* cartridge (for *OptiClik® Pen*) = £40.36; 5 × 3-mL *Lantus® OptiSet®* prefilled disposable injection devices (range 2–40 units, allowing 2-unit dosage adjustment) = £39.00; 5 × 3-mL *Lantus® SoloStar®* prefilled disposable injection devices (range 1–80 units, allowing 1-unit dosage adjustment) = £40.36

**Note** The *Scottish Medicines Consortium* (p. 4) has advised (October 2002) that insulin glargine is accepted for restricted use within NHS Scotland for the treatment of type 1 diabetes:

- in those who are at risk of or experience unacceptable frequency or severity of nocturnal hypoglycaemia on attempting to achieve better hypoglycaemic control during treatment with other insulins
- as a once daily insulin therapy for patients who require a carer to administer their insulin.

It is not recommended for routine use in patients with type 2 diabetes unless they suffer from recurrent episodes of hypoglycaemia or require assistance with their insulin injections.

**Counselling** Show container to patient and confirm that patient is expecting the version dispensed

## INSULIN ZINC SUSPENSION

(Insulin Zinc Suspension (Mixed)—long acting)

A sterile neutral suspension of bovine and/or porcine insulin or of human insulin in the form of a complex obtained by the addition of a suitable zinc salt; consists of rhombohedral crystals (10–40 microns) and of particles of no uniform shape (not exceeding 2 microns)

**Indications** diabetes mellitus

**Cautions** section 6.1.1.1; **interactions:** Appendix 1 (antidiabetics)

**Hepatic impairment** section 6.1.1

**Renal impairment** section 6.1.1

**Pregnancy** section 6.1.1

**Breast-feeding** section 6.1.1

**Side-effects** see under Insulin (section 6.1.1.1)

**Dose**

- By subcutaneous injection, according to requirements

### Highly purified animal

**Hypurin® Bovine Lente** (Wockhardt) (P<sub>M</sub>)

**Injection**, insulin zinc suspension (bovine, highly purified) 100 units/mL. Net price 10-mL vial = £27.72

**Counselling** Show container to patient and confirm that patient is expecting the version dispensed

## ISOPHANE INSULIN

(Isophane Insulin Injection; Isophane Protamine Insulin Injection; Isophane Insulin (NPH)—intermediate acting)

A sterile suspension of bovine or porcine insulin or of human insulin in the form of a complex obtained by the addition of protamine sulphate or another suitable protamine

**Indications** diabetes mellitus

**Cautions** section 6.1.1.1; **interactions:** Appendix 1 (antidiabetics)

**Hepatic impairment** section 6.1.1

**Renal impairment** section 6.1.1

**Pregnancy** section 6.1.1

**Breast-feeding** section 6.1.1

**Side-effects** see under Insulin (section 6.1.1.1); protamine may cause allergic reactions

**Dose**

- By subcutaneous injection, according to requirements

### Highly purified animal

**Counselling** Show container to patient and confirm that patient is expecting the version dispensed

**Hypurin® Bovine Isophane** (Wockhardt) (P<sub>M</sub>)

**Injection**, isophane insulin (bovine, highly purified) 100 units/mL. Net price 10-mL vial = £27.72; cartridges (for *Autopen® Classic*) 5 × 3 mL = £41.58

**Hypurin® Porcine Isophane** (Wockhardt) (P<sub>M</sub>)

**Injection**, isophane insulin (porcine, highly purified) 100 units/mL. Net price 10-mL vial = £25.20; cartridges (for *Autopen® Classic*) 5 × 3 mL = £37.80

### Human sequence

**Counselling** Show container to patient and confirm that patient is expecting the version dispensed

**Insulatard®** (Novo Nordisk) (P<sub>M</sub>)

**Injection**, isophane insulin (human, pyr) 100 units/mL. Net price 10-mL vial = £7.48; *Insulatard Penfill®* cartridge (for *Novopen®* devices) 5 × 3 mL = £22.90; 5 × 3-mL *Insulatard InnoLet®* prefilled disposable injection devices (range 1–50 units, allowing 1-unit dosage adjustment) = £20.40

**Humulin I®** (Lilly) (P<sub>M</sub>)

**Injection**, isophane insulin (human, prb) 100 units/mL. Net price 10-mL vial = £15.68; 5 × 3-mL cartridge (for *Autopen® Classic* or *Humapen®*) = £19.08; 5 × 3-mL *Humulin I-Pen®* prefilled disposable injection devices (range 1–60 units, allowing 1-unit dosage adjustment) = £28.44; 5 × 3-mL *Humulin I KwikPen®* prefilled disposable injection devices (range 1–60 units, allowing 1-unit dosage adjustment) = £21.70

**Insuman® Basal** (Sanofi-Aventis) (POM)

**Injection**, isophane insulin (human, crb) 100 units/mL, net price 5-mL vial = £5.61; 5 × 3-mL cartridge (for *ClikSTAR®* and *OptiPen® Pro I*) = £17.50; 5 × 3-mL *Insuman® Basal OptiSet®* prefilled disposable injection devices (range 2–40 units, allowing 2-unit dosage adjustment) = £17.50

#### ▲ Mixed preparations

See Biphasic Isophane Insulin (below)

## PROTAMINE ZINC INSULIN

(Protamine Zinc Insulin Injection—long acting)

A sterile suspension of insulin in the form of a complex obtained by the addition of a suitable protamine and zinc chloride; this preparation was included in BP 1980 but is not included in BP 1988

**Indications** diabetes mellitus

**Cautions** section 6.1.1.1; see also notes above; **interactions:** Appendix 1 (antidiabetics)

**Hepatic impairment** section 6.1.1

**Renal impairment** section 6.1.1

**Pregnancy** section 6.1.1

**Breast-feeding** section 6.1.1

**Side-effects** see under Insulin (section 6.1.1.1); protamine may cause allergic reactions

#### Dose

- By **subcutaneous injection**, according to requirements

#### Hypurin® Bovine Protamine Zinc

 (Wockhardt) (POM)

**Injection**, protamine zinc insulin (bovine, highly purified) 100 units/mL. Net price 10-mL vial = £27.72

**Counselling** Show container to patient and confirm that patient is expecting the version dispensed

## Biphasic insulins

## BIPHASIC INSULIN ASPART

(Intermediate-acting insulin)

**Indications** diabetes mellitus

**Cautions** see section 6.1.1.1; **interactions:** Appendix 1 (antidiabetics)

**Hepatic impairment** section 6.1.1

**Renal impairment** section 6.1.1

**Pregnancy** section 6.1.1

**Breast-feeding** section 6.1.1

**Side-effects** see under Insulin (section 6.1.1.1); protamine may cause allergic reactions

#### Dose

- By **subcutaneous injection**, up to 10 minutes before or soon after a meal, according to requirements

#### NovoMix® 30

 (Novo Nordisk) (POM)

**Injection**, biphasic insulin aspart (recombinant human insulin analogue), 30% insulin aspart, 70% insulin aspart protamine, 100 units/mL, net price 5 × 3-mL *Penfill®* cartridges (for *NovoPen®* devices) = £28.84; 5 × 3-mL *FlexPen®* prefilled disposable injection devices (range 1–60 units, allowing 1-unit dosage adjustment) = £32.00

**Counselling** Show container to patient and confirm that patient is expecting the version dispensed; the proportions of the two components should be checked **carefully** (the order in which the proportions are stated may not be the same in other countries)

## BIPHASIC INSULIN LISPRO

(Intermediate-acting insulin)

**Indications** diabetes mellitus

**Cautions** see section 6.1.1.1 and Insulin Lispro; **interactions:** Appendix 1 (antidiabetics)

**Hepatic impairment** section 6.1.1

**Renal impairment** section 6.1.1

**Pregnancy** section 6.1.1

**Breast-feeding** section 6.1.1

**Side-effects** see under Insulin (section 6.1.1.1); protamine may cause allergic reactions

#### Dose

- By **subcutaneous injection**, up to 15 minutes before or soon after a meal, according to requirements

#### Humalog® Mix25

 (Lilly) (POM)

**Injection**, biphasic insulin lispro (recombinant human insulin analogue), 25% insulin lispro, 75% insulin lispro protamine, 100 units/mL, net price 10-mL vial = £16.61; 5 × 3-mL cartridge (for *Autopen® Classic* or *HumaPen®*) = £29.46; 5 × 3-mL prefilled disposable injection devices (range 1–60 units, allowing 1-unit dosage adjustment) = £30.98; 5 × 3-mL *Humalog® Mix25 KwikPen* prefilled disposable injection devices (range 1–60 units, allowing 1-unit dosage adjustment) = £30.98

**Counselling** Show container to patient and confirm that patient is expecting the version dispensed; the proportions of the two components should be checked **carefully** (the order in which the proportions are stated may not be the same in other countries)

#### Humalog® Mix50

 (Lilly) (POM)

**Injection**, biphasic insulin lispro (recombinant human insulin analogue), 50% insulin lispro, 50% insulin lispro protamine, 100 units/mL, net price 5 × 3-mL cartridge (for *Autopen® Classic* or *HumaPen®*) = £29.46; 5 × 3-mL prefilled disposable injection devices (range 1–60 units, allowing 1-unit dosage adjustment) = £29.46; 5 × 3-mL *Humalog® Mix50 KwikPen* prefilled disposable injection devices (range 1–60 units, allowing 1-unit dosage adjustment) = £30.98

**Counselling** Show container to patient and confirm that patient is expecting the version dispensed; the proportions of the two components should be checked **carefully** (the order in which the proportions are stated may not be the same in other countries)

## BIPHASIC ISOPHANE INSULIN

(Biphasic Isophane Insulin Injection—intermediate acting)

A sterile buffered suspension of either porcine or human insulin complexed with protamine sulphate (or another suitable protamine) in a solution of insulin of the same species

**Indications** diabetes mellitus

**Cautions** section 6.1.1.1; **interactions:** Appendix 1 (antidiabetics)

**Hepatic impairment** section 6.1.1

**Renal impairment** section 6.1.1

**Pregnancy** section 6.1.1

**Breast-feeding** section 6.1.1

**Side-effects** see under Insulin (section 6.1.1.1); protamine may cause allergic reactions

#### Dose

- By **subcutaneous injection**, according to requirements

**Highly purified animal**

**Counselling** Show container to patient and confirm that patient is expecting the version dispensed; the proportions of the two components should be checked **carefully** (the order in which the proportions are stated may not be the same in other countries)

**Hypurin® Porcine 30/70 Mix** (Wockhardt) (POM)

**Injection**, biphasic isophane insulin (porcine, highly purified), 30% soluble, 70% isophane, 100 units/mL. Net price 10-mL vial = £16.80; cartridges (for *Autopen® Classic*) 5 × 3 mL = £25.20

**Human sequence**

**Counselling** Show container to patient and confirm that patient is expecting the version dispensed; the proportions of the two components should be checked **carefully** (the order in which the proportions are stated may not be the same in other countries)

**Humulin M3®** (Lilly) (POM)

**Injection**, biphasic isophane insulin (human, prb), 30% soluble, 70% isophane, 100 units/mL. Net price 10-mL vial = £15.68; 5 × 3-mL cartridge (for most *Autopen® Classic* or *HumaPen®*) = £19.08; 5 × 3-mL *Humulin M3 KwikPen®* prefilled disposable injection devices (range 1–60 units, allowing 1-unit dosage adjustment) = £21.70

**Insuman® Comb 15** (Sanofi-Aventis) (POM)

**Injection**, biphasic isophane insulin (human, crb), 15% soluble, 85% isophane, 100 units/mL, net price 5 × 3-mL *Insuman® Comb 15 OptiSet®* prefilled disposable injection devices (range 2–40 units, allowing 2-unit dosage adjustment) = £17.50

**Insuman® Comb 25** (Sanofi-Aventis) (POM)

**Injection**, biphasic isophane insulin (human, crb), 25% soluble, 75% isophane, 100 units/mL, net price 5-mL vial = £5.61; 5 × 3-mL cartridge (for *ClickSTAR®* and *OptiPen® Pro 1*) = £17.50; 5 × 3-mL *Insuman® Comb 25 OptiSet®* prefilled disposable injection devices (range 2–40 units, allowing 2-unit dosage adjustment) = £17.50; 5 × 3-mL *Insuman® Comb 25 SoloStar®* prefilled disposable injection devices (range 1–80 units, allowing 1-unit dosage adjustment) = £19.80

**Insuman® Comb 50** (Sanofi-Aventis) (POM)

**Injection**, biphasic isophane insulin (human, crb), 50% soluble, 50% isophane, 100 units/mL, net price 5 × 3-mL cartridge (for *ClickSTAR®* and *OptiPen® Pro 1*) = £17.50; 5 × 3-mL *Insuman® Comb 50 OptiSet®* prefilled disposable injection devices (range 2–40 units, allowing 2-unit dosage adjustment) = £17.50

**6.1.1.3 Hypodermic equipment**

Patients should be advised on the safe disposal of lancets, single-use syringes, and needles. Suitable arrangements for the safe disposal of contaminated waste must be made before these products are prescribed for patients who are carriers of infectious diseases.

**Injection devices****Autopen®** (Owen Mumford)

**Injection device**, *Autopen® 24* (for use with Sanofi-Aventis 3-mL insulin cartridges), allowing 1-unit dosage adjustment, max. 21 units (single-unit version) or 2-unit dosage adjustment, max. 42 units (2-unit version), net price (both) = £15.73; *Autopen® Classic* (for use with Lilly and Wockhardt 3-mL insulin cartridges), allowing 1-unit dosage adjustment, max. 21 units (single-unit version) or 2-unit dosage adjustment, max. 42 units (2-unit version), net price (all) = £15.97

**ClickSTAR®** (Sanofi-Aventis)

**Injection device**, for use with *Lantus®*, *Apidra®*, and *Insuman®* 3-mL insulin cartridges; allowing 1-unit dose adjustment, max. 80 units, net price = £25.00

**HumaPen® Luxura** (Lilly)

**Injection device**, for use with *Humulin®* and *Humalog®* 3-mL cartridges; allowing 1-unit dosage adjustment, max. 60 units, net price = £26.36

**HumaPen® Luxura HD** (Lilly)

**Injection device**, for use with *Humulin®* and *Humalog®* 3-mL cartridges; allowing 0.5-unit dosage adjustment, max. 30 units, net price = £26.36

**NovoPen®** (Novo Nordisk)

**Injection device**; for use with *Penfill®* insulin cartridges; *NovoPen® Junior* (for 3-mL cartridges), allowing 0.5-unit dosage adjustment, max. 35 units, net price = £24.79; *NovoPen® 3 Demi* (for 3-mL cartridges), allowing 0.5-unit dosage adjustment, max. 35 units, net price = £25.21; *NovoPen® 4* (for 3-mL cartridges), allowing 1-unit dosage adjustment, max. 60 units, net price = £26.56

**OptiClick®** (Sanofi-Aventis)

**Injection device**, for use with *Lantus OptiClick®* or *Apidra Opticlick®* insulin cartridges, allowing 1-unit dosage adjustment, max. 80 units, net price = £20.13

**OptiPen® Pro 1** (Sanofi-Aventis)

**Injection device**, for use with *Insuman®* insulin cartridges; allowing 1-unit dosage adjustment, max. 60 units, net price = £22.00

**Lancets****Lancets—sterile, single use** (Drug Tariff)

<sup>1</sup> *Ascensia Microlet®* 100 = £3.76, 200 = £7.17; *BD Micro-Fine®* + 100 = £3.16, 200 = £6.13; *CareSens®* 100 = £2.95; *Cleanlet Fine®* 100 = £3.19, 200 = £6.13; *Fastclix®* 204 = £9.20; <sup>2</sup> *Finepoint®* 100 = £3.54; <sup>1</sup> *FreeStyle®* 200 = £7.02; <sup>1</sup> *Milward Steri-Let®*, 23 gauge, 100 = £3.00, 200 = £5.70, 28 gauge, 100 = £3.00, 200 = £5.70; <sup>1</sup> *Monolet®* 100 = £3.28, 200 = £6.24; *Monolet Extra®* 100 = £3.28; *MPD Ultra Thin®* 100 = £3.30, 200 = £6.50; *Multiclix®* 204 = £9.27; *One Touch Comfort®* 200 = £7.22; <sup>1</sup> *One Touch UltraSoft®* 100 = £3.61; <sup>2</sup> *Softclix®* 200 = £7.40; <sup>2</sup> *Softclix XL®* 50 = £1.85; *Thin Lancets* (formerly *MediSense Thin®*), 200 = £7.16; <sup>1</sup> *Unilet ComfortTouch®* 100 = £3.60, 200 = £6.83; *Unilet Eco®* 100 = £2.94, 200 = £5.49; <sup>1</sup> *Unilet General Purpose Superlite®* 100 = £3.67, 200 = £6.96; *Unistik 3 Comfort®*, 28-gauge, 100 = £6.24, 200 = £12.20; *Unistik 3 Extra®*, 21-gauge, 100 = £6.24, 200 = £12.20; *Unistik 3 Normal®*, 23-gauge, 100 = £6.24, 200 = £12.20; *Universal®* (formerly *VitalCare®*), 200 = £6.37; *Vitrex Soft®*, 23-gauge, 100 = £3.00, 200 = £5.70; *Vitrex Gentle®* 28-gauge, 100 = £3.19, 200 = £6.13; *WaveSense Ultra-Thin®*, 28-gauge, 200 = £6.90, 33-gauge, 200 = £6.90

Compatible finger-pricking devices (unless indicated otherwise, see footnotes), all MS: *B-D Optimus®*, *Glucollet®*, *Monojector®*, *Penlet II®*, *Soft Touch®*

- MS *Autolet®* and MS *Autolet Impression®* are also compatible finger-pricking devices
- Use MS *Softclix®* finger-pricking device

**Needles****Hypodermic Needle, Sterile single use** (Drug Tariff)

For use with reusable glass syringe, sizes 0.5 mm (25G), 0.45 mm (26G), 0.4 mm (27G). Net price 100-needle pack = £2.74

Brands include *Microalance®*, *Monoject®*

**Needles for Prefilled and Reusable Pen Injectors (Drug Tariff)**

**Screw on**, needle length 6.1 mm or less, net price 100-needle pack = £12.53; 6.2–9.9 mm, 100-needle pack = £8.89; 10 mm or more, 100-needle pack = £8.89

Brands include *BD Micro-Fine® +*, *NovoFine®*, *NovoTwist®*, *Unifine® Pentips*

**Snap on**, needle length 6.1 mm or less, net price 100-needle pack = £12.02; 6.2–9.9 mm, 100-needle pack = £8.52; 10 mm or more, 100-needle pack = £8.52

Brands include *Penfine®*

**▲ Syringes****Hypodermic Syringe (Drug Tariff)**

Calibrated glass with Luer taper conical fitting, for use with U100 insulin. Net price 0.5 mL and 1 mL = £9.22

Brands include *Abcare®*

**Pre-Set U100 Insulin Syringe (Drug Tariff)**

Calibrated glass with Luer taper conical fitting, supplied with dosage chart and strong box, for blind patients. Net price 1 mL = £21.99

**U100 Insulin Syringe with Needle (Drug Tariff)**

Disposable with fixed or separate needle for single use or single patient-use, colour coded orange. Needle length 8 mm, diameters 0.33 mm (29G), 0.3 mm (30G), net price 10 (with needle), 0.3 mL = £1.38, 0.5 mL = £1.33, 1 mL = £1.32; needle length 12 mm, diameters 0.45 mm (26G), 0.4 mm (27G), 0.36 mm (28G), 0.33 mm (29G), net price 10 (with needle), 0.3 mL = £1.45; 0.5 mL = £1.43; 1 mL = £1.44

Brands include *BD Micro-Fine® +*, *Clinipak®*, *Insupak®*, *Monoject® Ultra*, *Omnikan®*, *Plastipak®*

**▲ Accessories****Needle Clipping (Chopping) Device (Drug Tariff)**

Consisting of a clipper to remove needle from its hub and container from which cut-off needles cannot be retrieved; designed to hold 1500 needles, not suitable for use with lancets. Net price = £1.35

Brands include *BD Safe-Clip®*

**Sharpsguard (Drug Tariff)**

Net price 1-litre sharpsbin = 85p

Exenatide and liraglutide, both given by subcutaneous injection, are also available for the treatment of type 2 diabetes, see section 6.1.2.3.

**Pregnancy and breast-feeding** During pregnancy, women with *pre-existing diabetes* can be treated with metformin [unlicensed use], either alone or in combination with insulin (section 6.1.1). Metformin can be continued, or glibenclamide resumed, during breast-feeding for those with pre-existing diabetes. Women with *gestational diabetes* may be treated, with or without concomitant insulin (section 6.1.1), with glibenclamide from 11 weeks gestation (after organogenesis) [unlicensed use] or with metformin [unlicensed use]. Women with gestational diabetes should discontinue hypoglycaemic treatment after giving birth.

Other oral hypoglycaemic drugs, exenatide, and liraglutide are contra-indicated in pregnancy.

**6.1.2.1 Sulfonylureas**

The sulfonylureas act mainly by augmenting insulin secretion and consequently are effective only when some residual pancreatic beta-cell activity is present; during long-term administration they also have an extrapancreatic action. All may cause hypoglycaemia but this is uncommon and usually indicates excessive dosage. Sulfonylurea-induced hypoglycaemia may persist for many hours and must always be treated in hospital.

Sulfonylureas are considered for patients who are not overweight, or in whom metformin is contra-indicated or not tolerated. Several sulfonylureas are available and choice is determined by side-effects and the duration of action as well as the patient's age and renal function. **Glibenclamide**, a long-acting sulfonylurea, is associated with a greater risk of hypoglycaemia; for this reason it should be avoided in the elderly, and shorter-acting alternatives, such as **gliclazide** or **tolbutamide**, should be used instead.

When the combination of strict diet and sulfonylurea treatment fails, other options include:

- combining with metformin (section 6.1.2.2) (reports of increased hazard with this combination remain unconfirmed);
- combining with pioglitazone, but see section 6.1.2.3;
- combining with saxagliptin, sitagliptin, or vildagliptin (section 6.1.2.3);
- combining with exenatide or liraglutide (section 6.1.2.3);
- combining with acarbose (section 6.1.2.3), which may have a small beneficial effect, but flatulence can be a problem;
- combining with bedtime isophane insulin (section 6.1.1) but weight gain and hypoglycaemia can occur.

The risk of hypoglycaemia associated with sulfonylureas (see notes above) should be discussed with the patient, especially when concomitant glucose-lowering drugs are prescribed.

Insulin therapy should be instituted temporarily during intercurrent illness (such as myocardial infarction, coma, infection, and trauma). Sulfonylureas should be

**6.1.2 Antidiabetic drugs****6.1.2.1 Sulfonylureas****6.1.2.2 Biguanides****6.1.2.3 Other antidiabetic drugs**

Oral antidiabetic drugs are used for the treatment of type 2 diabetes mellitus. They should be prescribed only if the patient fails to respond adequately to at least 3 months' restriction of energy and carbohydrate intake and an increase in physical activity. They should be used to augment the effect of diet and exercise, and not to replace them.

For patients not adequately controlled by diet and oral hypoglycaemic drugs, insulin may be added to the treatment regimen or substituted for oral therapy. When insulin is added to oral therapy, it is generally given at bedtime as isophane or long-acting insulin, and when insulin replaces an oral regimen it may be given as twice-daily injections of a biphasic insulin (or isophane insulin mixed with soluble insulin), or a multiple injection regimen. Weight gain and hypoglycaemia may be complications of insulin therapy but weight gain may be reduced if the insulin is given in combination with metformin.

omitted on the morning of surgery; insulin is required because of the ensuing hyperglycaemia in these circumstances.

**Cautions** Sulfonylureas can encourage weight gain and should be prescribed only if poor control and symptoms persist despite adequate attempts at dieting; metformin (section 6.1.2.2) is considered the drug of choice in obese patients. Caution is needed in the elderly.

**Contra-indications** Sulfonylureas should be avoided where possible in acute porphyria (section 9.8.2). Sulfonylureas are contra-indicated in the presence of ketoacidosis.

**Hepatic impairment** Sulfonylureas should be avoided or a reduced dose should be used in severe hepatic impairment, because there is an increased risk of hypoglycaemia. Jaundice may occur.

**Renal impairment** Sulfonylureas should be used with care in those with mild to moderate renal impairment, because of the hazard of hypoglycaemia; they should be avoided where possible in severe renal impairment. Glipizide should also be avoided if the patient has both renal and hepatic impairment. If necessary, the short-acting drug tolbutamide can be used in renal impairment, as can gliclazide which is principally metabolised in the liver, but careful monitoring of blood-glucose concentration is essential; care is required to use the lowest dose that adequately controls blood glucose.

**Pregnancy** The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia; however, glibenclamide can be used during the second and third trimesters of pregnancy in women with gestational diabetes, see section 6.1.2.

**Breast-feeding** The use of sulfonylureas (except glibenclamide [unlicensed use], see section 6.1.2) in breast-feeding should be avoided because there is a theoretical possibility of hypoglycaemia in the infant.

**Side-effects** Side-effects of sulfonylureas are generally mild and infrequent and include gastro-intestinal disturbances such as nausea, vomiting, diarrhoea, and constipation. Hyponatraemia has been reported with glimepiride and glipizide.

Sulfonylureas can occasionally cause a disturbance in liver function, which may rarely lead to cholestatic jaundice, hepatitis, and hepatic failure. Hypersensitivity reactions can occur, usually in the first 6–8 weeks of therapy. They consist mainly of allergic skin reactions which progress rarely to erythema multiforme and exfoliative dermatitis, fever, and jaundice; photosensitivity has rarely been reported with glipizide. Blood disorders are also rare but may include leucopenia, thrombocytopenia, agranulocytosis, pancytopenia, haemolytic anaemia, and aplastic anaemia.

## GLIBENCLAMIDE

**Indications** type 2 diabetes mellitus

**Cautions** see notes above; **interactions:** Appendix 1 (antidiabetics)

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above

### Dose

- Initially 5 mg daily with or immediately after breakfast, dose adjusted according to response (**ELDERLY** avoid, see notes above); max. 15 mg daily

**Glibenclamide** (Non-proprietary) **(POM)**

Tablets, glibenclamide 2.5 mg, net price 28-tab pack = 95p; 5 mg, 28-tab pack = £1.07

## GLICLAZIDE

**Indications** type 2 diabetes mellitus

**Cautions** see notes above; **interactions:** Appendix 1 (antidiabetics)

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above

### Dose

- Initially, 40–80 mg daily, adjusted according to response; up to 160 mg as a single dose, with breakfast; higher doses divided; max. 320 mg daily

**Gliclazide** (Non-proprietary) **(POM)**

Tablets, scored, gliclazide 80 mg, net price 28-tab pack = £1.10, 60-tab pack = £1.52

Brands include *DIAGLYK*<sup>®</sup>

**Diamicon**<sup>®</sup> (Servier) **(POM)**

Tablets, scored, gliclazide 80 mg, net price 60-tab pack = £4.38

### Modified release

**Diamicon**<sup>®</sup> MR (Servier) **(POM)**

Tablets, m/r, gliclazide 30 mg, net price 28-tab pack = £2.81, 56-tab pack = £5.62. Label: 25

**Dose** initially 30 mg daily with breakfast, adjusted according to response every 4 weeks (after 2 weeks if no decrease in blood glucose); max. 120 mg daily

**Note** *Diamicon*<sup>®</sup> MR 30 mg may be considered to be approximately equivalent in therapeutic effect to standard formulation *Diamicon*<sup>®</sup> 80 mg

## GLIMEPIRIDE

**Indications** type 2 diabetes mellitus

**Cautions** see notes above; manufacturer recommends regular hepatic and haematological monitoring but limited evidence of clinical value; **interactions:** Appendix 1 (antidiabetics)

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above

### Dose

- Initially 1 mg daily, adjusted according to response in 1-mg steps at 1–2 week intervals; usual max. 4 mg daily (exceptionally, up to 6 mg daily may be used); taken shortly before or with first main meal

**Glimepiride** (Non-proprietary) (POM)

Tablets, glimepiride 1 mg, net price 30-tab pack = £1.40; 2 mg, 30-tab pack = £1.38; 3 mg, 30-tab pack = £4.57; 4 mg, 30-tab pack = £1.75

**Amaryl®** (Sanofi-Aventis) (POM)

Tablets, all scored, glimepiride 1 mg (pink), net price 30-tab pack = £4.33; 2 mg (green), 30-tab pack = £7.13; 3 mg (yellow), 30-tab pack = £10.75; 4 mg (blue), 30-tab pack = £14.24

**GLIPIZIDE**

**Indications** type 2 diabetes mellitus

**Cautions** see notes above; **interactions:** Appendix 1 (antidiabetics)

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; also dizziness, drowsiness

**Dose**

- Initially 2.5–5 mg daily shortly before breakfast or lunch, adjusted according to response; max. 20 mg daily; up to 15 mg may be given as a single dose; higher doses divided

**Glipizide** (Non-proprietary) (POM)

Tablets, glipizide 5 mg, net price 56-tab pack = £4.23

**Minodiab®** (Pharmacia) (POM)

Tablets, scored, glipizide 5 mg, net price 28-tab pack = £1.26

**TOLBUTAMIDE**

**Indications** type 2 diabetes mellitus

**Cautions** see notes above; **interactions:** Appendix 1 (antidiabetics)

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; also headache, tinnitus

**Dose**

- 0.5–1.5 g (max. 2 g) daily in divided doses with or immediately after meals or as a single dose with or immediately after breakfast

**Tolbutamide** (Non-proprietary) (POM)

Tablets, tolbutamide 500 mg, net price 28-tab pack = £1.74

**6.1.2.2 Biguanides**

**Metformin**, the only available biguanide, has a different mode of action from the sulfonylureas, and is not interchangeable with them. It exerts its effect mainly by decreasing gluconeogenesis and by increasing peripheral utilisation of glucose; since it acts only in the presence of endogenous insulin it is effective only if

there are some residual functioning pancreatic islet cells.

Metformin is the drug of first choice in overweight patients in whom strict dieting has failed to control diabetes, if appropriate it may also be considered as an option in patients who are not overweight. It is also used when diabetes is inadequately controlled with sulfonylurea treatment. When the combination of strict diet and metformin treatment fails, other options include:

- combining with a sulfonylurea (section 6.1.2.1) (reports of increased hazard with this combination remain unconfirmed);
- combining with pioglitazone (section 6.1.2.3);
- combining with repaglinide or nateglinide (section 6.1.2.3);
- combining with saxagliptin, sitagliptin, or vildagliptin (section 6.1.2.3);
- combining with exenatide or liraglutide (section 6.1.2.3);
- combining with acarbose (section 6.1.2.3), which may have a small beneficial effect, but flatulence can be a problem;
- combining with insulin (section 6.1.1) but weight gain and hypoglycaemia can be problems (weight gain minimised if insulin given at night).

Insulin treatment is almost always required in medical and surgical emergencies; insulin should also be substituted before elective surgery (omit metformin on the morning of surgery and give insulin if required).

Hypoglycaemia does not usually occur with metformin; other advantages are the lower incidence of weight gain and lower plasma-insulin concentration. It does not exert a hypoglycaemic action in non-diabetic subjects unless given in overdose.

Gastro-intestinal side-effects are initially common with metformin, and may persist in some patients, particularly when very high doses such as 3 g daily are given.

Very rarely, metformin can provoke lactic acidosis. It is most likely to occur in patients with renal impairment, see Lactic Acidosis below.

Metformin is used for the symptomatic management of polycystic ovary syndrome [unlicensed indication]; however, treatment should be initiated by a specialist. Metformin improves insulin sensitivity, may aid weight reduction, helps to normalise menstrual cycle (increasing the rate of spontaneous ovulation), and may improve hirsutism.

**METFORMIN HYDROCHLORIDE**

**Indications** diabetes mellitus (see notes above); polycystic ovary syndrome [unlicensed indication]

**Cautions** see notes above; determine renal function before treatment and at least annually (at least twice a year in patients with additional risk factors for renal impairment, or if deterioration suspected); **interactions:** Appendix 1 (antidiabetics)

**Lactic acidosis** Use with caution in renal impairment—increased risk of lactic acidosis; avoid in significant renal impairment. NICE<sup>1</sup> recommends that the dose should be reviewed if eGFR less than 45 mL/minute/1.73 m<sup>2</sup> and to

1. NICE clinical guideline 87 (May 2009): Type 2 diabetes: The management of type 2 diabetes

avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>. Withdraw or interrupt treatment in those at risk of tissue hypoxia or sudden deterioration in renal function, such as those with dehydration, severe infection, shock, sepsis, acute heart failure, respiratory failure or hepatic impairment, or those who have recently had a myocardial infarction

**Contra-indications** ketoacidosis, see also Lactic Acidosis above; use of general anaesthesia (suspend metformin on the morning of surgery and restart when renal function returns to baseline)

**Iodine-containing X-ray contrast media** Intravascular administration of iodinated contrast agents can cause renal failure. Suspend metformin prior to the test; restart at least 48 hours after the test if renal function has returned to baseline

**Hepatic impairment** withdraw if tissue hypoxia likely

**Renal impairment** see under Cautions

**Pregnancy** used in pregnancy for both pre-existing and gestational diabetes—see also p. 427

**Breast-feeding** may be used during breast-feeding—see p. 427

**Side-effects** anorexia, nausea, vomiting, diarrhoea (usually transient), abdominal pain, taste disturbance, rarely lactic acidosis (withdraw treatment), decreased vitamin-B<sub>12</sub> absorption, erythema, pruritus and urticaria; hepatitis also reported

#### Dose

- Diabetes mellitus, **ADULT** and **CHILD** over 10 years initially 500 mg with breakfast for at least 1 week then 500 mg with breakfast and evening meal for at least 1 week then 500 mg with breakfast, lunch and evening meal; usual max. 2 g daily in divided doses
- Polycystic ovary syndrome [unlicensed], initially 500 mg with breakfast for 1 week, then 500 mg with breakfast and evening meal for 1 week, then 1.5–1.7 g daily in 2–3 divided doses

**Note** Metformin doses in the BNF may differ from those in the product literature

#### Metformin (Non-proprietary) (POM)

**Tablets**, coated, metformin hydrochloride 500 mg, net price 28-tab pack = £1.07, 84-tab pack = £1.57; 850 mg, 56-tab pack = £1.67. Label: 21

**Oral solution**, sugar-free, metformin hydrochloride 500 mg/5 mL, net price 100 mL = £62.48. Label: 21  
**Brands include** *Metsol*<sup>®</sup>

#### Glucophage<sup>®</sup> (Merck Serono) (POM)

**Tablets**, f/c, metformin hydrochloride 500 mg, net price 84-tab pack = £2.88; 850 mg, 56-tab pack = £3.20. Label: 21

**Oral powder**, sugar-free, metformin hydrochloride 500 mg/sachet, net price 30-sachet pack = £3.29, 60-sachet pack = £6.58; 1 g/sachet, 30-sachet pack = £6.58, 60-sachet pack = £13.16. Label: 13, 21, counselling, administration  
**Excipients** include aspartame (section 9.4.1)

**Counselling** The contents of each sachet should be mixed with 150 mL of water and taken immediately

The *Scottish Medicines Consortium* (p. 4) has advised (March 2010) that *Glucophage*<sup>®</sup> oral powder is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus in patients who are unable to swallow the solid dosage form.

#### Modified release

##### Metformin (Non-Proprietary)

**Tablets**, m/r, metformin hydrochloride 500 mg, net price 28 tab-pack = £3.07, 56 tab-pack = £6.14. Label: 21, 25

**Dose** initially 500 mg once daily, increased every 10–15 days, max. 2 g once daily with evening meal; if control not achieved, use

1 g twice daily with meals, and if control still not achieved change to standard-release tablets

**Note** Patients taking up to 2 g daily of the standard-release metformin may start with the same daily dose of metformin modified release; not suitable if dose of standard-release tablets more than 2 g daily

**Brands include** *Bolamyn*<sup>®</sup> SR, *Metabet*<sup>®</sup> SR

#### Glucophage<sup>®</sup> SR (Merck Serono) (POM)

**Tablets**, m/r, metformin hydrochloride 500 mg, net price 28-tab pack = £3.07, 56-tab pack = £6.14; 750 mg, 28-tab pack = £3.20, 56-tab pack = £6.40; 1 g, 28-tab pack = £4.26, 56-tab pack = £8.52. Label: 21, 25

**Dose** initially 500 mg once daily, increased every 10–15 days, max. 2 g once daily with evening meal; if control not achieved, use 1 g twice daily with meals, and if control still not achieved change to standard-release tablets

**Note** Patients taking up to 2 g daily of the standard-release metformin may start with the same daily dose of *Glucophage*<sup>®</sup> SR; not suitable if dose of standard-release tablets more than 2 g daily  
The *Scottish Medicines Consortium* (p. 4) has advised (September 2009) that *Glucophage*<sup>®</sup> SR is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus in adult patients who are intolerant of standard-release metformin, and in whom the prolonged-release tablet allows the use of a dose of metformin not previously tolerated, or in patients for whom a once daily preparation offers a clinically significant benefit.

#### With pioglitazone

Section 6.1.2.3

#### With sitagliptin

Section 6.1.2.3

#### With vildagliptin

Section 6.1.2.3

### 6.1.2.3 Other antidiabetic drugs

**Acarbose**, an inhibitor of intestinal alpha glucosidases, delays the digestion and absorption of starch and sucrose; it has a small but significant effect in lowering blood glucose. Use of acarbose is usually reserved for when other oral hypoglycaemics are not tolerated or are contra-indicated. Postprandial hyperglycaemia in type 1 diabetes can be reduced by acarbose, but it has been little used for this purpose. Flatulence deters some from using acarbose although this side-effect tends to decrease with time.

**Nateglinide** and **repaglinide** stimulate insulin release. Both drugs have a rapid onset of action and short duration of activity, and should be administered shortly before each main meal. Repaglinide may be given as monotherapy for patients who are not overweight or for those in whom metformin is contra-indicated or not tolerated, or it may be given in combination with metformin. Nateglinide is licensed only for use with metformin.

The thiazolidinedione, **pioglitazone**, reduces peripheral insulin resistance, leading to a reduction of blood-glucose concentration. Pioglitazone can be used alone or in combination with metformin or with a sulfonylurea (if metformin inappropriate), or with both; the combination of pioglitazone plus metformin is preferred to pioglitazone plus sulfonylurea, particularly for obese patients. Inadequate response to a combination of metformin and sulfonylurea may indicate failing insulin release; the introduction of pioglitazone has a limited role in these circumstances and the initiation of insulin is often more appropriate. Pioglitazone is also licensed in combination

with insulin, in patients who have not achieved adequate glycaemic control with insulin alone, when metformin is inappropriate. Blood-glucose control may deteriorate temporarily when pioglitazone is substituted for an oral antidiabetic drug that is being used in combination with another. Long-term benefits of pioglitazone have not yet been demonstrated. NICE (May 2009) has recommended that, when glycaemic control is inadequate with existing treatment, pioglitazone can be added to:

- a sulfonylurea, if metformin is contra-indicated or not tolerated;
- metformin, if risks of hypoglycaemia with sulfonylurea are unacceptable or a sulfonylurea is contra-indicated or not tolerated;
- a combination of metformin and a sulfonylurea, if insulin is unacceptable because of lifestyle or other personal issues, or because the patient is obese.

NICE has recommended that treatment with pioglitazone is continued only if HbA<sub>1c</sub> concentration is reduced by at least 0.5% within 6 months of starting treatment.

The *Scottish Medicines Consortium* (p. 4) accepts use of pioglitazone (February 2007) with metformin and a sulfonylurea, for patients (especially if overweight) whose glycaemic control is inadequate despite the use of 2 oral hypoglycaemic drugs and who are unable or unwilling to take insulin; treatment should be initiated and monitored by an experienced diabetes physician.

#### MHRA/CHM advice

##### Pioglitazone cardiovascular safety (December 2007 and January 2011)

Incidence of heart failure is increased when pioglitazone is combined with insulin especially in patients with predisposing factors e.g. previous myocardial infarction. Patients who take pioglitazone should be closely monitored for signs of heart failure; treatment should be discontinued if any deterioration in cardiac status occurs.

Pioglitazone should not be used in patients with heart failure or a history of heart failure.

#### Rosiglitazone

The marketing authorisation for rosiglitazone (*Avandia*®, *Avandamet*®) has been suspended (September 2010) following a review by the European Medicines Agency. The European Medicines Agency concluded that the benefits of rosiglitazone treatment do not outweigh the cardiovascular risks. Prescribers should not issue new or repeat prescriptions for rosiglitazone. Treatment of patients who are taking rosiglitazone should be reviewed.

**Saxagliptin, sitagliptin, and vildagliptin** inhibit dipeptidylpeptidase-4 to increase insulin secretion and lower glucagon secretion. They are licensed for use in type 2 diabetes in combination with metformin or a sulfonylurea (if metformin inappropriate) or pioglitazone, when treatment with either metformin or a sulfonylurea or pioglitazone fails to achieve adequate glycaemic control. Sitagliptin is also licensed for use as monotherapy (if metformin inappropriate), or in combination with both metformin and a sulfonylurea, or both metformin and pioglitazone when dual therapy with these drugs fails to achieve adequate glycaemic control. The com-

bination of sitagliptin and insulin (with or without metformin) is also licensed for use when a stable dose of insulin has not provided adequate glycaemic control.

NICE (May 2009) has recommended that, when glycaemic control is inadequate with existing treatment:

- sitagliptin or vildagliptin (instead of a sulfonylurea) can be added to metformin, if there is a significant risk of hypoglycaemia or if a sulfonylurea is contra-indicated or not tolerated;
- sitagliptin or vildagliptin can be added to a sulfonylurea, if metformin is contra-indicated or not tolerated;
- sitagliptin can be added to both metformin and a sulfonylurea, if insulin is unacceptable because of lifestyle or other personal issues, or because the patient is obese.

NICE has recommended that treatment with sitagliptin or vildagliptin is continued only if HbA<sub>1c</sub> concentration is reduced by at least 0.5% within 6 months of starting treatment.

The *Scottish Medicines Consortium* (p. 4) has advised that vildagliptin (*Galvus*®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus in combination with metformin when addition of a sulfonylurea is inappropriate (March 2008), and also in combination with a sulfonylurea if metformin is inappropriate (September 2009).

**Exenatide and liraglutide** both bind to, and activate, the GLP-1 (glucagon-like peptide-1) receptor to increase insulin secretion, suppress glucagon secretion, and slow gastric emptying. Treatment with exenatide and liraglutide is associated with the prevention of weight gain and possible promotion of weight loss which can be beneficial in overweight patients. They are both given by subcutaneous injection for the treatment of type 2 diabetes mellitus.

Exenatide is licensed in combination with metformin or a sulfonylurea, or both, or with pioglitazone, or with both metformin and pioglitazone, in patients who have not achieved adequate glycaemic control with these drugs alone or in combination.

NICE (May 2009) has recommended that, when glycaemic control is inadequate with metformin and sulfonylurea treatment, the addition of exenatide may be considered if the patient has:

- a body mass index of 35 kg/m<sup>2</sup> or over and is of European descent (with appropriate adjustment for other ethnic groups) and weight-related psychological or medical problems or
- a body mass index less than 35 kg/m<sup>2</sup>, and insulin would be unacceptable for occupational reasons or weight loss would benefit other significant obesity-related comorbidities.

NICE has recommended that treatment with exenatide is continued only if HbA<sub>1c</sub> concentration is reduced by at least 1% and a weight loss of at least 3% is achieved within 6 months of starting treatment.

The *Scottish Medicines Consortium* (p. 4) has advised (June 2007) that exenatide (*Byetta*®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes in combination with metformin or sulfonylurea (or both), as an alternative to treatment with insulin in patients where treatment with metformin or sulfonylurea (or both) at maximally tolerated doses

has been inadequate, and treatment with insulin would be the next option.

Liraglutide is licensed for the treatment of type 2 diabetes mellitus in combination with metformin or a sulfonylurea, or both, in patients who have not achieved adequate glycaemic control with these drugs alone or in combination. Liraglutide is also licensed for use in combination with both metformin and pioglitazone when dual therapy with these drugs fails to achieve adequate glycaemic control.

#### NICE guidance

##### Liraglutide for the treatment of type 2 diabetes mellitus (October 2010)

Liraglutide in triple therapy regimens (in combination with metformin and a sulfonylurea, or metformin and a thiazolidinedione) is recommended for the treatment of type 2 diabetes, only when glycaemic control is inadequate, and the patient has:

- a body mass index of 35 kg/m<sup>2</sup> or over and is of European descent (with appropriate adjustment for other ethnic groups) and weight-related psychological or medical problems, *or*
- a body mass index of less than 35 kg/m<sup>2</sup>, and insulin would be unacceptable for occupational reasons *or* weight loss would benefit other significant obesity-related comorbidities.

Treatment with liraglutide in a triple therapy regimen should be continued only if HbA<sub>1c</sub> concentration is reduced by at least 1% and a weight loss of at least 3% is achieved within 6 months of starting treatment.

Liraglutide in dual therapy regimens (in combination with metformin or a sulfonylurea) is recommended only if:

- treatment with metformin or a sulfonylurea is contra-indicated or not tolerated, *and*
- treatment with thiazolidinediones and dipeptidylpeptidase-4 inhibitors is contra-indicated or not tolerated.

Liraglutide, in combination with metformin or a sulfonylurea should be continued only if HbA<sub>1c</sub> concentration is reduced by at least 1% within 6 months of starting treatment.

Liraglutide 1.8 mg daily is not recommended.

tention and pain; *rarely*, nausea, abnormal liver function tests and skin reactions; *very rarely* ileus, oedema, jaundice, and hepatitis

**Note** Antacids unlikely to be beneficial for treating side-effects

#### Dose

- **ADULT** over 18 years, initially 50 mg daily increased to 50 mg 3 times daily, then increased if necessary after 6–8 weeks to 100 mg 3 times daily; max. 200 mg 3 times daily

**Counselling** Tablets should be chewed with first mouthful of food or swallowed whole with a little liquid immediately before food. To counteract possible hypoglycaemia, patients receiving insulin or a sulfonylurea as well as acarbose need to carry glucose (not sucrose—acarbose interferes with sucrose absorption)

#### Glucobay® (Bayer Schering) (POM)

**Tablets**, acarbose 50 mg, net price 90-tab pack = £6.15; 100 mg (scored), 90-tab pack = £11.35. Counselling, administration

## EXENATIDE

**Indications** see notes above

**Cautions** elderly; pancreatitis (see below); **interactions:** Appendix 1 (antidiabetics)

**Pancreatitis** Severe pancreatitis (sometimes fatal), including haemorrhagic or necrotising pancreatitis, has been reported rarely. Patients or their carers should be told how to recognise signs and symptoms of pancreatitis and advised to seek prompt medical attention if symptoms such as abdominal pain, nausea, and vomiting develop; discontinue permanently if pancreatitis is diagnosed

**Contra-indications** ketoacidosis; severe gastro-intestinal disease

**Renal impairment** use with caution if eGFR 30–50 mL/minute/1.73 m<sup>2</sup>; avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** avoid—toxicity in *animal* studies

**Breast-feeding** avoid—no information available

**Side-effects** gastro-intestinal disturbances including nausea, vomiting, diarrhoea, dyspepsia, abdominal pain and distension, gastro-oesophageal reflux disease, decreased appetite; headache, dizziness, agitation, asthenia; hypoglycaemia; increased sweating, injection-site reactions; antibody formation; *less commonly* pancreatitis (see Cautions above); *very rarely* anaphylactic reactions; also reported constipation, flatulence, eructation, dehydration, taste disturbance, renal impairment, drowsiness, rash, pruritus, urticaria, and angioedema

#### Dose

- **By subcutaneous injection, ADULT** over 18 years, initially 5 micrograms twice daily within 1 hour before 2 main meals (at least 6 hours apart), increased if necessary after at least 1 month to max. 10 micrograms twice daily

**Counselling** If a dose is missed, continue with the next scheduled dose—do not administer **after** a meal. Some oral medications should be taken at least 1 hour before or 4 hours after exenatide injection—consult product literature for details

#### Byetta® (Lilly) ▼ (POM)

**Injection**, exenatide 250 micrograms/mL, net price 5 microgram/dose pre-filled pen (60 doses) = £68.24, 10 microgram/dose pre-filled pen (60 doses) = £68.24. Counselling, administration

## LIRAGLUTIDE

**Indications** see notes above

**Cautions** discontinue if symptoms of acute pancreatitis (persistent, severe abdominal pain); **interactions:** Appendix 1 (antidiabetics)

**Contra-indications** ketoacidosis; inflammatory bowel disease; diabetic gastroparesis

**Hepatic impairment** avoid—limited experience

**Renal impairment** avoid if eGFR less than 60 mL/minute/1.73 m<sup>2</sup>—limited experience

**Pregnancy** avoid—toxicity in *animal* studies

**Breast-feeding** avoid—no information available

**Side-effects** gastro-intestinal disturbances including nausea, vomiting, constipation, diarrhoea, dyspepsia, abdominal pain and distension, flatulence, gastritis, gastro-oesophageal reflux disease, decreased appetite; headache, dizziness, fatigue; fever, bronchitis, nasopharyngitis; hypoglycaemia; injection site reactions; *also reported* acute pancreatitis, thyroid neoplasm, goitre, increased blood calcitonin, angioedema

## Dose

- By subcutaneous injection, **ADULT** over 18 years, initially 0.6 mg once daily, increased after at least 1 week to 1.2 mg once daily, further increased if necessary after an interval of at least 1 week to max. 1.8 mg once daily

**Note** Dose of concomitant sulfonylurea may need to be reduced

**Victoza**® (Novo Nordisk) ▼ (P<sub>M</sub>)

**Injection**, liraglutide 6 mg/mL, net price 2 × 3-mL pre-filled pens = £78.48, 3 × 3-mL pre-filled pens = £117.72. Counselling, administration

## NATEGLINIDE

**Indications** type 2 diabetes mellitus in combination with metformin (section 6.1.2.2) when metformin alone inadequate

**Cautions** substitute insulin during intercurrent illness (such as myocardial infarction, coma, infection, and trauma) and during surgery (omit nateglinide on morning of surgery and recommence when eating and drinking normally); elderly, debilitated and malnourished patients; **interactions:** Appendix 1 (antidiabetics)

**Contra-indications** ketoacidosis

**Hepatic impairment** caution in moderate hepatic impairment; avoid in severe impairment—no information available

**Pregnancy** avoid—toxicity in *animal* studies

**Breast-feeding** avoid—present in milk in *animal* studies

**Side-effects** hypoglycaemia; hypersensitivity reactions including pruritus, rashes and urticaria

## Dose

- **ADULT** over 18 years, initially 60 mg 3 times daily within 30 minutes before main meals, adjusted according to response up to max. 180 mg 3 times daily

**Starlix**® (Novartis) (P<sub>M</sub>)

**Tablets**, f/c, nateglinide 60 mg (pink), net price 84-tab pack = £22.71; 120 mg (yellow), 84-tab pack = £25.88; 180 mg (red), 84-tab pack = £25.88

## PIOGLITAZONE

**Indications** type 2 diabetes mellitus (alone or combined with metformin or a sulfonylurea, or with both, or with insulin—see also notes above)

**Cautions** monitor liver function (see below); cardiovascular disease or in combination with insulin (risk of heart failure—see MHRA/CHM advice p. 431); substitute insulin during peri-operative period (omit pioglitazone on morning of surgery and recommence when eating and drinking normally); increased risk of bone fractures, particularly in women; avoid in acute porphyria (but see section 9.8.2); **interactions:** Appendix 1 (antidiabetics)

**Liver toxicity** Rare reports of liver dysfunction; monitor liver function before treatment, and periodically thereafter; advise patients to seek immediate medical attention if symptoms such as nausea, vomiting, abdominal pain, fatigue and dark urine develop; discontinue if jaundice occurs

**Contra-indications** history of heart failure

**Hepatic impairment** avoid; see also Cautions above

**Pregnancy** avoid—toxicity in *animal* studies

**Breast-feeding** avoid—present in milk in *animal* studies

**Side-effects** gastro-intestinal disturbances, weight gain, oedema, anaemia, headache, visual disturbances, dizziness, arthralgia, hypoaesthesia, haematuria, impotence; *less commonly* hypoglycaemia, fatigue, insomnia, vertigo, sweating, altered blood lipids, proteinuria; see also Liver Toxicity above

## Dose

- **ADULT** over 18 years, initially 15–30 mg once daily increased to 45 mg once daily according to response
- Note** Dose of concomitant sulfonylurea or insulin may need to be reduced

**Actos**® (Takeda) ▼ (P<sub>M</sub>)

**Tablets**, pioglitazone (as hydrochloride) 15 mg, net price 28-tab pack = £25.83; 30 mg, 28-tab pack = £35.89; 45 mg, 28-tab pack = £39.55

## ▲ With metformin

For prescribing information on metformin, see section 6.1.2.2

**Competac**® (Takeda) ▼ (P<sub>M</sub>)

**Tablets**, f/c, pioglitazone (as hydrochloride) 15 mg, metformin hydrochloride 850 mg, net price 56-tab pack = £35.89. Label: 21

**Dose** **ADULT** over 18 years, type 2 diabetes not controlled by metformin alone, 1 tablet twice daily

**Note** Titration with the individual components (pioglitazone and metformin) desirable before initiating *Competac*®

## REPAGLINIDE

**Indications** type 2 diabetes mellitus (as monotherapy or in combination with metformin when metformin alone inadequate)

**Cautions** substitute insulin during intercurrent illness (such as myocardial infarction, coma, infection, and trauma) and during surgery (omit repaglinide on morning of surgery and recommence when eating and drinking normally); debilitated and malnourished patients; **interactions:** Appendix 1 (antidiabetics)

**Contra-indications** ketoacidosis

**Hepatic impairment** avoid in severe liver disease

**Renal impairment** use with caution

**Pregnancy** avoid

**Breast-feeding** avoid—present in milk in *animal* studies

**Side-effects** abdominal pain, diarrhoea, constipation, nausea, vomiting; *rarely* hypoglycaemia, hypersensitivity reactions including pruritus, rashes, vasculitis, urticaria, and visual disturbances

#### Dose

● **ADULT** over 18 years, initially 500 micrograms within 30 minutes before main meals (1 mg if transferring from another oral hypoglycaemic), adjusted according to response at intervals of 1–2 weeks; up to 4 mg may be given as a single dose, max. 16 mg daily; **ELDERLY** over 75 years, not recommended

**Prandin**<sup>®</sup> (Daiichi Sankyo) [POM]

**Tablets**, repaglinide 500 micrograms, net price 30-tab pack = £3.92, 90-tab pack = £11.76; 1 mg (yellow), 30-tab pack = £3.92, 90-tab pack = £11.76; 2 mg (peach), 90-tab pack = £11.76

Formerly marketed as *NovoNorm*<sup>®</sup>

## SAXAGLIPTIN

**Indications** see notes above

**Cautions** elderly; **interactions**: Appendix 1 (anti-diabetics)

**Hepatic impairment** use with caution in moderate impairment; avoid in severe impairment

**Renal impairment** avoid if eGFR less than 50 mL/minute/1.73m<sup>2</sup>

**Pregnancy** avoid unless essential—toxicity in *animal* studies

**Breast-feeding** avoid—present in milk in *animal* studies

**Side-effects** vomiting, dyspepsia, gastritis; peripheral oedema; headache, dizziness, fatigue; upper respiratory tract infection, urinary tract infection, gastroenteritis, sinusitis, nasopharyngitis; hypoglycaemia, myalgia; *less commonly* dyslipidaemia, hypertriglyceridaemia, erectile dysfunction, arthralgia; *also reported* rash

#### Dose

● **ADULT** over 18 years, 5 mg once daily

**Note** Dose of concomitant sulfonylurea may need to be reduced

**Onglyza**<sup>®</sup> (Bristol-Myers Squibb) ▼ [POM]

**Tablets**, pink, f/c, saxagliptin (as hydrochloride) 5 mg, net price 28-tab pack = £31.60

## SITAGLIPTIN

**Indications** see notes above

**Cautions** **interactions**: Appendix 1 (anti-diabetics)

**Contra-indications** ketoacidosis

**Renal impairment** avoid if eGFR less than 50 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** avoid—toxicity in *animal* studies

**Breast-feeding** avoid—present in milk in *animal* studies

**Side-effects** gastro-intestinal disturbances; peripheral oedema; upper respiratory tract infection, nasopharyngitis; pain; *less commonly* dry mouth, anorexia, headache, drowsiness, dizziness, hypoglycaemia, osteoarthritis; *also reported* pancreatitis, rash, cutaneous vasculitis, and Stevens-Johnson syndrome

#### Dose

● **ADULT** over 18 years, 100 mg once daily

**Note** Dose of concomitant sulfonylurea or insulin may need to be reduced

**Januvia**<sup>®</sup> (MSD) ▼ [POM]

**Tablets**, beige, f/c, sitagliptin (as phosphate) 100 mg, net price 28-tab pack = £33.26

The *Scottish Medicines Consortium* (p. 4) has advised (June 2010) that *Januvia*<sup>®</sup> is accepted for restricted use within NHS Scotland as monotherapy, to improve glycaemic control in patients with type 2 diabetes mellitus, for whom both metformin and sulfonylureas are not appropriate

#### ▲ With metformin

For prescribing information on metformin, see section 6.1.2.2

**Janumet**<sup>®</sup> (MSD) ▼ [POM]

**Tablets**, f/c, red, sitagliptin 50 mg, metformin hydrochloride 1 g, net price 56-tab pack = £34.56. Label: 21

**Dose** type 2 diabetes mellitus not controlled by metformin alone or by metformin in combination with either a sulfonylurea or pioglitazone or insulin, **ADULT** over 18 years, 1 tablet twice daily

**Note** Dose of concomitant sulfonylurea or insulin may need to be reduced

The *Scottish Medicines Consortium* (p. 4) has advised (July 2008) that *Janumet*<sup>®</sup> is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus when the addition of a sulfonylurea to metformin is not appropriate; it is also accepted for use in NHS Scotland in combination with a sulfonylurea in patients inadequately controlled on maximum tolerated doses of metformin and a sulfonylurea.

## VILDAGLIPTIN

**Indications** type 2 diabetes mellitus (in combination with metformin or with a sulfonylurea or with pioglitazone—see also notes above)

**Cautions** elderly; monitor liver function (see below); heart failure (avoid if moderate or severe); **interactions**: Appendix 1 (anti-diabetics)

**Liver toxicity** Rare reports of liver dysfunction; monitor liver function before treatment and every 3 months for first year and periodically thereafter; advise patients to seek prompt medical attention if symptoms such as nausea, vomiting, abdominal pain, fatigue, and dark urine develop; discontinue if jaundice or other signs of liver dysfunction occur

**Contra-indications** ketoacidosis

**Hepatic impairment** avoid; see also Cautions above

**Renal impairment** avoid if eGFR less than 50 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** avoid—toxicity in *animal* studies

**Breast-feeding** avoid—present in milk in *animal* studies

**Side-effects** nausea, peripheral oedema, headache, tremor, asthenia, dizziness; *less commonly* constipation, hypoglycaemia, arthralgia; *rarely* hepatic dysfunction (see also Liver Toxicity above); *very rarely* nasopharyngitis, upper respiratory tract infection; pancreatitis *also reported*

#### Dose

● **ADULT** over 18 years, in combination with metformin or pioglitazone, 50 mg twice daily; in combination with a sulfonylurea, 50 mg daily in the morning

**Galvus**<sup>®</sup> (Novartis) ▼ [POM]

**Tablets**, pale yellow, vildagliptin 50 mg, net price 56-tab pack = £31.76

**With metformin**

For prescribing information on metformin, see section 6.1.2.2

**Eucreas®** (Novartis) ▼ [POM]

**Eucreas® 50 mg/850 mg tablets**, f/c, yellow, vildagliptin 50 mg, metformin hydrochloride 850 mg, net price 60-tab pack = £31.76. Label: 21

**Eucreas® 50 mg/1 g tablets**, f/c, dark yellow, vildagliptin 50 mg, metformin hydrochloride 1 g, net price 60-tab pack = £31.76. Label: 21

**Dose** type 2 diabetes mellitus not controlled by metformin alone, **ADULT** over 18 years, 1 **Eucreas®** tablet twice daily (based on patient's current metformin dose)

The *Scottish Medicines Consortium* (p. 4) has advised (June 2008) that **Eucreas®** is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus in patients unable to achieve adequate glycaemic control with metformin alone or those already treated with vildagliptin and metformin as separate tablets

**6.1.3 Diabetic ketoacidosis**

The management of diabetic ketoacidosis involves the replacement of fluid and electrolytes and the administration of insulin. Guidelines for the Management of Diabetic Ketoacidosis in Adults, published by the Joint British Diabetes Societies Inpatient Care Group<sup>1</sup>, should be followed.

- To restore circulating volume if systolic blood pressure is below 90 mmHg (adjusted for age, sex, and medication as appropriate), give 500 mL **sodium chloride 0.9%** by intravenous infusion over 10–15 minutes; repeat if blood pressure remains below 90 mmHg and seek senior medical advice.
- When blood pressure is over 90 mmHg, **sodium chloride 0.9%** should be given by intravenous infusion at a rate that replaces deficit and provides maintenance; see guideline for suggested regimen.
- Include **potassium chloride** in the fluids unless anuria is suspected; adjust according to plasma-potassium concentration (measure at 60 minutes, 2 hours, and 2 hourly thereafter; measure hourly if outside the normal range).
- Start an intravenous insulin infusion: **soluble insulin** should be diluted (and **mixed thoroughly**) with **sodium chloride 0.9%** intravenous infusion to a concentration of 1 unit/mL; infuse at a fixed rate of 0.1 units/kg/hour.
- Established subcutaneous therapy with long-acting insulin analogues (insulin detemir or insulin glargine) should be continued during treatment of diabetic ketoacidosis.
- Monitor blood-ketone and blood-glucose concentrations hourly and adjust the insulin infusion rate accordingly. Blood-ketone concentration should fall by at least 0.5 mmol/litre/hour and blood-glucose concentration should fall by at least 3 mmol/litre/hour.
- Once blood-glucose concentration falls below 14 mmol/litre, **glucose 10%** should be given by intravenous infusion (into a large vein through a large-gauge needle) at a rate of 125 mL/hour, in addition to the **sodium chloride 0.9%** infusion.
- Continue insulin infusion until blood-ketone concentration is below 0.3 mmol/litre, blood pH is

above 7.3 and the patient is able to eat and drink; ideally give subcutaneous fast-acting insulin and a meal, and stop the insulin infusion 1 hour later.

For the management of diabetic ketoacidosis in children under 18 years, see *BNF for Children*.

The management of hyperosmolar hyperglycaemic state or hyperosmolar hyperglycaemic nonketotic coma is similar to that of diabetic ketoacidosis, although lower rates of insulin infusion are usually necessary and slower rehydration may be required.

**6.1.4 Treatment of hypoglycaemia**

Initially glucose 10–20 g is given by mouth either in liquid form or as granulated sugar or sugar lumps. Approximately 10 g of glucose is available from non-diet versions of **Lucozade® Energy Original** 55 mL, **Coca-Cola®** 100 mL, **Ribena® Blackcurrant** 18 mL (to be diluted), 2 teaspoons of sugar, and also from 3 sugar lumps<sup>2</sup>. If necessary this may be repeated in 10–15 minutes. After initial treatment, a snack providing sustained availability of carbohydrate (e.g. a sandwich, fruit, milk, or biscuits) or the next meal, if it is due, can prevent blood-glucose concentration from falling again.

Hypoglycaemia which causes unconsciousness is an emergency. **Glucagon**, a polypeptide hormone produced by the alpha cells of the islets of Langerhans, increases plasma-glucose concentration by mobilising glycogen stored in the liver. In hypoglycaemia, if sugar cannot be given by mouth, glucagon can be given by injection. Carbohydrates should be given as soon as possible to restore liver glycogen; glucagon is not appropriate for chronic hypoglycaemia. Glucagon may be issued to close relatives of insulin-treated patients for emergency use in hypoglycaemic attacks. It is often advisable to prescribe on an 'if necessary' basis to hospitalised insulin-treated patients, so that it may be given rapidly by the nurses during an hypoglycaemic emergency. If not effective in 10 minutes intravenous glucose should be given.

Alternatively, 50 mL of **glucose intravenous infusion 20%** (section 9.2.2) may be given intravenously into a large vein through a large-gauge needle; care is required since this concentration is irritant especially if extravasation occurs. Glucose intravenous infusion 10% may also be used but larger volumes are needed. Glucose intravenous infusion 50% is not recommended because of the higher risk of extravasation injury and because administration is difficult. Close monitoring is necessary in the case of an overdose with a long-acting insulin because further administration of glucose may be required. Patients whose hypoglycaemia is caused by an oral antidiabetic drug should be transferred to hospital because the hypoglycaemic effects of these drugs may persist for many hours.

For advice on the emergency management of hypoglycaemia in dental practice, see p. 28.

2. Proprietary products of quick-acting carbohydrate (e.g. **GlucoGel®**, **DextroGel®**, **Hypo-Fit®**) are available on prescription for the patient to keep to hand in case of hypoglycaemia.

1. Available at [www.diabetes.nhs.uk](http://www.diabetes.nhs.uk)

## GLUCAGON

**Indications** see notes above and under Dose

**Cautions** see notes above, insulinoma, glucagonoma; ineffective in chronic hypoglycaemia, starvation, and adrenal insufficiency

**Contra-indications** phaeochromocytoma

**Side-effects** nausea, vomiting, abdominal pain, hypokalaemia, hypotension, rarely hypersensitivity reactions

### Dose

- Insulin-induced hypoglycaemia, by **subcutaneous, intramuscular, or intravenous injection**, **ADULT** and **CHILD** over 8 years (or body-weight over 25 kg), 1 mg; **CHILD** under 8 years (or body-weight under 25 kg), 500 micrograms; if no response within 10 minutes intravenous glucose must be given
  - Diagnostic aid, consult product literature
  - Beta-blocker poisoning, see p. 37
- Note** 1 unit of glucagon = 1 mg of glucagon

**1 GlucaGen® HypoKit** (Novo Nordisk) (POM)

**Injection**, powder for reconstitution, glucagon (rys) as hydrochloride with lactose, net price 1-mg vial with prefilled syringe containing water for injection = £11.52

1. (POM) restriction does not apply where administration is for saving life in emergency

## Chronic hypoglycaemia

**Diazoxide**, administered by mouth, is useful in the management of patients with chronic hypoglycaemia from excess endogenous insulin secretion, either from an islet cell tumour or islet cell hyperplasia. It has no place in the management of acute hypoglycaemia.

## DIAZOXIDE

**Indications** chronic intractable hypoglycaemia; hypertensive emergency—but no longer recommended, see section 2.5

**Cautions** ischaemic heart disease; monitor blood pressure; during prolonged use monitor white cell and platelet count, and in children, regularly assess growth, bone, and psychological development; **interactions:** Appendix 1 (diazoxide)

**Renal impairment** dose reduction may be required

**Pregnancy** prolonged use in second or third trimesters may produce alopecia and impaired glucose tolerance in neonate; inhibits uterine activity during labour

**Side-effects** anorexia, nausea, vomiting, hyperuricaemia, hypotension, oedema, tachycardia, arrhythmias, extrapyramidal effects; hypertrichosis on prolonged treatment

### Dose

- **By mouth**, **ADULT** and **CHILD**, initially 5 mg/kg daily in 2–3 divided doses

**Eudemine®** (UCB Pharma) (POM)

**Tablets**, diazoxide 50 mg. Net price 100 = £44.64

**Injection**, see section 2.5.1

## 6.1.5 Treatment of diabetic nephropathy and neuropathy

### Diabetic nephropathy

Regular review of diabetic patients should include an annual test for urinary protein (using *Albustix®*) and serum creatinine measurement. If the urinary protein test is negative, the urine should be tested for microalbuminuria (the earliest sign of nephropathy). If reagent strip tests (*Mical-Test II®* (PMS) or *Microbumintest®* (PMS)) are used and prove positive, the result should be confirmed by laboratory analysis of a urine sample. Provided there are no contra-indications, all diabetic patients with nephropathy causing proteinuria or with established microalbuminuria (at least 3 positive tests) should be treated with an ACE inhibitor (section 2.5.5.1) or an angiotensin-II receptor antagonist (section 2.5.5.2) even if the blood pressure is normal; in any case, to minimise the risk of renal deterioration, blood pressure should be carefully controlled (section 2.5).

ACE inhibitors can potentiate the hypoglycaemic effect of insulin and oral antidiabetic drugs; this effect is more likely during the first weeks of combined treatment and in patients with renal impairment.

For the treatment of hypertension in diabetes, see section 2.5.

### Diabetic neuropathy

Optimal diabetic control is beneficial for the management of *painful neuropathy* in patients with type 1 diabetes (see also section 4.7.3). **Paracetamol** (p. 259) or a non-steroidal anti-inflammatory drug such as **ibuprofen** (p. 636) may relieve *mild to moderate pain*.

**Duloxetine** (p. 243) is effective for the treatment of painful diabetic neuropathy; **amitriptyline** (p. 235) [unlicensed use] can be used if duloxetine is ineffective or unsuitable. **Nortriptyline** (p. 236) [unlicensed] may be better tolerated than amitriptyline. If treatment with amitriptyline or duloxetine is inadequate, treatment with **pregabalin** (p. 284) should be tried. Combination therapy of duloxetine or amitriptyline with pregabalin can be used if monotherapy at the maximum tolerated dose does not control symptoms.

Neuropathic pain may respond to opioid analgesics. There is evidence of efficacy for **tramadol** (p. 271), **morphine** (p. 268), and **oxycodone** (p. 269); however, treatment with morphine or oxycodone should be initiated only under specialist supervision. Tramadol can be prescribed while the patient is waiting for assessment by a specialist if other treatments have been unsuccessful.

**Gabapentin** (p. 284) and **carbamazepine** (p. 281) are sometimes used for the treatment of neuropathic pain. **Capsaicin** cream 0.075% (p. 664) is licensed for painful diabetic neuropathy and may have some effect, but it produces an intense burning sensation during the initial treatment period.

In *autonomic neuropathy* diabetic diarrhoea can often be managed by 2 or 3 doses of **tetracycline** 250 mg [unlicensed use] (p. 347). Otherwise **codeine** (p. 58) is

the best drug, but other anti-diarrhoeal preparations can be tried. An antiemetic which promotes gastric transit, such as **metoclopramide** (p. 253) or **domperidone** (p. 253), is helpful for gastroparesis. In rare cases when an antiemetic does not help, erythromycin (especially when given intravenously) may be beneficial but this needs confirmation.

In *neuropathic postural hypotension* increased salt intake and the use of the mineralocorticoid **fludrocortisone** 100–400 micrograms daily [unlicensed use] (p. 442) may help by increasing plasma volume, but uncomfortable oedema is a common side-effect. Fludrocortisone can also be combined with **flurbiprofen** (p. 636) and **ephedrine hydrochloride** (p. 179) [both unlicensed]. **Midodrine** [unlicensed], an alpha agonist, may also be useful in postural hypotension.

*Gustatory sweating* can be treated with an antimuscarinic such as **propranolol bromide** (p. 48); side-effects are common. For the management of hyperhidrosis, see section 13.12.

In some patients with *neuropathic oedema*, ephedrine hydrochloride [unlicensed use] 30–60 mg 3 times daily offers effective relief.

For the management of erectile dysfunction, see section 7.4.5.

## 6.1.6 Diagnostic and monitoring devices for diabetes mellitus

### Blood monitoring

Blood **glucose** monitoring using a meter gives a direct measure of the glucose concentration at the time of the test and can detect hypoglycaemia as well as hyperglycaemia. Patients should be properly trained in the use of blood glucose monitoring systems and to take appropriate action on the results obtained. Inadequate understanding of the normal fluctuations in blood glucose can lead to confusion and inappropriate action.

Patients using multiple injection regimens should understand how to adjust their insulin dose according to their carbohydrate intake. With fixed-dose insulin regimens, the carbohydrate intake needs to be regulated, and should be distributed throughout the day to match the insulin regimen.

Self-monitoring of blood-glucose concentration is appropriate for patients with type 2 diabetes:

- who are treated with insulin;
- who are treated with oral hypoglycaemic drugs e.g. sulfonylureas, to provide information on hypoglycaemia;
- to monitor changes in blood-glucose concentration resulting from changes in lifestyle or medication, and during intercurrent illness;
- to ensure safe blood-glucose concentration during activities, including driving.

**Note** In the UK blood-glucose concentration is expressed in mmol/litre and Diabetes UK advises that these units should be used for self-monitoring of blood glucose. In other European countries units of mg/100 mL (or mg/dL) are commonly used. It is advisable to check that the meter is pre-set in the correct units.

If the patient is unwell and diabetic ketoacidosis is suspected, blood **ketones** should be measured according to local guidelines (section 6.1.3). Patients and their carers should be trained in the use of blood ketone monitoring systems and to take appropriate action on the results obtained, including when to seek medical attention.

### Urinalysis

Tests for glucose range from reagent strips specific to glucose to reagent tablets which detect all reducing sugars. Few patients still use *Clinitest*<sup>®</sup>; *Clinistix*<sup>®</sup> is suitable for screening purposes only. Tests for ketones by patients are rarely required unless they become unwell—see also Blood Monitoring, above.

Microalbuminuria can be detected with *Micral-Test II*<sup>®</sup>  but this should be followed by confirmation in the laboratory, since false positive results are common.

#### ▲ Glucose

**Clinistix**<sup>®</sup> (Bayer Diabetes Care)

**Reagent strips**, for detection of glucose in urine. Net price 50-strip pack = £3.27

**Clinitest**<sup>®</sup> (Bayer Diabetes Care) 

**Reagent tablets**, for detection of glucose and other reducing substances in urine. Net price 36-tablet pack = £2.00

**Diabur-Test 5000**<sup>®</sup> (Roche Diagnostics)

**Reagent strips**, for detection of glucose in urine. Net price 50-strip pack = £2.87

**Diastix**<sup>®</sup> (Bayer Diabetes Care)

**Reagent strips**, for detection of glucose in urine. Net price 50-strip pack = £2.78

**Medi-Test<sup>®</sup> Glucose** (BHR)

**Reagent strips**, for detection of glucose in urine. Net price 50-strip pack = £2.33

#### ▲ Ketones

**Ketostix**<sup>®</sup> (Bayer Diabetes Care)

**Reagent strips**, for detection of ketones in urine. Net price 50-strip pack = £2.95

**Ketur Test**<sup>®</sup> (Roche Diagnostics)

**Reagent strips**, for detection of ketones in urine. Net price 50-strip pack = £2.76

#### ▲ Protein

**Albustix**<sup>®</sup> (Siemens)

**Reagent strips**, for detection of protein in urine. Net price 50-strip pack = £4.10

**Medi-Test<sup>®</sup> Protein 2** (BHR)

**Reagent strips**, for detection of protein in urine. Net price 50-strip pack = £3.27

#### ▲ Other reagent strips available for urinalysis include:

*Combur-3 Test*<sup>®</sup>  (glucose and protein—Roche Diagnostics), *Clintek Microalbumin*<sup>®</sup>  (albumin and creatinine—Siemens), *Ketodiastix*<sup>®</sup>  (glucose and ketones—Bayer Diagnostics), *Medi-Test Combi 2*<sup>®</sup>  (glucose and protein—BHR), *Micral-Test II*<sup>®</sup>  (albumin—Roche Diagnostics), *Microalbustix*<sup>®</sup>  (albumin and creatinine—Siemens), *Uristix*<sup>®</sup>  (glucose and protein—Siemens)

## Meters and test strips

Meter (all <sup>(UKS)</sup> )	Type of monitoring	Meter retail price	Compatible test strips	Test strip net price	Sensitivity range (mmol/litre)	Manufacturer
<b>Accu-Chek® Active<sup>1</sup></b>	Blood glucose		<b>Active®</b>	50-strip pack = £15.16	0.6–33.3	Roche Diagnostics

## Oral glucose tolerance test

The oral glucose tolerance test is used mainly for diagnosis of impaired glucose tolerance; it is not recommended or necessary for routine diagnostic use when severe symptoms of hyperglycaemia are present. In patients who have less severe symptoms and blood glucose levels that do not establish or exclude diabetes (e.g. impaired fasting glycaemia), an oral glucose tolerance test may be required. It is also used to establish the presence of gestational diabetes. The oral glucose tolerance test generally involves giving anhydrous glucose 75 g (equivalent to Glucose BP 82.5 g) by mouth to the fasting patient, and measuring blood-glucose concentrations at intervals.

The appropriate amount of glucose should be given with 200–300 mL fluid. Anhydrous glucose 75 g may alternatively be given as 113 mL *Polyca®* (Nutricia Clinical) with extra fluid to administer a total volume of 200–300 mL.

## 6.2 Thyroid and antithyroid drugs

### 6.2.1 Thyroid hormones

#### 6.2.2 Antithyroid drugs

### 6.2.1 Thyroid hormones

Thyroid hormones are used in hypothyroidism (myxoedema), and also in diffuse non-toxic goitre, Hashimoto's thyroiditis (lymphadenoid goitre), and thyroid carcinoma. Neonatal hypothyroidism requires prompt treatment for normal development. **Levothyroxine sodium** (thyroxine sodium) is the treatment of choice for *maintenance* therapy.

In infants and children with congenital hypothyroidism and juvenile myxoedema, the dose of levothyroxine should be titrated according to clinical response, growth assessment, and measurements of plasma thyroxine and thyroid-stimulating hormone. See *BNF for Children* (section 6.2.1) for suitable dosage regimens.

**Liothyronine sodium** has a similar action to levothyroxine but is more rapidly metabolised and has a more rapid effect; 20 micrograms is equivalent to 100 micrograms of levothyroxine. Its effects develop after a few hours and disappear within 24 to 48 hours of discontinuing treatment. It may be used in *severe hypothyroid states* when a rapid response is desired.

Liothyronine by intravenous injection is the treatment of choice in *hypothyroid coma*. Adjunctive therapy includes intravenous fluids, hydrocortisone, and treatment of infection; assisted ventilation is often required.

### LEVOTHYROXINE SODIUM (Thyroxine sodium)

**Indications** hypothyroidism; see also notes above

**Cautions** panhypopituitarism or predisposition to adrenal insufficiency (initiate corticosteroid therapy before starting levothyroxine), elderly, cardiovascular disorders (including hypertension, myocardial insufficiency or myocardial infarction, see Initial Dosage below), long-standing hypothyroidism, diabetes insipidus, diabetes mellitus (dose of antidiabetic drugs including insulin may need to be increased); **interactions:** Appendix 1 (thyroid hormones)

**Initial dosage** Baseline ECG is valuable because changes induced by hypothyroidism can be confused with ischaemia. If metabolism increases too rapidly (causing diarrhoea, nervousness, rapid pulse, insomnia, tremors and sometimes anginal pain where there is latent myocardial ischaemia), reduce dose or withhold for 1–2 days and start again at a lower dose

**Contra-indications** thyrotoxicosis

**Pregnancy** monitor maternal serum-thyrotrophin concentration—levothyroxine may cross the placenta and excessive maternal concentration can be detrimental to fetus

**Breast-feeding** amount too small to affect tests for neonatal hypothyroidism

**Side-effects** usually at excessive dosage (see Initial Dosage above) include diarrhoea, vomiting, anginal pain, arrhythmias, palpitation, tachycardia, tremor, restlessness, excitability, insomnia; headache, flushing, sweating, fever, heat intolerance, weight-loss, muscle cramp, and muscular weakness; transient hair loss in children; hypersensitivity reactions including rash, pruritus and oedema also reported

#### Dose

- **ADULT** over 18 years, initially 50–100 micrograms once daily, preferably before breakfast, adjusted in steps of 25–50 micrograms every 3–4 weeks according to response (usual maintenance dose 100–200 micrograms once daily); in cardiac disease, severe hypothyroidism, and patients over 50 years, initially 25 micrograms once daily, adjusted in steps of 25 micrograms every 4 weeks according to response; usual maintenance dose 50–200 micrograms once daily; **CHILD** under 18 years see *BNF for Children* (section 6.2.1)
- Congenital hypothyroidism and juvenile myxoedema, see *BNF for Children* (section 6.2.1)

**Levothyroxine** (Non-proprietary) (POM)

**Tablets**, levothyroxine sodium 25 micrograms, net price 28-tab pack = £2.22; 50 micrograms, 28-tab pack = £1.09; 100 micrograms, 28-tab pack = £1.09  
Brands include *Eltroxin*<sup>®</sup>

**Oral solution**, levothyroxine sodium 25 micrograms/5 mL, net price 100 mL = £42.75; 50 micrograms/

5 mL, 100 mL = £44.90; 100 micrograms/5 mL, 100 mL = £52.75

Brands include *Evotrox*<sup>®</sup> (sugar-free)

**Note** All strengths of levothyroxine oral solution by Almus and branded as *Evotrox*<sup>®</sup>, have been reformulated (August 2010) leading to an increase in potency of approximately 10%; the manufacturer advises that the recommended dose has not changed, but recommends increased monitoring of patients on these preparations as dose adjustments may be necessary

### LIOTHYRONINE SODIUM (l-Tri-iodothyronine sodium)

**Indications** see notes above

**Cautions** see under Levothyroxine Sodium; **interactions:** Appendix 1 (thyroid hormones)

**Contra-indications** see under Levothyroxine Sodium

**Pregnancy** does not cross the placenta in significant amounts; monitor maternal thyroid function tests—dosage adjustment may be necessary

**Breast-feeding** amount too small to affect tests for neonatal hypothyroidism

**Side-effects** see under Levothyroxine Sodium

#### Dose

- **By mouth**, initially 10–20 micrograms daily gradually increased to 60 micrograms daily in 2–3 divided doses; **ELDERLY** smaller initial doses; **CHILD**, adult dose reduced in proportion to body-weight
- **By slow intravenous injection**, hypothyroid coma, 5–20 micrograms repeated every 12 hours or as often as every 4 hours if necessary; *alternatively* initially 50 micrograms then 25 micrograms every 8 hours reducing to 25 micrograms twice daily

**Liothyronine sodium** (Goldshield) (POM)

**Tablets**, scored, liothyronine sodium 20 micrograms, net price 28-tab pack = £26.15

**Triiodothyronine** (Goldshield) (POM)

**Injection**, powder for reconstitution, liothyronine sodium (with dextran). Net price 20-microgram amp = £37.92

## 6.2.2 Antithyroid drugs

Antithyroid drugs are used for hyperthyroidism either to prepare patients for thyroidectomy or for long-term management. In the UK carbimazole is the most commonly used drug. Propylthiouracil should be reserved for patients who are intolerant of carbimazole or for those who suffer sensitivity reactions to carbimazole, because sensitivity is not necessarily displayed to both drugs. Both drugs act primarily by interfering with the synthesis of thyroid hormones.

### Neutropenia and agranulocytosis

Doctors are reminded of the importance of recognising bone marrow suppression induced by carbimazole and the need to stop treatment promptly.

1. Patient should be asked to report symptoms and signs suggestive of infection, especially sore throat.
2. A white blood cell count should be performed if there is any clinical evidence of infection.
3. Carbimazole should be stopped promptly if there is clinical or laboratory evidence of neutropenia.

**Carbimazole** is given in a dose of 15 to 40 mg daily; higher doses should be prescribed under specialist supervision only. This dose is continued until the patient becomes euthyroid, usually after 4 to 8 weeks and the dose is then gradually reduced to a maintenance dose of 5 to 15 mg. Therapy is usually given for 12 to 18 months. Children may be given carbimazole in an initial dose of 250 micrograms/kg three times daily, adjusted according to response; treatment in children should be undertaken by a specialist. Rashes and pruritus are common but they can be treated with antihistamines without discontinuing therapy; alternatively propylthiouracil can be substituted. All patients should be advised to report any sore throat immediately because of the rare complication of agranulocytosis (see Neutropenia and Agranulocytosis, above).

**Propylthiouracil** is given in a dose of 200 to 400 mg daily in divided doses in adults and this dose is maintained until the patient becomes euthyroid; the dose may then be gradually reduced to a maintenance dose of 50 to 150 mg daily in divided doses.

Over-treatment with antithyroid drugs can result in the rapid development of hypothyroidism and should be avoided particularly during pregnancy because it can cause fetal goitre.

A combination of carbimazole, 40 to 60 mg daily with levothyroxine, 50 to 150 micrograms daily, may be used in a *blocking-replacement regimen*; therapy is usually given for 18 months. The blocking-replacement regimen is **not** suitable during pregnancy.

**Iodine** has been used as an adjunct to antithyroid drugs for 10 to 14 days before partial thyroidectomy; however, there is little evidence of a beneficial effect. Iodine should not be used for long-term treatment because its antithyroid action tends to diminish.

Radioactive sodium iodide ( $^{131}\text{I}$ ) solution is used increasingly for the treatment of thyrotoxicosis at all ages, particularly where medical therapy or compliance is a problem, in patients with cardiac disease, and in patients who relapse after thyroidectomy.

**Propranolol** is useful for rapid relief of thyrotoxic symptoms and may be used in conjunction with antithyroid drugs or as an adjunct to radioactive iodine. Beta-blockers are also useful in neonatal thyrotoxicosis and in supraventricular arrhythmias due to hyperthyroidism. Propranolol has been used in conjunction with iodine to prepare mildly thyrotoxic patients for surgery but it is preferable to make the patient euthyroid with carbimazole. Laboratory tests of thyroid function are not altered by beta-blockers. Most experience in treating thyrotoxicosis has been gained with propranolol but **nadolol** is also used. For doses and preparations of beta-blockers see section 2.4.

*Thyrotoxic crisis* ('thyroid storm') requires emergency treatment with intravenous administration of fluids, propranolol (5 mg) and hydrocortisone (100 mg every 6 hours, as sodium succinate), as well as oral iodine solution and carbimazole or propylthiouracil which may need to be administered by nasogastric tube.

**Pregnancy and breast-feeding** Radioactive iodine therapy is contra-indicated during pregnancy. Propylthiouracil and carbimazole can be given but the blocking-replacement regimen (see above) is **not** suitable. Rarely, carbimazole has been associated with congenital defects, including aplasia cutis of the neonate—use car-

bimazole in pregnancy only if propylthiouracil is not suitable. Both propylthiouracil and carbimazole cross the placenta and in high doses may cause fetal goitre and hypothyroidism—the lowest dose that will control the hyperthyroid state should be used (requirements in Graves' disease tend to fall during pregnancy).

Carbimazole and propylthiouracil appear in breast milk but this does not preclude breast-feeding as long as neonatal development is closely monitored and the lowest effective dose is used.

## CARBIMAZOLE

**Indications** hyperthyroidism

**Contra-indications** severe blood disorders

**Hepatic impairment** use with caution in mild to moderate impairment; avoid in severe impairment

**Pregnancy** neonatal goitre and hypothyroidism; has been associated with congenital defects including aplasia cutis of the neonate; see also notes above

**Breast-feeding** amount in milk may be sufficient to affect neonatal thyroid function therefore lowest effective dose should be used; see also notes above

**Side-effects** nausea, mild gastro-intestinal disturbances, taste disturbance, headache; fever, malaise; rash, pruritus, arthralgia; rarely myopathy, alopecia, bone marrow suppression (including pancytopenia and agranulocytosis, see Neutropenia and Agranulocytosis above), and jaundice

**Counselling** Warn patient to tell doctor **immediately** if sore throat, mouth ulcers, bruising, fever, malaise, or non-specific illness develops

### Dose

- See notes above

**Carbimazole** (Non-proprietary) (PoM)

**Tablets**, carbimazole 5 mg, net price 100-tab pack = £4.53; 20 mg, 100-tab pack = £16.83. **Counselling**, blood disorder symptoms

**Neo-Mercazole**<sup>®</sup> (Amdipharm) (PoM)

**Tablets**, both pink, carbimazole 5 mg, net price 100-tab pack = £3.85; 20 mg, 100-tab pack = £11.44. **Counselling**, blood disorder symptoms

## IODINE AND IODIDE

**Indications** thyrotoxicosis (pre-operative)

**Cautions** children; not for long-term treatment

**Pregnancy** neonatal goitre and hypothyroidism; see also notes above

**Breast-feeding** stop breast-feeding; danger of neonatal hypothyroidism or goitre; appears to be concentrated in milk; see also notes above

**Side-effects** hypersensitivity reactions including coryza-like symptoms, headache, lacrimation, conjunctivitis, pain in salivary glands, laryngitis, bronchitis, rashes; on prolonged treatment depression, insomnia, impotence; goitre in infants of mothers taking iodides

### Dose

- See under preparation

**Aqueous Iodine Oral Solution**

**Oral solution**, iodine 5%, potassium iodide 10% in purified water, freshly boiled and cooled, total iodine 130 mg/mL, net price 500 mL = £6.24. **Label**: 27

**Dose** 0.1–0.3 mL 3 times daily well diluted with milk or water

## PROPYLTHIOURACIL

**Indications** hyperthyroidism

**Cautions** monitor for hepatotoxicity

**Hepatotoxicity** Severe hepatic reactions have been reported, including fatal cases and cases requiring liver transplant—discontinue if significant liver-enzyme abnormalities develop

**Counselling** Patients should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain, jaundice, dark urine, or pruritus develop

**Hepatic impairment** reduce dose (see also Hepatotoxicity above)

**Renal impairment** use three-quarters normal dose if eGFR 10–50 mL/minute/1.73 m<sup>2</sup>; use half normal dose if eGFR less than 10 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** neonatal goitre and hypothyroidism; see also notes above

**Breast-feeding** monitor infant's thyroid status but amount in milk probably too small to affect infant; high doses may affect neonatal thyroid function; see also notes above

**Side-effects** see under Carbimazole; leucopenia; rarely cutaneous vasculitis, thrombocytopenia, aplastic anaemia, hypoproteinaemia, hepatic disorders (including hepatitis, hepatic failure, encephalopathy, hepatic necrosis; see also Hepatotoxicity above), nephritis, lupus erythematosus-like syndromes

### Dose

- See notes above

**Propylthiouracil** (Non-proprietary) (P<sub>o</sub>M)

Tablets, propylthiouracil 50 mg. Net price 56-tab pack = £47.11, 100-tab pack = £67.38

## 6.3 Corticosteroids

6.3.1 Replacement therapy

6.3.2 Glucocorticoid therapy

### 6.3.1 Replacement therapy

The adrenal cortex normally secretes hydrocortisone (cortisol) which has glucocorticoid activity and weak mineralocorticoid activity. It also secretes the mineralocorticoid aldosterone.

In deficiency states, physiological replacement is best achieved with a combination of **hydrocortisone** (section 6.3.2) and the mineralocorticoid **fludrocortisone**; hydrocortisone alone does not usually provide sufficient mineralocorticoid activity for complete replacement.

In *Addison's disease* or following adrenalectomy, **hydrocortisone** 20 to 30 mg daily by mouth is usually required. This is given in 2 doses, the larger in the morning and the smaller in the evening, mimicking the normal diurnal rhythm of cortisol secretion. The optimum daily dose is determined on the basis of clinical response. Glucocorticoid therapy is supplemented by fludrocortisone 50 to 300 micrograms daily.

In *acute adrenocortical insufficiency*, **hydrocortisone** is given intravenously (preferably as sodium succinate) in doses of 100 mg every 6 to 8 hours in sodium chloride intravenous infusion 0.9%.

In *hypopituitarism* glucocorticoids should be given as in adrenocortical insufficiency, but since production of aldosterone is also regulated by the renin-angiotensin system a mineralocorticoid is not usually required. Additional replacement therapy with levothyroxine (section 6.2.1) and sex hormones (section 6.4) should be given as indicated by the pattern of hormone deficiency.

## FLUDROCORTISONE ACETATE

**Indications** mineralocorticoid replacement in adrenocortical insufficiency

**Cautions** section 6.3.2; **interactions:** Appendix 1 (corticosteroids)

**Contra-indications** section 6.3.2

**Hepatic impairment** section 6.3.2

**Renal impairment** section 6.3.2

**Pregnancy** section 6.3.2

**Breast-feeding** section 6.3.2

**Side-effects** section 6.3.2

### Dose

- 50–300 micrograms daily; **CHILD** 5 micrograms/kg daily

**Florinef**<sup>®</sup> (Squibb) (P<sub>o</sub>M)

Tablets, scored, fludrocortisone acetate 100 micrograms. Net price 100-tab pack = £5.05. Label: 10, steroid card

### 6.3.2 Glucocorticoid therapy

In comparing the relative potencies of corticosteroids in terms of their anti-inflammatory (glucocorticoid) effects it should be borne in mind that high glucocorticoid activity in itself is of no advantage unless it is accompanied by relatively low mineralocorticoid activity (see Disadvantages of Corticosteroids below). The mineralocorticoid activity of **fludrocortisone** (section 6.3.1) is so high that its anti-inflammatory activity is of no clinical relevance. The table below shows equivalent anti-inflammatory doses.

#### Equivalent anti-inflammatory doses of corticosteroids

This table takes no account of mineralocorticoid effects, nor does it take account of variations in duration of action

Prednisolone 5 mg
≡ Betamethasone 750 micrograms
≡ Cortisone acetate 25 mg
≡ Deflazacort 6 mg
≡ Dexamethasone 750 micrograms
≡ Hydrocortisone 20 mg
≡ Methylprednisolone 4 mg
≡ Prednisone 5 mg
≡ Triamcinolone 4 mg

The relatively high mineralocorticoid activity of **cortisone** and **hydrocortisone**, and the resulting fluid retention, make them unsuitable for disease suppression on a long-term basis. However, they can be used for adrenal replacement therapy (section 6.3.1); hydrocortisone is preferred because cortisone requires conversion in the

liver to hydrocortisone. Hydrocortisone is used on a short-term basis by intravenous injection for the emergency management of some conditions. The relatively moderate anti-inflammatory potency of hydrocortisone also makes it a useful topical corticosteroid for the management of inflammatory skin conditions because side-effects (both topical and systemic) are less marked (section 13.4); cortisone is not active topically.

**Prednisolone** and **prednisone** have predominantly glucocorticoid activity. Prednisolone is the corticosteroid most commonly used by mouth for long-term disease suppression.

**Betamethasone** and **dexamethasone** have very high glucocorticoid activity in conjunction with insignificant mineralocorticoid activity. This makes them particularly suitable for high-dose therapy in conditions where fluid retention would be a disadvantage.

Betamethasone and dexamethasone also have a long duration of action and this, coupled with their lack of mineralocorticoid action makes them particularly suitable for conditions which require suppression of corticotropin (corticotrophin) secretion (e.g. congenital adrenal hyperplasia). Some esters of betamethasone and of **beclometasone** (beclomethasone) exert a considerably more marked topical effect (e.g. on the skin or the lungs) than when given by mouth; use is made of this to obtain topical effects whilst minimising systemic side-effects (e.g. for skin applications and asthma inhalations).

**Deflazacort** has a high glucocorticoid activity; it is derived from prednisolone.

## Use of corticosteroids

Dosages of corticosteroids vary widely in different diseases and in different patients. If the use of a corticosteroid can save or prolong life, as in exfoliative dermatitis, pemphigus, acute leukaemia or acute transplant rejection, high doses may need to be given, because the complications of therapy are likely to be less serious than the effects of the disease itself.

When long-term corticosteroid therapy is used in some chronic diseases, the adverse effects of treatment may become greater than the disabilities caused by the disease. To minimise side-effects the maintenance dose should be kept as low as possible.

When potentially less harmful measures are ineffective corticosteroids are used topically for the treatment of inflammatory conditions of the skin (section 13.4). Corticosteroids should be avoided or used only under specialist supervision in psoriasis (section 13.5).

Corticosteroids are used both topically (by rectum) and systemically (by mouth or intravenously) in the management of ulcerative colitis and Crohn's disease (section 1.5). They are also included in locally applied creams for haemorrhoids (section 1.7.2).

Use can be made of the mineralocorticoid activity of fludrocortisone to treat postural hypotension in autonomic neuropathy (section 6.1.5).

High-dose corticosteroids should be avoided for the management of septic shock. However, there is evidence that administration of lower doses of hydrocortisone (50 mg intravenously every 6 hours) and fludrocortisone (50 micrograms daily by mouth) is of benefit in adrenocortical insufficiency resulting from septic shock.

Dexamethasone and betamethasone have little if any mineralocorticoid action and their long duration of action makes them particularly suitable for suppressing corticotropin secretion in congenital adrenal hyperplasia where the dose should be tailored to clinical response and by measurement of adrenal androgens and 17-hydroxyprogesterone. In common with all glucocorticoids their suppressive action on the hypothalamic-pituitary-adrenal axis is greatest and most prolonged when they are given at night. In most individuals a single dose of 1 mg of dexamethasone at night, is sufficient to inhibit corticotropin secretion for 24 hours. This is the basis of the 'overnight dexamethasone suppression test' for diagnosis of Cushing's syndrome.

Betamethasone and dexamethasone are also appropriate for conditions where water retention would be a disadvantage.

A corticosteroid may be used in the management of raised intracranial pressure or cerebral oedema that occurs as a result of malignancy (see also p. 22); high doses of betamethasone or dexamethasone are generally used. However, a corticosteroid should **not** be used for the management of head injury or stroke because it is unlikely to be of benefit and may even be harmful.

In acute hypersensitivity reactions such as angioedema of the upper respiratory tract and anaphylaxis, corticosteroids are indicated as an adjunct to emergency treatment with adrenaline (epinephrine) (section 3.4.3). In such cases hydrocortisone (as sodium succinate) by intravenous injection in a dose of 100 to 300 mg may be required.

Corticosteroids are preferably used by inhalation in the management of asthma (section 3.2) but systemic therapy in association with bronchodilators is required for the emergency treatment of severe acute asthma (section 3.1.1).

Corticosteroids may also be useful in conditions such as autoimmune hepatitis, rheumatoid arthritis and sarcoidosis; they may also lead to remissions of acquired haemolytic anaemia (section 9.1.3), and some cases of the nephrotic syndrome (particularly in children) and thrombocytopenic purpura (section 9.1.4).

Corticosteroids can improve the prognosis of serious conditions such as systemic lupus erythematosus, temporal arteritis, and polyarteritis nodosa; the effects of the disease process may be suppressed and symptoms relieved, but the underlying condition is not cured, although it may ultimately remit. It is usual to begin therapy in these conditions at fairly high dose, such as 40 to 60 mg prednisolone daily, and then to reduce the dose to the lowest commensurate with disease control.

For other references to the use of corticosteroids see Prescribing in Palliative Care, section 8.2.2 (immunosuppression), section 10.1.2 (rheumatic diseases), section 11.4 (eye), section 12.1.1 (otitis externa), section 12.2.1 (allergic rhinitis), and section 12.3.1 (aphthous ulcers).

## Administration

Whenever possible *local treatment* with creams, intra-articular injections, inhalations, eye-drops, or enemas should be used in preference to *systemic treatment*. The suppressive action of a corticosteroid on cortisol secretion is least when it is given as a single dose in the morning. In an attempt to reduce pituitary-adrenal suppression further, the total dose for two days can

sometimes be taken as a single dose on alternate days; alternate-day administration has not been very successful in the management of asthma (section 3.2). Pituitary-adrenal suppression can also be reduced by means of intermittent therapy with short courses. In some conditions it may be possible to reduce the dose of corticosteroid by adding a small dose of an immunosuppressive drug (section 8.2.1).

## Cautions and contra-indications of corticosteroids

### Adrenal suppression

During prolonged therapy with corticosteroids, adrenal atrophy develops and can persist for years after stopping. Abrupt withdrawal after a prolonged period can lead to acute adrenal insufficiency, hypotension or death (see Withdrawal of Corticosteroids, below). Withdrawal can also be associated with fever, myalgia, arthralgia, rhinitis, conjunctivitis, painful itchy skin nodules and weight loss.

To compensate for a diminished adrenocortical response caused by prolonged corticosteroid treatment, any significant intercurrent illness, trauma, or surgical procedure requires a temporary increase in corticosteroid dose, or if already stopped, a temporary re-introduction of corticosteroid treatment. To avoid a precipitous fall in blood pressure during anaesthesia or in the immediate postoperative period, anaesthetists **must** know whether a patient is taking or has been taking a corticosteroid. A suitable regimen for corticosteroid replacement, in patients who have taken more than 10 mg prednisolone daily (or equivalent) within 3 months of surgery, is:

- *Minor surgery under general anaesthesia*—usual oral corticosteroid dose on the morning of surgery or hydrocortisone 25–50 mg (usually the sodium succinate) intravenously at induction; the usual oral corticosteroid dose is recommenced after surgery
- *Moderate or major surgery*—usual oral corticosteroid dose on the morning of surgery and hydrocortisone 25–50 mg intravenously at induction, followed by hydrocortisone 25–50 mg 3 times a day by intravenous injection for 24 hours after moderate surgery or for 48–72 hours after major surgery; the usual pre-operative oral corticosteroid dose is recommenced on stopping hydrocortisone injections

Patients on long-term corticosteroid treatment should carry a Steroid Treatment Card (see p. 445) which gives guidance on minimising risk and provides details of prescriber, drug, dosage and duration of treatment.

### Infections

Prolonged courses of corticosteroids increase susceptibility to infections and severity of infections; clinical presentation of infections may also be atypical. Serious infections e.g. *septicaemia* and *tuberculosis* may reach an advanced stage before being recognised, and *amoebiasis* or *strongyloidiasis* may be activated or exacerbated (exclude before initiating a corticosteroid in those at risk or with suggestive symptoms). Fungal or viral *ocular infections* may also be exacerbated (see also section 11.4.1).

**Chickenpox** Unless they have had chickenpox, patients receiving oral or parenteral corticosteroids for purposes other than replacement should be regarded as being *at risk of severe chickenpox* (see Steroid Treatment Card). Manifestations of fulminant illness include pneumonia, hepatitis and disseminated intravascular coagulation; rash is not necessarily a prominent feature.

Passive immunisation with varicella-zoster immunoglobulin (section 14.5.2) is needed for exposed non-immune patients receiving systemic corticosteroids or for those who have used them within the previous 3 months. Confirmed chickenpox warrants specialist care and urgent treatment (section 5.3.2.1). Corticosteroids should not be stopped and dosage may need to be increased.

Topical, inhaled or rectal corticosteroids are less likely to be associated with an increased risk of severe chickenpox.

**Measles** Patients taking corticosteroids should be advised to take particular care to avoid exposure to measles and to seek immediate medical advice if exposure occurs. Prophylaxis with intramuscular normal immunoglobulin (section 14.5.1) may be needed.

### Withdrawal of corticosteroids

The magnitude and speed of dose reduction in corticosteroid withdrawal should be determined on a case-by-case basis, taking into consideration the underlying condition that is being treated, and individual patient factors such as the likelihood of relapse and the duration of corticosteroid treatment. *Gradual* withdrawal of systemic corticosteroids should be considered in those whose disease is unlikely to relapse and have:

- received more than 40 mg prednisolone (or equivalent) daily for more than 1 week;
- been given repeat doses in the evening;
- received more than 3 weeks' treatment;
- recently received repeated courses (particularly if taken for longer than 3 weeks);
- taken a short course within 1 year of stopping long-term therapy;
- other possible causes of adrenal suppression.

Systemic corticosteroids may be stopped abruptly in those whose disease is unlikely to relapse *and* who have received treatment for 3 weeks or less *and* who are not included in the patient groups described above.

During corticosteroid withdrawal the dose may be reduced rapidly down to physiological doses (equivalent to prednisolone 7.5 mg daily) and then reduced more slowly. Assessment of the disease may be needed during withdrawal to ensure that relapse does not occur.

### Psychiatric reactions

Systemic corticosteroids, particularly in high doses, are linked to psychiatric reactions including euphoria, nightmares, insomnia, irritability, mood lability, suicidal thoughts, psychotic reactions, and behavioural disturbances. A serious paranoid state or depression with risk of suicide can be induced, particularly in patients with a history of mental disorder. These reactions frequently subside on reducing the dose or discontinuing the corticosteroid but they may also require specific management. Patients should be advised to seek medical advice if psychiatric symptoms (especially depression and suicidal thoughts) occur and they should also be

alert to the rare possibility of such reactions during withdrawal of corticosteroid treatment.

Systemic corticosteroids should be prescribed with care in those predisposed to psychiatric reactions, including those who have previously suffered corticosteroid-induced psychosis, or who have a personal or family history of psychiatric disorders.

#### Advice to patients

A patient information leaflet should be supplied to every patient when a systemic corticosteroid is prescribed. Patients should especially be advised of the following (for details, see Infections, Adrenal Suppression, Psychiatric Reactions, and Withdrawal of Corticosteroids above):

- **Immunosuppression** Prolonged courses of corticosteroids can increase susceptibility to infection and serious infections can go unrecognised. Unless already immune, patients are at risk of severe **chickenpox** and should avoid close contact with people who have chickenpox or shingles. Similarly, precautions should also be taken against contracting **measles**;
- **Adrenal suppression** If the corticosteroid is given for longer than 3 weeks, treatment must not be stopped abruptly. Adrenal suppression can last for a year or more after stopping treatment and the patient must mention the course of corticosteroid when receiving treatment for any illness or injury;
- **Mood and behaviour changes** Corticosteroid treatment, especially with high doses, can alter mood and behaviour early in treatment—the patient can become confused, irritable and suffer from delusion and suicidal thoughts. These effects can also occur when corticosteroid treatment is being withdrawn. Medical advice should be sought if worrying psychological changes occur;
- **Other serious effects** Serious gastro-intestinal, musculoskeletal, and ophthalmic effects which require medical help can also occur; for details see Side-effects of Corticosteroids, p. 446.

Steroid treatment cards (see below) should be issued where appropriate. Doctors and pharmacists can obtain supplies of the card from:

#### England and Wales

3M Security Printing and Systems Limited  
Gorse Street, Chadderton  
Oldham, OL9 9QH

## STEROID TREATMENT CARD

I am a patient on STEROID  
treatment which must  
not be stopped suddenly

- If you have been taking this medicine for more than three weeks, the dose should be reduced gradually when you stop taking steroids unless your doctor says otherwise.
- Read the patient information leaflet given with the medicine.
- Always carry this card with you and show it to anyone who treats you (for example a doctor, nurse, pharmacist or dentist). For one year after you stop the treatment, you must mention that you have taken steroids.
- If you become ill, or if you come into contact with anyone who has an infectious disease, consult your doctor promptly. If you have never had chickenpox, you should avoid close contact with people who have chickenpox or shingles. If you do come into contact with chickenpox, see your doctor urgently.
- Make sure that the information on the card is kept up to date.

### Other cautions and contra-indications

*Other cautions include:* children and adolescents (growth restriction possibly irreversible), elderly (close supervision required particularly on long-term treatment); frequent monitoring required if history of tuberculosis (or X-ray changes), hypertension, recent myocardial infarction (rupture reported), congestive heart failure, diabetes mellitus including family history, osteoporosis (post-menopausal women at special risk), glaucoma (including family history), ocular herpes simplex—risk of corneal perforation, severe affective disorders (particularly if history of steroid-induced psychosis—see also Psychiatric Reactions, p. 444), epilepsy, peptic ulcer, hypothyroidism, history of steroid myopathy, ulcerative colitis, diverticulitis, recent intestinal anastomoses, thromboembolic disorders; myasthenia gravis; **interactions:** Appendix 1 (corticosteroids).

*Other contra-indications include:* systemic infection (unless specific therapy given); avoid live virus vaccines in those receiving immunosuppressive doses (serum antibody response diminished).

## Hepatic impairment

When corticosteroids are administered orally or parenterally, the plasma-drug concentration may be increased in patients with hepatic impairment. Corticosteroids should be used with caution in hepatic impairment and the patient should be monitored closely.

## Renal impairment

Oral and parenteral preparations of corticosteroids should be used with caution in patients with renal impairment.

## Pregnancy and breast-feeding

The benefit of treatment with corticosteroids during pregnancy and breast-feeding outweighs the risk; pregnant women with fluid retention should be monitored closely. Corticosteroid cover is required during labour.

Following a review of the data on the safety of systemic corticosteroids used in pregnancy and breast-feeding the CSM (May 1998) has concluded:

- corticosteroids vary in their ability to cross the placenta; betamethasone and dexamethasone cross the placenta readily while 88% of prednisolone is inactivated as it crosses the placenta;
- there is no convincing evidence that systemic corticosteroids increase the incidence of congenital abnormalities such as cleft palate or lip;
- when administration is prolonged or repeated during pregnancy, systemic corticosteroids increase the risk of intra-uterine growth restriction; there is no evidence of intra-uterine growth restriction following short-term treatment (e.g. prophylactic treatment for neonatal respiratory distress syndrome);
- any adrenal suppression in the neonate following prenatal exposure usually resolves spontaneously after birth and is rarely clinically important;
- prednisolone appears in small amounts in breast milk but maternal doses of up to 40 mg daily are unlikely to cause systemic effects in the infant; infants should be monitored for adrenal suppression if the mothers are taking a higher dose.

## Side-effects of corticosteroids

Overdosage or prolonged use can exaggerate some of the normal physiological actions of corticosteroids leading to mineralocorticoid and glucocorticoid side-effects.

**Mineralocorticoid** side-effects include hypertension, sodium and water retention, and potassium and calcium loss. They are most marked with fludrocortisone, but are significant with cortisone, hydrocortisone, corticotropin, and tetracosactide (tetracosactrin). Mineralocorticoid actions are negligible with the high potency glucocorticoids, betamethasone and dexamethasone, and occur only slightly with methylprednisolone, prednisolone, and triamcinolone.

**Glucocorticoid** side-effects include diabetes and osteoporosis (section 6.6), which is a danger, particularly in the elderly, as it can result in osteoporotic fractures for example of the hip or vertebrae; in addition high doses are associated with avascular necrosis of the femoral head. Muscle wasting (proximal myopathy) can also occur. Corticosteroid therapy is also weakly linked with peptic ulceration and perforation (the potential

advantage of soluble or enteric-coated preparations to reduce the risk is speculative only). See also Psychiatric Reactions, p. 444.

High doses of corticosteroids can cause Cushing's syndrome, with moon face, striae, and acne; it is usually reversible on withdrawal of treatment, but this must always be gradually tapered to avoid symptoms of acute adrenal insufficiency (**important**: see also Adrenal Suppression, p. 444).

In children, administration of corticosteroids may result in suppression of growth. For the effect of corticosteroids given in pregnancy, see Pregnancy and Breast-feeding, above.

Side-effects can be minimised by using lowest effective dose for minimum period possible.

*Other side-effects include:* **gastro-intestinal effects:** dyspepsia, abdominal distension, acute pancreatitis, oesophageal ulceration and candidiasis; **musculoskeletal effects:** muscle weakness, vertebral and long bone fractures, tendon rupture; **endocrine effects:** menstrual irregularities and amenorrhoea, hirsutism, weight gain, hypercholesterolaemia, hyperlipidaemia, negative nitrogen and calcium balance, increased appetite; increased susceptibility to and severity of infection, reactivation of dormant tuberculosis; **neuropsychiatric effects:** psychological dependence, insomnia, increased intracranial pressure with papilloedema in children (usually after withdrawal), aggravation of schizophrenia, aggravation of epilepsy; **ophthalmic effects:** glaucoma, papilloedema, posterior subcapsular cataracts, corneal or scleral thinning and exacerbation of ophthalmic viral or fungal disease, increased intra-ocular pressure, exophthalmos; **also** impaired healing, petechiae, ecchymoses, facial erythema, suppression of skin test reactions, urticaria, hyperhidrosis, skin atrophy, bruising, telangiectasia, myocardial rupture following recent myocardial infarction, congestive heart failure, leucocytosis, hyperglycaemia, thromboembolism, nausea, malaise, hiccups, headache, vertigo.

For other references to the side-effects of corticosteroids see section 3.2 (asthma), section 11.4 (eye) and section 13.4 (skin).

## BETAMETHASONE

**Indications** suppression of inflammatory and allergic disorders; congenital adrenal hyperplasia; see also notes above; ear (section 12.1.1); eye (section 11.4.1); nose (section 12.2.1); oral ulceration (section 12.3.1)

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above; transient effect on fetal movements and heart rate

**Breast-feeding** see notes above

**Side-effects** see notes above

### Dose

- **By mouth**, usual range 0.5–5 mg daily; see also Administration (above)
- **By intramuscular injection or slow intravenous injection or infusion**, 4–20 mg, repeated up to 4 times in 24 hours; **CHILD**, by **slow intravenous injection**, up to 1 year 1 mg, 1–5 years 2 mg, 6–12 years 4 mg, repeated up to 4 times in 24 hours according to response

**Betnelan®** (UCB Pharma) (POM)

Tablets, scored, betamethasone 500 micrograms. Net price 100-tab pack = £4.22. Label: 10, steroid card, 21

**Betnesol®** (UCB Pharma) (POM)

Soluble tablets, pink, scored, betamethasone 500 micrograms (as sodium phosphate). Net price 100-tab pack = £4.97. Label: 10, steroid card, 13, 21

Injection, betamethasone 4 mg (as sodium phosphate)/mL. Net price 1-mL amp = £1.17. Label: 10, steroid card

**CORTISONE ACETATE**

**Indications** see under Dose but now superseded, see also notes above

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above; hepatic conversion to active metabolite hydrocortisone may be affected

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above

**Dose**

- For replacement therapy, 25–37.5 mg daily in divided doses

**Cortisone** (Non-proprietary) (POM)

Tablets, cortisone acetate 25 mg, net price 56-tab pack = £10.54. Label: 10, steroid card, 21

**DEFLAZACORT**

**Indications** suppression of inflammatory and allergic disorders

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above

**Dose**

- Usual maintenance 3–18 mg daily (acute disorders, initially up to 120 mg daily); see also Administration (above)
- CHILD 0.25–1.5 mg/kg daily (or on alternate days); see also Administration (above)

**Calcort®** (Sanofi-Aventis) (POM)

Tablets, deflazacort 6 mg, net price 60-tab pack = £15.82. Label: 5, 10, steroid card

**DEXAMETHASONE**

**Indications** suppression of inflammatory and allergic disorders; diagnosis of Cushing's disease, congenital adrenal hyperplasia; cerebral oedema associated with malignancy; croup (section 3.1); nausea and vomiting with chemotherapy (section 8.1); rheumatic disease (section 10.1.2); eye (section 11.4.1); see also notes above

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; also perineal irritation may follow intravenous administration of the phosphate ester

**Dose**

- **By mouth**, usual range 0.5–10 mg daily; CHILD 10–100 micrograms/kg daily; see also Administration (above)
  - **By intramuscular injection or slow intravenous injection or infusion**, see under preparations
- Note** Dexamethasone 1 mg = dexamethasone phosphate 1.2 mg = dexamethasone sodium phosphate 1.3 mg

**Dexamethasone** (Non-proprietary) (POM)

Tablets, dexamethasone 500 micrograms, net price 28-tab pack = £38.00; 2 mg, 50-tab pack = £7.46, 100-tab pack = £13.85. Label: 10, steroid card, 21

Oral solution, sugar-free, dexamethasone (as sodium phosphate) 2 mg/5 mL, net price 150-mL = £42.30. Label: 10, steroid card, 21

Brands include *Dexso®*

Injection, dexamethasone (as sodium phosphate) 4 mg/mL, net price 1-mL amp = 83p. Label: 10, steroid card

**Dose** **By intramuscular injection or slow intravenous injection or infusion**, 0.4–20 mg; CHILD 200–400 micrograms/kg daily  
Cerebral oedema, **by intravenous injection** 8–16 mg initially, then 5 mg **by intramuscular injection or intravenous injection** every 6 hours as required for 2–4 days then gradually reduced and stopped over 5–7 days

Adjunctive treatment of bacterial meningitis, (starting before or with first dose of antibacterial treatment), [unlicensed indication], **by intravenous injection** 8.3 mg every 6 hours for 4 days; CHILD 125 micrograms/kg every 6 hours for 4 days

Injection, dexamethasone (as sodium phosphate) 3.3 mg/mL, net price 1-mL amp = £1.00, 2-mL vial = £1.98. Label: 10, steroid card

**Dose** **By intramuscular injection or slow intravenous injection or infusion**, 0.4–20 mg; CHILD 167–333 micrograms/kg daily  
Cerebral oedema associated with malignancy, **by intravenous injection** 8.3 mg initially, then 3.3 mg **by intramuscular injection** every 6 hours as required for 2–4 days then gradually reduced and stopped over 5–7 days

Adjunctive treatment of bacterial meningitis, (starting before or with first dose of antibacterial treatment), [unlicensed indication], **by intravenous injection** 8.3 mg every 6 hours for 4 days; CHILD 125 micrograms/kg every 6 hours for 4 days

**HYDROCORTISONE**

**Indications** adrenocortical insufficiency (section 6.3.1); shock; see also notes above; hypersensitivity reactions e.g. anaphylaxis and angioedema (section 3.4.3); asthma (section 3.1); severe inflammatory bowel disease (section 1.5); haemorrhoids (section 1.7.2); rheumatic disease (section 10.1.2); eye (section 11.4.1); skin (section 13.4)

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; also phosphate ester associated with paraesthesia and pain (particularly in the perineal region)

**Dose**

- **By mouth**, replacement therapy, 20–30 mg daily in divided doses—see section 6.3.1; CHILD 10–30 mg
- **By intramuscular injection or slow intravenous injection or infusion**, 100–500 mg, 3–4 times in 24 hours or

as required; CHILD by slow intravenous injection up to 1 year 25 mg, 1–5 years 50 mg, 6–12 years 100 mg

### Hydrocortisone (Non-proprietary) (POM)

Tablets, scored, hydrocortisone 10 mg, net price 30-tab pack = £44.25; 20 mg, 30-tab pack = £47.17. Label: 10, steroid card, 21

### <sup>1</sup>Efcortesol® (Sovereign) (POM)

Injection, hydrocortisone 100 mg (as sodium phosphate)/mL, net price 1-mL amp = £1.08, 5-mL amp = £4.89. Label: 10, steroid card

**Note** Paraesthesia and pain (particularly in the perineal region) may follow intravenous injection of the phosphate ester

- <sup>1</sup> (POM) restriction does not apply where administration is for saving life in emergency

### <sup>1</sup>Solu-CorteF® (Pharmacia) (POM)

Injection, powder for reconstitution, hydrocortisone (as sodium succinate). Net price 100-mg vial = 92p, 100-mg vial with 2-mL amp water for injections = £1.16. Label: 10, steroid card

- <sup>1</sup> (POM) restriction does not apply where administration is for saving life in emergency

## METHYLPREDNISOLONE

**Indications** suppression of inflammatory and allergic disorders; severe inflammatory bowel disease (section 1.5); cerebral oedema associated with malignancy; see also notes above; rheumatic disease (section 10.1.2); skin (section 13.4)

**Cautions** see notes above; also rapid intravenous administration of large doses associated with cardiovascular collapse

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above

### Dose

- **By mouth**, usual range 2–40 mg daily; see also Administration (above)
- **By intramuscular injection or slow intravenous injection or infusion**, initially 10–500 mg; graft rejection, up to 1 g daily by intravenous infusion for up to 3 days

### Medrone® (Pharmacia) (POM)

Tablets, scored, methylprednisolone 2 mg (pink), net price 30-tab pack = £3.88; 4 mg, 30-tab pack = £6.19; 16 mg, 30-tab pack = £17.17; 100 mg (blue), 20-tab pack = £48.32. Label: 10, steroid card, 21

### Solu-Medrone® (Pharmacia) (POM)

Injection, powder for reconstitution, methylprednisolone (as sodium succinate) (all with solvent). Net price 40-mg vial = £1.58; 125-mg vial = £4.75; 500-mg vial = £9.60; 1-g vial = £17.30; 2-g vial = £32.86. Label: 10, steroid card

### ▲ Intramuscular depot

### Depo-Medrone® (Pharmacia) (POM)

Injection (aqueous suspension), methylprednisolone acetate 40 mg/mL. Net price 1-mL vial = £2.87; 2-mL vial = £5.15; 3-mL vial = £7.47. Label: 10, steroid card

**Dose** by deep intramuscular injection into gluteal muscle, 40–120 mg, a second injection may be given after 2–3 weeks if required

## PREDNISOLONE

**Indications** suppression of inflammatory and allergic disorders; see also notes above; inflammatory bowel disease (section 1.5); asthma (section 3.1 and section 3.2); croup (section 3.1); immunosuppression (section 8.2.2); rheumatic disease (section 10.1.2); eye (section 11.4.1); ear (section 12.1.1)

**Cautions** see notes above; also Duchenne's muscular dystrophy (possible transient rhabdomyolysis and myoglobinuria following strenuous physical activity)

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above

### Dose

- **By mouth**, initially, up to 10–20 mg daily (severe disease, up to 60 mg daily), preferably taken in the morning after breakfast; can often be reduced within a few days but may need to be continued for several weeks or months

Maintenance, usual range, 2.5–15 mg daily, but higher doses may be needed; cushingoid side-effects increasingly likely with doses above 7.5 mg daily

- **By intramuscular injection**, prednisolone acetate (section 10.1.2.2), 25–100 mg once or twice weekly

### Prednisolone (Non-proprietary) (POM)

Tablets, prednisolone 1 mg, net price 28-tab pack = 93p; 5 mg, 28-tab pack = £1.03; 25 mg, 56-tab pack = £30.00. Label: 10, steroid card, 21

Tablets, e/c, prednisolone 2.5 mg (brown), net price 30-tab pack = £4.65, 100-tab pack = £30.79; 5 mg (red), 28-tab pack = £8.69, 100-tab pack = £31.04. Label: 5, 10, steroid card, 25

Brands include *Deltacortril*®

**Soluble tablets**, prednisolone 5 mg (as sodium phosphate), net price 30-tab pack = £8.95. Label: 10, steroid card, 13, 21

**Injection**, see section 10.1.2.2

## PREDNISONE

**Indications** moderate to severe rheumatoid arthritis (section 10.1.2.1)

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above

### Dose

- **ADULT** over 18 years, initially 10–20 mg at bedtime, adjusted according to response

### Lodotra® (Napp) (POM)

Tablets, m/r, yellow, prednisone 1 mg, net price 30-tab pack = £26.70; 2 mg, 30-tab pack = £26.70, 100-tab pack = £89.00; 5 mg, 30-tab pack = £26.70, 100-tab pack = £89.00. Label: 10, steroid card, 21, 25

## TRIAMCINOLONE

**Indications** suppression of inflammatory and allergic disorders; see also notes above; rheumatic disease (section 10.1.2); skin (section 13.4)

**Cautions** see notes above; also high dosage may cause proximal myopathy, avoid in chronic therapy

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above

### Dose

- By deep intramuscular injection, into gluteal muscle, 40 mg of acetamide for depot effect, repeated at intervals according to the patient's response; max. single dose 100 mg

**Kenalog® Intra-articular/Intramuscular** (Squibb) (PMA)  
Injection (aqueous suspension), triamcinolone acetamide 40 mg/mL, net price 1-mL vial = £1.49.  
Label: 10, steroid card

## 6.4 Sex hormones

6.4.1 Female sex hormones

6.4.2 Male sex hormones and antagonists

6.4.3 Anabolic steroids

### 6.4.1 Female sex hormones

6.4.1.1 Oestrogens and HRT

6.4.1.2 Progestogens

#### 6.4.1.1 Oestrogens and HRT

Oestrogens are necessary for the development of female secondary sexual characteristics; they also stimulate myometrial hypertrophy with endometrial hyperplasia.

In terms of oestrogenic activity *natural oestrogens* (estradiol (oestradiol), estrone (oestrone), and estriol (oestriol)) have a more appropriate profile for hormone replacement therapy (HRT) than *synthetic oestrogens* (ethinylestradiol (ethinyl-oestradiol) and mestranol). Tibolone has oestrogenic, progestogenic and weak androgenic activity.

Oestrogen therapy is given cyclically or continuously for a number of gynaecological conditions. If long-term therapy is required in women with a uterus, a progestogen should normally be added to reduce the risk of cystic hyperplasia of the endometrium (or of endometrial foci in women who have had a hysterectomy) and possible transformation to cancer.

Oestrogens are no longer used to suppress lactation because of their association with thromboembolism.

### Hormone replacement therapy

Hormone replacement therapy (HRT) with small doses of an oestrogen (together with a progestogen in women with a uterus) is appropriate for alleviating menopausal

symptoms such as vaginal atrophy or vasomotor instability. Oestrogen given systemically in the perimenopausal and postmenopausal period or tibolone given in the postmenopausal period also diminish postmenopausal osteoporosis (section 6.6.1) but other drugs (section 6.6) are preferred. Menopausal atrophic vaginitis may respond to a short course of a topical vaginal oestrogen preparation (section 7.2.1) used for a few weeks and repeated if necessary.

Systemic therapy with an oestrogen or drugs with oestrogenic properties alleviates the symptoms of oestrogen deficiency such as vasomotor symptoms. Tibolone combines oestrogenic and progestogenic activity with weak androgenic activity; it is given continuously, without cyclical progestogen.

HRT may be used in women with early natural or surgical menopause (before age 45 years), since they are at high risk of osteoporosis. For early menopause, HRT can be given until the approximate age of natural menopause (i.e. until age 50 years). Alternatives to HRT should be considered if osteoporosis is the main concern (section 6.6).

Clonidine (section 2.5.2 and section 4.7.4.2) may be used to reduce vasomotor symptoms in women who cannot take an oestrogen, but clonidine may cause unacceptable side-effects.

HRT increases the risk of venous thromboembolism, stroke, endometrial cancer (reduced by a progestogen), breast cancer, and ovarian cancer; there is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. For details of these risks see HRT Risk table, p. 450.

The minimum effective dose of HRT should be used for the shortest duration. Treatment should be reviewed at least annually and for osteoporosis alternative treatments considered (section 6.6). HRT does not prevent coronary heart disease or protect against a decline in cognitive function and it should **not** be prescribed for these purposes. Experience of treating women over 65 years with HRT is limited.

For the treatment of menopausal symptoms the benefits of short-term HRT outweigh the risks in the majority of women, especially in those aged under 60 years.

**Risk of breast cancer** It is estimated that using *all* types of HRT, including tibolone, increases the risk of breast cancer within 1–2 years of initiating treatment, see HRT Risk table, p. 450 for details. The increased risk is related to the duration of HRT use (but not to the age at which HRT is started) and this excess risk disappears within 5 years of stopping.

Radiological detection of breast cancer can be made more difficult as mammographic density can increase with HRT use; tibolone has only a limited effect on mammographic density.

**Risk of endometrial cancer** The increased risk of endometrial cancer depends on the dose and duration of oestrogen-only HRT, see HRT Risk table, p. 450 for details.

In women with a uterus, the addition of a progestogen cyclically (for at least 10 days per 28-day cycle) reduces the additional risk of endometrial cancer; this additional risk is eliminated if a progestogen is given continuously. However, this should be weighed against the increased risk of breast cancer.

**Risk of ovarian cancer** Long-term use of combined HRT or oestrogen-only HRT is associated with a small increased risk of ovarian cancer, see HRT Risk table, below for details; this excess risk disappears within a few years of stopping.

**Risk of venous thromboembolism** Women using combined or oestrogen-only HRT are at an increased risk of deep vein thrombosis and of pulmonary embolism especially in the first year of use, see HRT Risk table, below for details.

In women who have predisposing factors (such as a personal or family history of deep vein thrombosis or pulmonary embolism, severe varicose veins, obesity, trauma, or prolonged bed-rest) it is prudent to review the need for HRT, as in some cases the risks of HRT may exceed the benefits. See below for advice on surgery.

Travel involving prolonged immobility further increases the risk of deep vein thrombosis, see under Travel in section 7.3.1.

**Risk of stroke** Risk of stroke increases with age, therefore older women have a greater absolute risk of

stroke. Combined HRT or oestrogen-only HRT slightly increases the risk of stroke. Tibolone increases the risk of stroke about 2.2 times from the first year of treatment, see HRT Risk table, below for details.

**Risk of coronary heart disease** HRT does not prevent coronary heart disease and should not be prescribed for this purpose. There is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause, see HRT Risk table, below for details. Although very little information is available on the risk of coronary heart disease in younger women who start HRT close to the menopause, studies suggest a lower relative risk compared with older women.

**Choice** The choice of HRT for an individual depends on an overall balance of indication, risk, and convenience. A woman with a uterus normally requires oestrogen with cyclical progestogen for the last 12 to 14 days of the cycle or a preparation which involves continuous administration of an oestrogen and a progestogen (or one which provides both oestrogenic and progestogenic

## HRT Risk

Risk	Age range (years)	Background incidence per 1000 women in Europe not using HRT		Additional cases per 1000 women using oestrogen only HRT (estimated)		Additional cases per 1000 women using combined (oestrogen-progestogen) HRT (estimated)	
		Over 5 years	Over 10 years	For 5 years' use	For 10 years' use	For 5 years' use	For 10 years' use
Breast cancer <sup>1</sup>	50–59	10	20	2	6	6	24
	60–69	15	30	3	9	9	36
Endometrial cancer <sup>2,3</sup>	50–59	2	4	4	32	NS	NS
	60–69	3	6	6	48	NS	NS
Ovarian cancer	50–59	2	4	<1	1	<1	1
	60–69	3	6	<1	2	<1	2
Venous thromboembolism <sup>4,5</sup>	50–59	5		2		7	
	60–69	8		2		10	
Stroke <sup>6</sup>	50–59	4		1		1	
	60–69	9		3		3	
Coronary heart disease <sup>7,8</sup>	70–79	29–44		NS		15	

**Note** Where background incidence or additional cases have not been included in the table, this indicates a lack of available data. NS indicates a non-significant difference

Taken from MHRA/CHM (*Drug Safety Update* 2007; 1 (2): 2–6) available at [www.mhra.gov.uk/drugsafetyupdate](http://www.mhra.gov.uk/drugsafetyupdate)

- Tibolone increases the risk of breast cancer but to a lesser extent than with combined HRT.
- Evidence suggests an increased risk of endometrial cancer with tibolone. After 2.7 years of use (in women of average age 68 years), 1 extra case of endometrial hyperplasia and 4 extra cases of endometrial cancer were diagnosed compared with placebo users.
- The risk of endometrial cancer cannot be reliably estimated in those using combined HRT because the addition of progestogen for at least 10 days per 28-day cycle greatly reduces the additional risk, and addition of a daily progestogen eliminates the additional risk. The risk of endometrial cancer in women who have not used HRT increases with body mass index (BMI); the increased risk of endometrial cancer in users of oestrogen-only HRT or tibolone is more apparent in women who are not overweight.
- Limited data does not suggest an increased risk of thromboembolism with tibolone compared with combined HRT or women not taking HRT.
- Although the level of risk of thromboembolism associated with non-oral routes of administration of HRT has not been established, it may be lower for the transdermal route.
- Tibolone increases the risk of stroke about 2.2 times from the first year of treatment; risk of stroke is age-dependent and therefore the absolute risk of stroke with tibolone increases with age.
- Increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause.
- There is insufficient data to draw a conclusion on the risk of coronary heart disease with tibolone.

activity in a single preparation). Continuous combined preparations or tibolone are **not suitable** for use in the perimenopause or within 12 months of the last menstrual period; women who use such preparations may bleed irregularly in the early stages of treatment—if bleeding continues endometrial abnormality should be ruled out and consideration given to changing to cyclical HRT.

An oestrogen alone is suitable for continuous use in women without a uterus. However, in endometriosis, endometrial foci may remain despite hysterectomy and the addition of a progestogen should be considered in these circumstances.

An oestrogen may be given by mouth or it may be given by subcutaneous or transdermal administration, which avoids first-pass metabolism. In the case of subcutaneous implants, recurrence of vasomotor symptoms at supraphysiological plasma concentrations may occur; moreover, there is evidence of prolonged endometrial stimulation after discontinuation (calling for continued cyclical progestogen). For the use of topical HRT preparations see section 7.2.1.

**Contraception** HRT does not provide contraception and a woman is considered potentially fertile for 2 years after her last menstrual period if she is under 50 years, and for 1 year if she is over 50 years. A woman who is under 50 years and free of all risk factors for venous and arterial disease can use a low-oestrogen combined oral contraceptive pill (section 7.3.1) to provide both relief of menopausal symptoms and contraception; it is recommended that the oral contraceptive be stopped at 50 years of age since there are more suitable alternatives. If any potentially fertile woman needs HRT, non-hormonal contraceptive measures (such as condoms) are necessary.

Measurement of follicle-stimulating hormone can help to determine fertility, but high measurements alone (particularly in women aged under 50 years) do not necessarily preclude the possibility of becoming pregnant.

**Surgery** Major surgery under general anaesthesia, including orthopaedic and vascular leg surgery, is a predisposing factor for venous thromboembolism and it may be prudent to stop HRT 4–6 weeks before surgery (see Risk of Venous Thromboembolism, above); it should be restarted only after full mobilisation. If HRT is continued or if discontinuation is not possible (e.g. in non-elective surgery), prophylaxis with unfractionated or low molecular weight heparin and graduated compression hosiery is advised. Oestrogenic activity may persist after removing an estradiol implant (see above).

**Reasons to stop HRT** For circumstances in which HRT should be stopped, see p. 496.

## OESTROGENS FOR HRT

**Note** Relates only to small amounts of oestrogens given for hormone replacement therapy

**Indications** see notes above and under preparations

**Cautions** prolonged exposure to unopposed oestrogens may increase risk of developing endometrial

cancer (see notes above); migraine (or migraine-like headaches); diabetes (increased risk of heart disease); history of breast nodules or fibrocystic disease—closely monitor breast status (risk of breast cancer, see notes above); risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative); uterine fibroids may increase in size, symptoms of endometriosis may be exacerbated; history of endometrial hyperplasia; factors predisposing to thromboembolism (see notes above); presence of antiphospholipid antibodies (increased risk of thrombotic events); increased risk of gall-bladder disease reported; hypophyseal tumours; acute porphyria (see section 9.8.2); **interactions:** Appendix 1 (oestrogens) **Other conditions** The product literature advises caution in other conditions including hypertension, renal disease, asthma, epilepsy, sickle-cell disease, melanoma, otosclerosis, multiple sclerosis, and systemic lupus erythematosus (but care required if antiphospholipid antibodies present, see above). Evidence for caution in these conditions is unsatisfactory and many women with these conditions may stand to benefit from HRT.

**Contra-indications** oestrogen-dependent cancer, history of breast cancer, active thrombophlebitis, active or recent arterial thromboembolic disease (e.g. angina or myocardial infarction), venous thromboembolism, or history of recurrent venous thromboembolism (unless already on anticoagulant treatment), liver disease (where liver function tests have failed to return to normal), Dubin-Johnson and Rotor syndromes (or monitor closely), untreated endometrial hyperplasia, undiagnosed vaginal bleeding

**Hepatic impairment** see Combined Hormonal Contraceptives, section 7.3.1

**Renal impairment** see Other Conditions, above

**Pregnancy** see Combined Hormonal Contraceptives, section 7.3.1

**Breast-feeding** see Combined Hormonal Contraceptives, section 7.3.1

**Side-effects** see notes above for risks of long-term use; nausea and vomiting, abdominal cramps and bloating, weight changes, breast enlargement and tenderness, premenstrual-like syndrome, sodium and fluid retention, cholestatic jaundice, glucose intolerance, altered blood lipids—may lead to pancreatitis, rashes and chloasma, changes in libido, depression, mood changes, headache, migraine, dizziness, leg cramps (rule out venous thrombosis), vaginal candidiasis, contact lenses may irritate; transdermal delivery systems may cause contact sensitisation (possible severe hypersensitivity reaction on continued exposure), and headache has been reported on vigorous exercise

**Withdrawal bleeding** Cyclical HRT (where a progestogen is taken for 12–14 days of each 28-day oestrogen treatment cycle) usually results in *regular withdrawal bleeding* towards the end of the progestogen. The aim of continuous combined HRT (where a combination of oestrogen and progestogen is taken, usually in a single tablet, throughout each 28-day treatment cycle) is to avoid bleeding, but *irregular bleeding* may occur during the early treatment stages (if it continues endometrial abnormality should be excluded and consideration given to cyclical HRT instead)

### Dose

- See under preparations
- **Counselling on patches** Patch should be removed after 3–4 days (or once a week in case of 7-day patch) and replaced with fresh patch on slightly different site; recommended sites: clean, dry, unbroken areas of skin on trunk below waistline; not to be applied on or near breasts or under waistband. If patch falls off in bath allow skin to cool before applying new patch

**Conjugated oestrogens with progestogen**

For prescribing information on progestogens, see section 6.4.1.2

**Premique®** (Wyeth) (Pom)

**Premique® Low Dose tablets**, m/r, ivory, s/c, conjugated oestrogen (equine) 300 micrograms and medroxyprogesterone acetate 1.5 mg, net price 3 × 28-tab pack = £6.52

**Dose** menopausal symptoms in women with a uterus, 1 tablet daily continuously

**Premique® tablets**, s/c, blue, conjugated oestrogen (equine) 625 micrograms and medroxyprogesterone acetate 5 mg, net price 3 × 28-tab pack = £10.61

**Dose** menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, 1 tablet daily continuously

**Prempak-C®** (Wyeth) (Pom)

**Prempak C® 0.625 Calendar pack**, s/c, 28 maroon tablets, conjugated oestrogens (equine) 625 micrograms; 12 light brown tablets, norgestrel 150 micrograms (= levonorgestrel 75 micrograms), net price 3 × 40-tab pack = £6.25

**Dose** menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, 1 maroon tablet daily continuously, starting on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), and 1 brown tablet daily on days 17–28 of each 28-day treatment cycle; subsequent courses are repeated without interval

**Prempak C® 1.25 Calendar pack**, s/c, 28 yellow tablets, conjugated oestrogens (equine) 1.25 mg; 12 light brown tablets, norgestrel 150 micrograms (= levonorgestrel 75 micrograms), net price 3 × 40-tab pack = £7.40

**Dose** see under 0.625 Calendar pack, but taking 1 yellow tablet daily continuously (instead of 1 maroon tablet) if symptoms not fully controlled with lower strength

**Estradiol with progestogen**

For prescribing information on progestogens, see section 6.4.1.2

**Angeliq®** (Bayer Schering) (Pom)

**Tablets**, f/c, red, estradiol 1 mg, drospirenone 2 mg, net price 3 × 28-tab pack = £24.32

**Dose** menopausal symptoms and osteoporosis prophylaxis (see section 6.6) in women with a uterus whose last menstrual period occurred over 12 months previously, 1 tablet daily continuously (if changing from cyclical HRT begin treatment the day after finishing oestrogen plus progestogen phase)

**Cautions** use with care if an increased concentration of potassium might be hazardous

**Renal impairment** avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>

**Climagest®** (Novartis) (Pom)

**Climagest® 1-mg tablets**, 16 grey-blue, estradiol valerate 1 mg; 12 white, estradiol valerate 1 mg and norethisterone 1 mg, net price 28-tab pack = £4.59; 3 × 28-tab pack = £13.35

**Dose** menopausal symptoms, 1 grey-blue tablet daily for 16 days, starting on day 1 of menstruation (or at any time if cycles have ceased or are infrequent) then 1 white tablet for 12 days; subsequent courses are repeated without interval

**Climagest® 2-mg tablets**, 16 blue, estradiol valerate 2 mg; 12 yellow, estradiol valerate 2 mg and norethisterone 1 mg, net price 28-tab pack = £4.59; 3 × 28-tab pack = £13.35

**Dose** see *Climagest® 1-mg*, but starting with 1 blue tablet daily (instead of 1 grey-blue tablet) if symptoms not controlled with lower strength

**Climesse®** (Novartis) (Pom)

**Tablets**, pink, estradiol valerate 2 mg, norethisterone 700 micrograms, net price 1 × 28-tab pack = £8.27; 3 × 28-tab pack = £24.82

**Dose** menopausal symptoms and osteoporosis prophylaxis (see section 6.6) in women with a uterus whose last menstrual period occurred over 12 months previously, 1 tablet daily continuously

**Clinorette®** (ReSource Medical) (Pom)

**Tablets**, f/c, 16 white, estradiol 2 mg; 12 pink, estradiol 2 mg and norethisterone 1 mg, net price 3 × 28-tab pack = £9.23

**Dose** menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, 1 white tablet daily for 16 days starting on day 5 of menstruation (or at any time if cycles have ceased or are infrequent), then 1 pink tablet daily for 12 days; subsequent courses repeated without interval

**Cyclo-Progynova®** (Meda) (Pom)

**Cyclo-Progynova® 2-mg tablets**, s/c, 11 white, estradiol valerate 2 mg; 10 brown, estradiol valerate 2 mg and norgestrel 500 micrograms (= levonorgestrel 250 micrograms), net price per pack = £3.11

**Dose** menopausal symptoms and osteoporosis prophylaxis (see section 6.6) in women with a uterus, 1 white tablet daily for 11 days, starting on day 5 of menstruation (or at any time if cycles have ceased or are infrequent), then 1 brown tablet daily for 10 days, followed by a 7-day tablet-free interval

**Elleste-Duet®** (Meda) (Pom)

**Elleste-Duet® 1-mg tablets**, 16 white, estradiol 1 mg; 12 green, estradiol 1 mg and norethisterone acetate 1 mg, net price 3 × 28-tab pack = £9.16

**Dose** menopausal symptoms, 1 white tablet daily for 16 days starting on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), then 1 green tablet daily for 12 days; subsequent courses are repeated without interval

**Elleste-Duet® 2-mg tablets**, 16 orange, estradiol 2 mg; 12 grey, estradiol 2 mg, norethisterone acetate 1 mg, net price 3 × 28-tab pack = £9.72

**Dose** menopausal symptoms and osteoporosis prophylaxis (see section 6.6), 1 orange tablet daily for 16 days, starting on day 1 of menstruation (or at any time if cycles have ceased or are infrequent) then 1 grey tablet daily for 12 days; subsequent courses are repeated without interval

**Elleste-Duet Conti® tablets**, f/c, grey, estradiol 2 mg, norethisterone acetate 1 mg, net price 3 × 28-tab pack = £16.93

**Dose** menopausal symptoms and osteoporosis prophylaxis (see section 6.6) in women with a uterus whose last menstrual period occurred over 12 months previously, 1 tablet daily on a continuous basis (if changing from cyclical HRT begin treatment at the end of scheduled bleed)

**Evorel®** (Janssen-Cilag) (Pom)

**Evorel® Conti patches**, self-adhesive, (releasing estradiol approx. 50 micrograms/24 hours and norethisterone acetate approx. 170 micrograms/24 hours), net price 8-patch pack = £13.00, 24-patch pack = £37.22. Counselling, administration

**Dose** menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, 1 patch to be applied twice weekly continuously

**Evorel® Sequi combination pack**, 4 self-adhesive patches of *Evorel® 50* (releasing estradiol approx. 50 micrograms/24 hours) and 4 self-adhesive patches of *Evorel® Conti* (releasing estradiol approx. 50 micrograms/24 hours and norethisterone acetate approx. 170 micrograms/24 hours), net price 8-patch pack = £11.09. Counselling, administration

**Dose** menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, 1 *Evorel® 50* patch to be applied twice weekly for 2 weeks, starting within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), followed by 1 *Evorel® Conti* patch twice weekly for 2 weeks; subsequent courses are repeated without interval

**Femapak®** (Abbott Healthcare) (PoM)

**Femapak® 40 combination pack** of 8 self-adhesive patches of *Fematrix® 40* (releasing estradiol approx. 40 micrograms/24 hours) and 14 tablets of dydrogesterone 10 mg, net price per pack = £7.61.

Counselling, administration

**Dose** see under *Femapak® 80*

**Femapak® 80 combination pack** of 8 self-adhesive patches of *Fematrix® 80* (releasing estradiol approx. 80 micrograms/24 hours) and 14 tablets of dydrogesterone 10 mg, net price per pack = £8.06.

Counselling, administration

**Dose** menopausal symptoms (and osteoporosis prophylaxis (see section 6.6) in case of *Femapak® 80 only*), in women with a uterus, starting within 5 days of onset of menstruation (or any time if cycles have ceased or are infrequent), apply 1 patch twice weekly continuously and take 1 tablet daily on days 15–28 of each 28-day treatment cycle; therapy should be initiated with *Femapak® 40* in those with menopausal symptoms, prolonged oestrogen deficiency or anticipated intolerance to higher strengths, subsequently adjusted to lowest effective dose

**Femoston®** (Abbott Healthcare) (PoM)

**Femoston® 1/10 tablets, f/c, 14 white, estradiol 1 mg; 14 grey, estradiol 1 mg, dydrogesterone 10 mg, net price 3 × 28-tab pack = £13.47**

**Dose** menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, 1 white tablet daily for 14 days, starting within 5 days of onset of menstruation (or any time if cycles have ceased or are infrequent) then 1 grey tablet daily for 14 days; subsequent courses repeated without interval

**Femoston® 2/10 tablets, f/c, 14 red, estradiol 2 mg; 14 yellow, estradiol 2 mg, dydrogesterone 10 mg, net price 3 × 28-tab pack = £13.47**

**Dose** menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, 1 red tablet daily for 14 days, starting within 5 days of onset of menstruation (or any time if cycles have ceased or are infrequent) then 1 yellow tablet daily for 14 days; subsequent courses repeated without interval; where therapy required for menopausal symptoms alone, *Femoston® 1/10* given initially and *Femoston® 2/10* substituted if symptoms not controlled

**Femoston®-conti tablets, f/c, salmon, estradiol 1 mg, dydrogesterone 5 mg, net price 3 × 28-tab pack = £22.44**

**Dose** menopausal symptoms and osteoporosis prophylaxis (see section 6.6) in women with a uterus whose last menstrual period occurred over 12 months previously, 1 tablet daily continuously (if changing from cyclical HRT begin treatment the day after finishing oestrogen plus progestogen phase)

**FemSeven® Conti** (Merck Serono) (PoM)

**Patches, self-adhesive** (releasing estradiol approx. 50 micrograms/24 hours and levonorgestrel approx. 7 micrograms/24 hours); net price 4-patch pack = £15.48, 12-patch pack = £ 44.12. Counselling, administration

**Dose** menopausal symptoms in women with a uterus whose last menstrual period occurred over 12 months previously, 1 patch to be applied once a week continuously

**FemSeven® Sequi** (Merck Serono) (PoM)

**Combination pack, self-adhesive patches of *FemSeven® Sequi Phase 1*** (releasing estradiol approx.

50 micrograms/24 hours) and of *FemSeven® Sequi Phase 2* (releasing estradiol approx. 50 micrograms/24 hours and levonorgestrel approx. 10 micrograms/24 hours); net price 1-month pack (2 of each) = £13.18, 3-month pack (6 of each) = £37.54. Counselling, administration

**Dose** menopausal symptoms in women with a uterus, 1 *Phase 1* patch applied once a week for 2 weeks followed by 1 *Phase 2* patch once a week for 2 weeks; subsequent courses are repeated without interval

**Indivina®** (Orion) (PoM)

**Indivina® 1 mg/2.5 mg tablets, estradiol valerate 1 mg, medroxyprogesterone acetate 2.5 mg, net price 3 × 28-tab pack = £20.58**

**Indivina® 1 mg/5 mg tablets, estradiol valerate 1 mg, medroxyprogesterone acetate 5 mg, net price 3 × 28-tab pack = £20.58**

**Indivina® 2 mg/5 mg tablets, estradiol valerate 2 mg, medroxyprogesterone acetate 5 mg, net price 3 × 28-tab pack = £20.58**

**Dose** menopausal symptoms and osteoporosis prophylaxis (see section 6.6) in women with a uterus whose last menstrual period occurred over 3 years previously, 1 tablet daily continuously; initiate therapy with *Indivina® 1 mg/2.5 mg* tablets and adjust according to response; start at end of scheduled bleed if changing from cyclical HRT

**Kliofem®** (Novo Nordisk) (PoM)

**Tablets, f/c yellow, estradiol 2 mg, norethisterone acetate 1 mg, net price 3 × 28-tab pack = £11.43**

**Dose** menopausal symptoms and osteoporosis prophylaxis (see section 6.6) in women with a uterus whose last menstrual period occurred over 12 months previously, 1 tablet daily continuously; start at end of scheduled bleed if changing from cyclical HRT

**Kliovance®** (Novo Nordisk) (PoM)

**Tablets, f/c, estradiol 1 mg, norethisterone acetate 500 micrograms, net price 3 × 28-tab pack = £13.20**

**Dose** menopausal symptoms and osteoporosis prophylaxis (see section 6.6) in women with a uterus whose last menstrual period occurred over 12 months previously, 1 tablet daily continuously; start at end of scheduled bleed if changing from cyclical HRT

**Novofem®** (Novo Nordisk) (PoM)

**Tablets, f/c, 16 red, estradiol 1 mg; 12 white, estradiol 1 mg, norethisterone acetate 1 mg, net price 3 × 28-tab pack = £13.50**

**Dose** menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, 1 red tablet daily for 16 days then 1 white tablet daily for 12 days; subsequent courses are repeated without interval; start treatment with red tablet at any time or if changing from cyclical HRT, start treatment the day after finishing oestrogen plus progestogen phase

**Nuvelle® Continuous** (Bayer Schering) (PoM)

**Tablets, f/c, pink, estradiol 2 mg, norethisterone acetate 1 mg, net price 3 × 28-tab pack = £15.89**

**Dose** menopausal symptoms and osteoporosis prophylaxis (see section 6.6) in women with a uterus whose last menstrual period occurred over 12 months previously, 1 tablet daily continuously; if changing from cyclical HRT, start treatment the day after finishing oestrogen plus progestogen phase

**Tridestra®** (Orion) (PoM)

**Tablets, 70 white, estradiol valerate 2 mg; 14 blue, estradiol valerate 2 mg and medroxyprogesterone acetate 20 mg; 7 yellow, inactive, net price 91-tab pack = £20.49**

**Dose** menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, 1 white tablet daily for 70 days, then 1 blue tablet daily for 14 days, then 1 yellow tablet daily for 7 days; subsequent courses are repeated without interval

**Trisequens®** (Novo Nordisk) (PoM)

**Tablets, 12 blue, estradiol 2 mg; 10 white, estradiol 2 mg, norethisterone acetate 1 mg; 6 red, estradiol 1 mg, net price 3 × 28-tab pack = £11.10**

**Dose** menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, 1 blue tablet daily, starting on day 5 of menstruation (or at any time if cycles have ceased or are infrequent), then 1 tablet daily in sequence (without interruption)

### ▲ Conjugated oestrogens only

#### Premarin® (Wyeth) (POM)

**Tablets**, all *s/c*, conjugated oestrogens (equine) 300 micrograms (green) net price 3 × 28-tab pack = £6.07; 625 micrograms (maroon), 3 × 28-tab pack = £4.02; 1.25 mg (yellow), 3 × 28-tab pack = £3.58

**Dose** menopausal symptoms, 0.3–1.25 mg daily continuously; osteoporosis prophylaxis (see section 6.6), 0.625–1.25 mg daily continuously; with cyclical progestogen for 12–14 days of each cycle in women with a uterus

### ▲ Estradiol only

#### Estradiol Implants (Organon) (POM)

**Implant**, estradiol 25 mg, net price each = £12.47; 50 mg, each = £20.29

**Dose** by implantation, oestrogen replacement, and osteoporosis prophylaxis (see section 6.6) (with cyclical progestogen for 12–14 days of each cycle in women with a uterus, see notes above), 25–100 mg as required (usually every 4–8 months) according to oestrogen levels—check before each implant

**Note** On cessation of treatment or if implants are removed from those with a uterus, cyclical progestogen should be continued until withdrawal bleed stops

#### Bedol® (ReSource Medical) (POM)

**Tablets**, *f/c*, estradiol 2 mg, net price 3 × 28-tab pack = £5.07

**Dose** menopausal symptoms and osteoporosis prophylaxis (see section 6.6), with cyclical progestogen for 12–14 days of each cycle in women with a uterus, 2 mg daily starting on day 1–5 of menstruation (or at any time if cycles have ceased or are infrequent)

#### Climaval® (Novartis) (POM)

**Tablets**, estradiol valerate 1 mg (grey-blue), net price 1 × 28-tab pack = £2.45, 3 × 28-tab pack = £7.35; 2 mg (blue), 1 × 28-tab pack = £2.45, 3 × 28-tab pack = £7.35

**Dose** menopausal symptoms (if patient has had a hysterectomy), 1–2 mg daily

#### Elleste-Solo® (Meda) (POM)

**Elleste-Solo® 1-mg tablets**, estradiol 1 mg, net price 3 × 28-tab pack = £5.03

**Dose** menopausal symptoms, with cyclical progestogen for 12–14 days of each cycle in women with a uterus, 1 mg daily starting on day 1 of menstruation (or at any time if cycles have ceased or are infrequent)

**Elleste-Solo® 2-mg tablets**, orange, estradiol 2 mg, net price 3 × 28-tab pack = £5.34

**Dose** menopausal symptoms not controlled with lower strength and osteoporosis prophylaxis (see section 6.6), with cyclical progestogen for 12–14 days of each cycle in women with a uterus, 2 mg daily starting on day 1 of menstruation (or at any time if cycles have ceased or are infrequent)

#### Elleste Solo® MX (Meda) (POM)

**Patches**, self-adhesive, estradiol, *MX 40 patch* (releasing approx. 40 micrograms/24 hours), net price 8-patch pack = £5.19; *MX 80 patch* (releasing approx. 80 micrograms/24 hours), 8-patch pack = £5.99. Counselling, administration.

**Dose** menopausal symptoms and osteoporosis prophylaxis (see section 6.6), 1 patch to be applied twice weekly continuously starting within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent); with cyclical progestogen for 12–14 days of each cycle in women with a uterus; for menopausal symptoms initiate therapy with *MX 40*, subsequently adjust according to response; for osteoporosis prophylaxis, initiate therapy with *MX 80*

#### Estraderm MX® (Novartis) (POM)

**Patches**, self-adhesive, estradiol, *MX 25 patch* (releasing approx. 25 micrograms/24 hours), net price 8-patch pack = £4.58, 24-patch pack = £13.72; *MX 50 patch* (releasing approx. 50 micrograms/24 hours), 8-

patch pack = £4.59, 24-patch pack = £13.72, 20-patch pack (hosp. only) = £13.04; *MX 75 patch* (releasing approx. 75 micrograms/24 hours), 8-patch pack = £5.35, 24-patch pack = £16.06; *MX 100 patch* (releasing approx. 100 micrograms/24 hours), 8-patch pack = £5.55, 24-patch pack = £16.66. Counselling, administration

**Dose** menopausal symptoms and osteoporosis prophylaxis (see section 6.6), 1 patch to be applied twice weekly continuously starting within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), with cyclical progestogen for at least 12 days of each cycle in women with a uterus; for menopausal symptoms, initiate therapy with *MX 25* for first 3 months; for osteoporosis prophylaxis, initiate therapy with *MX 50*; subsequently adjust according to response

#### Estraderm TTS® (Novartis) (POM)

**Patches**, self-adhesive, estradiol, *TTS 25 patch* (releasing approx. 25 micrograms/24 hours), net price, 8-patch pack = £5.96, 24-patch pack = £17.88; *TTS 100 patch* (releasing approx. 100 micrograms/24 hours), 8-patch pack = £7.22, 24-patch pack = £21.72, 20-patch pack (hosp. only) = £16.76. Counselling, administration

**Dose** menopausal symptoms, 1 patch to be applied twice weekly continuously starting within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), with cyclical progestogen for at least 12 days of each cycle in women with a uterus; initiate therapy with *TTS 25* for first 3 months, subsequently adjust according to response

#### Estradot® (Novartis) (POM)

**Patches**, self-adhesive, estradiol, *'25' patch* (releasing approx. 25 micrograms/24 hours), net price 8-patch pack = £4.16; *'37.5' patch* (releasing approx. 37.5 micrograms/24 hours), 8-patch pack = £4.17; *'50' patch* (releasing approx. 50 micrograms/24 hours), 8-patch pack = £4.18; *'75' patch* (releasing approx. 75 micrograms/24 hours), 8-patch pack = £4.86; *'100' patch* (releasing approx. 100 micrograms/24 hours), 8-patch pack = £5.05. Counselling, administration

**Dose** menopausal symptoms and osteoporosis prophylaxis (see section 6.6), 1 patch to be applied twice weekly continuously, with cyclical progestogen for 12–14 days of each cycle in women with a uterus; for menopausal symptoms, initiate therapy with *25 patch* for 3 months; for osteoporosis prophylaxis initiate therapy with *50 patch*; subsequently adjust according to response

#### Evorel® (Janssen-Cilag) (POM)

**Patches**, self-adhesive, estradiol, *'25' patch* (releasing approx. 25 micrograms/24 hours), net price 8-patch pack = £3.42; *'50' patch* (releasing approx. 50 micrograms/24 hours), 8-patch pack = £3.88, 24-patch pack = £11.66; *'75' patch* (releasing approx. 75 micrograms/24 hours), 8-patch pack = £4.12; *'100' patch* (releasing approx. 100 micrograms/24 hours), 8-patch pack = £4.28. Counselling, administration

**Dose** menopausal symptoms and osteoporosis prophylaxis (see section 6.6), 1 patch to be applied twice weekly continuously starting within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), with cyclical progestogen for 12–14 days of each cycle in women with a uterus; therapy should be initiated with *Evorel 50 patch*; subsequently adjust according to response; dose may be reduced to *Evorel 25 patch* after first month if necessary for menopausal symptoms only

#### Fematrix® (Abbott Healthcare) (POM)

**Patches**, self-adhesive, estradiol, *'40' patch* (releasing approx. 40 micrograms/24 hours), net price 8-patch pack = £4.95; *'80' patch* (releasing approx. 80 micrograms/24 hours), 8-patch pack = £5.40. Counselling, administration

**Dose** menopausal symptoms and osteoporosis prophylaxis (see section 6.6), 1 patch to be applied twice weekly continuously starting within 5 days of onset of menstruation (or at any time if

cycles have ceased or are infrequent), with cyclical progestogen for 12–14 days of each cycle in women with a uterus; for menopausal symptoms, initiate therapy with *Fematrix 40*, subsequently adjust according to response; for osteoporosis prophylaxis, initiate therapy with *Fematrix 80*

**FemSeven®** (Merck Serono) (PmM)

**Patches**, self-adhesive, estradiol, '50' patch (releasing approx. 50 micrograms/24 hours), net price 4-patch pack = £6.04, 12-patch pack = £18.02; '75' patch (releasing approx. 75 micrograms/24 hours), net price 4-patch pack = £6.98; '100' patch (releasing approx. 100 micrograms/24 hours), net price 4-patch pack = £7.28. Counselling, administration

**Dose** menopausal symptoms and osteoporosis prophylaxis (see section 6.6), 1 patch to be applied once a week continuously, with cyclical progestogen for 12–14 days of each cycle in women with a uterus; initiate therapy with *FemSeven 50* patches for the first few months, subsequently adjust according to response

**Oestrogel®** (Ferring) (PmM)

**Gel**, estradiol 0.06%, net price 64-dose pump pack = £4.80. Counselling, administration

**Dose** menopausal symptoms and osteoporosis prophylaxis (see section 6.6), 2 measures (estradiol 1.5 mg) to be applied over an area twice that of the template provided once daily continuously, starting within 5 days of menstruation (or anytime if cycles have ceased or are infrequent), with cyclical progestogen for at least 12 days of each cycle in women with a uterus; for menopausal symptoms may be increased if necessary after 1 month to max. 4 measures daily

**Counselling** Apply gel to clean, dry, intact skin such as arms, shoulders or inner thighs and allow to dry for 5 minutes before covering with clothing. Not to be applied on or near breasts or on vulval region. Avoid skin contact with another person (particularly male) and avoid other skin products or washing the area for at least 1 hour after application

**Prognova®** (Bayer Schering) (PmM)

**Tablets**, s/c, estradiol valerate 1 mg (beige), net price 3 × 28-tab pack = £6.18; 2 mg (blue), 3 × 28-tab pack = £6.18

**Dose** menopausal symptoms, 1–2 mg daily continuously starting on day 1 of menstruation (or at any time if cycles have ceased or are infrequent); osteoporosis prophylaxis (see section 6.6), 2 mg daily continuously; with cyclical progestogen for 12–14 days of each cycle in women with a uterus

**Prognova® TS** (Bayer Schering) (PmM)

**Patches**, self-adhesive, *Prognova® TS 50* (releasing estradiol approx. 50 micrograms/24 hours), net price 12-patch pack = £15.75; *Prognova® TS 100* (releasing estradiol approx. 100 micrograms/24 hours), 12-patch pack = £17.34. Counselling, administration

**Dose** menopausal symptoms and osteoporosis prophylaxis (see section 6.6), 1 patch to be applied once a week continuously or 1 patch per week for 3 weeks followed by a 7-day patch-free interval (cyclical); with cyclical progestogen for 12–14 days of each cycle in women with a uterus; initiate therapy with *Prognova TS 50*, subsequently adjust according to response

**Note** Women receiving *Prognova TS 100* patches for menopausal symptoms may continue with this strength for osteoporosis prophylaxis (see section 6.6)

**Sandrena®** (Orion) (PmM)

**Gel**, estradiol (0.1%), 500 microgram/500 mg sachet, net price 28-sachet pack = £5.08, 1 mg/1 g sachet, 28-sachet pack = £5.85. Counselling, administration  
**Excipients** include propylene glycol (see section 13.1.3)

**Dose** menopausal symptoms, estradiol 1 mg (1 g gel) to be applied once daily over area 1–2 times size of hand, with cyclical progestogen for 12–14 days of each cycle in women with a uterus; dose may be adjusted after 2–3 cycles to lowest effective dose (usual dose of estradiol 0.5–1.5 mg (0.5–1.5 g gel) daily)

**Counselling** Apply gel to intact areas of skin such as lower trunk or thighs, using right and left sides on alternate days. Wash hands after application. Not to be applied on the breasts or face and avoid contact with eyes. Allow area of application to dry for 5 minutes and do not wash area for at least 1 hour

**Zumenon®** (Abbott Healthcare) (PmM)

**Tablets**, f/c, estradiol 1 mg, net price 84-tab pack = £6.89; 2 mg (red), 84-tab pack = £6.89

**Dose** menopausal symptoms, initially 1 mg daily starting within 5 days of onset of menstruation (or any time if cycles have ceased or are infrequent) increased to 2 mg daily if required; osteoporosis prophylaxis (see section 6.6), 2 mg daily; with cyclical progestogen for 12–14 days of each cycle in women with a uterus

▲ **Estradiol, estriol and estrone**

**Hormonin®** (Amdipharm) (PmM)

**Tablets**, pink, estradiol 600 micrograms, estriol 270 micrograms, estrone 1.4 mg, net price 84-tab pack = £6.94

**Dose** menopausal symptoms and osteoporosis prophylaxis (see section 6.6), 1–2 tablets daily starting within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), with cyclical progestogen for 12–14 days of each cycle in women with a uterus

**Note** *Hormonin* tablets can be given continuously or cyclically (21 days out of 28)

**TIBOLONE**

**Indications** short-term treatment of symptoms of oestrogen deficiency (including women being treated with gonadotrophin releasing hormone analogues); osteoporosis prophylaxis in women at risk of fractures (second-line)

**Cautions** see Hormone Replacement Therapy, p. 449 and under Oestrogens for HRT; vaginal bleeding (investigate for endometrial cancer if bleeding continues beyond 6 months or after stopping treatment); history of liver disease, epilepsy, migraine, diabetes mellitus, hypercholesterolaemia; withdraw if signs of thromboembolic disease, abnormal liver function tests or cholestatic jaundice; see also Note below; **interactions:** Appendix 1 (tibolone)

**Contra-indications** see notes above and under Oestrogens for HRT; hormone-dependent tumours, history of cardiovascular or cerebrovascular disease (e.g. thrombophlebitis, thromboembolism), uninvestigated vaginal bleeding

**Hepatic impairment** avoid in severe impairment

**Renal impairment** risk of fluid retention—patients with renal impairment should be closely monitored

**Pregnancy** avoid; toxicity in animal studies

**Breast-feeding** avoid

**Side-effects** see notes above; also abdominal pain, weight changes, vaginal bleeding, leucorrhoea, facial hair, and rarely amnesia; gastro-intestinal disturbances, oedema, dizziness, headache, migraine, depression, breast cancer (see notes above and section 6.4.1.1), arthralgia, myalgia, visual disturbances, seborrhoeic dermatitis, rash and pruritus also reported

**Dose**

• 2.5 mg daily

**Note** Unsuitable for use in the premenopause (unless being treated with gonadotrophin-releasing hormone analogue) and as (or with) an oral contraceptive; also unsuitable for use within 12 months of last menstrual period (may cause irregular bleeding); induce withdrawal bleed with progestogen if transferring from another form of HRT

**Livial®** (Organon) (PmM)

**Tablets**, tibolone 2.5 mg, net price 28-tab pack = £10.36; 3 × 28-tab pack = £31.08

## Ethinylestradiol

Ethinylestradiol (ethinylestradiol) is licensed for short-term treatment of symptoms of oestrogen deficiency, for osteoporosis prophylaxis if other drugs (section 6.6) cannot be used and for the treatment of female hypogonadism and menstrual disorders.

Ethinylestradiol is occasionally used under **specialist supervision** for the management of *hereditary haemorrhagic telangiectasia* (but evidence of benefit is limited). Side-effects include nausea, fluid retention, and thrombosis. Impotence and gynaecomastia have been reported in men.

For use in prostate cancer, see section 8.3.1.

### ETHINYLESTRADIOL (Ethinylestradiol)

**Indications** see notes above

**Cautions** cardiovascular disease (sodium retention with oedema, thromboembolism); see also under Combined Hormonal Contraceptives (section 7.3.1) and under Oestrogens for HRT (p. 451)

**Contra-indications** see under Combined Hormonal Contraceptives (section 7.3.1) and under Oestrogens for HRT (p. 451)

**Hepatic impairment** avoid; see also Combined Hormonal Contraceptives, section 7.3.1

**Pregnancy** see Combined Hormonal Contraceptives, section 7.3.1

**Breast-feeding** see Combined Hormonal Contraceptives, section 7.3.1

**Side-effects** feminising effects in men; see also under Combined Hormonal Contraceptives (section 7.3.1) and under Oestrogens for HRT (p. 451)

#### Dose

- Menopausal symptoms and osteoporosis prophylaxis, (with progestogen for 12–14 days per cycle in women with intact uterus), 10–50 micrograms daily for 21 days, repeated after 7-day tablet-free period
- Female hypogonadism, 10–50 micrograms daily, usually on cyclical basis; initial oestrogen therapy should be followed by combined oestrogen and progestogen therapy
- Menstrual disorders, 20–50 micrograms daily from day 5 to 25 of each cycle, with progestogen added either throughout the cycle or from day 15 to 25

**Ethinylestradiol** (Non-proprietary) (P<sub>m</sub>)

**Tablets**, ethinylestradiol 10 micrograms, net price 21-tab pack = £29.95; 50 micrograms, 21-tab pack = £38.20; 1 mg, 28-tab pack = £49.50

## Raloxifene

**Raloxifene** is licensed for the treatment and prevention of *postmenopausal osteoporosis*; unlike hormone replacement therapy, raloxifene does not reduce menopausal vasomotor symptoms.

Raloxifene may reduce the incidence of oestrogen-receptor-positive breast cancer but its role in established breast cancer is not yet clear. The manufacturer advises avoiding its use during treatment for breast cancer.

## RALOXIFENE HYDROCHLORIDE

**Indications** treatment and prevention of postmenopausal osteoporosis

**Cautions** risk factors for venous thromboembolism (discontinue if prolonged immobilisation); risk factors for stroke; breast cancer (see notes above); history of oestrogen-induced hypertriglyceridaemia (monitor serum triglycerides); **interactions:** Appendix 1 (raloxifene)

**Contra-indications** history of venous thromboembolism, undiagnosed uterine bleeding, endometrial cancer, cholestasis

**Hepatic impairment** avoid

**Renal impairment** caution in mild to moderate impairment; avoid in severe impairment

**Side-effects** hot flushes, leg cramps, peripheral oedema, influenza-like symptoms; *less commonly* venous thromboembolism, thrombophlebitis; *rarely* rashes, gastro-intestinal disturbances, hypertension, arterial thromboembolism, headache (including migraine), breast discomfort, thrombocytopenia

#### Dose

- 60 mg once daily

**Evista**<sup>®</sup> (Daiichi Sankyo) (P<sub>m</sub>)

**Tablets**, f/c, raloxifene hydrochloride 60 mg, net price 28-tab pack = £17.06; 84-tab pack = £59.59

### 6.4.1.2 Progestogens

There are two main groups of progestogen, progesterone and its analogues (dydrogesterone and medroxyprogesterone) and testosterone analogues (norethisterone and norgestrel). The newer progestogens (desogestrel, norgestimate, and gestodene) are all derivatives of norgestrel; levonorgestrel is the active isomer of norgestrel and has twice its potency. Progesterone and its analogues are less androgenic than the testosterone derivatives and neither progesterone nor dydrogesterone causes virilisation.

Where endometriosis requires drug treatment, it may respond to a progestogen, e.g. norethisterone, administered on a continuous basis. Danazol and gonadorelin analogues are also available (section 6.7.2).

Although oral progestogens have been used widely for menorrhagia they are relatively ineffective compared with tranexamic acid (section 2.11) or, particularly where dysmenorrhoea is also a factor, mefenamic acid (section 10.1.1); the levonorgestrel-releasing intra-uterine system (section 7.3.2.3) may be particularly useful for women also requiring contraception. Oral progestogens have also been used for severe dysmenorrhoea, but where contraception is also required in younger women the best choice is a combined oral contraceptive (section 7.3.1).

Progestogens have also been advocated for the alleviation of premenstrual symptoms, but no convincing physiological basis for such treatment has been shown.

Progestogens have been used for the prevention of spontaneous abortion in women with a history of recurrent miscarriage (habitual abortion) but there is no evidence of benefit and they are not recommended for this purpose. In pregnant women with antiphospholipid antibody syndrome who have suffered recurrent miscarriage, administration of low-dose

aspirin (section 2.9) and a prophylactic dose of a low molecular weight heparin (section 2.8.1) may decrease the risk of fetal loss (use under specialist supervision only).

**Hormone replacement therapy** In women with a uterus a progestogen needs to be added to long-term oestrogen therapy for hormone replacement, to prevent cystic hyperplasia of the endometrium and possible transformation to cancer; it can be added on a cyclical or a continuous basis (see section 6.4.1.1). Combined packs incorporating suitable progestogen tablets are available, see p. 452.

**Oral contraception** Desogestrel, etynodiol (ethynodiol), gestodene, levonorgestrel, norethisterone, and norgestimate are used in combined oral contraceptives and in progestogen-only contraceptives (section 7.3.1 and section 7.3.2).

**Cancer** Progestogens also have a role in neoplastic disease (section 8.3.2).

**Cautions** Progestogens should be used with caution in conditions that may worsen with fluid retention e.g. epilepsy, hypertension, migraine, asthma, or cardiac dysfunction, and in those susceptible to thromboembolism (particular caution with high dose). Care is also required in those with a history of depression. Progestogens can decrease glucose tolerance and patients with diabetes should be monitored closely. For **interactions** see Appendix 1 (progestogens).

**Contra-indications** Progestogens should be avoided in patients with a history of liver tumours. They are also contra-indicated in those with genital or breast cancer (unless progestogens are being used in the management of these conditions), severe arterial disease, undiagnosed vaginal bleeding and acute porphyria (section 9.8.2). Progestogens should not be used if there is a history during pregnancy of idiopathic jaundice, severe pruritus, or pemphigoid gestationis.

**Side-effects** Side-effects of progestogens include menstrual disturbances, premenstrual-like syndrome (including bloating, fluid retention, breast tenderness), weight change, nausea, headache, dizziness, insomnia, drowsiness, depression, change in libido; also skin reactions (including urticaria, pruritus, rash, and acne), hirsutism and alopecia. Jaundice and anaphylactoid reactions have also been reported.

## DIHYDROGESTERONE

**Indications** HRT (section 6.4.1.1)

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** avoid; see also Combined Hormonal Contraceptives, section 7.3.1

**Renal impairment** use with caution

**Pregnancy** not known to be harmful

**Breast-feeding** present in milk—no adverse effects reported

**Side-effects** see notes above

### Dose

- See under combined preparations (section 6.4.1.1)

## MEDROXYPROGESTERONE ACETATE

**Indications** see under Dose; contraception (section 7.3.2.2); malignant disease (section 8.3.2)

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** section 8.3.2

**Renal impairment** use with caution

**Pregnancy** section 8.3.2

**Breast-feeding** section 8.3.2

**Side-effects** see notes above; indigestion

### Dose

- **By mouth**, 2.5–10 mg daily for 5–10 days beginning on day 16 to 21 of cycle, repeated for 2 cycles in dysfunctional uterine bleeding and 3 cycles in secondary amenorrhoea
- Mild to moderate endometriosis, 10 mg 3 times daily for 90 consecutive days, beginning on day 1 of cycle
- Progestogenic opposition of oestrogen HRT, 10 mg daily for the last 14 days of each 28-day oestrogen HRT cycle

**Provera**<sup>®</sup> (Pharmacia) (P<sub>M</sub>)

**Tablets**, all scored, medroxyprogesterone acetate 2.5 mg (orange), net price 30-tab pack = £1.84; 5 mg (blue), 10-tab pack = £1.23; 10 mg (white), 10-tab pack = £2.47, 90-tab pack = £22.16

**Climanor**<sup>®</sup> (ReSource Medical) (P<sub>M</sub>)

**Tablets**, f/c, medroxyprogesterone acetate 5 mg, net price 28-tab pack = £3.27

### Combined preparations

Section 6.4.1.1

## NORETHISTERONE

**Indications** see under Dose; HRT (section 6.4.1.1); contraception (section 7.3.1 and section 7.3.2); malignant disease (section 8.3.2)

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** section 8.3.2

**Renal impairment** use with caution

**Pregnancy** section 8.3.2

**Breast-feeding** section 8.3.2

**Side-effects** see notes above

### Dose

- Endometriosis, **by mouth**, 10–15 mg daily for 4–6 months or longer, starting on day 5 of cycle (if spotting occurs increase dose to 20–25 mg daily, reduced once bleeding has stopped)
- Dysfunctional uterine bleeding, menorrhagia (but see notes above), **by mouth**, 5 mg 3 times daily for 10 days to arrest bleeding; to prevent bleeding 5 mg twice daily from day 19 to 26
- Dysmenorrhoea (but see notes above), **by mouth**, 5 mg 3 times daily from day 5 to 24 for 3–4 cycles
- Premenstrual syndrome (but not recommended, see notes above), **by mouth**, 5 mg 2–3 times daily from day 19 to 26 for several cycles
- Postponement of menstruation, **by mouth**, 5 mg 3 times daily starting 3 days before expected onset (menstruation occurs 2–3 days after stopping)

**Norethisterone** (Non-proprietary) (PoM)

Tablets, norethisterone 5 mg, net price 30-tab pack = £2.18

**Primolut N**<sup>®</sup> (Bayer Schering) (PoM)

Tablets, norethisterone 5 mg, net price 30-tab pack = £1.89

**Utoflan**<sup>®</sup> (Pharmacia) (PoM)

Tablets, norethisterone 5 mg, net price 30-tab pack = £1.40, 90-tab pack = £4.21

### Combined preparations

Section 6.4.1.1

## PROGESTERONE

**Indications** see under preparations

**Cautions** see notes above

**Contra-indications** see notes above; missed or incomplete abortion

**Hepatic impairment** avoid; see also Combined Hormonal Contraceptives, section 7.3.1

**Renal impairment** use with caution

**Pregnancy** not known to be harmful

**Breast-feeding** avoid—present in milk

**Side-effects** see notes above; injection-site reactions; pain, diarrhoea and flatulence can occur with rectal administration

### Dose

- See under preparations

**Crinone**<sup>®</sup> (Merck Serono) (PoM)

Vaginal gel, progesterone 90 mg/application (8%), 15 = £30.83

**Dose** by vagina, infertility due to inadequate luteal phase, insert 1 applicatorful daily starting either after documented ovulation or on day 18–21 of cycle. *In vitro* fertilisation, daily application continued for 30 days after laboratory evidence of pregnancy

**Cyclogest**<sup>®</sup> (Actavis) (PoM) 

Pessaries, progesterone 200 mg, net price 15 = £7.03; 400 mg, 15 = £10.18

**Dose** by vagina or rectum, premenstrual syndrome and post-natal depression, 200 mg daily to 400 mg twice daily; for premenstrual syndrome start on day 12–14 and continue until onset of menstruation (but not recommended, see notes above); rectally if barrier methods of contraception are used, in patients who have recently given birth or in those who suffer from vaginal infection or recurrent cystitis

**Gestone**<sup>®</sup> (Nordic) (PoM)

Injection, progesterone 50 mg/mL, net price 1-mL amp = £4.50, 2-mL amp = £4.50

**Dose** by deep intramuscular injection into buttock, dysfunctional uterine bleeding, 5–10 mg daily for 5–10 days until 2 days before expected onset of menstruation

Recurrent miscarriage due to inadequate luteal phase (but not recommended, see notes above) or following *in vitro* fertilisation or gamete intra-fallopian transfer, 25–100 mg 2–7 times a week from day 15, or day of embryo or gamete transfer, until 8–16 weeks of pregnancy; max. 200 mg daily

**Utrogestan**<sup>®</sup> (Ferring) (PoM)

Capsules, progesterone (micronised) 100 mg, net price 30-cap pack = £5.13; 200 mg 15-cap pack = £5.13. Counselling, administration

**Excipients** include arachis (peanut) oil

**Counselling** Capsules should be taken at bedtime on an empty stomach

**Dose** progestogenic opposition of oestrogen HRT 200 mg once daily on days 15–26, or 100 mg once daily on days 1–25, of each 28-day oestrogen HRT cycle

## 6.4.2 Male sex hormones and antagonists

Androgens cause masculinisation; they may be used as replacement therapy in castrated adults and in those who are hypogonadal due to either pituitary or testicular disease. In the normal male they inhibit pituitary gonadotrophin secretion and depress spermatogenesis. Androgens also have an anabolic action which led to the development of anabolic steroids (section 6.4.3).

Androgens are useless as a treatment of impotence and impaired spermatogenesis unless there is associated hypogonadism; they should not be given until the hypogonadism has been properly investigated. Treatment should be under expert supervision.

When given to patients with hypopituitarism they can lead to normal sexual development and potency but not to fertility. If fertility is desired, the usual treatment is with gonadotrophins or pulsatile gonadotrophin-releasing hormone (section 6.5.1) which will stimulate spermatogenesis as well as androgen production.

Caution should be used when androgens or chorionic gonadotrophin are used in treating boys with delayed puberty since the fusion of epiphyses is hastened and may result in short stature; skeletal maturation should be monitored.

Intramuscular depot preparations of testosterone esters are preferred for replacement therapy. Testosterone enantate, propionate or undecanoate, or alternatively *Sustanon*<sup>®</sup>, which consists of a mixture of testosterone esters and has a longer duration of action, may be used. Satisfactory replacement therapy can sometimes be obtained with 1 mL of *Sustanon 250*<sup>®</sup>, given by intramuscular injection once a month, although more frequent dose intervals are often necessary. Implants of testosterone can be used for hypogonadism; the implants are replaced every 4 to 5 months.

Testosterone implants can be used in postmenopausal women as an adjunct to hormone replacement therapy. A testosterone patch is also licensed to improve libido in surgically induced menopausal women (receiving concomitant oestrogen therapy).

## TESTOSTERONE AND ESTERS

**Indications** see under preparations

**Cautions** cardiac impairment, elderly, ischaemic heart disease, hypertension, epilepsy, migraine, diabetes mellitus, skeletal metastases (risk of hypercalcaemia), undertake regular examination of the prostate and breast during treatment; monitor full blood count, lipid profile and liver function; pre-pubertal boys (see notes above and under Side-effects); **interactions:** Appendix 1 (testosterone)

**Women** Regularly assess for androgenic side-effects; women should be advised to report any signs of virilisation e.g. deepening of the voice or hirsutism

**Contra-indications** breast cancer in men, prostate cancer, history of primary liver tumours, hypercalcaemia, nephrotic syndrome

**Hepatic impairment** avoid if possible—fluid retention and dose-related toxicity

**Renal impairment** caution—potential for fluid retention

**Pregnancy** avoid; causes masculinisation of female fetus

**Breast-feeding** avoid; may cause masculinisation in the female infant or precocious development in the male infant; high doses suppress lactation

**Side-effects** prostate abnormalities and prostate cancer, headache, depression, gastro-intestinal bleeding, nausea, vomiting, cholestatic jaundice, changes in libido, gynaecomastia, polycythaemia, anxiety, irritability, nervousness, asthenia, paraesthesia, hypertension, electrolyte disturbances including sodium retention with oedema and hypercalcaemia, weight gain; increased bone growth, muscle cramps, arthralgia; androgenic effects such as hirsutism, male-pattern baldness, seborrhoea, acne, pruritus, excessive frequency and duration of penile erection, precocious sexual development and premature closure of epiphyses in pre-pubertal males, suppression of spermatogenesis in men and virilism in women; rarely liver tumours; sleep apnoea also reported; with patches, buccal tablets, and gel, local irritation and allergic reactions (including burn-like lesions with patches), and taste disturbances

#### Dose

- See under preparations

#### Oral

##### Restandol® Testocaps (Organon) (POM)

**Capsules**, orange, testosterone undecanoate 40 mg in oily solution, net price 30-cap pack = £8.55; 60-cap pack = £17.10. Label: 21, 25

**Dose** androgen deficiency, 120–160 mg daily for 2–3 weeks; maintenance 40–120 mg daily

#### Buccal

##### Striant® SR (The Urology Co.) (POM)

**Mucoadhesive buccal tablets**, m/r, testosterone 30 mg, net price 60-tab pack = £45.84. Counselling, see under Dose below

**Dose** hypogonadism, 30 mg every 12 hours; CHILD and ADOLESCENT under 18 years not recommended

**Counselling** Place rounded side of tablet on gum above front teeth and hold lip firmly over the gum for 30 seconds. If tablet detaches within 4 hours of next dose, replace with new tablet which is considered the second dose for the day.

#### Intramuscular

##### Testosterone Enantate (Non-proprietary) (POM)

**Injection** (oily), testosterone enantate 250 mg/mL, net price 1-mL amp = £13.33

**Dose** by slow intramuscular injection, hypogonadism, initially 250 mg every 2–3 weeks; maintenance 250 mg every 3–6 weeks  
Breast cancer, 250 mg every 2–3 weeks

##### Nebido® (Bayer Schering) (POM)

**Injection** (oily), testosterone undecanoate 250 mg/mL, net price 4-mL amp = £76.70

**Dose** by deep intramuscular injection, hypogonadism in men over 18 years, 1 g every 10–14 weeks; if necessary, second dose may be given after 6 weeks to achieve rapid steady state plasma testosterone levels and then every 10–14 weeks

##### Sustanon 250® (Organon) (POM)

**Injection** (oily), testosterone propionate 30 mg, testosterone phenylpropionate 60 mg, testosterone isocaproate 60 mg, and testosterone decanoate 100 mg/mL, net price 1-mL amp = £2.45

**Excipients** include arachis (peanut) oil, benzyl alcohol (see Excipients p. 2)

**Dose** by deep intramuscular injection, androgen deficiency, 1 mL usually every 3 weeks

##### Virormone® (Nordic) (POM)

**Injection**, testosterone propionate 50 mg/mL, net price 2-mL amp = £4.50

**Dose** by intramuscular injection, androgen deficiency, 50 mg 2–3 times weekly

Delayed puberty, 50 mg weekly

Breast cancer in women, 100 mg 2–3 times weekly

#### Implant

##### Testosterone (Organon) (POM)

**Implant**, testosterone 100 mg, net price = £7.40; 200 mg = £13.79

**Dose** by implantation, male hypogonadism, 100–600 mg; 600 mg usually maintains plasma-testosterone concentration within the normal range for 4–5 months

Postmenopausal women, 50–100 mg every 4–8 months, as an adjunct to oestrogen replacement therapy

#### Transdermal preparations

##### Intrinsa® (Warner Chilcott) (POM)

**Patches**, self-adhesive, releasing testosterone approx. 300 micrograms/24 hours, net price 8-patch pack = £26.91. Counselling, administration

**Dose** hypogonadism due to testosterone deficiency associated with surgically induced menopause (in women receiving concomitant oestrogen therapy (section 6.4.1.1)), apply 1 patch twice weekly continuously to clean, dry, unbroken skin on lower abdomen below waistline; site replacement patch on a different area (avoid using same area for 7 days); assess treatment after 3–6 months, discontinue if no benefit

**Note** Not recommended for women naturally menopausal or those taking conjugated oestrogens. Safety and efficacy of use beyond 1 year not established

##### Testim® (Ferring) (POM)

**Gel**, testosterone 50 mg/5 g tube, net price 30-tube pack = £32.00. Counselling, administration

**Excipients** include propylene glycol (see section 13.1.3)

**Dose** hypogonadism due to testosterone deficiency in men (over 18 years), 50 mg testosterone (5 g gel) applied once daily; subsequent application adjusted according to response; max. 100 mg (10 g gel) daily

**Counselling** Squeeze entire content of tube on to one palm and apply as a thin layer on clean, dry, healthy skin of shoulder or upper arm, preferably in the morning after washing or bathing (if 2 tubes required use 1 per shoulder or upper arm); rub in and allow to dry before putting on clothing to cover site; wash hands with soap after application; avoid washing application site for at least 6 hours  
Avoid skin contact with application sites to prevent testosterone transfer to other people, especially pregnant women and children—consult product literature

##### Testogel® (Bayer Schering) (POM)

**Gel**, testosterone 50 mg/5 g sachet, net price 30-sachet pack = £31.11. Counselling, administration

**Dose** hypogonadism due to androgen deficiency in men (over 18 years), 50 mg testosterone (5 g gel) to be applied once daily; subsequent application adjusted according to response in 25-mg (2.5 g gel) increments to max. 100 mg (10 g gel) daily

**Counselling** Apply thin layer of gel on clean, dry, healthy skin such as shoulders, arms or abdomen, immediately after sachet is opened. Not to be applied on genital area as high alcohol content may cause local irritation. Allow to dry for 3–5 minutes before dressing. Wash hands with soap and water after applying gel, avoid shower or bath for at least 6 hours

Avoid skin contact with gel application sites to prevent testosterone transfer to other people, especially pregnant women and children—consult product literature

##### Tostran® (ProStrakan) (POM)

**Gel**, testosterone 2% (10 mg/metered application), net price 60-g multidose dispenser = £26.67. Counselling, administration

**Excipients** include butylhydroxytoluene, propylene glycol (see section 13.1.3)

**Dose** hypogonadism due to testosterone deficiency in men (over 18 years), initially 60 mg testosterone (3 g gel) applied

once daily; subsequent applications adjusted according to response; max. 80 mg (4 g gel) daily

**Counselling** Apply gel on clean, dry, intact skin of abdomen or both inner thighs, preferably in the morning. Gently rub in with a finger until dry before dressing. Wash hands with soap and water after applying gel, avoid washing application site for at least 2 hours. Not to be applied on genital area.

Avoid skin contact with gel application sites to prevent testosterone transfer to other people, especially pregnant women and children—consult product literature

## MESTEROLONE

**Indications** see under Dose

**Cautions** see under Testosterone and Esters

**Contra-indications** see under Testosterone and Esters

**Hepatic impairment** see under Testosterone and Esters

**Renal impairment** see under Testosterone and Esters

**Pregnancy** see under Testosterone and Esters

**Breast-feeding** see under Testosterone and Esters

**Side-effects** see under Testosterone and Esters but spermatogenesis unimpaired

### Dose

- Androgen deficiency and male infertility associated with hypogonadism, 25 mg 3–4 times daily for several months, reduced to 50–75 mg daily in divided doses for maintenance; **CHILD** not recommended

**Pro-Viron®** (Bayer Schering) (POM)

**Tablets**, scored, mesterolone 25 mg. Net price 30-tab pack = £4.19

## Anti-androgens

### Cyproterone acetate

**Cyproterone acetate** is an anti-androgen used in the treatment of severe hypersexuality and sexual deviation in the male. It inhibits spermatogenesis and produces reversible infertility (but is not a male contraceptive); abnormal sperm forms are produced. Fully informed consent is recommended and an initial spermatogram. As hepatic tumours have been produced in *animal* studies, careful consideration should be given to the risk/benefit ratio before treatment. Cyproterone acetate is also used as an adjunct in prostatic cancer (section 8.3.4.2) and in the treatment of acne and hirsutism in women (section 13.6.2).

## CYPROTERONE ACETATE

**Indications** see notes above; prostate cancer (section 8.3.4.2)

**Cautions** ineffective for male hypersexuality in chronic alcoholism (relevance to prostate cancer not known); blood counts initially and throughout treatment; monitor hepatic function regularly (liver function tests should be performed before treatment, see also under Side-effects below); monitor adrenocortical function regularly; diabetes mellitus (see also Contra-indications)

**Driving** Fatigue and lassitude may impair performance of skilled tasks (e.g. driving)

**Contra-indications** (do not apply in prostate cancer), severe diabetes (with vascular changes), sickle-cell anaemia, liver-disease including Dubin-Johnson and Rotor syndromes, previous or existing liver tumours, malignant or wasting diseases, meningioma or history of meningioma, severe depression, history of thromboembolic disorders; youths under 18 years (may arrest bone maturation and testicular development)

**Hepatic impairment** dose-related toxicity; see also side-effects, p. 573

**Side-effects** fatigue and lassitude, breathlessness, weight changes, reduced sebum production (may clear acne), changes in hair pattern, gynaecomastia (rarely leading to galactorrhoea and benign breast nodules); rarely hypersensitivity reactions, rash and osteoporosis; inhibition of spermatogenesis (see notes above); hepatotoxicity reported (including jaundice, hepatitis and hepatic failure usually in men given 200–300 mg daily for prostatic cancer, see section 8.3.4.2 for details and warnings)

### Dose

- **ADULT** over 18 years, male hypersexuality, 50 mg twice daily after food

**Cyproterone Acetate** (Non-proprietary) (POM)

**Tablets**, cyproterone acetate 50 mg, net price 56-tab pack = £31.54. Label: 21 counselling, driving

**Androcur®** (Bayer Schering) (POM)

**Tablets**, scored, cyproterone acetate 50 mg, net price 56-tab pack = £24.41. Label: 21 counselling, driving

## Dutasteride and finasteride

**Dutasteride** and **finasteride** are specific inhibitors of the enzyme 5 $\alpha$ -reductase, which metabolises testosterone into the more potent androgen, dihydrotestosterone. This inhibition of testosterone metabolism leads to reduction in prostate size, with improvement in urinary flow rate and in obstructive symptoms. Dutasteride and finasteride are alternatives to alpha-blockers (section 7.4.1) particularly in men with a significantly enlarged prostate. Finasteride is also licensed for use with doxazosin in the management of benign prostatic hyperplasia.

A low strength of finasteride is licensed for treating male-pattern baldness in men (section 13.9).

**Cautions** Dutasteride and finasteride decrease serum concentration of prostate cancer markers such as prostate-specific antigen; reference values may need adjustment. Both dutasteride and finasteride are excreted in semen and use of a condom is recommended if sexual partner is pregnant or likely to become pregnant. Women of childbearing potential should avoid handling crushed or broken tablets of finasteride and leaking capsules of dutasteride.

**Side-effects** The side-effects of dutasteride and finasteride include impotence, decreased libido, ejaculation disorders, and breast tenderness and enlargement.

## DUTASTERIDE

**Indications** benign prostatic hyperplasia

**Cautions** see notes above; **interactions:** Appendix 1 (dutasteride)

**Hepatic impairment** avoid in severe impairment—no information available

**Side-effects** see notes above

### Dose

- 500 micrograms daily, review treatment at 3–6 months and then every 6–12 months (may require several months treatment before benefit is obtained)

**Avodart®** (GSK) (POM)

**Capsules**, yellow, dutasteride 500 micrograms, net price 30-cap pack = £19.80. Label: 25

### ▲ With tamsulosin

Section 7.4.1

## FINASTERIDE

**Indications** benign prostatic hyperplasia; male-pattern baldness in men (section 13.9)

**Cautions** see notes above; also obstructive uropathy

**Male breast cancer** Cases of male breast cancer have been reported. Patients or their carers should be told to promptly report to their doctor any changes in breast tissue such as lumps, pain, or nipple discharge

**Side-effects** see notes above; also testicular pain, hypersensitivity reactions (including lip and face swelling, pruritus and rash); male breast cancer also reported (see Cautions above)

### Dose

- 5 mg daily, review treatment at 3–6 months and then every 6–12 months (may require several months' treatment before benefit is obtained)

**Finasteride** (Non-proprietary) (PoM)

Tablets, finasteride 5 mg, net price 28-tab pack = £2.19

**Proscar**<sup>®</sup> (MSD) (PoM)

Tablets, blue, f/c, finasteride 5 mg, net price 28-tab pack = £13.94

## 6.4.3 Anabolic steroids

Anabolic steroids have some androgenic activity but they cause less virilisation than androgens in women. They are used in the treatment of some *aplastic anaemias* (section 9.1.3). Anabolic steroids have been given for osteoporosis in women but they are no longer advocated for this purpose.

The protein-building properties of anabolic steroids have not proved beneficial in the clinical setting. Their use as body builders or tonics is unjustified; some athletes abuse them.

## NANDROLONE

**Indications** osteoporosis in postmenopausal women (but not recommended, see notes above); aplastic anaemia (section 9.1.3)

**Cautions** cardiac impairment, hypertension, diabetes mellitus, epilepsy, migraine; monitor skeletal maturation in young patients; skeletal metastases (risk of hypercalcaemia); **interactions:** Appendix 1 (anabolic steroids)

**Contra-indications** prostate cancer, male breast cancer, acute porphyria (section 9.8.2)

**Hepatic impairment** use in severe hepatic impairment only if benefit outweighs risk

**Renal impairment** use with caution—may cause sodium and water retention

**Side-effects** acne, sodium retention with oedema, virilisation with high doses including voice changes (sometimes irreversible), amenorrhoea, inhibition of spermatogenesis, premature epiphyseal closure; abnormal liver-function tests reported with high doses; liver tumours reported occasionally on prolonged treatment with anabolic steroids

### Dose

- See below

**Deca-Durabolin**<sup>®</sup> (Organon) (PoM) 

**Injection** (oily), nandrolone decanoate 50 mg/mL, net price 1-mL amp = £3.17

**Excipients** include arachis (peanut) oil, benzyl alcohol (see Excipients, p. 2)

**Dose** by deep intramuscular injection, 50 mg every 3 weeks

## 6.5 Hypothalamic and pituitary hormones and anti-oestrogens

**6.5.1 Hypothalamic and anterior pituitary hormones and anti-oestrogens**

**6.5.2 Posterior pituitary hormones and antagonists**

Use of preparations in these sections requires detailed prior investigation of the patient and *should be reserved for specialist centres.*

### 6.5.1 Hypothalamic and anterior pituitary hormones and anti-oestrogens

#### Anti-oestrogens

The anti-oestrogens **clomifene** (clomiphene) and **tamoxifen** (section 8.3.4.1) are used in the treatment of female infertility due to oligomenorrhoea or secondary amenorrhoea (e.g. associated with polycystic ovarian disease). They induce gonadotrophin release by occupying oestrogen receptors in the hypothalamus, thereby interfering with feedback mechanisms; chorionic gonadotrophin is sometimes used as an adjunct. Patients should be warned that there is a risk of multiple pregnancy (*rarely* more than twins).

## CLOMIFENE CITRATE (Clomiphene Citrate)

**Indications** anovulatory infertility—see notes above

**Cautions** see notes above; polycystic ovary syndrome (cysts may enlarge during treatment, also risk of exaggerated response to usual doses), ovarian hyperstimulation syndrome, uterine fibroids, ectopic pregnancy, incidence of multiple births increased (consider ultrasound monitoring), visual symptoms (discontinue and initiate ophthalmological examination)

**CSM Advice** The CSM has recommended that clomifene should not normally be used for longer than 6 cycles (possibly increased risk of ovarian cancer)

**Contra-indications** ovarian cysts, hormone-dependent tumours or abnormal uterine bleeding of undetermined cause

**Hepatic impairment** avoid in severe liver disease

**Pregnancy** exclude pregnancy before treatment; possible effects on fetal development

**Breast-feeding** may inhibit lactation

**Side-effects** visual disturbances (withdraw), ovarian hyperstimulation (withdraw), hot flushes, abdominal discomfort, occasionally nausea, vomiting, depression, insomnia, breast tenderness, headache, intermenstrual spotting, menorrhagia, endometriosis, convulsions, weight gain, rashes, dizziness, hair loss

#### Dose

- 50 mg daily for 5 days, starting within about 5 days of onset of menstruation (preferably on 2nd day) or at any time (normally preceded by a progestogen-induced withdrawal bleed) if cycles have ceased; second course of 100 mg daily for 5 days may be given in absence of ovulation; most patients who are going to respond will do so to first course; 3 courses should constitute adequate therapeutic trial; long-term cyclical therapy not recommended—see CSM advice, above

**Clomifene** (Non-proprietary) (PmI)

Tablets, clomifene citrate 50 mg, net price 30-tab pack = £15.94

**Clomid**<sup>®</sup> (Sanofi-Aventis) (PmI)

Tablets, yellow, scored, clomifene citrate 50 mg. Net price 30-tab pack = £8.46

## Anterior pituitary hormones

### Corticotrophins

**Tetracosactide** (tetracosactrin), an analogue of corticotropin (ACTH), is used to test adrenocortical function; failure of the plasma cortisol concentration to rise after administration of tetracosactide indicates adrenocortical insufficiency.

Both corticotropin and tetracosactide were formerly used as alternatives to corticosteroids in conditions such as Crohn's disease or rheumatoid arthritis; their value was limited by the variable and unpredictable therapeutic response and by the waning of their effect with time.

### TETRACOSACTIDE

(Tetracosactrin)

**Indications** see notes above

**Cautions** as for corticosteroids, section 6.3.2; **important:** risk of anaphylaxis (medical supervision; consult product literature); **interactions:** Appendix 1 (corticosteroids)

**Contra-indications** as for corticosteroids, section 6.3.2; avoid injections containing benzyl alcohol in neonates (see under preparations)

**Hepatic impairment** see section 6.3.2

**Renal impairment** see section 6.3.2

**Pregnancy** avoid (but may be used diagnostically if essential)

**Breast-feeding** avoid (but may be used diagnostically if essential)

**Side-effects** as for corticosteroids, section 6.3.2

#### Dose

- See under preparations below

**Synacthen**<sup>®</sup> (Alliance) (PmI)

**Injection**, tetracosactide 250 micrograms (as acetate)/mL. Net price 1-mL amp = £2.70

**Dose** diagnostic (30-minute test), by **intramuscular or intravenous injection**, 250 micrograms as a single dose

**Synacthen Depot**<sup>®</sup> (Alliance) (PmI)

**Injection** (aqueous suspension), tetracosactide acetate 1 mg/mL, with zinc phosphate complex. Net price 1-mL amp = £3.87

**Excipients** include benzyl alcohol (avoid in neonates, see Excipients p. 2)

**Dose** diagnostic (5-hour test), by **intramuscular injection**, 1 mg as a single dose

**Note** Formerly used therapeutically by **intramuscular injection**, in an initial dose of 1 mg daily (or every 12 hours in acute cases); reduced to 1 mg every 2–3 days, then 1 mg weekly (or 500 micrograms every 2–3 days) but value was limited (see notes above)

### Gonadotrophins

Follicle-stimulating hormone (FSH) and luteinising hormone (LH) together (as in **human menopausal gonadotrophin**), follicle-stimulating hormone alone (as in **follitropin**), or chorionic gonadotrophin, are used in the treatment of infertility in women with proven hypopituitarism or who have not responded to clomifene, or in superovulation treatment for assisted conception (such as *in vitro* fertilisation).

The gonadotrophins are also occasionally used in the treatment of hypogonadotrophic hypogonadism and associated oligospermia. There is no justification for their use in primary gonadal failure.

Chorionic gonadotrophin has also been used in delayed puberty in the male to stimulate endogenous testosterone production, but has little advantage over testosterone (section 6.4.2).

## CHORIONIC GONADOTROPHIN

(Human Chorionic Gonadotrophin; HCG)

A preparation of a glycoprotein fraction secreted by the placenta and obtained from the urine of pregnant women having the action of the pituitary luteinising hormone

**Indications** see notes above

**Cautions** cardiac impairment, asthma, epilepsy, migraine; prepubertal boys (risk of premature epiphyseal closure or precocious puberty); acute porphyria (section 9.8.2)

**Contra-indications** androgen-dependent tumours

**Renal impairment** use with caution

**Side-effects** oedema (particularly in males—reduce dose), headache, tiredness, mood changes, gynaecomastia, local reactions; may aggravate ovarian hyperstimulation, multiple pregnancy

#### Dose

- By **subcutaneous or intramuscular injection**, according to patient's response

**Choragon**<sup>®</sup> (Ferring) (PmI)

**Injection**, powder for reconstitution, chorionic gonadotrophin. Net price 5000-unit amp (with solvent) = £3.26. For intramuscular injection

**Pregnyl**<sup>®</sup> (Organon) (PmI)

**Injection**, powder for reconstitution, chorionic gonadotrophin. Net price 1500-unit amp = £2.12; 5000-unit amp = £3.15 (both with solvent). For subcutaneous or intramuscular injection

**CHORIOGONADOTROPIN ALFA**

(Human chorionic gonadotropin)

**Indications** see notes above**Cautions** acute porphyria (section 9.8.2)**Contra-indications** ovarian enlargement or cyst (unless caused by polycystic ovarian disease); ectopic pregnancy in previous 3 months; active thromboembolic disorders; hypothalamus, pituitary, ovarian, uterine or mammary malignancy**Side-effects** nausea, vomiting, abdominal pain; headache, tiredness; injection-site reactions; ovarian hyperstimulation syndrome; rarely diarrhoea, depression, irritability, breast pain; ectopic pregnancy and ovarian torsion reported**Dose**

- By subcutaneous injection, according to patient's response

**Ovitrelle**<sup>®</sup> (Merck Serono) (Pom)

**Injection**, choriogonadotropin alfa, net price 6500-unit/0.5 mL (250-micrograms/0.5 mL) prefilled syringe = £31.38

**CORIFOLLITROPIN ALFA****Indications** controlled ovarian stimulation in combination with a gonadotrophin-releasing hormone antagonist**Cautions** risk factors for thromboembolism; risk of ovarian hyperstimulation syndrome; acute porphyria (section 9.8.2)**Contra-indications** ovarian enlargement or cyst; polycystic ovarian syndrome; tumours of hypothalamus, pituitary, ovaries, uterus, or breast; vaginal bleeding of unknown cause; history of ovarian hyperstimulation syndrome**Renal impairment** avoid**Breast-feeding** avoid**Side-effects** nausea; headache, fatigue; ovarian hyperstimulation, pelvic pain, breast pain; *less commonly* vomiting, abdominal distension and pain, diarrhoea, constipation, dizziness, ovarian torsion; *also reported* ectopic pregnancy, miscarriage, and multiple pregnancies**Dose**

- By subcutaneous injection, body-weight under 60 kg, 100 micrograms; body-weight over 60 kg, 150 micrograms

**Elonva**<sup>®</sup> (Organon) ▼ (Pom)

**Injection**, prefilled syringe, corifollitropin alfa, net price 100 micrograms/0.5 mL = £638.00; 150 micrograms/0.5 mL = £638.00

**FOLLITROPIN ALFA and BETA**

(Recombinant human follicle stimulating hormone)

**Indications** see notes above**Cautions** acute porphyria (section 9.8.2)**Contra-indications** see under Human Menopausal Gonadotrophins**Pregnancy** avoid**Breast-feeding** avoid**Side-effects** see under Human Menopausal Gonadotrophins**Dose**

- By subcutaneous or intramuscular injection, according to patient's response

**Follitropin alfa****Gonal-F**<sup>®</sup> (Merck Serono) (Pom)

**Injection**, powder for reconstitution, follitropin alfa. Net price 75-unit amp = £21.02; 450 units/0.75 mL, multidose vial = £126.10; 1050 units/1.75 mL, multidose vial = £294.22 (all with solvent). For subcutaneous injection

**Injection**, prefilled pen, follitropin alfa 600 units/mL, net price 0.5 mL (300 units) = £94.00, 0.75 mL (450 units) = £141.00, 1.5 mL (900 units) = £282.00. For subcutaneous injection

**Follitropin alfa with lutropin alfa****Pergoveris**<sup>®</sup> (Merck Serono) (Pom)

**Injection**, powder for reconstitution, follitropin alfa 150 units (11 micrograms), lutropin alfa 75 units (3 micrograms), net price per vial (with solvent) = £60.29. For subcutaneous injection

**Electrolytes** Na<sup>+</sup> < 1 mmol/vial

**Follitropin beta****Puregon**<sup>®</sup> (Organon) (Pom)

**Injection**, follitropin beta 100 units/mL, net price 0.5-mL (50-unit) vial = £18.03; 200 units/mL, 0.5-mL (100-unit) vial = £36.06; 300 units/mL, 0.5-mL (150-unit) vial = £50.62; 400 units/mL, 0.5-mL (200-unit) vial = £67.49; 0.36-mL (300-unit) cartridge = £97.41, 0.72-mL (600-unit) cartridge = £194.82, 1.08-mL (900-unit) cartridge = £292.23, (cartridges for use with *Puregon*<sup>®</sup> pen). For subcutaneous (cartridges and vials) or intramuscular injection (vials)

**Excipients** may include neomycin and streptomycin**HUMAN MENOPAUSAL GONADOTROPHINS****Indications** see notes above**Cautions** acute porphyria (section 9.8.2)**Contra-indications** ovarian cysts (not caused by polycystic ovarian syndrome); tumours of pituitary, hypothalamus, breast, uterus, ovaries, testes or prostate; vaginal bleeding of unknown cause**Pregnancy** avoid**Breast-feeding** avoid**Side-effects** ovarian hyperstimulation, increased risk of multiple pregnancy and miscarriage, hypersensitivity reactions, gastro-intestinal disturbances, headache, joint pain, fever, injection site reactions, *very rarely* thromboembolism; gynaecomastia, acne, and weight gain reported in men**Dose**

- By deep intramuscular or subcutaneous injection, according to patient's response

**Menotrophin**

Purified extract of human post-menopausal urine containing follicle-stimulating hormone (FSH) and luteinising hormone (LH) in a ratio of 1:1

**Merional**<sup>®</sup> (Pharmasure) (Pom)

**Injection**, powder for reconstitution, menotrophin as follicle-stimulating hormone 75 units and luteinising hormone 75 units, net price per vial (with solvent) = £13.95; follicle-stimulating hormone 150 units, luteinising hormone 150 units, net price per vial (with solvent) = £27.90. For intramuscular injection

**Menopur®** (Ferring) (Pom)

**Injection**, powder for reconstitution, menotropin as follicle-stimulating hormone 75 units and luteinising hormone 75 units, net price per vial (with solvent) = £13.38. For intramuscular or subcutaneous injection

#### Urofollitropin

Purified extract of human post-menopausal urine containing follicle-stimulating hormone (FSH)

**Fostimon®** (Pharmasure) (Pom)

**Injection**, powder for reconstitution, urofollitropin as follicle-stimulating hormone 75 units, net price per vial (with solvent) = £27.90; follicle-stimulating hormone 150 units, net price per vial (with solvent) = £55.80. For intramuscular or subcutaneous injection

## LUTROPIN ALFA

(Recombinant human luteinising hormone)

**Indications** see notes above

**Cautions** acute porphyria (section 9.8.2)

**Contra-indications** ovarian enlargement or cyst (unless caused by polycystic ovarian disease); undiagnosed vaginal bleeding; tumours of hypothalamus and pituitary; ovarian, uterine or mammary carcinoma

**Side-effects** nausea, vomiting, abdominal and pelvic pain; headache, somnolence; injection-site reactions; ovarian hyperstimulation syndrome, ovarian cyst, breast pain, ectopic pregnancy; thromboembolism, adnexal torsion, and haemoperitoneum

#### Dose

- By **subcutaneous injection**, in conjunction with follicle-stimulating hormone, according to response

**Luveris®** (Merck Serono) (Pom)

**Injection**, powder for reconstitution, lutropin alfa, net price 75-unit vial = £31.38 (with solvent)

### Growth hormone

Growth hormone is used to treat deficiency of the hormone in children and in adults (see NICE guidance below). In children it is used in Prader-Willi syndrome, Turner syndrome, chronic renal insufficiency, short children considered small for gestational age at birth, and short stature homeobox-containing gene (SHOX) deficiency.

Growth hormone of human origin (HGH; somatotrophin) has been replaced by a growth hormone of human sequence, **somatropin**, produced using recombinant DNA technology.

#### NICE guidance

##### Somatropin for the treatment of growth failure in children (May 2010)

Somatropin is recommended for children with growth failure who:

- have growth-hormone deficiency;
- have Turner syndrome;
- have Prader-Willi syndrome;
- have chronic renal insufficiency;
- are born small for gestational age with subsequent growth failure at 4 years of age or later;
- have short stature homeobox-containing gene (SHOX) deficiency.

Treatment should be discontinued if growth velocity increases by less than 50% from baseline in the first year of treatment.

#### NICE guidance

##### Somatropin for adults with growth hormone deficiency (August 2003)

Somatropin is recommended in adults **only** if the following 3 criteria are fulfilled:

- Severe growth hormone deficiency, established by an appropriate method,
- Impaired quality of life, measured by means of a specific questionnaire,
- Already receiving treatment for another pituitary hormone deficiency.

Somatropin treatment should be discontinued if the quality of life has not improved sufficiently by 9 months.

Severe growth hormone deficiency developing after linear growth is complete but before the age of 25 years should be treated with growth hormone; treatment should continue until adult peak bone mass has been achieved. Treatment for adult-onset growth hormone deficiency should be stopped only when the patient and the patient's physician consider it appropriate.

Treatment with somatropin should be initiated and managed by a physician with expertise in growth hormone disorders; maintenance treatment can be prescribed in the community under a shared-care protocol.

**Mecasermin**, a human insulin-like growth factor-I (rhIGF-I), is licensed to treat growth failure in children and adolescents with severe primary insulin-like growth factor-I deficiency (section 6.7.4).

## SOMATROPIN

(Recombinant Human Growth Hormone)

**Indications** see under Dose

**Cautions** diabetes mellitus (adjustment of antidiabetic therapy may be necessary), papilloedema (see under Side-effects), relative deficiencies of other pituitary hormones (notably hypothyroidism—manufacturers recommend periodic thyroid function tests but limited evidence of clinical value), history of malignant disease, disorders of the epiphysis of the hip (monitor for limping), resolved intracranial hypertension (monitor closely), initiation of treatment close to puberty not recommended in child born small for gestational age; Silver-Russell syndrome; rotate subcutaneous injection sites to prevent lipatrophy; **interactions:** Appendix 1 (somatropin)

**Contra-indications** evidence of tumour activity (complete antitumour therapy and ensure intracranial lesions inactive before starting); not to be used after renal transplantation or for growth promotion in children with closed epiphyses (or near closure in Prader-Willi syndrome); severe obesity or severe respiratory impairment in Prader-Willi syndrome

**Pregnancy** discontinue if pregnancy occurs—no information available

**Breast-feeding** no information available

**Side-effects** headache, funduscopy for papilloedema recommended if severe or recurrent headache, visual problems, nausea and vomiting occur—if papilloedema confirmed consider benign intracranial hypertension (rare cases reported); fluid retention (peripheral oedema), arthralgia, myalgia, carpal tunnel syndrome, paraesthesia, antibody formation, hypothyroidism, insulin resistance, hyperglycaemia, hypo-

glycaemia, reactions at injection site; leukaemia in children with growth hormone deficiency also reported

### Dose

- Gonadal dysgenesis (Turner syndrome), by **subcutaneous injection**, 45–50 micrograms/kg daily or 1.4 mg/m<sup>2</sup> daily
- Deficiency of growth hormone in children, by **subcutaneous** or **intramuscular injection**, 23–39 micrograms/kg daily or 0.7–1 mg/m<sup>2</sup> daily
- Growth disturbance in short children born small for gestational age whose growth has not caught up by 4 years or later, by **subcutaneous injection**, 35 micrograms/kg daily or 1 mg/m<sup>2</sup> daily
- Prader-Willi syndrome, by **subcutaneous injection** in children with growth velocity greater than 1 cm/year, in combination with energy-restricted diet, 35 micrograms/kg daily or 1 mg/m<sup>2</sup> daily; max. 2.7 mg daily
- Chronic renal insufficiency in children (renal function decreased to less than 50%), by **subcutaneous injection**, 45–50 micrograms/kg daily or 1.4 mg/m<sup>2</sup> daily (higher doses may be needed) adjusted if necessary after 6 months
- Adult growth hormone deficiency, by **subcutaneous injection**, initially 150–300 micrograms daily, gradually increased if required to max. 1 mg daily; use minimum effective dose (requirements may decrease with age)
- SHOX deficiency in children, by **subcutaneous injection**, 45–50 micrograms/kg daily

**Note** Dose formerly expressed in units; somatropin 1 mg ≡ 3 units

### Genotropin® (Pharmacia) (POM)

**Injection**, two-compartment cartridge containing powder for reconstitution, somatropin (rbe) and diluent, net price 5.3-mg (16-unit) cartridge = £122.87, 12-mg (36-unit) cartridge = £278.20. For use with **Genotropin® Pen** (JMS) device (available free of charge from clinics). For subcutaneous injection

**GoQuick® injection**, two-compartment, multi-dose disposable, prefilled pen containing powder for reconstitution, somatropin (rbe) and diluent, net price 5.3-mg (16-unit) prefilled pen = £122.87; 12-mg (36-unit) prefilled pen = £278.20. For subcutaneous injection

**MiniQuick injection**, two-compartment single-dose syringe containing powder for reconstitution, somatropin (rbe) and diluent, net price 0.2-mg (0.6-unit) syringe = £4.64; 0.4-mg (1.2-unit) syringe = £9.27; 0.6-mg (1.8-unit) syringe = £13.91; 0.8-mg (2.4-unit) syringe = £18.55; 1-mg (3-unit) syringe = £23.18; 1.2-mg (3.6-unit) syringe = £27.82; 1.4-mg (4.2-unit) syringe = £32.46; 1.6-mg (4.8-unit) syringe = £37.09; 1.8-mg (5.4-unit) syringe = £41.73; 2-mg (6-unit) syringe = £46.37. For subcutaneous injection

### Humatrope® (Lilly) (POM)

**Injection**, powder for reconstitution, somatropin (rbe), net price 6-mg (18-unit) cartridge = £108.00; 12-mg (36-unit) cartridge = £216.00; 24-mg (72-unit) cartridge = £432.00; all supplied with diluent. For subcutaneous or intramuscular injection; cartridges for subcutaneous injection

### Norditropin® (Novo Nordisk) (POM)

**SimpleXx injection**, somatropin (epi) 3.3 mg (10 units)/mL, net price 1.5-mL (5-mg, 15-unit) cartridge = £106.35; 6.7 mg (20 units)/mL, 1.5-mL (10-

mg, 30-unit) cartridge = £212.70; 10 mg (30 units)/mL, 1.5-mL (15-mg, 45-unit) cartridge = £319.05. For use with appropriate **NordiPen®** (JMS) device (available free of charge from clinics). For subcutaneous injection

### NutropinAq® (Ipsen) (POM)

**Injection**, somatropin (rbe), net price 10 mg (30 units) 2-mL cartridge = £203.00. For use with **NutropinAq® Pen** (JMS) device (available free of charge from clinics). For subcutaneous injection

### Omnitrope® (Sandoz) (POM)

**Injection**, somatropin (rbe) 3.3 mg (10 units)/mL, net price 1.5 mL (5-mg, 15-unit) cartridge = £86.77; 6.7 mg (20 units)/mL, 1.5 mL (10-mg, 30-unit) cartridge = £173.50. For use with **Omnitrope Pen 5®** (JMS) and **Omnitrope Pen 10®** (JMS) devices respectively (available free of charge from clinics). For subcutaneous injection

**Excipients** include benzyl alcohol (in 5-mg cartridge) (avoid in neonates, see Excipients, p. 2)

**Note** Biosimilar medicine, see p. 1

### Saizen® (Merck Serono) (POM)

**Injection**, powder for reconstitution, somatropin (rbc), net price 1.33-mg (4-unit) vial (with diluent) = £29.28; 3.33-mg (10-unit) vial (with diluent) = £73.20. For subcutaneous or intramuscular injection

**Click.easy®**, powder for reconstitution, somatropin (rbc), net price 8-mg (24-unit) vial (in **Click.easy®** device with diluent) = £185.44. For use with **One.click®** (JMS) autoinjector device or **Cool.Click®** (JMS) needle-free device (both available free of charge from clinics). For subcutaneous injection

**Excipients** include benzyl alcohol (in diluent for 3.33 mg vial) (avoid in neonates, see Excipients p. 2)

**Note** **Saizen®** 3.33 mg vial may be reconstituted with sodium chloride intravenous infusion or water for injections for immediate use when administering to children under 3 years of age

### Zomacton® (Ferring) (POM)

**Injection**, powder for reconstitution, somatropin (rbe), net price 4-mg (12-unit) vial (with diluent) = £79.69, for use with **ZomaJet 2® Vision** (JMS) needle-free device (available free of charge from clinics) or with needles and syringes; 10 mg (30-unit) vial (with diluent) = £199.23, for use with **ZomaJet Vision X®** (JMS) needle-free device (available free of charge from clinics) or with needles and syringes. For subcutaneous injection

**Excipients** include benzyl alcohol (in 4-mg vial) (avoid in neonates, see Excipients p. 2)

## Growth hormone receptor antagonists

**Pegvisomant** is a genetically modified analogue of human growth hormone and is a highly selective growth hormone receptor antagonist. Pegvisomant is licensed for the treatment of acromegaly in patients with inadequate response to surgery, radiation, or both, and to treatment with somatostatin analogues. Pegvisomant should be initiated only by physicians experienced in the treatment of acromegaly.

## PEGVISOMANT

**Indications** see notes above

**Cautions** liver disease (monitor liver enzymes every 4–6 weeks for 6 months or if symptoms of hepatitis develop); diabetes mellitus (adjustment of antidiabetic therapy may be necessary); possible increase in female fertility

**Pregnancy** avoid**Breast-feeding** avoid**Side-effects** diarrhoea, constipation, nausea, vomiting, abdominal distension, dyspepsia, flatulence, elevated liver enzymes; hypertension; headache, asthenia, dizziness, drowsiness, tremor, sleep disturbances; influenza-like syndrome, weight gain, hyperglycaemia, hypoglycaemia; arthralgia, myalgia; injection-site reactions, sweating, pruritus, rash; fatigue; hypercholesterolaemia; less commonly thrombocytopenia, leucopenia, leucocytosis, bleeding tendency**Dose**

- By **subcutaneous injection**, initially 80 mg, then 10 mg daily, increased in steps of 5 mg daily according to response; max. 30 mg daily; **CHILD** not recommended

**Somavert**<sup>®</sup> (Pfizer) (PmM)**Injection**, powder for reconstitution, pegvisomant, net price 10-mg vial = £50.00; 15-mg vial = £75.00; 20-mg vial = £100.00 (all with solvent)**Thyrotrophin**

**Thyrotrophin alfa** is a recombinant form of thyrotrophin (thyroid stimulating hormone). It is licensed for use with or without radioiodine imaging, together with serum thyroglobulin testing, for the detection of thyroid remnants and thyroid cancer in post-thyroidectomy patients. It is also licensed to increase radio-iodine uptake for the ablation of thyroid remnant tissue in suitable post-thyroidectomy patients.

**THYROTROPIN ALFA**

(Recombinant human thyroid stimulating hormone, rhTSH)

**Indications** see notes above and product literature**Cautions** presence of thyroglobulin autoantibodies may give false negative results**Contra-indications** hypersensitivity to bovine or human thyrotrophin**Pregnancy** avoid**Breast-feeding** avoid**Side-effects** nausea, vomiting; headache, dizziness, fatigue; *less commonly* asthenia, paraesthesia, back pain, influenza-like symptoms, rash, urticaria; *rarely* diarrhoea; *very rarely* palpitation, flushing, dyspnoea, pain at site of metastases, tremor, arthralgia, myalgia, hyperhidrosis, and injection-site reactions including pain, pruritus, and rash**Dose**

- By **intramuscular injection** into the gluteal muscle, 900 micrograms every 24 hours for 2 doses, consult product literature

**Thyrogen**<sup>®</sup> (Genzyme) (PmM)**Injection**, powder for reconstitution, thyrotrophin alfa 900 micrograms/vial, net price = £291.52**Hypothalamic hormones**

**Gonadorelin** when injected intravenously in normal subjects leads to a rapid rise in plasma concentrations of both luteinising hormone (LH) and follicle-stimulating hormone (FSH). It has not proved to be very helpful, however, in distinguishing hypothalamic from pituitary lesions. **Gonadorelin analogues** are indicated in endometriosis and infertility (section 6.7.2) and in breast and prostate cancer (section 8.3.4).

**GONADORELIN**

(Gonadotrophin-releasing hormone; GnRH; LH-RH)

**Indications** see preparations below**Cautions** pituitary adenoma**Pregnancy** avoid**Breast-feeding** avoid**Side-effects** rarely, nausea, headache, abdominal pain, increased menstrual bleeding; rarely, hypersensitivity reaction on repeated administration of large doses; irritation at injection site**Dose**

- See under preparations

**HRF**<sup>®</sup> (Intrapharm) (PmM)**Injection**, powder for reconstitution, gonadorelin. Net price 100-microgram vial (with diluent) = £13.72 (hosp. only)**Excipients** include benzyl alcohol (avoid in neonates, see Excipients p. 2)**Dose** for assessment of pituitary function (adults), by **subcutaneous or intravenous injection**, 100 micrograms**6.5.2 Posterior pituitary hormones and antagonists****Posterior pituitary hormones**

**Diabetes insipidus** **Vasopressin** (antidiuretic hormone, ADH) is used in the treatment of *pituitary* ('cranial') *diabetes insipidus* as is its analogue **desmopressin**. Dosage is tailored to produce a slight diuresis every 24 hours to avoid water intoxication. Treatment may be required for a limited period only in diabetes insipidus following trauma or pituitary surgery.

Desmopressin is more potent and has a longer duration of action than vasopressin; unlike vasopressin it has no vasoconstrictor effect. It is given by mouth or intranasally for maintenance therapy, and by injection in the postoperative period or in unconscious patients. Desmopressin is also used in the differential diagnosis of diabetes insipidus. Following a dose of 2 micrograms intramuscularly or 20 micrograms intranasally, restoration of the ability to concentrate urine after water deprivation confirms a diagnosis of cranial diabetes insipidus. Failure to respond occurs in nephrogenic diabetes insipidus.

In *nephrogenic* and *partial pituitary diabetes insipidus* benefit may be gained from the paradoxical antidiuretic effect of thiazides (section 2.2.1) e.g. chlorthalidone 100 mg twice daily reduced to maintenance dose of 50 mg daily.

Carbamazepine (section 4.8.1) is sometimes useful in partial pituitary diabetes insipidus (in a dose of 200 mg once or twice daily) [unlicensed]; it may act by sensitising the renal tubules to the action of remaining endogenous vasopressin.

**Other uses** Desmopressin is also used to boost factor VIII concentration in mild to moderate haemophilia and in von Willebrand's disease; it is also used to test fibrinolytic response. For a comment on use of desmopressin in nocturnal enuresis see section 7.4.2.

Vasopressin infusion is used to control variceal bleeding in portal hypertension, prior to more definitive treatment and with variable results. **Terlipressin**, a derivative of vasopressin, is used similarly.

Oxytocin, another posterior pituitary hormone, is indicated in obstetrics (section 7.1.1).

## DESMOPRESSIN

**Indications** see under Dose

**Cautions** see under Vasopressin; less pressor activity, but still considerable caution in cardiovascular disease and in hypertension (not indicated for nocturnal enuresis or nocturia in these circumstances); elderly (avoid for nocturnal enuresis and nocturia in those over 65 years); also considerable caution in cystic fibrosis; in nocturia and nocturnal enuresis limit fluid intake to minimum from 1 hour before dose until 8 hours afterwards; in nocturia periodic blood pressure and weight checks needed to monitor for fluid overload; **interactions:** Appendix 1 (desmopressin)

**Hyponaatraemic convulsions** Patients being treated for primary nocturnal enuresis should be warned to avoid fluid overload (including during swimming) and to stop taking desmopressin during an episode of vomiting or diarrhoea (until fluid balance normal). The risk of hyponaatraemic convulsions can also be minimised by keeping to the recommended starting doses and by avoiding concomitant use of drugs which increase secretion of vasopressin (e.g. tricyclic antidepressants)

**Contra-indications** cardiac insufficiency and other conditions treated with diuretics; psychogenic polydipsia and polydipsia in alcohol dependence

**Renal impairment** use with caution; antidiuretic effect may be reduced

**Pregnancy** small oxytocic effect in third trimester; increased risk of pre-eclampsia

**Breast-feeding** not known to be harmful

**Side-effects** fluid retention, and hyponaatraemia (in more serious cases with convulsions) on administration without restricting fluid intake; stomach pain, headache, nausea, vomiting, allergic reactions, and emotional disturbance in children also reported; epistaxis, nasal congestion, rhinitis with nasal spray

### Dose

• **By mouth** (as desmopressin acetate)

Diabetes insipidus, treatment, **ADULT** and **CHILD** initially 300 micrograms daily (in 3 divided doses); maintenance, 300–600 micrograms daily in 3 divided doses; range 0.2–1.2 mg daily

Primary nocturnal enuresis, **ADULT** (under 65 years) and **CHILD** over 5 years (preferably over 7 years)

200 micrograms at bedtime, only increased to 400 micrograms if lower dose not effective (**important:** see also Cautions); withdraw for at least 1 week for reassessment after 3 months

Postoperative polyuria or polydipsia, adjust dose according to urine osmolality

• **Sublingually** (as desmopressin base)

Diabetes insipidus, treatment, **ADULT** and **CHILD** initially 180 micrograms daily in 3 divided doses; range 120–720 micrograms daily

Primary nocturnal enuresis, **ADULT** (under 65 years) and **CHILD** over 5 years (preferably over 7 years)

120 micrograms at bedtime, only increased to 240 micrograms if lower dose not effective (**important:** see also Cautions); withdraw for at least 1 week for reassessment after 3 months

Polyuria or polydipsia after hypophysectomy, adjust dose according to urine osmolality

• **Intranasally** (as desmopressin acetate)

Diabetes insipidus, diagnosis, **ADULT** and **CHILD** 20 micrograms (limit fluid intake to 500 mL from 1 hour before to 8 hours after administration)

Diabetes insipidus, treatment, **ADULT** 10–40 micrograms daily (in 1–2 divided doses); **CHILD** 5–20 micrograms daily; infants may require lower doses

Nocturia associated with multiple sclerosis (when other treatments have failed), **ADULT** (under 65 years) 10–20 micrograms at bedtime (**important:** see also Cautions), dose not to be repeated within 24 hours

Renal function testing (empty bladder at time of administration and limit fluid intake to 500 mL from 1 hour before until 8 hours after administration), **ADULT** 40 micrograms; **INFANT** under 1 year 10 micrograms (restrict fluid intake to 50% at next 2 feeds to avoid fluid overload), **CHILD** 1–15 years 20 micrograms

Mild to moderate haemophilia and von Willebrand's disease, **ADULT** 300 micrograms (one 150-microgram spray into each nostril) 30 minutes before surgery or when bleeding; may be repeated at intervals of 12 hours (or at intervals of at least 3 days if self-administered)

Fibrinolytic response testing, **ADULT** 300 micrograms (one 150-microgram spray into each nostril); blood sampled after 1 hour for fibrinolytic activity

• **By injection** (as desmopressin acetate)

Diabetes insipidus, diagnosis (**subcutaneous** or **intramuscular**), **ADULT** and **CHILD** 2 micrograms (limit fluid intake to 500 mL from 1 hour before to 8 hours after administration)

Diabetes insipidus, treatment (**subcutaneous**, **intramuscular** or **intravenous**), **ADULT** 1–4 micrograms daily; **INFANT** and **CHILD** 400 nanograms

Renal function testing (empty bladder at time of administration and limit fluid intake to 500 mL from 1 hour before until 8 hours after administration) (**subcutaneous** or **intramuscular**), **ADULT** and **CHILD** 2 micrograms; **INFANT** 400 nanograms (restrict fluid intake to 50% at next 2 feeds)

Mild to moderate haemophilia and von Willebrand's disease, (**subcutaneous** or **intravenous**), **ADULT** and **CHILD** over 1 month 300 nanograms/kg as a single dose immediately before surgery or after trauma; may be repeated at intervals of 12 hours

Fibrinolytic response testing, (**subcutaneous** or **intravenous**), **ADULT** and **CHILD** 300 nanograms/kg; blood sampled after 20 minutes for fibrinolytic activity

Lumbar-puncture-associated headache, consult product literature

**Desmopressin acetate** (Non-proprietary) (PvM)

**Tablets**, desmopressin acetate 100 micrograms, net price 90-tab pack = £50.57; 200 micrograms, 30-tab pack = £24.36, 90-tab pack = 69.82

**Nasal spray**, desmopressin acetate 10 micrograms/metered spray, net price 6-mL unit (60 metered sprays) = £18.74. Counselling, fluid intake, see above

Brands include *Presinex*<sup>®</sup>

**Note** Children requiring dose of less than 10 micrograms should be given *DDAVP*<sup>®</sup> intranasal solution

**DDAVP**<sup>®</sup> (Ferring) (PvM)

**Tablets**, both scored, desmopressin acetate 100 micrograms, net price 90-tab pack = £44.12; 200 micrograms, 90-tab pack = £88.23. Counselling, fluid intake, see above

**Oral lyophilisates** (*DDAVP*<sup>®</sup> *Melt*), desmopressin (as acetate) 60 micrograms, net price 100-tab pack =

£50.53; 120 micrograms, 100-tab pack = £101.07; 240 micrograms, 100-tab pack = £202.14. Label: 26, counselling, fluid intake, see above

**Intranasal solution**, desmopressin acetate 100 micrograms/mL. Net price 2.5-mL dropper bottle and catheter = £9.72. Counselling, fluid intake, see above

**Injection**, desmopressin acetate 4 micrograms/mL. Net price 1-mL amp = £1.10

**Desmotabs**<sup>®</sup> (Ferring) (POM)

**Tablets**, scored, desmopressin acetate 200 micrograms, net price 30-tab pack = £29.43. Counselling, fluid intake, see above

**DesmoMelt**<sup>®</sup> (Ferring) (POM)

**Oral lyophilisates**, desmopressin (as acetate) 120 micrograms, net price 30-tab pack = £30.34; 240 micrograms, 30-tab pack = £60.68. Label: 26, counselling, fluid intake, see above

**Desmospray**<sup>®</sup> (Ferring) (POM)

**Nasal spray**, desmopressin acetate 10 micrograms/ metered spray. Net price 6-mL unit (60 metered sprays) = £25.02. Counselling, fluid intake, see above

**Note** Children requiring dose of less than 10 micrograms should be given *DDAVP*<sup>®</sup> intranasal solution

**Octim**<sup>®</sup> (Ferring) (POM)

**Nasal spray**, desmopressin acetate 150 micrograms/ metered spray, net price 2.5-mL unit (25 metered sprays) = £576.60. Counselling, fluid intake, see above

**Injection**, desmopressin acetate 15 micrograms/mL, net price 1-mL amp = £19.22

## TERLIPRESSIN

**Indications** bleeding from oesophageal varices

**Cautions** see under Vasopressin

**Contra-indications** see under Vasopressin

**Breast-feeding** see under Vasopressin

**Side-effects** see under Vasopressin, but effects milder  
**Dose**

- By **intravenous injection**, 2 mg followed by 1 or 2 mg every 4 to 6 hours until bleeding is controlled, for up to 72 hours

**Glypressin**<sup>®</sup> (Ferring) (POM)

**Injection**, terlipressin, powder for reconstitution, net price 1-mg vial with 5 mL diluent = £18.47

**Injection**, terlipressin 0.12 mg/mL, solution for injection, net price 1-mg (8.5 mL) vial = £19.39

## VASOPRESSIN

**Indications** pituitary diabetes insipidus; bleeding from oesophageal varices

**Cautions** heart failure, hypertension, asthma, epilepsy, migraine or other conditions which might be aggravated by water retention; avoid fluid overload

**Contra-indications** vascular disease (especially disease of coronary arteries) unless extreme caution, chronic nephritis (until reasonable blood nitrogen concentrations attained)

**Renal impairment** see Contra-indications

**Pregnancy** oxytocic effect in third trimester

**Breast-feeding** not known to be harmful

**Side-effects** fluid retention, pallor, tremor, sweating, vertigo, headache, nausea, vomiting, belching, abdominal cramps, desire to defaecate, hypersensitivity reactions (including anaphylaxis), constriction of coronary arteries (may cause anginal attacks and myocardial ischaemia), peripheral ischaemia and rarely gangrene

**Dose**

- By **subcutaneous or intramuscular injection**, diabetes insipidus, 5–20 units every four hours
- By **intravenous infusion**, initial control of variceal bleeding, 20 units over 15 minutes

▲ **Synthetic vasopressin**

**Pitressin**<sup>®</sup> (Goldshield) (POM)

**Injection**, argipressin (synthetic vasopressin) 20 units/mL. Net price 1-mL amp = £17.14 (hospital only)

## Antidiuretic hormone antagonists

**Demeclocycline** (section 5.1.3) can be used in the treatment of hyponatraemia resulting from inappropriate secretion of antidiuretic hormone, if fluid restriction alone does not restore sodium concentration or is not tolerable. Demeclocycline is thought to act by directly blocking the renal tubular effect of antidiuretic hormone. Initially 0.9–1.2 g is given daily in divided doses, reduced to 600–900 mg daily for maintenance.

## Tolvaptan

**Tolvaptan** is a vasopressin V<sub>2</sub>-receptor antagonist licensed for the treatment of hyponatraemia secondary to syndrome of inappropriate antidiuretic hormone secretion; treatment duration with tolvaptan is determined by the underlying disease and its treatment.

## TOLVAPTAN

**Indications** see notes above

**Cautions** ensure adequate fluid intake (monitor for dehydration in patients who are fluid-restricted); discontinue if rapid rise in serum sodium (greater than 12 mmol/litre in 24 hours); diabetes mellitus; pseudo-hyponatraemia associated with diabetes mellitus (exclude before treatment); **interactions**: Appendix 1 (tolvaptan)

**Contra-indications** anuria; volume depletion; hypovolaemic hyponatraemia; hypernatraemia; impaired perception of thirst

**Hepatic impairment** use with caution in severe impairment—no information available

**Renal impairment** no information available in severe impairment

**Pregnancy** avoid—toxicity in animal studies

**Breast-feeding** avoid—present in milk in animal studies

**Side-effects** nausea, constipation, dry mouth; postural hypotension; thirst, decreased appetite, fever, asthenia; hyperglycaemia; urinary frequency;

hyperkalaemia, dehydration, ecchymosis, increased blood creatinine; pruritus; *less commonly* taste disturbance; *also reported* hypernatraemia, hyperuricaemia, hypoglycaemia, syncope, and dizziness

#### Dose

- **ADULT** over 18 years, 15 mg once daily, increased as required to max. 60 mg daily

**Samsca®** (Otsuka) ▼ [Pain]

Tablets, blue, tolvaptan 15 mg, net price 10-tab pack = £746.80; 30 mg, 10-tab pack = £746.80

## 6.6 Drugs affecting bone metabolism

- 6.6.1 Calcitonin and parathyroid hormone
- 6.6.2 Bisphosphonates and other drugs affecting bone metabolism

See also calcium (section 9.5.1.1), phosphorus (section 9.5.2), vitamin D (section 9.6.4), and oestrogens in postmenopausal osteoporosis (section 6.4.1.1).

### Osteoporosis

Osteoporosis occurs most commonly in postmenopausal women and in those taking long-term oral corticosteroids (glucocorticosteroids). Other risk factors for osteoporosis include low body weight, cigarette smoking, excess alcohol intake, lack of physical activity, family history of osteoporosis, and early menopause.

Those at risk of osteoporosis should maintain an adequate intake of **calcium and vitamin D** and any deficiency should be corrected by increasing dietary intake or taking supplements.

Elderly patients, especially those who are housebound or live in residential or nursing homes, are at increased risk of calcium and vitamin D deficiency and may benefit from supplements (section 9.5.1.1 and section 9.6.4). Reversible secondary causes of osteoporosis such as hyperthyroidism, hyperparathyroidism, osteomalacia or hypogonadism should be excluded, in both men and women, before treatment for osteoporosis is initiated.

**Postmenopausal osteoporosis** The bisphosphonates (alendronate, disodium etidronate, and risedronate, section 6.6.2) are effective for preventing postmenopausal osteoporosis. **Hormone replacement therapy** (HRT section 6.4.1.1) is an option where other therapies are contra-indicated, cannot be tolerated, or if there is a lack of response. The CSM has advised that HRT should **not** be considered first-line therapy for long-term prevention of osteoporosis in women over 50 years of age. HRT is of most benefit for the prophylaxis of postmenopausal osteoporosis if started early in menopause and continued for up to 5 years, but bone loss resumes (possibly at an accelerated rate) on stopping HRT. **Calcitonin** (section 6.6.1) may be considered for those at high risk of osteoporosis for whom a bisphosphonate is unsuitable. Women of Afro-

Caribbean origin appear to be less susceptible to osteoporosis than those who are white or of Asian origin.

Postmenopausal osteoporosis may be treated with a **bisphosphonate** (section 6.6.2). The bisphosphonates (such as alendronate, etidronate, and risedronate) decrease the risk of vertebral fracture; alendronate and risedronate have also been shown to reduce non-vertebral fractures. If bisphosphonates are unsuitable **calcitriol** (section 9.6.4), **calcitonin** or **strontium ranelate** (section 6.6.2) may be considered. Calcitonin [unlicensed indication] may also be useful for pain relief for up to 3 months after a vertebral fracture if other analgesics are ineffective. **Parathyroid hormone**, and **teriparatide** (section 6.6.1) have been introduced for the treatment of postmenopausal osteoporosis.

**Raloxifene** (section 6.4.1.1) is licensed for the *prophylaxis and treatment* of vertebral fractures in postmenopausal women.

#### NICE guidance

**Alendronate, etidronate, risedronate, raloxifene and strontium ranelate for the primary prevention of osteoporotic fragility fractures in postmenopausal women (October 2008)**

**Alendronate** is recommended as a treatment option for the primary prevention of osteoporotic fractures in the following susceptible postmenopausal women:

- Women over 70 years who have an independent risk factor for fracture (parental history of hip fracture, alcohol intake of 4 or more units per day, or rheumatoid arthritis) *or* an indicator of low bone mineral density (body mass index under 22 kg/m<sup>2</sup>, ankylosing spondylitis, Crohn's disease, prolonged immobility, untreated premature menopause, or rheumatoid arthritis) **and** confirmed osteoporosis
- Women aged 65–69 years who have an independent risk factor for fracture **and** confirmed osteoporosis
- Women under 65 years who have an independent risk factor for fracture **and** at least one additional indicator of low bone mineral density **and** confirmed osteoporosis

**Risedronate or etidronate** are recommended as alternatives for women:

- in whom alendronate is contra-indicated or not tolerated **and**
- who comply with particular combinations of bone mineral density measurement, age, and independent risk factors for fracture, as indicated in the full NICE guidance<sup>1</sup>

**Strontium ranelate** is recommended as an alternative for women:

- in whom alendronate and either risedronate or etidronate are contra-indicated or not tolerated **and**
- who comply with particular combinations of bone mineral density measurement, age, and independent risk factors for fracture, as indicated in the full NICE guidance<sup>1</sup>

**Raloxifene** is **not** recommended as a treatment option in postmenopausal women for primary prevention of osteoporotic fractures.

1. Available at [www.nice.org.uk/TA160](http://www.nice.org.uk/TA160)

**NICE guidance****Alendronate, etidronate, risedronate, raloxifene, strontium ranelate, and teriparatide for the secondary prevention of osteoporotic fragility fractures in postmenopausal women (October 2008)**

This guideline recommends treatment options for the secondary prevention of osteoporotic fractures in postmenopausal women with confirmed osteoporosis who have also sustained a clinically apparent osteoporotic fracture.

**Alendronate** is recommended as a treatment option for the secondary prevention of osteoporotic fractures in susceptible postmenopausal women.

**Risedronate** or **etidronate** are recommended as alternatives for women:

- in whom alendronate is contra-indicated or not tolerated **and**
- who comply with particular combinations of bone mineral density measurement, age, and independent risk factors for fracture (parental history of hip fracture, alcohol intake of 4 or more units per day, or rheumatoid arthritis, as indicated in the full NICE guidance<sup>1</sup>)

**Strontium ranelate** or **raloxifene** are recommended as alternatives for women:

- in whom alendronate and either risedronate or etidronate are contra-indicated or not tolerated **and**
- who comply with particular combinations of bone mineral density measurement, age, and independent risk factors for fracture, as indicated in the full NICE guidance<sup>1</sup>

**Teriparatide** is recommended as an alternative for women:

- in whom alendronate and either risedronate or etidronate, or strontium ranelate are contra-indicated or not tolerated, or where treatment with alendronate, risedronate or etidronate has been unsatisfactory (indicated by another fragility fracture and a decline in bone mineral density despite treatment for 1 year) **and**
- who comply with particular combinations of bone mineral density measurement, age, and number of fractures, as indicated in the full NICE guidance<sup>1</sup>

oral corticosteroids who have sustained a low-trauma fracture should receive treatment for osteoporosis. The therapeutic options for *prophylaxis* and *treatment* of corticosteroid-induced osteoporosis are the same:

- a bisphosphonate (section 6.6.2);
- calcitriol [unlicensed indication] (section 9.6.4);
- hormone replacement (HRT in women (section 6.4.1), testosterone in men [unlicensed indication] (section 6.4.2)).

## 6.6.1 Calcitonin and parathyroid hormone

Calcitonin is involved with parathyroid hormone in the regulation of bone turnover and hence in the maintenance of calcium balance and homeostasis. **Calcitonin (salmon)** (**salcatonin**, synthetic or recombinant salmon calcitonin) is used to lower the plasma-calcium concentration in some patients with hypercalcaemia (notably when associated with malignant disease). Calcitonin is licensed for treatment of Paget's disease of bone. It can also be used in the prevention and treatment of postmenopausal osteoporosis (see section 6.6).

Recombinant **parathyroid hormone** is used for the treatment of postmenopausal osteoporosis. **Teriparatide** (a recombinant fragment of parathyroid hormone) is used for the treatment of postmenopausal osteoporosis, osteoporosis in men at increased risk of fracture, and corticosteroid-induced osteoporosis. *The Scottish Medicines Consortium*, p. 4 has advised (February 2007) that parathyroid hormone (*Preotact*®) should be initiated by specialists experienced in the treatment of osteoporosis; also that the use of teriparatide (*Forsteo*®) (December 2003) in postmenopausal women should be restricted to the treatment of established (severe) osteoporosis and should be initiated by specialists experienced in the treatment of osteoporosis.

**Cinacalcet** (section 9.5.1.2) is licensed for the treatment of hypercalcaemia in parathyroid carcinoma.

**Corticosteroid-induced osteoporosis** To reduce the risk of osteoporosis doses of oral corticosteroids should be as low as possible and courses of treatment as short as possible. The risk of osteoporosis may be related to cumulative dose of corticosteroids; even intermittent courses can therefore increase the risk. The greatest rate of bone loss occurs during the first 6–12 months of corticosteroid use and so early steps to prevent the development of osteoporosis are important. Long-term use of high-dose inhaled corticosteroids may also contribute to corticosteroid-induced osteoporosis (section 3.2).

Patients taking (or who are likely to take) an oral corticosteroid for 3 months or longer should be assessed and where necessary given prophylactic treatment; those aged over 65 years are at greater risk. Patients taking

### CALCITONIN (SALMON)/SALCATONIN

**Indications** see under Dose

**Cautions** history of allergy (skin test advised); heart failure

**Contra-indications** hypocalcaemia

**Renal impairment** use with caution

**Pregnancy** avoid unless potential benefit outweighs risk (toxicity in *animal* studies)

**Breast-feeding** avoid; inhibits lactation in *animals*

**Side-effects** nausea, vomiting, diarrhoea, abdominal pain; flushing; dizziness, headache, taste disturbances; musculoskeletal pain; with nasal spray nose and throat irritation, rhinitis, sinusitis and epistaxis; *less commonly* diuresis, oedema, cough, visual disturbances, injection-site reactions, rash, hypersensitivity reactions including pruritus

1. Available at [www.nice.org.uk/TA161](http://www.nice.org.uk/TA161)

**Dose**

- Hypercalcaemia of malignancy (see also section 9.5.1.2), **ADULT** over 18 years, by **subcutaneous or intramuscular injection**, 100 units every 6–8 hours adjusted according to response; max. 400 units every 6–8 hours; in severe or emergency cases, by **intravenous infusion**, up to 10 units/kg over at least 6 hours
- Paget's disease of bone, **ADULT** over 18 years, by **subcutaneous or intramuscular injection**, 50 units 3 times weekly to 100 units daily adjusted according to response
- Postmenopausal osteoporosis to reduce risk of vertebral fractures, **intranasally**, 200 units (1 spray) into one nostril daily, with dietary calcium and vitamin D supplements (section 9.5.1.1 and section 9.6.4)
- Prevention of acute bone loss due to sudden immobility, **ADULT** over 18 years, by **subcutaneous or intramuscular injection**, 100 units daily in 1–2 divided doses for 2–4 weeks, reduced to 50 units daily at start of mobilisation and continued until fully mobile

**Miacalcic®** (Novartis) (POM)

**Nasal spray** ▼, calcitonin (salmon) 200 units/metered spray, net price 2-mL unit (approx. 14 metered sprays) = £16.79

**Injection**, calcitonin (salmon) 50 units/mL, net price 1-mL amp = £3.42; 100 units/mL, 1-mL amp = £6.85; 200 units/mL, 2-mL vial = £30.75

For subcutaneous or intramuscular injection and for dilution and use as an intravenous infusion

## PARATHYROID HORMONE

(Human recombinant parathyroid hormone)

**Indications** treatment of osteoporosis in postmenopausal women at high risk of fractures (to reduce the risk of vertebral fractures) (see also notes above)

**Cautions** monitor serum or urinary calcium concentration at 1, 3 and 6 months after initiation of treatment (consult product literature for guidance if serum-calcium concentration raised); active or previous urolithiasis; concomitant cardiac glycosides

**Contra-indications** previous radiation therapy to skeleton, pre-existing hypercalcaemia, metabolic bone disease (including hyperparathyroidism and Paget's disease), unexplained raised levels of alkaline phosphatase

**Hepatic impairment** avoid

**Renal impairment** avoid if eGFR less than 30 mL/minute/1.73m<sup>2</sup>

**Pregnancy** avoid

**Breast-feeding** avoid

**Side-effects** nausea, vomiting, dyspepsia, constipation, diarrhoea; palpitation; headache, dizziness, fatigue, asthenia; transient hypercalcaemia, hypercalciuria; muscle cramp, pain in extremities, back pain; injection-site reactions; *less commonly* abdominal pain, altered sense of smell, taste disturbance, anorexia, influenza, hyperuricaemia

**Dose**

- By **subcutaneous injection**, 100 micrograms daily, max. duration of treatment 24 months

**Preoact®** (Nycomed) (POM)

**Injection**, dual-chamber cartridge containing powder for reconstitution, parathyroid hormone (rdna) and diluent, net price 1.61-mg (14-dose) cartridge = £156.24. For use with *Preoact®* pen device.

**TERIPARATIDE**

**Indications** treatment of osteoporosis in postmenopausal women and in men at increased risk of fractures; treatment of corticosteroid-induced osteoporosis; see also notes above

**Contra-indications** pre-existing hypercalcaemia, skeletal malignancies or bone metastases, metabolic bone diseases, including Paget's disease and hyperparathyroidism, unexplained raised alkaline phosphatase, previous radiation therapy to the skeleton

**Renal impairment** caution in moderate impairment; avoid if severe

**Pregnancy** avoid

**Breast-feeding** avoid

**Side-effects** gastro-intestinal disorders (including nausea, reflux and haemorrhoids); palpitation; dyspnoea; headache, fatigue, asthenia, depression, dizziness, vertigo; anaemia, increased sweating, muscle cramps, sciatica, myalgia, arthralgia; *less commonly* urinary disorders, hypercalcaemia; injection-site reactions; *rarely* hypersensitivity reactions

**Dose**

- By **subcutaneous injection**, 20 micrograms daily; max. duration of treatment 18 months (course not to be repeated)

**Forsteo®** (Lilly) (POM)

**Injection**, teriparatide 250 micrograms/mL, net price 2.4-mL pre-filled pen = £271.88, 3-mL pre-filled pen = £271.88

**Note** 3-mL pre-filled pen intended for 28 doses

## 6.6.2 Bisphosphonates and other drugs affecting bone metabolism

**Bisphosphonates**

Bisphosphonates are adsorbed onto hydroxyapatite crystals in bone, slowing both their rate of growth and dissolution, and therefore reducing the rate of bone turnover. Bisphosphonates have an important role in the prophylaxis and treatment of osteoporosis and corticosteroid-induced osteoporosis; **alendronic acid** or **risedronate sodium** are considered the drugs of choice for these conditions, but **disodium etidronate** may be considered if these drugs are unsuitable or not tolerated (see also section 6.6).

Bisphosphonates are also used in the treatment of *Paget's disease*, hypercalcaemia of malignancy (section 9.5.1.2), and in bone metastases in breast cancer (section 8.3.4.1). Disodium etidronate can impair bone

mineralisation when used continuously or in high doses (such as in the treatment of *Paget's disease*).

#### MHRA/CHM advice

#### Bisphosphonates: osteonecrosis of the jaw (October 2007 and November 2009)

The risk of osteonecrosis of the jaw is substantially greater for patients receiving intravenous bisphosphonates in the treatment of cancer than for patients receiving oral bisphosphonates for osteoporosis or Paget's disease.

Risk factors for developing osteonecrosis of the jaw that should be considered are: potency of bisphosphonate (highest for zoledronate), route of administration, cumulative dose, duration and type of malignant disease, concomitant treatment, smoking, comorbid conditions, and history of dental disease. All patients receiving bisphosphonates for cancer should have a dental check-up (and any necessary remedial work should be performed) before bisphosphonate treatment. However, urgent bisphosphonate treatment should not be delayed, and a dental check-up should be carried out as soon as possible in these patients. All other patients who are prescribed bisphosphonates should have a dental examination only if they have poor dental health.

During bisphosphonate treatment patients should maintain good oral hygiene, receive routine dental check-ups, and report any oral symptoms.

## ALENDRONIC ACID

**Indications** see under Dose

**Cautions** upper gastro-intestinal disorders (dysphagia, symptomatic oesophageal disease, gastritis, duodenitis, or ulcers—see also under Contra-indications and Side-effects); history (within 1 year) of ulcers, active gastro-intestinal bleeding, or surgery of the upper gastro-intestinal tract; correct disturbances of calcium and mineral metabolism (e.g. vitamin-D deficiency, hypocalcaemia) before starting and monitor serum-calcium concentration during treatment; consider dental check-up before initiating bisphosphonate (risk of osteonecrosis of the jaw, see MHRA/CHM advice, above); exclude other causes of osteoporosis; atypical stress fractures reported (discontinue unless benefits of continued treatment clearly outweigh risks); **interactions:** Appendix 1 (bisphosphonates)

**Contra-indications** abnormalities of oesophagus and other factors which delay emptying (e.g. stricture or achalasia), hypocalcaemia

**Renal impairment** avoid if eGFR less than 35 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** avoid

**Breast-feeding** no information available

**Side-effects** oesophageal reactions (see below), abdominal pain and distension, dyspepsia, regurgitation, melaena, diarrhoea or constipation, flatulence, musculoskeletal pain, headache; *rarely* rash, pruritus, erythema, photosensitivity, uveitis, scleritis, transient decrease in serum calcium and phosphate; nausea, vomiting, gastritis, peptic ulceration, hypersensitivity reactions (including urticaria and angioedema), and atypical stress fractures with long-term use also reported; myalgia, malaise, and fever at initiation of treatment; *very rarely* severe skin reactions (including

Stevens-Johnson syndrome), osteonecrosis of the jaw (see MHRA/CHM advice, above)

**Oesophageal reactions** Severe oesophageal reactions (oesophagitis, oesophageal ulcers, oesophageal stricture and oesophageal erosions) have been reported; patients should be advised to stop taking the tablets and to seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, new or worsening heartburn, pain on swallowing or retrosternal pain

#### Dose

- Treatment of postmenopausal osteoporosis, 10 mg daily *or* 70 mg once weekly
- Treatment of osteoporosis in men, 10 mg daily
- Prevention and treatment of corticosteroid-induced osteoporosis in postmenopausal women not receiving hormone replacement therapy, 10 mg daily

**Counselling** Tablets should be swallowed whole with plenty of water while sitting or standing; to be taken on an empty stomach at least 30 minutes before breakfast (or another oral medicine); patient should stand or sit upright for at least 30 minutes after taking tablet

#### Alendronic acid (Non-proprietary) (PoM)

**Tablets**, alendronic acid (as sodium alendronate) 10 mg, net price 28-tab pack = £1.65. Counselling, administration

#### Fosamax<sup>®</sup> (MSD) (PoM)

**Tablets**, alendronic acid (as sodium alendronate) 10 mg, 28-tab pack = £23.12. Counselling, administration

#### Alendronic Acid Once-Weekly (Non-proprietary) (PoM)

**Tablets**, alendronic acid (as sodium alendronate) 70 mg, net price 4-tab pack = £1.05. Counselling, administration

#### Fosamax<sup>®</sup> Once Weekly (MSD) (PoM)

**Tablets**, alendronic acid (as sodium alendronate) 70 mg, net price 4-tab pack = £22.80. Counselling, administration

#### ▲ With colecalciferol

For prescribing information on colecalciferol, see section 9.6.4

#### Fosavance<sup>®</sup> (MSD) (PoM)

**Tablets**, alendronic acid (as sodium alendronate) 70 mg, colecalciferol 70 micrograms (2 800 units), net price 4-tab pack = £22.80. Counselling, administration

**Dose** treatment of postmenopausal osteoporosis in women at risk of vitamin D deficiency, 1 tablet once weekly

**Counselling** Tablets should be swallowed whole with plenty of water while sitting or standing; to be taken on an empty stomach at least 30 minutes before breakfast (or another oral medicine); patient should stand or sit upright for at least 30 minutes after taking tablet

## DISODIUM ETIDRONATE

**Indications** see under Dose

**Cautions** consider dental check-up before initiating bisphosphonate (risk of osteonecrosis of the jaw, see MHRA/CHM advice, above); **interactions:** Appendix 1 (bisphosphonates)

**Contra-indications** not indicated for osteoporosis in presence of hypercalcaemia or hypercalcaemia or for osteomalacia

**Renal impairment** reduce dose in mild impairment; avoid in moderate to severe renal impairment

**Pregnancy** avoid

**Breast-feeding** no information available

**Side-effects** nausea, diarrhoea or constipation, abdominal pain; increased bone pain in Paget's disease, also increased risk of fractures with high doses in Paget's disease (discontinue if fractures occur); rarely exacerbation of asthma, skin reactions (including angioedema, rash, urticaria and pruritus), transient hyperphosphataemia, headache, paraesthesia, peripheral neuropathy reported; blood disorders (including leucopenia, agranulocytosis and pancytopenia) also reported; *very rarely* osteonecrosis of the jaw (see MHRA/CHM advice, p. 472)

#### Dose

- Paget's disease of bone, **by mouth**, 5 mg/kg as a single daily dose for up to 6 months; doses above 10 mg/kg daily for up to 3 months may be used with caution but doses above 20 mg/kg daily are not recommended; after interval of not less than 3 months may be repeated where evidence of reactivation—including biochemical indices (avoid premature retreatment)

**Monitoring** Serum phosphate, serum alkaline phosphatase and (if possible) urinary hydroxyproline should be measured before starting and at intervals of 3 months—consult product literature for further details

- Osteoporosis, see under *Didronel PMO*<sup>®</sup>

**Counselling** Avoid food for at least 2 hours before and after oral treatment, particularly calcium-containing products e.g. milk; also avoid iron and mineral supplements and antacids

**Didronel**<sup>®</sup> (Warner Chilcott) (POM)

**Tablets**, disodium etidronate 200 mg. Net price 60-tablet pack = £19.48. Counselling, food and calcium (see above)

#### ▲ With calcium carbonate

For prescribing information on calcium carbonate see section 9.5.1.1

**Didronel PMO**<sup>®</sup> (Warner Chilcott) (POM)

**Tablets**, 14 white, disodium etidronate 400 mg; 76 pink, effervescent, calcium carbonate 1.25 g (*Cacit*<sup>®</sup>). Net price per pack = £19.89. Label: 10, patient information leaflet, counselling, food and calcium (see above)

**Dose** treatment of osteoporosis, prevention of bone loss in postmenopausal women (particularly if hormone replacement therapy inappropriate), and prevention and treatment of corticosteroid-induced osteoporosis, given in 90-day cycles, 1 *Didronel*<sup>®</sup> tablet daily for 14 days, then 1 *Cacit*<sup>®</sup> tablet daily for 76 days

## DISODIUM PAMIDRONATE

Disodium pamidronate was formerly called aminohydroxypropylidenediphosphonate disodium (APD)

**Indications** see under Dose

**Cautions** assess renal function before each dose; ensure adequate hydration; cardiac disease (especially in elderly); previous thyroid surgery (risk of hypocalcaemia); monitor serum electrolytes, calcium and phosphate—possibility of convulsions due to electrolyte changes; avoid concurrent use with other bisphosphonates; consider dental check-up before initiating bisphosphonate (risk of osteonecrosis of the jaw, see MHRA/CHM advice, p. 472); **interactions:** Appendix 1 (bisphosphonates)

**Driving** Patients should be warned against driving or operating machinery immediately after treatment (somnolence or dizziness can occur)

**Hepatic impairment** caution in severe hepatic impairment—no information available

**Renal impairment** max. infusion rate 20 mg/hour; avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>, except in life-threatening hypercalcaemia if benefit outweighs risk; if renal function deteriorates in patients with bone metastases, withhold dose until serum creatinine returns to within 10% of baseline value

**Pregnancy** avoid

**Breast-feeding** avoid

**Side-effects** hypophosphataemia, fever and influenza-like symptoms (sometimes accompanied by malaise, rigors, fatigue and flushes); nausea, vomiting, anorexia, abdominal pain, diarrhoea, constipation; symptomatic hypocalcaemia (paraesthesia, tetany), hypomagnesaemia, headache, insomnia, drowsiness; hypertension; anaemia, thrombocytopenia, lymphocytopenia; rash; arthralgia, myalgia, bone pain; *rarely* muscle cramps, dyspepsia, agitation, confusion, dizziness, lethargy; leucopenia, hypotension, pruritus, hyperkalaemia or hypokalaemia, and hypernatraemia; osteonecrosis of the jaw (see also MHRA/CHM advice, p. 472), isolated cases of seizures, hallucinations, haematuria, acute renal failure, deterioration of renal disease, conjunctivitis and other ocular symptoms; atrial fibrillation, and reactivation of herpes simplex and zoster also reported; also injection-site reactions

#### Dose

- **By slow intravenous infusion** (via cannula in a relatively large vein), see also Appendix 6

Hypercalcaemia of malignancy, according to serum calcium concentration 15–60 mg in single infusion or in divided doses over 2–4 days; max. 90 mg per treatment course

Osteolytic lesions and bone pain in bone metastases associated with breast cancer or multiple myeloma, 90 mg every 4 weeks (or every 3 weeks to coincide with chemotherapy in breast cancer)

Paget's disease of bone, 30 mg once a week for 6 weeks (total dose 180 mg) or 30 mg in first week then 60 mg every other week (total dose 210 mg); max. total 360 mg (in divided doses of 60 mg) per treatment course; may be repeated every 6 months

- **CHILD** not recommended

**Calcium and vitamin D supplements** Oral supplements are advised to minimise potential risk of hypocalcaemia for those with mainly lytic bone metastases or multiple myeloma at risk of calcium or vitamin D deficiency (e.g. through malabsorption or lack of exposure to sunlight) and in those with Paget's disease

**Disodium pamidronate** (Non-proprietary) (POM)

**Concentrate for intravenous infusion**, disodium pamidronate 3 mg/mL, net price 5-mL vial = £27.50, 10-mL vial = £55.00; 6 mg/mL, 10-mL vial = £95.00; 9 mg/mL, 10-mL vial = £165.00; 15 mg/mL, 1-mL vial = £29.83, 2-mL vial = £59.66, 4-mL vial = £119.32, 6-mL vial £170.46

**Aredia Dry Powder**<sup>®</sup> (Novartis) (POM)

**Injection**, powder for reconstitution, disodium pamidronate, for use as an infusion. Net price 15-mg vial = £29.83; 30-mg vial = £59.66; 90-mg vial = £170.45 (all with diluent)

## IBANDRONIC ACID

**Indications** see under Dose

**Cautions** consider dental check-up before initiating bisphosphonate (risk of osteonecrosis of the jaw, see MHRA/CHM advice, p. 472); monitor renal function and serum calcium, phosphate and magnesium; cardiac disease (avoid fluid overload); **interactions:** Appendix 1 (bisphosphonates)

**Contra-indications** hypocalcaemia; *oral route* abnormalities of the oesophagus and other factors which delay emptying (e.g. stricture or achalasia)

**Renal impairment** for treatment of osteoporosis, avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>; for reduction of bone damage in bone metastases, if eGFR 30–50 mL/minute/1.73 m<sup>2</sup> reduce *intravenous dose* to 4 mg and infuse over 1 hour, reduce *oral dose* to 50 mg on alternative days, if eGFR less than 30 mL/minute/1.73 m<sup>2</sup> reduce *intravenous dose* to 2 mg and infuse over 1 hour, reduce *oral dose* to 50 mg once weekly

**Pregnancy** avoid

**Breast-feeding** avoid—present in milk in *animal* studies

**Side-effects** hypocalcaemia, hypophosphataemia, influenza-like symptoms (including fever, chills, and muscle pain), bone pain; oesophageal reactions (see below), diarrhoea, nausea, vomiting, gastritis, abdominal pain, dyspepsia, pharyngitis; headache, asthenia, rash; *rarely* anaemia, hypersensitivity reactions (pruritus, bronchospasm and angioedema reported); urticaria; injection-site reactions; *very rarely* osteonecrosis of the jaw (see MHRA/CHM advice, p. 472) **Oesophageal reactions** Severe oesophageal reactions reported with all *oral* bisphosphonates; patients should be advised to stop tablets and seek medical attention for symptoms of oesophageal irritation such as dysphagia, pain on swallowing, retrosternal pain, or heartburn

## Dose

- Reduction of bone damage in bone metastases in breast cancer, **by mouth**, 50 mg daily, *or by intravenous infusion*, 6 mg every 3–4 weeks
- Hypercalcaemia of malignancy **by intravenous infusion**, according to serum calcium concentration, 2–4 mg in single infusion
- Treatment of postmenopausal osteoporosis, **by mouth**, 150 mg once a month *or by intravenous injection* over 15–30 seconds, 3 mg every 3 months
- **CHILD** not recommended  
**Counselling** Tablets should be swallowed whole with plenty of water while sitting or standing; to be taken on an empty stomach at least 30 minutes (*Bondronat*<sup>®</sup> tablets, 50 mg) or 1 hour (*Bonviva*<sup>®</sup> tablets, 150 mg) before first food or drink (other than water) of the day, or another oral medicine; patient should stand or sit upright for at least 1 hour after taking tablet

**Bondronat**<sup>®</sup> (Roche) (POM)

Tablets, f/c, ibandronic acid 50 mg, net price 28-tab pack = £183.69. Counselling, administration

**Concentrate for intravenous infusion**, ibandronic acid 1 mg/mL, net price 2-mL amp = £89.36, 6-mL vial = £183.69

**Bonviva**<sup>®</sup> (Roche) (POM)

Tablets, f/c, ibandronic acid 150 mg, net price 1-tab pack = £18.40, 3-tab pack = £55.21. Counselling, administration

**Injection**, ibandronic acid 1 mg/mL, net price 3-mL pre-filled syringe = £68.64

## RISEDRONATE SODIUM

**Indications** see under Dose

**Cautions** oesophageal abnormalities and other factors which delay transit or emptying (e.g. stricture or achalasia—see also under Side-effects); correct hypocalcaemia before starting, correct other disturbances of bone and mineral metabolism (e.g. vitamin-D deficiency) at onset of treatment; consider dental check-up before initiating bisphosphonate (risk of osteonecrosis of the jaw, see MHRA/CHM advice, p. 472); **interactions:** Appendix 1 (bisphosphonates)

**Contra-indications** hypocalcaemia (see Cautions above)

**Renal impairment** avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** avoid

**Breast-feeding** avoid

**Side-effects** abdominal pain, dyspepsia, nausea, diarrhoea, constipation, headache, musculoskeletal pain; *less commonly* oesophagitis, oesophageal ulcer, dysphagia, gastritis, duodenitis, uveitis; *rarely* glossitis, oesophageal stricture; *also reported* gastroduodenal ulceration, hepatic disorders, Stevens-Johnson syndrome, toxic epidermal necrolysis, hair loss, osteonecrosis of the jaw (see MHRA/CHM advice, p. 472)

**Oesophageal reactions** Patients should be advised to stop taking the tablets and seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, pain on swallowing, retrosternal pain, or heartburn

## Dose

- Paget's disease of bone, 30 mg daily for 2 months; may be repeated if necessary after at least 2 months
- Treatment of postmenopausal osteoporosis to reduce risk of vertebral or hip fractures, 5 mg daily *or* 35 mg once weekly
- Prevention of osteoporosis (including corticosteroid-induced osteoporosis) in postmenopausal women, 5 mg daily
- Treatment of osteoporosis in men at high risk of fractures, 35 mg once weekly
- **CHILD** see *BNF for Children*  
**Counselling** Swallow tablets whole with full glass of water; on rising, take on an empty stomach at least 30 minutes before first food or drink of the day or, if taking at any other time of the day, avoid food and drink for at least 2 hours before or after risedronate (particularly avoid calcium-containing products e.g. milk; also avoid iron and mineral supplements and antacids); stand or sit upright for at least 30 minutes; do not take tablets at bedtime or before rising

**Actonel**<sup>®</sup> (Warner Chilcott) (POM)

Tablets, f/c, risedronate sodium 5 mg (yellow), net price 28-tab pack = £17.99; 30 mg (white), 28-tab pack = £143.95. Counselling, administration, food and calcium (see above)

**Actonel Once a Week**<sup>®</sup> (Warner Chilcott) (POM)

Tablets, f/c, orange, risedronate sodium 35 mg, net price 4-tab pack = £19.12. Counselling, administration, food and calcium (see above)

▲ **With calcium carbonate and colecalciferol**

For cautions, contra-indications, and side-effects of calcium carbonate, see section 9.5.1.1 and of colecalciferol, see section 9.6.4

**Actonel Combi** (Warner Chilcott) (POM)

Tablets, f/c, orange, risedronate sodium 35 mg (*Actonel Once a Week*<sup>®</sup>);

Granules, effervescent, lemon flavour, calcium carbonate 2.5 g (calcium 1 g or  $\text{Ca}^{2+}$  25 mmol) and colecalciferol 22 micrograms (880 units)/sachet, net price 24-sachet plus 4-tab pack = £19.12. Counselling, administration, food and calcium (see above)

**Dose** treatment of postmenopausal osteoporosis to reduce risk of vertebral or hip fractures, given in weekly cycles, 1 *Actonel Once a Week*<sup>®</sup> tablet on the first day followed by 1 calcium and colecalciferol sachet daily for 6 days

**Counselling** Tablets should be swallowed whole with plenty of water while sitting or standing; to be taken on an empty stomach at least 30 minutes before breakfast (or another oral medicine); patient should stand or sit upright for at least 30 minutes after taking tablet. Granules should be stirred into a glass of water and after dissolution complete taken immediately

## SODIUM CLODRONATE

**Indications** see under Dose

**Cautions** monitor renal and hepatic function and white cell count; also monitor serum calcium and phosphate periodically; renal dysfunction reported in patients receiving concomitant NSAIDs; maintain adequate fluid intake during treatment; consider dental check-up before initiating bisphosphonate (risk of osteonecrosis of the jaw, see MHRA/CHM advice, p. 472); **interactions:** Appendix 1 (bisphosphonates)

**Contra-indications** acute gastro-intestinal inflammatory conditions

**Renal impairment** use half normal dose if eGFR 10–30 mL/minute/1.73 m<sup>2</sup>; avoid if eGFR less than 10 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** avoid

**Breast-feeding** no information available

**Side-effects** nausea, diarrhoea; skin reactions; bronchospasm; *very rarely* osteonecrosis of the jaw (see MHRA/CHM advice, p. 472)

### Dose

- Osteolytic lesions, hypercalcaemia and bone pain associated with skeletal metastases in patients with breast cancer or multiple myeloma, **by mouth**, 1.6 g daily in single or 2 divided doses increased if necessary to a max. of 3.2 g daily

**Counselling** Avoid food for 1 hour before and after treatment, particularly calcium-containing products e.g. milk; also avoid iron and mineral supplements and antacids; maintain adequate fluid intake

**Bonefos**<sup>®</sup> (Bayer Schering) (POM)

**Capsules**, yellow, sodium clodronate 400 mg, net price 120-cap pack = £139.83. Counselling, food and calcium

**Tablets**, f/c, scored, sodium clodronate 800 mg, net price 60-tab pack = £146.43. Counselling, food and calcium

**Clasteon**<sup>®</sup> (Beacon) (POM)

**Capsules**, blue/white, sodium clodronate 400 mg, net price 30-cap pack = £34.96, 120-cap pack = £139.83. Counselling, food and calcium

**Loron 520**<sup>®</sup> (Roche) (POM)

**Tablets**, f/c, scored, sodium clodronate 520 mg, net price 60-tab pack = £152.59. Label: 10, patient information leaflet, counselling, food and calcium

**Dose** 2 tablets daily in single or two divided doses; may be increased to max. 4 tablets daily

## TILUDRONIC ACID

**Indications** Paget's disease of bone

**Cautions** correct disturbances of calcium metabolism (e.g. vitamin D deficiency, hypocalcaemia) before starting; avoid concomitant use of indometacin; consider dental check-up before initiating bisphosphonate (risk of osteonecrosis of the jaw, see MHRA/CHM advice, p. 472); **interactions:** Appendix 1 (bisphosphonates)

**Contra-indications** juvenile Paget's disease

**Renal impairment** use with caution and monitor renal function regularly if eGFR 30–90 mL/minute/1.73 m<sup>2</sup>; avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** avoid

**Breast-feeding** avoid—no information available

**Side-effects** stomach pain, nausea, diarrhoea; rarely asthenia, dizziness, headache and skin reactions; *very rarely* osteonecrosis of the jaw (see MHRA/CHM advice, p. 472)

### Dose

- 400 mg daily as a single dose for 12 weeks; may be repeated if necessary after 6 months

**Counselling** Avoid food for 2 hours before and after treatment, particularly calcium-containing products e.g. milk; also avoid antacids

**Skelid**<sup>®</sup> (Sanofi-Aventis) (POM)

**Tablets**, tiludronic acid (as tiludronate disodium) 200 mg. Net price 28-tab pack = £95.14. Counselling, food and calcium

## ZOLEDRONIC ACID

**Indications** see under preparations

**Cautions** correct disturbances of calcium metabolism (e.g. vitamin D deficiency, hypocalcaemia) before starting; monitor serum electrolytes, calcium, phosphate and magnesium; cardiac disease (avoid fluid overload); consider dental check-up before initiating bisphosphonate (risk of osteonecrosis of the jaw, see MHRA/CHM advice, p. 472); **interactions:** Appendix 1 (bisphosphonates)

**Renal function** Renal impairment and renal failure have been reported. Before each dose ensure patient is hydrated and assess renal function. Continue to monitor renal function in patients at risk, such as those with pre-existing renal impairment, those of advanced age, those taking concomitant nephrotoxic drugs or diuretics, or those who are dehydrated. Use with caution with concomitant medicines that affect renal function

**Contra-indications** women of child-bearing potential  
**Hepatic impairment** caution in severe hepatic impairment—limited information available

**Renal impairment** avoid if serum creatinine above 400 micromol/litre in tumour-induced hypercalcaemia; in advanced malignancies involving bone, if eGFR 50–60 mL/minute/1.73 m<sup>2</sup> reduce dose to 3.5 mg every 3–4 weeks, if eGFR 40–50 mL/minute/1.73 m<sup>2</sup> reduce dose to 3.3 mg every 3–4 weeks, if eGFR 30–40 mL/minute/1.73 m<sup>2</sup> reduce dose to 3 mg every 3–4 weeks, avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup> (or if serum creatinine greater than 265 micromol/litre); if renal function deteriorates in patients with bone metastases, withhold dose until serum creatinine returns to within 10% of baseline value; avoid in Paget's disease, treatment of postmenopausal osteoporosis and osteoporosis in men if

eGFR less than 35 mL/minute/1.73 m<sup>2</sup>; see also

Cautions above

**Pregnancy** avoid—toxicity in *animal* studies

**Breast-feeding** avoid—no information available

**Side-effects** hypophosphataemia, anaemia, influenza-like symptoms including bone pain, myalgia, arthralgia, fever and rigors; gastro-intestinal disturbances; atrial fibrillation; headache, dizziness, conjunctivitis, renal impairment (rarely acute renal failure); *less commonly* anorexia, taste disturbance, dry mouth, stomatitis, chest pain, hypertension, hypotension, dyspnoea, cough, paraesthesia, tremor, anxiety, lethargy, sleep disturbance, blurred vision, weight gain, pruritus, rash, sweating, muscle cramps, haematuria, proteinuria, urinary frequency, hypersensitivity reactions (including angioedema), asthenia, peripheral oedema, thrombocytopenia, leucopenia, hypomagnesaemia, hypokalaemia, also injection-site reactions; *rarely* bradycardia, confusion, hyperkalaemia, hypematraemia, pancytopenia, osteonecrosis of the jaw (see also MHRA/CHM advice, p. 472); *very rarely* uveitis and episcleritis

#### Dose

- See under preparations

**Aclasta**<sup>®</sup> (Novartis) ▼ (POM)

**Intravenous infusion**, zoledronic acid 50 micrograms/mL, net price 100-mL bottle = £266.72

**Dose** treatment of Paget's disease of bone, by **intravenous infusion**, 5 mg as a single dose over at least 15 minutes

**Note** At least 500 mg elemental calcium twice daily (with vitamin D, section 9.6.4) for at least 10 days is recommended following infusion

Treatment of postmenopausal osteoporosis and osteoporosis in men (including corticosteroid-induced osteoporosis), by **intravenous infusion**, 5 mg over at least 15 minutes once a year

**Note** In patients with a recent low-trauma hip fracture, the dose should be given 2 or more weeks following hip fracture repair; before first infusion give 50 000–125 000 units of vitamin D (section 9.6.4)

**Note** The *Scottish Medicines Consortium* (p. 4) has advised (February 2008) that in postmenopausal women *Aclasta*<sup>®</sup> is accepted for restricted use within the NHS Scotland for the treatment of osteoporosis in those for whom oral treatment options for osteoporosis are inappropriate and when initiated by a specialist

**Zometa**<sup>®</sup> (Novartis) (POM)

**Concentrate for intravenous infusion**, zoledronic acid, 800 micrograms/mL, net price 5-mL (4-mg) vial = £183.30

**Dose** reduction of bone damage in advanced malignancies involving bone, by **intravenous infusion**, 4 mg over at least 15 minutes every 3–4 weeks; **CHILD** not recommended

**Note** Calcium 500 mg daily and vitamin D 400 units daily should also be taken

Hypercalcaemia of malignancy, by **intravenous infusion**, 4 mg as a single dose over at least 15 minutes; **CHILD** not recommended

**Note** The *Scottish Medicines Consortium* (p. 4) has advised (May 2003) that for the prevention of skeletal related events *Zometa*<sup>®</sup> is accepted for restricted use within NHS Scotland for the treatment of patients with breast cancer and multiple myeloma if prescribed by an oncologist

## Denosumab

**Denosumab** is a human monoclonal antibody that inhibits osteoclast formation, function, and survival, thereby decreasing bone resorption. It is licensed for the treatment of postmenopausal osteoporosis in women at increased risk of fractures and for the treatment of bone loss associated with hormone ablation in men with prostate cancer.

#### NICE guidance

##### Denosumab for the prevention of osteoporotic fractures in postmenopausal women (October 2010)

Denosumab is recommended as a treatment option for the *primary prevention* of osteoporotic fragility fractures in postmenopausal women at increased risk of fractures:

- who are unable to comply with the special instructions for administering alendronate and either risedronate or etidronate, or have an intolerance of, or a contra-indication to, those treatments **and**
- who comply with particular combinations of bone mineral density measurement, age, and independent risk factors for fracture, as indicated in the full NICE guidance (available at [www.nice.org.uk/TA204](http://www.nice.org.uk/TA204)).

Denosumab is recommended as a treatment option for the *secondary prevention* of osteoporotic fragility fractures only in postmenopausal women at increased risk of fractures who are unable to comply with the special instructions for administering alendronate and either risedronate or etidronate, or have an intolerance of, or a contra-indication to, those treatments.

## DENOSUMAB

**Indications** see notes above

**Cautions** correct hypocalcaemia and vitamin D deficiency before starting (monitor plasma-calcium concentration during therapy); consider dental check-up and carry out invasive procedures before initiating treatment (risk of osteonecrosis of the jaw)

**Renal impairment** increased risk of hypocalcaemia if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>—monitor plasma-calcium concentration

**Pregnancy** avoid

**Breast-feeding** avoid

**Side-effects** constipation; urinary tract infection, upper respiratory tract infection; pain in extremity, sciatica; cataracts, rash; *less commonly* diverticulitis, cellulitis (seek prompt medical attention), ear infection, eczema; *rarely* osteonecrosis of the jaw; *very rarely* hypocalcaemia

#### Dose

- By **subcutaneous injection**, 60 mg every 6 months
- Note** Supplement with calcium and vitamin D

**Prolia**<sup>®</sup> (Amgen) ▼ (POM)

**Injection**, denosumab 60 mg/mL, net price 1-mL prefilled syringe = £183.00

## Strontium ranelate

**Strontium ranelate** stimulates bone formation and reduces bone resorption. It is licensed for the treatment of postmenopausal osteoporosis. The *Scottish Medicines Consortium* (p. 4) has advised (July 2005) that treatment with strontium ranelate should be restricted to those patients in whom bisphosphonates are contra-indicated or not tolerated, and then only in women aged over 75 years with a previous fracture and low bone mineral density or in other women at equivalent risk.

## STRONTIUM RANELATE

**Indications** see notes above

**Cautions** predisposition to thromboembolism; interferes with colorimetric measurements of calcium in blood and urine; **interactions:** Appendix 1 (strontium ranelate)

**Renal impairment** avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** avoid—toxicity in *animal* studies

**Breast-feeding** avoid

**Side-effects** nausea, diarrhoea; venous thromboembolism; headache; dermatitis, eczema; *very rarely* vomiting, abdominal pain, stomatitis, and hypersensitivity reactions, including rash, pruritus, urticaria and angioedema—see Severe Allergic Reactions, below

### Severe allergic reactions

Severe allergic reactions, including drug rash with eosinophilia and systemic symptoms (DRESS), have been reported in patients taking strontium ranelate. DRESS starts with rash, fever, swollen glands, and increased white cell count, and it can affect the liver, kidneys and lungs; DRESS can also be fatal. Patients should be advised to stop taking strontium ranelate and consult their doctor immediately if skin rash develops. Treatment with strontium ranelate should not be restarted.

### Dose

- 2 g once daily in water, preferably at bedtime

**Counselling** Avoid food for 2 hours before and after taking granules, particularly calcium-containing products e.g. milk; also preferably avoid concomitant antacids containing aluminium and magnesium hydroxides for 2 hours after taking granules

**Protelos**<sup>®</sup> (Servier) (POM)

Granules, yellow, strontium ranelate, 2 g/sachet, net price 28-sachets = £25.60. Label: 5, 13, counselling, food and calcium

Excipients include aspartame (section 9.4.1)

## 6.7 Other endocrine drugs

- 6.7.1 Bromocriptine and other dopaminergic drugs
- 6.7.2 Drugs affecting gonadotrophins
- 6.7.3 Metyrapone and trilostane
- 6.7.4 Somatomedins

### 6.7.1 Bromocriptine and other dopaminergic drugs

**Bromocriptine** is a stimulant of dopamine receptors in the brain; it also inhibits release of prolactin by the pituitary. Bromocriptine is used for the treatment of galactorrhoea, and for the treatment of prolactinomas (when it reduces both plasma prolactin concentration and tumour size). Bromocriptine also inhibits the release of growth hormone and is sometimes used in the treatment of acromegaly, but somatostatin analogues (such as octreotide, section 8.3.4.3) are more effective.

**Cabergoline** has actions and uses similar to those of bromocriptine, but its duration of action is longer. It has

similar side-effects to bromocriptine, however patients intolerant of bromocriptine may be able to tolerate cabergoline (and *vice versa*).

**Quinagolid** is a non-ergot dopamine D<sub>2</sub> agonist; it has actions and uses similar to those of ergot-derived dopamine agonists, but its side-effects differ slightly.

**Cautions** see notes below; also bromocriptine and cabergoline should be used with caution in patients with a history of peptic ulcer, particularly in acromegalic patients. Treatment should be withdrawn if gastro-intestinal bleeding occurs. In hyperprolactinaemic patients, the source of the hyperprolactinaemia should be established (i.e. exclude pituitary tumour before treatment). Bromocriptine and cabergoline should be used with caution in patients with Raynaud's syndrome and cardiovascular disease (see also Contra-indications under Bromocriptine, below). Monitor for fibrotic disease (see Fibrotic Reactions, below). Caution is also advised in patients with a history of serious mental disorders (especially psychotic disorders) and in those with acute porphyria (see section 9.8.2). Tolerance may be reduced by alcohol.

**Contra-indications** Bromocriptine and cabergoline should not be used in patients with hypersensitivity to ergot alkaloids. They are contra-indicated in those with cardiac valvulopathy (exclude before treatment, see Fibrotic Reactions, below). They should also be avoided in pre-eclampsia (see also Contra-indications under Bromocriptine, below).

**Side-effects** Nausea, constipation, and headache are common side-effects of bromocriptine and cabergoline. Paraesthesia has been reported rarely. Other reported side-effects include hypotension (see also Hypotensive Reactions, below), dyskinesia, pathological gambling, increased libido, hypersexuality, leg cramps, allergic skin reactions, alopecia, and peripheral oedema. Bromocriptine and cabergoline have been associated with pleuritis, pleural effusion, cardiac valvulopathy, pericardial effusion, constrictive pericarditis, and retroperitoneal, pleural, and pulmonary fibrosis (see Fibrotic Reactions).

### Fibrotic reactions

Ergot-derived dopamine-receptor agonists, bromocriptine, cabergoline, lisuride [discontinued], and pergolide have been associated with pulmonary, retroperitoneal, and pericardial fibrotic reactions. Exclude cardiac valvulopathy with echocardiography before starting treatment with these ergot derivatives for chronic endocrine disorders (excludes suppression of lactation) or Parkinson's disease; it may also be appropriate to measure the erythrocyte sedimentation rate and serum creatinine and to obtain a chest X-ray. Patients should be monitored for dyspnoea, persistent cough, chest pain, cardiac failure, and abdominal pain or tenderness. If long-term treatment is expected, then lung-function tests may also be helpful. Patients taking cabergoline or pergolide should be regularly monitored for cardiac fibrosis, by echocardiography (within 3–6 months of initiating treatment and subsequently at 6–12 month intervals).

**Driving**

**Sudden onset of sleep** Excessive daytime sleepiness and sudden onset of sleep can occur with dopaminergic drugs.

Patients starting treatment with these drugs should be warned of the possibility of these effects and of the need to exercise caution when driving or operating machinery.

Patients who have suffered excessive sedation or sudden onset of sleep should refrain from driving or operating machines until those effects have stopped recurring.

**Hypotensive reactions** Hypotensive reactions can be disturbing in some patients during the first few days of treatment with bromocriptine, cabergoline, or quinagolide—monitor blood pressure for a few days after starting treatment and following dosage increases; particular care should be exercised when driving or operating machinery.

**Suppression of lactation** Although bromocriptine and cabergoline are licensed to suppress lactation, they are **not** recommended for routine suppression (or for the relief of symptoms of postpartum pain and engorgement) that can be adequately treated with simple analgesics and breast support. If a dopamine-receptor agonist is required, cabergoline is preferred. Quinagolide is not licensed for the suppression of lactation.

**BROMOCRIPTINE**

**Indications** see notes above and under Dose; Parkinson's disease (section 4.9.1)

**Cautions** see notes above; also specialist evaluation—monitor for pituitary enlargement, particularly during pregnancy; monitor visual field to detect secondary field loss in macroprolactinoma; contraceptive advice if appropriate (oral contraceptives may increase prolactin concentration); **interactions:** Appendix 1 (bromocriptine)

**Contra-indications** see notes above; also hypertension in postpartum women or in puerperium (see also below)

**Postpartum or puerperium** Should not be used postpartum or in puerperium in women with high blood pressure, coronary artery disease, or symptoms (or history) of serious mental disorder; monitor blood pressure carefully (especially during first few days) in postpartum women. Very rarely hypertension, myocardial infarction, seizures or stroke (both sometimes preceded by severe headache or visual disturbances), and mental disorders have been reported in postpartum women given bromocriptine for lactation suppression—caution with antihypertensive therapy and avoid other ergot alkaloids. Discontinue immediately if hypertension, unremitting headache, or signs of CNS toxicity develop

**Hepatic impairment** dose reduction may be necessary

**Pregnancy** see Cautions above

**Breast-feeding** suppresses lactation; avoid breast-feeding for about 5 days if lactation prevention fails

**Side-effects** see notes above; also drowsiness (see also Driving, above), nasal congestion; *less commonly* vomiting, postural hypotension, fatigue, dizziness, dry mouth; also, particularly with *high doses*, confusion, psychomotor excitation, hallucinations; *rarely* diarrhoea, gastro-intestinal bleeding, gastric ulcer, abdominal pain, tachycardia, bradycardia, arrhythmia, insomnia, psychosis, visual disturbances, tinnitus;

*very rarely* vasospasm of fingers and toes particularly in patients with Raynaud's syndrome, and effects like neuroleptic malignant syndrome on withdrawal; urinary incontinence, leucopenia, thrombocytopenia, hyponatraemia, reversible hearing loss, increased libido, and hypersexuality also reported

**Dose**

- Prevention or suppression of lactation (but see notes above and under Cautions), 2.5 mg on day 1 (prevention) or daily for 2–3 days (suppression); then 2.5 mg twice daily for 14 days
- Hypogonadism, galactorrhoea, infertility, initially 1–1.25 mg at bedtime, increased gradually; usual dose 7.5 mg daily in divided doses, increased if necessary to max. 30 mg daily, usual dose in infertility without hyperprolactinaemia, 2.5 mg twice daily
- Acromegaly, initially 1–1.25 mg at bedtime, increase gradually to 5 mg every 6 hours
- Prolactinoma, initially 1–1.25 mg at bedtime; increased gradually to 5 mg every 6 hours (occasional patients may require up to 30 mg daily)
- **CHILD** under 15 years, not recommended

**Bromocriptine** (Non-proprietary) (POM)

**Tablets**, bromocriptine (as mesilate) 2.5 mg, net price 30-tab pack = £22.92. Label: 10, 21, counselling, driving, see notes above

**Parlodel®** (Meda) (POM)

**Tablets**, both scored, bromocriptine (as mesilate) 1 mg, net price 100-tab pack = £9.90; 2.5 mg, 30-tab pack = £5.78. Label: 10, 21, counselling, driving, see notes above

**Capsules**, bromocriptine (as mesilate) 5 mg (blue/white), net price 100-cap pack = £37.57; 10 mg (white), 100-cap pack = £69.50. Label: 10, 21, counselling, driving, see notes above

**CABERGOLINE**

**Indications** see notes above and under Dose

**Cautions** see notes above; also monthly pregnancy tests during the amenorrhoeic period; advise non-hormonal contraception if pregnancy not desired (see also Pregnancy, below); **interactions:** Appendix 1 (cabergoline)

**Contra-indications** see notes above; history of puerperal psychosis; history of pulmonary, pericardial, or retroperitoneal fibrotic disorders (see Fibrotic Reactions in notes above); cardiac valvulopathy

**Hepatic impairment** reduce dose in severe hepatic impairment

**Pregnancy** no evidence of harm; exclude pregnancy before starting and discontinue 1 month before intended conception (ovulatory cycles persist for 6 months)—discontinue if pregnancy occurs during treatment (specialist advice needed)

**Breast-feeding** suppresses lactation; avoid breast-feeding if lactation prevention fails

**Side-effects** see notes above; also cardiac valvulopathy, drowsiness (see also Driving, above), dyspepsia, gastritis, epigastric and abdominal pain, angina, syncope, depression, confusion, hallucinations, breast pain; *rarely* vomiting, palpitation, epistaxis, digital vasospasm, hot flushes, transient hemianopia, muscle weakness; *also reported* erythromelalgia

**Dose**

- Prevention of lactation (but see notes above and under Contra-indications), during first day postpartum, 1 mg as a single dose; suppression of established lactation (but see notes above) 250 micrograms every 12 hours for 2 days; **CHILD** under 16 years, not recommended
- Hyperprolactinaemic disorders, 500 micrograms weekly (as a single dose or as 2 divided doses on separate days) increased at monthly intervals in steps of 500 micrograms until optimal therapeutic response (usually 1 mg weekly, range 0.25–2 mg weekly) with monthly monitoring of serum prolactin levels; reduce initial dose and increase more gradually if patient intolerant; over 1 mg weekly give as divided doses; up to 4.5 mg weekly has been used in hyperprolactinaemic patients; **CHILD** under 16 years, not recommended
- Parkinson's disease, section 4.9.1

**Cabergoline** (Non-proprietary) (P<sub>M</sub>)

Tablet, scored, cabergoline 500 micrograms, net price 8-tab pack = £34.03. Label: 10, 21, counselling, driving, see notes above

**Note** Dispense in original container (contains desiccant)

**Dostinex**<sup>®</sup> (Pharmacia) (P<sub>M</sub>)

Tablets, scored, cabergoline 500 micrograms. Net price 8-tab pack = £30.04. Label: 10, 21, counselling, driving, see notes above

**Note** Dispense in original container (contains desiccant)

**QUINAGOLIDE**

**Indications** see notes above and under Dose

**Cautions** see notes above; history of psychotic illness; advise non-hormonal contraception if pregnancy not desired; **interactions:** Appendix 1 (quinagolide)

**Contra-indications** hypersensitivity to quinagolide (but not ergot alkaloids)

**Hepatic impairment** avoid—no information available

**Renal impairment** avoid—no information available

**Pregnancy** discontinue when pregnancy confirmed unless medical reason for continuing (specialist advice needed)

**Breast-feeding** suppresses lactation

**Side-effects** nausea, vomiting, anorexia, abdominal pain, constipation or diarrhoea; syncope, hypotension (see also notes above), oedema, flushing; nasal congestion; headache, dizziness, fatigue, insomnia; *rarely* sudden onset of sleep (see notes above); *very rarely* psychosis

**Dose**

- Hyperprolactinaemia, 25 micrograms at bedtime for 3 days; increased at intervals of 3 days in steps of 25 micrograms to usual maintenance dose of 75–150 micrograms daily; for doses higher than 300 micrograms daily increase in steps of 75–150 micrograms at intervals of not less than 4 weeks; **CHILD** not recommended

**Norprolac**<sup>®</sup> (Ferring) (P<sub>M</sub>)

Tablets, quinagolide (as hydrochloride) 75 micrograms (white), net price 30-tab pack = £27.00; starter pack of 3 × 25-microgram tabs (pink) with 3 × 50-microgram tabs (blue) = £4.50. Label: 10, 21, counselling, driving, see notes above

**6.7.2 Drugs affecting gonadotrophins**

**Danazol** inhibits pituitary gonadotrophins; it combines androgenic activity with antioestrogenic and anti-progestogenic activity. It is licensed for the treatment of *endometriosis* and for the relief of severe pain and tenderness in *benign fibrocystic breast disease* where other measures have proved unsatisfactory. It may also be effective in the long-term management of *hereditary angioedema* [unlicensed indication].

**Cetorelix** and **ganirelix** are luteinising hormone releasing hormone antagonists, which inhibit the release of gonadotrophins (luteinising hormone and follicle-stimulating hormone). They are used in the treatment of infertility by assisted reproductive techniques.

**CETORELIX**

**Indications** adjunct in the treatment of female infertility (under specialist supervision)

**Hepatic impairment** avoid in moderate or severe liver impairment

**Renal impairment** avoid in moderate or severe renal impairment

**Pregnancy** avoid in confirmed pregnancy

**Breast-feeding** avoid

**Side-effects** nausea, headache, injection site reactions; rarely hypersensitivity reactions

**Dose**

- **By subcutaneous injection** into the lower abdominal wall, *either* 250 micrograms in the morning, starting on day 5 or 6 of ovarian stimulation with gonadotrophins (*or* each evening starting on day 5 of ovarian stimulation); continue throughout administration of gonadotrophin including day of ovulation induction (*or* evening before ovulation induction) *or* 3 mg on day 7 of ovarian stimulation with gonadotrophins; if ovulation induction not possible on day 5 after 3-mg dose, additional 250 micrograms once daily until day of ovulation induction

**Cetrotide**<sup>®</sup> (Merck Serono) (P<sub>M</sub>)

**Injection**, powder for reconstitution, cetorelix (as acetate), net price 250-micrograms vial = £22.61; 3-mg vial = £158.26 (both with solvent)

**DANAZOL**

**Indications** see notes above and under Dose

**Cautions** cardiac impairment (avoid if severe), elderly, polycythaemia, epilepsy, diabetes mellitus, hypertension, migraine, lipoprotein disorder, history of thrombosis or thromboembolic disease; withdraw if virilisation (may be irreversible on continued use); non-hormonal contraceptive methods should be used, if appropriate; **interactions:** Appendix 1 (danazol)

**Contra-indications** ensure that patients with amenorrhoea are not pregnant; thromboembolic disease; undiagnosed genital bleeding; androgen-dependent tumours; acute porphyria (section 9.8.2)

**Hepatic impairment** caution in hepatic impairment (avoid if severe)

**Renal impairment** caution in renal impairment (avoid if severe)

**Pregnancy** avoid; has weak androgenic effects and virilisation of female fetus reported

**Breast-feeding** no data available but avoid because of possible androgenic effects in infant

**Side-effects** nausea, dizziness, skin reactions including rashes, photosensitivity and exfoliative dermatitis, fever, backache, nervousness, mood changes, anxiety, changes in libido, vertigo, fatigue, epigastric and pleuritic pain, headache, weight gain; menstrual disturbances, vaginal dryness and irritation, flushing and reduction in breast size; musculo-skeletal spasm, joint pain and swelling, hair loss; androgenic effects including acne, oily skin, oedema, hirsutism, voice changes and rarely clitoral hypertrophy (see also Cautions); temporary alteration in lipoproteins and other metabolic changes, insulin resistance; thrombotic events; leucopenia, thrombocytopenia, eosinophilia, reversible erythrocytosis or polycythaemia reported; headache and visual disturbances may indicate benign intracranial hypertension; rarely cholestatic jaundice, pancreatitis, peliosis hepatis and benign hepatic adenomata

#### Dose

**Note** In women of child-bearing potential, treatment should start during menstruation, preferably on day 1

- Endometriosis, 200–800 mg daily in up to 4 divided doses, adjusted to achieve amenorrhoea, usually for 3–6 months
- Severe pain and tenderness in benign fibrocystic breast disease not responding to other treatment, 300 mg daily in divided doses usually for 3–6 months
- Hereditary angioedema [unlicensed indication], initially 200 mg 2–3 times daily, then reduced according to response

**Danazol** (Non-proprietary) (Pm)

**Capsules**, danazol 100 mg, net price 28-cap pack = £18.40, 60-cap pack = £17.04; 200 mg, 56-cap pack = £66.20

**Danol**<sup>®</sup> (Sanofi-Aventis) (Pm)

**Capsules**, danazol 100 mg (grey/white), net price 60-cap pack = £16.38; 200 mg (pink/white), 60-cap pack = £32.43

## GANIRELIX

**Indications** adjunct in the treatment of female infertility (under specialist supervision)

**Hepatic impairment** avoid in moderate or severe hepatic impairment

**Renal impairment** avoid in moderate to severe renal impairment

**Pregnancy** avoid in confirmed pregnancy—toxicity in animal studies

**Breast-feeding** avoid—no information available

**Side-effects** nausea, headache, malaise, injection-site reactions; very rarely hypersensitivity reactions including rash, facial oedema, and dyspnoea also reported

#### Dose

- By **subcutaneous injection** preferably into the upper leg (rotate injection sites to prevent lipatrophy), 250 micrograms in the morning (or each afternoon) starting on day 5 or day 6 of ovarian stimulation with gonadotrophins; continue throughout administration of gonadotrophins including day of ovulation induction (if administering in afternoon, give last dose in afternoon before ovulation induction)

**Orgalutran**<sup>®</sup> (Organon) (Pm)

**Injection**, ganirelix, 500 micrograms/mL, net price 0.5-mL prefilled syringe = £21.48

## Gonadorelin analogues

Administration of **gonadorelin analogues** produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

Gonadorelin analogues are used in the treatment of endometriosis, precocious puberty, infertility, anaemia due to uterine fibroids (together with iron supplementation), breast cancer (section 8.3.4.1), prostate cancer (section 8.3.4.2) and before intra-uterine surgery. Use of leuprorelin and triptorelin for 3 to 4 months before surgery reduces the uterine volume, fibroid size and associated bleeding. For women undergoing hysterectomy or myomectomy, a vaginal procedure is made more feasible following the use of a gonadorelin analogue.

**Cautions** Non-hormonal, barrier methods of contraception should be used during entire treatment period with gonadorelin analogues; also use with caution in patients with metabolic bone disease because decrease in bone mineral density can occur.

**Contra-indications** Gonadorelin analogues are contra-indicated for use longer than 6 months in the treatment of endometriosis (do not repeat) and when there is unexplained vaginal bleeding.

**Pregnancy** The use of gonadorelin analogues in pregnancy is contra-indicated. Pregnancy should be excluded before treatment; the first injection should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.

**Breast-feeding** Gonadorelin analogues are contra-indicated in breast-feeding.

**Side-effects** Side-effects of the gonadorelin analogues related to the inhibition of oestrogen production include menopausal-like symptoms (e.g. hot flushes, increased sweating, vaginal dryness, dyspareunia and loss of libido) and a decrease in trabecular bone density; these effects can be reduced by hormone replacement (e.g. with an oestrogen and a progestogen or with tibolone). Side-effects of gonadorelin analogues also include headache (rarely migraine) and hypersensitivity reactions including urticaria, pruritus, rash, asthma and anaphylaxis; when treating uterine fibroids, bleeding associated with fibroid degeneration can occur; spray formulations can cause irritation of the nasal mucosa including nose bleeds; local reactions at injection site can occur; other side-effects also reported with some gonadorelin analogues include palpitation, hypertension, ovarian cysts (may require withdrawal), changes in breast size, musculoskeletal pain or weakness, visual disturbances, paraesthesia, changes in scalp and body hair, oedema of the face and extremities, weight changes, and mood changes including depression.

## BUSERELIN

**Indications** see under Dose; prostate cancer (section 8.3.4.2)

**Cautions** see notes above; polycystic ovarian disease, depression, hypertension, diabetes

**Contra-indications** see notes above; hormone-dependent tumours

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; initially withdrawal bleeding and subsequently breakthrough bleeding, leucorrhoea; nausea, vomiting, constipation, diarrhoea; anxiety, memory and concentration disturbances, sleep disturbances, nervousness, dizziness, drowsiness; breast tenderness, lactation; abdominal pain; fatigue; increased thirst, changes in appetite; acne, dry skin, splitting nails, dry eyes; altered blood lipids, leucopenia, thrombocytopenia; hearing disturbances; reduced glucose tolerance

### Dose

- Endometriosis, **intranasally**, 300 micrograms (one 150-microgram spray in each nostril) 3 times daily (starting on days 1 or 2 of menstruation); max. duration of treatment 6 months (do not repeat)
- Pituitary desensitisation before induction of ovulation by gonadotrophins for *in vitro* fertilisation (under specialist supervision), **by subcutaneous injection**, 200–500 micrograms daily given as a single injection (occasionally up to 500 micrograms twice daily may be needed) starting in early follicular phase (day 1) *or*, after exclusion of pregnancy, in midluteal phase (day 21) and continued until down-regulation achieved (usually about 1–3 weeks) then maintained during gonadotrophin administration (stopping gonadotrophin and buserelin on administration of chorionic gonadotrophin at appropriate stage of follicular development)

**Intranasally**, 150 micrograms (one spray in one nostril) 4 times daily during waking hours (occasionally up to 300 micrograms 4 times daily may be needed) starting in early follicular phase (day 1) *or*, after exclusion of pregnancy, in midluteal phase (day 21) and continued until down-regulation achieved (usually about 2–3 weeks) then maintained during gonadotrophin administration (stopping gonadotrophin and buserelin on administration of chorionic gonadotrophin at appropriate stage of follicular development)

**Counselling** Avoid use of nasal decongestants before and for at least 30 minutes after treatment

**Suprecur**® (Sanofi-Aventis) (POM)

**Nasal spray**, buserelin (as acetate) 150 micrograms/ metered spray. Net price 2 × 100-dose pack (with metered dose pumps) = £87.63. Counselling, nasal decongestants

**Injection**, buserelin (as acetate) 1 mg/mL. Net price 5.5-mL vial = £13.76

## GOSERELIN

**Indications** see under Dose; prostate cancer (section 8.3.4.2); early and advanced breast cancer (section 8.3.4.1)

**Cautions** see notes above; polycystic ovarian disease; diabetes

**Contra-indications** see notes above

**Pregnancy** use non-hormonal contraceptives during treatment; see also notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; withdrawal bleeding

### Dose

- **By subcutaneous injection** into anterior abdominal wall (as *Zoladex*®)
  - Endometriosis, 3.6 mg every 28 days; max. duration of treatment 6 months (do not repeat)
  - Endometrial thinning before intra-uterine surgery, 3.6 mg (may be repeated after 28 days if uterus is large or to allow flexible surgical timing)
  - Before surgery in women who have anaemia due to uterine fibroids, 3.6 mg every 28 days (with supplementary iron); max. duration of treatment 3 months
  - Pituitary desensitisation before induction of ovulation by gonadotrophins for *in vitro* fertilisation (under specialist supervision), after exclusion of pregnancy, 3.6 mg to achieve pituitary down-regulation (usually 1–3 weeks) then gonadotrophin is administered (stopping gonadotrophin on administration of chorionic gonadotrophin at appropriate stage of follicular development)

### Preparation

Section 8.3.4.2

## LEUPRORELIN ACETATE

**Indications** see under Dose; prostate cancer (section 8.3.4.2)

**Cautions** see notes above; monitor liver function; family history of osteoporosis; chronic use of other drugs which reduce bone density including alcohol and tobacco; diabetes

**Contra-indications** see notes above

**Pregnancy** teratogenic in *animal* studies; see also notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; breast tenderness; nausea, vomiting, diarrhoea, anorexia; fever, chills; sleep disturbances, dizziness, fatigue, leucopenia, thrombocytopenia, altered blood lipids, pulmonary embolism; spinal fracture, paralysis, hypotension and worsening of depression also reported

### Dose

- **By subcutaneous or intramuscular injection** (as *Prostap*® SR)
  - Endometriosis, 3.75 mg as a single dose in first 5 days of menstrual cycle then every month for max. 6 months (course not to be repeated)
  - Endometrial thinning before intra-uterine surgery, 3.75 mg as a single dose (given between days 3 and 5 of menstrual cycle) 5–6 weeks before surgery
  - Reduction of size of uterine fibroids and of associated bleeding before surgery, 3.75 mg as a single dose every month usually for 3–4 months (max. 6 months)
- **By intramuscular injection** (as *Prostap*® 3)
  - Endometriosis, 11.25 mg as a single dose in first 5 days of menstrual cycle then every 3 months for max. 6 months (course not to be repeated)

### Preparations

Section 8.3.4.2

## NAFARELIN

**Indications** see under Dose

**Cautions** see notes above

**Contra-indications** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; acne

### Dose

- Endometriosis, women over 18 years, 200 micrograms twice daily as one spray in one nostril in the morning and one spray in the other nostril in the evening (starting on days 2–4 of menstruation), max. duration of treatment 6 months (do not repeat)
- Pituitary desensitisation before induction of ovulation by gonadotrophins for *in vitro* fertilisation (under specialist supervision), 400 micrograms (one spray in each nostril) twice daily starting in early follicular phase (day 2) or, after exclusion of pregnancy, in midluteal phase (day 21) and continued until down-regulation achieved (usually within 4 weeks) then maintained (usually for 8–12 days) during gonadotrophin administration (stopping gonadotrophin and nafarelin on administration of chorionic gonadotrophin at follicular maturity); discontinue if down-regulation not achieved within 12 weeks

**Counselling** Avoid use of nasal decongestants before and for at least 30 minutes after treatment; repeat dose if sneezing occurs during or immediately after administration

**Synarel®** (Pharmacia) (POM)

**Nasal spray**, nafarelin (as acetate) 200 micrograms/ metered spray. Net price 30-dose unit = £30.41; 60-dose unit = £52.43. Label: 10, patient information leaflet, counselling, see above

## TRIPTORELIN

**Indications** endometriosis, precocious puberty, reduction in size of uterine fibroids; advanced prostate cancer (section 8.3.4.2)

**Cautions** see notes above

**Contra-indications** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; also gastro-intestinal disturbances; in precocious puberty, withdrawal bleeding may occur in the first month of treatment; asthenia

### Dose

- See under preparations below

**Decapeptyl® SR** (Ipsen) (POM)

**Injection**, (powder for suspension), m/r, triptorelin (as acetate), net price 3-mg vial (with diluent) = £69.00

**Dose** by intramuscular injection, endometriosis and reduction in size of uterine fibroids, 3 mg every 4 weeks starting during first 5 days of menstrual cycle; for uterine fibroids continue treatment for at least 3 months; max. duration of treatment 6 months (not to be repeated)

**Note** Each vial includes an overage to allow accurate administration of 3-mg dose

**Injection**, (powder for suspension), m/r, triptorelin (as acetate), net price 11.25-mg vial (with diluent) = £207.00

**Dose** by intramuscular injection, endometriosis, 11.25 mg every 3 months starting during first 5 days of menstrual cycle; max. duration of treatment 6 months (not to be repeated)

Precocious puberty, 11.25 mg every 3 months; discontinue when bone maturation consistent with age of 12 years in girls or 13–14 years in boys

**Note** Each vial includes an overage to allow accurate administration of 11.25-mg dose

**Gonapeptyl Depot®** (Ferring) (POM)

**Injection**, (powder for suspension), triptorelin (as acetate), net price 3.75-mg prefilled syringe (with prefilled syringe of vehicle) = £81.69

**Dose** by subcutaneous or deep intramuscular injection, endometriosis and reduction in size of uterine fibroids, 3.75 mg every 2 weeks for 3 doses, then every 3–4 weeks; body-weight 20–30 kg, initially 2.5 mg every 2 weeks for 3 doses, then every 3–4 weeks; body-weight under 20 kg, initially 1.875 mg every 2 weeks for 3 doses, then every 3–4 weeks; discontinue when bone maturation consistent with age over 12 years in girls or over 13 years in boys

## Breast pain (mastalgia)

Once any serious underlying cause for breast pain has been ruled out, most women will respond to reassurance and reduction in dietary fat; withdrawal of an oral contraceptive or of hormone replacement therapy may help to resolve the pain.

Mild, non-cyclical breast pain is treated with simple analgesics (section 4.7.1); moderate to severe pain, cyclical pain or symptoms that persist for longer than 6 months may require specific drug treatment.

**Danazol** (section 6.7.2) is licensed for the relief of severe pain and tenderness in benign fibrocystic breast disease which has not responded to other treatment.

**Tamoxifen** (section 8.3.4.1) may be a useful adjunct in the treatment of mastalgia [unlicensed indication] especially when symptoms can definitely be related to cyclic oestrogen production; it may be given on the days of the cycle when symptoms are predicted.

Treatment for breast pain should be reviewed after 6 months and continued if necessary. Symptoms recur in about 50% of women within 2 years of withdrawal of therapy but may be less severe.

## 6.7.3 Metyrapone and trilostane

**Metyrapone** is a competitive inhibitor of 11 $\beta$ -hydroxylation in the adrenal cortex; the resulting inhibition of cortisol (and to a lesser extent aldosterone) production leads to an increase in ACTH production which, in turn, leads to increased synthesis and release of cortisol precursors. It may be used as a test of anterior pituitary function.

Although most types of *Cushing's syndrome* are treated surgically, that which occasionally accompanies carcinoma of the bronchus is not usually amenable to surgery. Metyrapone has been found helpful in controlling the symptoms of the disease; it is also used in other forms of Cushing's syndrome to prepare the patient for surgery. The dosages used are either low, and tailored to cortisol production, or high, in which case corticosteroid replacement therapy is also needed.

**Trilostane** reversibly inhibits the enzyme system essential for the production of mineralocorticoids and gluco-

corticoids in the adrenal cortex, and may be useful in *Cushing's syndrome* and *primary hyperaldosteronism*. Trilostane appears to be less effective than metyrapone for Cushing's syndrome (where it is tailored to corticosteroid production). It also has a minor role in postmenopausal breast cancer that has relapsed following initial oestrogen antagonist therapy (corticosteroid replacement therapy is also required). **Ketoconazole** (section 5.2.2) is also used by specialists for the management of *Cushing's syndrome* [unlicensed indication].

## METYRAPONE

**Indications** see notes above and under Dose (specialist supervision in hospital)

**Cautions** gross hypopituitarism (risk of precipitating acute adrenal failure); hypertension on long-term administration; hypothyroidism (delayed response); many drugs interfere with diagnostic estimation of steroids; avoid in acute porphyria (section 9.8.2)  
**Driving** Drowsiness may affect the performance of skilled tasks (e.g. driving)

**Contra-indications** adrenocortical insufficiency (see Cautions)

**Hepatic impairment** use with caution in hepatic impairment (delayed response)

**Pregnancy** avoid (may impair biosynthesis of fetal-placental steroids)

**Breast-feeding** avoid—no information available

**Side-effects** occasional nausea, vomiting, dizziness, headache, hypotension, sedation; rarely abdominal pain, allergic skin reactions, hypoadrenalism, hirsutism

### Dose

- Differential diagnosis of ACTH-dependent Cushing's syndrome, 750 mg every 4 hours for 6 doses; **CHILD** 15 mg/kg (minimum 250 mg) every 4 hours for 6 doses
- Management of Cushing's syndrome, range 0.25–6 g daily, tailored to cortisol production; see notes above
- Resistant oedema due to increased aldosterone secretion in cirrhosis, nephrotic syndrome, and congestive heart failure (with glucocorticoid replacement therapy) 3 g daily in divided doses

**Metopirone**<sup>®</sup> (Alliance) (POM)

**Capsules**, ivory, metyrapone 250 mg, net price 100-tab pack = £38.88. Label: 21, counselling, driving

## TRILOSTANE

**Indications** see notes above and under Dose (specialist supervision)

**Cautions** breast cancer (concurrent corticosteroid replacement therapy needed, see under Dose), adrenal cortical hyperfunction (tailored to cortisol and electrolytes, concurrent corticosteroid therapy may be needed, see under Dose); **interactions:** Appendix 1 (trilostane)

**Contra-indications** children

**Hepatic impairment** use with caution

**Renal impairment** use with caution

**Pregnancy** avoid; interferes with placental sex hormone production; use non-hormonal method of contraception

**Breast-feeding** avoid

**Side-effects** flushing, tingling and swelling of mouth, rhinorrhoea, nausea, vomiting, diarrhoea, and rashes reported; rarely granulocytopenia

### Dose

- Adrenal cortical hyperfunction, 240 mg daily in divided doses for at least 3 days then tailored according to response with regular monitoring of plasma electrolytes and circulating corticosteroids (both mineralocorticoid and glucocorticoid replacement therapy may be needed); usual dose: 120–480 mg daily (may be increased to 960 mg)
- Postmenopausal breast cancer (with glucocorticoid replacement therapy) following relapse to initial oestrogen receptor antagonist therapy, initially 240 mg daily increased every 3 days in steps of 240 mg to a maintenance dose of 960 mg daily (720 mg daily if not tolerated)

**Modrenal**<sup>®</sup> (Bioenvision) (POM)

**Capsules**, trilostane 60 mg (pink/black), net price 100-cap pack = £49.50; 120 mg (pink/yellow), 100-cap pack = £98.50. Label: 21

## 6.7.4 Somatomedins

Somatomedins are a group of polypeptide hormones structurally related to insulin and commonly known as insulin-like growth factors (IGFs). **Mecasermin**, a human insulin-like growth factor-I (rhIGF-I), is the principal mediator of the somatotrophic effects of human growth hormone and is used to treat growth failure in children and adolescents with severe primary insulin-like growth factor-I deficiency.

## MECASERMIN

(Recombinant human insulin-like growth factor-I; rhIGF-I)

**Indications** see notes above

**Cautions** correct hypothyroidism before initiating treatment; diabetes mellitus (adjustment of antidiabetic therapy may be necessary), monitor ECG before and on termination of treatment (and during treatment if ECG abnormal), papilloedema (see under Side-effects), monitor for disorders of the epiphysis of the hip (monitor for limping), monitor for signs of tonsillar hypertrophy (snoring, sleep apnoea, and chronic middle ear effusions)

**Contra-indications** evidence of tumour activity (discontinue treatment)

**Pregnancy** avoid unless essential; contraception advised in women of child-bearing potential

**Breast-feeding** avoid

**Side-effects** headache, funduscopy for papilloedema recommended if severe or recurrent headache, visual problems, nausea and vomiting occur—if papilloedema confirmed consider benign intracranial hypertension (rare cases reported); cardiomegaly, ventricular hypertrophy, tachycardia; convulsions, sleep apnoea, night terrors, dizziness, nervousness; tonsillar hypertrophy (see Cautions above); hypoglycaemia (especially in first month, and in younger children), hyperglycaemia, gynaecomastia; arthralgia, myalgia; visual disturbance, impaired hearing; antibody formation; injection-site reactions (rotate site)

**Dose**

- By subcutaneous injection, ADOLESCENT and CHILD over 2 years, initially 40 micrograms/kg twice daily for 1 week, if tolerated increase dose in steps of 40 micrograms/kg to max. 120 micrograms/kg twice daily; discontinue if no response within 1 year

**Counselling** Dose should be administered just before or after food; do not increase dose if a dose is missed

**Note** Reduce dose if hypoglycaemia occurs despite adequate food intake; withhold injection if patient unable to eat

**Increlex**<sup>®</sup> (Ipsen) ▼ (POM)

**Injection**, mecasermin 10 mg/mL, net price 4-mL vial = £605.00. Counselling, administration

**Excipients** include benzyl alcohol (avoid in neonates, see Excipients, p. 2)

## 7.1 Drugs used in obstetrics

- 7.1.1 Prostaglandins and oxytocics
- 7.1.2 Mifepristone
- 7.1.3 Myometrial relaxants

Because of the complexity of dosage regimens in obstetrics, in all cases **detailed specialist literature** should be consulted.

### 7.1.1 Prostaglandins and oxytocics

Prostaglandins and oxytocics are used to induce abortion or induce or augment labour and to minimise blood loss from the placental site. They include oxytocin, carbetocin, ergometrine, and the prostaglandins. All induce uterine contractions with varying degrees of pain according to the strength of contractions induced.

**Induction of abortion** **Gemeprost**, a prostaglandin administered vaginally as pessaries, is suitable for the medical induction of late therapeutic abortion; gemeprost is also used to ripen the cervix before surgical abortion, particularly in primigravidas. The prostaglandin **misoprostol** (section 7.1.2) is given by mouth or by vaginal administration to induce medical abortion [unlicensed indication]; intravaginal use ripens the cervix before surgical abortion [unlicensed indication]. Extra-amniotic **dinoprostone** is rarely used nowadays.

Pre-treatment with **mifepristone** (section 7.1.2) can facilitate the process of medical abortion. It sensitises the uterus to subsequent administration of a prostaglandin and, therefore, abortion occurs in a shorter time and with a lower dose of prostaglandin.

**Induction and augmentation of labour** **Dinoprostone** is available as vaginal tablets, pessaries and

This chapter also includes advice on the drug management of the following:  
 emergency contraception, p. 505  
 induction of abortion, below  
 induction and augmentation of labour, below  
 nocturnal enuresis, p. 512  
 premature labour, p. 489  
 prevention and treatment of post-partum  
 haemorrhage, p. 486  
 priapism, p. 514

vaginal gels for the induction of labour. The intravenous solution is rarely used; it is associated with more side-effects.

**Oxytocin** (*Syntocinon*<sup>®</sup>) is administered by slow intravenous infusion, using an infusion pump, to induce or augment labour, usually in conjunction with amniotomy. Uterine activity must be monitored carefully and hyperstimulation avoided. Large doses of oxytocin may result in excessive fluid retention.

**Misoprostol** is given orally or vaginally for the induction of labour [unlicensed indication].

#### NICE guidance

Induction of labour (updated July 2008)

Available at [www.nice.org.uk](http://www.nice.org.uk)

**Prevention and treatment of haemorrhage** Bleeding due to incomplete abortion can be controlled with **ergometrine** and **oxytocin** (*Syntometrine*<sup>®</sup>) given intramuscularly, the dose is adjusted according to the patient's condition and blood loss. This is commonly used before surgical evacuation of the uterus, particularly when surgery is delayed. Oxytocin and ergometrine combined are more effective in early pregnancy than either drug alone.

Active management of the third stage of labour reduces the risk of postpartum haemorrhage; oxytocin is given by intramuscular injection [unlicensed] on delivery of the anterior shoulder or, at the latest, immediately after the baby is delivered. Alternatively, ergometrine 500 micrograms with oxytocin 5 units (*Syntometrine*<sup>®</sup> 1 mL) can be given by intramuscular injection in the absence of hypertension; oxytocin alone causes less nausea, vomiting, and hypertension than when given with ergometrine.

In excessive uterine bleeding, any placental products remaining in the uterus should be removed. Oxytocic drugs are used to treat postpartum haemorrhage caused by uterine atony; treatment options are as follows:

- oxytocin 5 units by slow intravenous injection (dose may be repeated), followed in severe cases by intravenous infusion of oxytocin 40 units in 500 mL infusion fluid (prolonged administration—see Appendix 6) at a rate that controls uterine atony *or*
- ergometrine 250–500 micrograms by intramuscular injection *or*
- ergometrine 250–500 micrograms by slow intravenous injection (use with caution—risk of hypertension) *or*
- ergometrine 500 micrograms with oxytocin 5 units (*Syntometrine*<sup>®</sup> 1 mL) by intramuscular injection

**Carboprost** has an important role in severe postpartum haemorrhage unresponsive to ergometrine and oxytocin.

**Misoprostol** [unlicensed] can be used in postpartum haemorrhage when oxytocin, ergometrine, and carboprost are not available or are inappropriate.

## CARBETOCIN

**Indications** prevention of uterine atony after caesarean section

**Cautions** hyponatraemia; cardiovascular disease (avoid if severe); migraine; asthma

**Contra-indications** pre-eclampsia and eclampsia; epilepsy

**Hepatic impairment** manufacturer advises avoid

**Renal impairment** manufacturer advises avoid

**Side-effects** nausea, vomiting, abdominal pain, metallic taste; flushing, hypotension, chest pain; dyspnoea; headache, tremor, dizziness; anaemia; back pain; pruritus; feeling of warmth, chills; tachycardia and sweating also reported

#### Dose

- By **slow intravenous injection** over 1 minute, a single dose of 100 micrograms, as soon as possible after delivery, preferably before removal of placenta

**Pabal**<sup>®</sup> (Ferring) ▼ (POM)

**Injection**, carbetocin 100 micrograms/mL, net price 1-mL amp = £17.64

## CARBOPROST

**Indications** postpartum haemorrhage due to uterine atony in patients unresponsive to ergometrine and oxytocin

**Cautions** history of glaucoma or raised intra-ocular pressure, asthma, hypertension, hypotension, anaemia, jaundice, diabetes, epilepsy; uterine scars; excessive dosage may cause uterine rupture; **interactions**: Appendix 1 (prostaglandins)

**Contra-indications** untreated pelvic infection; cardiac or pulmonary disease

**Hepatic impairment** manufacturer advises avoid

**Renal impairment** manufacturer advises avoid

**Side-effects** nausea, vomiting and diarrhoea, hyperthermia and flushing, bronchospasm; less frequent effects include raised blood pressure, dyspnoea, and pulmonary oedema; chills, headache, diaphoresis, dizziness; cardiovascular collapse also reported; erythema and pain at injection site reported

#### Dose

- By **deep intramuscular injection**, 250 micrograms repeated if necessary at intervals of not less than 15 minutes; total dose should not exceed 2 mg (8 doses)

**Hemabate**<sup>®</sup> (Pharmacia) (POM)

**Injection**, carboprost as trometamol salt (tromethamine salt) 250 micrograms/mL, net price 1-mL amp = £18.20 (hosp. only)

## DINOPROSTONE

**Indications** see notes above and under preparations below

**Cautions** history of asthma, glaucoma and raised intra-ocular pressure; hypertension; history of epilepsy; uterine scarring; monitor uterine activity and fetal status (particular care if history of uterine hypertony); uterine rupture; see also notes above; monitor for disseminated intravascular coagulation after parturition; risk factors for disseminated intravascular coagulation; effect of oxytocin enhanced (care needed in monitoring uterine activity when used in sequence); **interactions**: Appendix 1 (prostaglandins)

**Contra-indications** active cardiac, or pulmonary disease; placenta praevia or unexplained vaginal bleeding during pregnancy, ruptured membranes, major cephalopelvic disproportion or fetal malpresentation, history of caesarean section or major uterine surgery,

untreated pelvic infection, fetal distress, grand multiparas and multiple pregnancy, history of difficult or traumatic delivery; avoid extra-amniotic route in cervicitis or vaginitis

**Hepatic impairment** manufacturers advise avoid

**Renal impairment** manufacturers advise avoid

**Side-effects** nausea, vomiting, diarrhoea; other side-effects include uterine hypertension, severe uterine contractions, pulmonary or amniotic fluid embolism, abruptio placenta, fetal distress, maternal hypertension, bronchospasm, rapid cervical dilation, fever, backache; uterine hypercontractility with or without fetal bradycardia, low Apgar scores; cardiac arrest, uterine rupture, stillbirth or neonatal death also reported; vaginal symptoms (warmth, irritation, pain); after intravenous administration—flushing, shivering, headache, dizziness, temporary pyrexia and raised white blood cell count; disseminated intravascular coagulation reported; also local tissue reaction and erythema after intravenous administration and possibility of infection after extra-amniotic administration

#### Dose

- See under preparations, below

**Important** Do not confuse dose of *Prostin E2*<sup>®</sup> vaginal gel with that of *Prostin E2*<sup>®</sup> vaginal tablets—not bioequivalent.

**Propess**<sup>®</sup> (Ferring) (POM)

**Pessaries** (within retrieval device), releasing dinoprostone approx. 10 mg over 24 hours; net price 1-pessary pack = £30.00

**Dose** by vagina, cervical ripening and induction of labour at term, 1 pessary (in retrieval device) inserted high into posterior fornix and removed when cervical ripening adequate; if oxytocin necessary, remove 30 minutes before oxytocin infusion; remove if cervical ripening inadequate after 24 hours (dose not to be repeated)

**Prostin E2**<sup>®</sup> (Pharmacia) (POM)

**Intravenous solution**  for dilution and use as an infusion, dinoprostone 1 mg/mL, net price 0.75-mL amp = £8.52; 10 mg/mL, 0.5-mL amp = £18.40 (both hosp. only; rarely used, consult product literature for dose and indications)

**Extra-amniotic solution**  dinoprostone 10 mg/mL, net price 0.5-mL amp (with diluent) = £18.40 (hosp. only; less commonly used nowadays, consult product literature for dose and indications)

**Vaginal gel**, dinoprostone 400 micrograms/mL, net price 2.5 mL (1 mg) = £13.28; 800 micrograms/mL, 2.5 mL (2 mg) = £13.28

**Dose** by vagina, induction of labour, inserted high into posterior fornix (avoid administration into cervical canal), 1 mg (unfavourable primigravida 2 mg), followed after 6 hours by 1–2 mg if required; max. [gel] 3 mg (unfavourable primigravida 4 mg)

**Vaginal tablets**, dinoprostone 3 mg, net price 8-vaginal tab pack = £106.23

**Dose** by vagina, induction of labour, inserted high into posterior fornix, 3 mg, followed after 6–8 hours by 3 mg if labour is not established; max. 6 mg [vaginal tablets]

**Note** *Prostin E2 Vaginal Gel* and *Vaginal Tablets* are not bioequivalent

## ERGOMETRINE MALEATE

**Indications** see notes above

**Cautions** cardiac disease; hypertension; multiple pregnancy; acute porphyria (section 9.8.2); **interactions:** Appendix 1 (ergot alkaloids)

**Contra-indications** induction of labour, first and second stages of labour, vascular disease, severe cardiac disease, sepsis, severe hypertension, eclampsia

**Hepatic impairment** manufacturer advises caution in mild or moderate impairment and avoid in severe impairment

**Renal impairment** manufacturer advises caution in mild or moderate impairment and avoid in severe impairment

**Side-effects** nausea, vomiting, abdominal pain; chest pain, arrhythmias (including bradycardia), palpitation, hypertension, vasoconstriction; dyspnoea, pulmonary oedema; headache, dizziness; tinnitus; rash; *very rarely* myocardial infarction

#### Dose

- See notes above

**Ergometrine** (Non-proprietary) (POM)

**Injection**, ergometrine maleate 500 micrograms/mL, net price 1-mL amp = 60p

**With oxytocin**

**Syntometrine**<sup>®</sup> (Alliance) (POM)

**Injection**, ergometrine maleate 500 micrograms, oxytocin 5 units/mL, net price 1-mL amp = £1.35

**Dose** by intramuscular injection, 1 mL; by intravenous injection, no longer recommended

## GEMEPROST

**Indications** see under Dose

**Cautions** obstructive airways disease, cardiovascular insufficiency, raised intra-ocular pressure, cervicitis or vaginitis; **interactions:** Appendix 1 (prostaglandins) **Important** For warnings relating to use of gemeprost in a patient undergoing induction of abortion with mifepristone, see under Mifepristone and Note below

**Contra-indications** unexplained vaginal bleeding, uterine scarring, placenta praevia

**Renal impairment** manufacturer advises avoid

**Side-effects** vaginal bleeding and uterine pain; nausea, vomiting, or diarrhoea; headache, muscle weakness, dizziness, flushing, chills, backache, dyspnoea, chest pain, palpitation and mild pyrexia; uterine rupture reported (most commonly in multiparas or if history of uterine surgery or if given with intravenous oxytocics); also reported severe hypotension, coronary artery spasm and myocardial infarction

#### Dose

- By vagina, cervical ripening prior to first trimester surgical abortion, 1 mg inserted into posterior fornix 3 hours before surgery
  - Second trimester abortion, 1 mg inserted into posterior fornix every 3 hours for max. of 5 administrations; second course may begin 24 hours after start of treatment (if treatment fails pregnancy should be terminated by another method)
  - Second trimester intra-uterine death, 1 mg inserted into posterior fornix every 3 hours for max. of 5 administrations only; monitor for coagulopathy
- Note** If used in combination with mifepristone, carefully monitor blood pressure and pulse for 3 hours

**Gemeprost** (Sanofi-Aventis) (POM)

**Pessaries**, gemeprost 1 mg, net price 5-pessary pack = £215.00

## OXYTOCIN

**Indications** see under Dose and notes above

**Cautions** induction or enhancement of labour—presence of borderline cephalopelvic disproportion (avoid if significant), secondary uterine inertia, mild or moderate pregnancy-induced hypertension or cardiac disease, women over 35 years or with history of lower-uterine segment caesarean section (see also under Contra-indications below); risk factors for disseminated intravascular coagulation; monitor for disseminated intravascular coagulation after parturition; avoid large infusion volumes and restrict fluid intake by mouth (risk of hyponatraemia and water-intoxication—see also Appendix 6); effects enhanced by concomitant prostaglandins (very careful monitoring of uterine activity); caudal block anaesthesia (may enhance hypertensive effects of sympathomimetic vasopressors); see also **interactions**: Appendix 1 (oxytocin)

**Contra-indications** hypertonic uterine contractions, fetal distress; any condition where spontaneous labour or vaginal delivery inadvisable; avoid prolonged administration in oxytocin-resistant uterine inertia, severe pre-eclamptic toxæmia, or severe cardiovascular disease

**Side-effects** nausea, vomiting; arrhythmia; headache; rarely disseminated intravascular coagulation, rash, and anaphylactoid reactions (with dyspnoea, hypotension, or shock); uterine spasm (may occur at low doses), uterine hyperstimulation (usually with excessive doses—may cause fetal distress, asphyxia, and death, or may lead to hypertonicity, tetanic contractions, soft-tissue damage or uterine rupture); water intoxication and hyponatraemia associated with high doses with large infusion volumes of electrolyte-free fluid (see also under Dose below); placental abruption and amniotic fluid embolism also reported on overdose

### Dose

- Induction of labour for medical reasons or stimulation of labour in hypotonic uterine inertia, by **intravenous infusion** (not to be started for at least 6 hours after administration of vaginal prostaglandin), initially 0.001–0.004 units/minute, increased at intervals of at least 30 minutes until a maximum of 3–4 contractions occur every 10 minutes (0.01 units/minute is often adequate) up to max. 0.02 units/minute; if regular contractions not established after total of 5 units stop induction attempt (may be repeated next day starting again at 0.001–0.004 units/minute)

**Important** Careful monitoring of fetal heart rate and uterine motility essential for dose titration (avoid intravenous injection during labour); discontinue immediately in uterine hyperactivity or fetal distress

- Caesarean section, by **slow intravenous injection** immediately after delivery, 5 units
- Prevention of postpartum haemorrhage, after delivery of placenta, by **slow intravenous injection**, 5 units (if infusion used for induction or enhancement of labour, increase rate during third stage and for next few hours).

**Important** Avoid rapid intravenous injection (may transiently reduce blood pressure)

**Note** Can be given in a dose of 10 units by **intramuscular injection** (unlicensed route) instead of oxytocin with ergometrine (*Syntometrine*®), see notes above

- Treatment of postpartum haemorrhage, by **slow intravenous injection**, 5 units (dose may be repeated), followed in severe cases by **intravenous infusion** of

40 units in 500 mL infusion fluid at a rate sufficient to control uterine atony

**Important** Avoid rapid intravenous injection (may transiently reduce blood pressure); prolonged administration, see warning below

- Incomplete, inevitable, or missed abortion, by **slow intravenous injection**, 5 units followed if necessary by **intravenous infusion**, 0.02–0.04 units/minute or faster

**Important** Prolonged intravenous administration at high doses with large volume of fluid (which is possible in inevitable or missed abortion or postpartum haemorrhage) may cause water intoxication with hyponatraemia. To avoid: use electrolyte-containing diluent (i.e. not glucose), increase oxytocin concentration to reduce fluid, restrict fluid intake by mouth; monitor fluid and electrolytes.

**Note** Oxytocin doses in the BNF may differ from those in the product literature

**Syntocinon**® (Alliance) PM

**Injection**, oxytocin, net price 5 units/mL, 1-mL amp = 76p; 10 units/mL, 1-mL amp = 86p

### With ergometrine

See *Syntometrine*®, p. 487

## 7.1.1.1 Drugs affecting the ductus arteriosus

This section is not included in the BNF. For the management of ductus arteriosus, see *BNF for Children* section 2.14.

## 7.1.2 Mifepristone

**Mifepristone**, an antiprogesterone steroid, sensitises the myometrium to prostaglandin-induced contractions and ripens the cervix. For termination of pregnancy, a single dose of mifepristone is followed by administration of a prostaglandin (gemeprost or misoprostol [unlicensed]). Guidelines of the Royal College of Obstetricians and Gynaecologists (September 2004) include the following [unlicensed] regimens for inducing medical abortion:

- For gestation up to 9 weeks, mifepristone 200 mg by mouth followed 1–3 days later by misoprostol 800 micrograms vaginally; in women at more than 7 weeks gestation (49–63 days), if the abortion has not occurred 4 hours after misoprostol, a further dose of misoprostol 400 micrograms may be given vaginally or by mouth
- For gestation between 9 and 13 weeks, mifepristone 200 mg by mouth followed 36–48 hours later by misoprostol 800 micrograms vaginally followed if necessary by a maximum of 4 further doses at 3-hourly intervals of misoprostol 400 micrograms vaginally or by mouth
- For gestation between 13 and 24 weeks, mifepristone 200 mg by mouth followed 36–48 hours later by misoprostol 800 micrograms vaginally then a maximum of 4 further doses at 3-hourly intervals of misoprostol 400 micrograms by mouth

## MIFEPRISTONE

**Indications** see under dose

**Cautions** asthma (avoid if severe and uncontrolled); haemorrhagic disorders and anticoagulant therapy; prosthetic heart valve or history of endocarditis (see

section 5.1 table 2); risk factors for or existing cardiovascular disease; adrenal suppression (may require corticosteroid); **interactions:** Appendix 1 (mifepristone)

**Important** For warnings relating to use of gemeprost in a patient undergoing induction of abortion with mifepristone, see under Gemeprost

**Contra-indications** uncontrolled severe asthma; suspected ectopic pregnancy (use other specific means of termination); chronic adrenal failure; acute porphyria (section 9.8.2)

**Hepatic impairment** manufacturer advises avoid

**Renal impairment** manufacturer advises avoid

**Side-effects** gastro-intestinal cramps; uterine contractions, vaginal bleeding (sometimes severe) may occur between administration of mifepristone and surgery (and rarely abortion may occur before surgery); *less commonly* hypersensitivity reactions including rash and urticaria; *rarely* hypotension, malaise, headache, fever, hot flushes, dizziness, and chills; infections (including toxic shock syndrome) also reported

#### Dose

- Medical termination of intra-uterine pregnancy of up to 49 days gestation, **by mouth**, mifepristone 600 mg as a single dose under medical supervision followed 36–48 hours later (unless abortion already complete) by gemeprost 1 mg **by vagina** or misoprostol 400 micrograms **by mouth** [unlicensed]; alternative regimen, mifepristone 200 mg **by mouth** as a single dose followed 36–48 hours later (unless abortion already complete) by gemeprost 1 mg **by vagina**; observe for at least 3 hours (or until bleeding or pain at acceptable level); follow-up visit within 2 weeks to verify complete expulsion and to assess vaginal bleeding
  - Medical termination of intra-uterine pregnancy of 50–63 days gestation, **by mouth**, mifepristone 600 mg (200 mg also effective) as a single dose under medical supervision, followed 36–48 hours later (unless abortion already complete) by gemeprost 1 mg **by vagina**; observe for at least 3 hours (or until bleeding or pain at acceptable level); follow-up visit within 2 weeks to verify complete expulsion and to assess vaginal bleeding
  - Cervical ripening before mechanical cervical dilatation for termination of pregnancy of up to 84 days gestation, **by mouth**, mifepristone 200 mg as a single dose under medical supervision 36–48 hours before procedure
  - Termination of pregnancy of 13–24 weeks gestation (in combination with a prostaglandin), **by mouth**, mifepristone 600 mg (200 mg may be effective) as a single dose under medical supervision followed 36–48 hours later by gemeprost 1 mg **by vagina** every 3 hours up to max. 5 mg or misoprostol (see above [unlicensed]); if abortion does not occur, 24 hours after start of treatment repeat course of gemeprost 1 mg **by vagina** up to max. 5 mg; follow-up visit after appropriate interval to assess vaginal bleeding recommended
- Note** Careful monitoring of blood pressure and pulse essential for 3 hours after administration of gemeprost pessary (risk of profound hypotension)
- Labour induction in fetal death *in utero* where prostaglandin or oxytocin inappropriate, **by mouth**, mifepristone 600 mg daily as a single dose for 2 days under medical supervision; if labour not started within 72 hours of first dose, another method should be used

#### Mifegyne® (Nordic) [POM]

**Tablets**, yellow, mifepristone 200 mg, net price 3-tablet pack = £52.66 (supplied to NHS hospitals and pre-mises approved under Abortion Act 1967). Label: 10, patient information leaflet

### 7.1.3 Myometrial relaxants

Tocolytic drugs postpone *premature labour* and they are used with the aim of reducing harm to the child. However, there is no satisfactory evidence that the use of these drugs reduces mortality. The greatest benefit is gained by using the delay to administer corticosteroid therapy or to implement other measures which improve perinatal health (including transfer to a unit with neonatal intensive care facility).

The oxytocin receptor antagonist, **atosiban**, is licensed for the inhibition of uncomplicated premature labour *between 24 and 33 weeks* of gestation. Atosiban may be preferable to a beta<sub>2</sub> agonist because it has fewer side-effects.

The dihydropyridine calcium-channel blocker **nifedipine** (section 2.6.2) also has fewer side-effects than a beta<sub>2</sub> agonist. Nifedipine [unlicensed indication] can be given initially in a dose of 20 mg followed by 10–20 mg 3–4 times daily adjusted according to uterine activity.

A beta<sub>2</sub> agonist (**ritodrine**, **salbutamol**, or **terbutaline**) is used for inhibiting uncomplicated premature labour between 24 and 33 weeks of gestation and it may permit a delay in delivery of at least 48 hours. Prolonged therapy should be avoided since risk to the mother increases after 48 hours and there is a lack of evidence of benefit from further treatment; maintenance treatment is therefore **not recommended**.

**Indometacin** (section 10.1.1), a cyclo-oxygenase inhibitor, also inhibits labour [unlicensed indication] and it can be useful in situations where a beta<sub>2</sub> agonist is not appropriate; however, there are concerns about neonatal complications such as transient impairment of renal function and premature closure of ductus arteriosus.

#### Atosiban

##### ATOSIBAN

**Indications** uncomplicated premature labour (see notes above)

**Cautions** monitor blood loss after delivery; intra-uterine growth restriction; abnormal placental site

**Contra-indications** eclampsia and severe pre-eclampsia, intra-uterine infection, intra-uterine fetal death, antepartum haemorrhage (requiring immediate delivery), placenta praevia, abruptio placenta, intra-uterine growth restriction with abnormal fetal heart rate, premature rupture of membranes after 30 weeks' gestation

**Hepatic impairment** no information available

**Renal impairment** no information available

**Side-effects** nausea, vomiting, tachycardia, hypotension, headache, dizziness, hot flushes, hyperglycaemia, injection-site reaction; *less commonly* pruritus, rash, fever, insomnia

**Dose**

- **By intravenous injection**, initially 6.75 mg over 1 minute, then **by intravenous infusion** 18 mg/hour for 3 hours, then 6 mg/hour for up to 45 hours; max. duration of treatment 48 hours

**Tractocile®** (Ferring) (PAM)

**Injection**, atosiban (as acetate) 7.5 mg/mL, net price 0.9-mL (6.75-mg) vial = £18.41

**Concentrate for intravenous infusion**, atosiban (as acetate) 7.5 mg/mL, net price 5-mL vial = £52.82

**Beta<sub>2</sub> agonists**

**Cautions** Beta<sub>2</sub> agonists should be used with caution in patients with suspected cardiovascular disease (such patients should be assessed by a cardiologist before initiating therapy—see also Contra-indications, below), hypertension, mild to moderate pre-eclampsia, hyperthyroidism, and hypokalaemia (particular risk with potassium-depleting diuretics—see also Hypokalaemia, p. 176). It is important to monitor pulse rate (should not exceed 140 beats per minute), ECG (discontinue treatment if signs of myocardial ischaemia develop), and the patient's fluid and electrolyte status (avoid over-hydration—discontinue drug immediately and initiate diuretic therapy if pulmonary oedema occurs). Beta<sub>2</sub> agonists should also be used with caution in diabetes—monitor blood glucose (risk of hyperglycaemia and ketoacidosis, especially with intravenous beta<sub>2</sub> agonists).

**Contra-indications** Beta<sub>2</sub> agonists are contra-indicated in cardiac disease and in patients with significant risk factors for myocardial ischaemia; they should also be avoided in antepartum haemorrhage, intra-uterine infection, intra-uterine fetal death, placenta praevia, abruptio placenta, threatened miscarriage, cord compression, and eclampsia or severe pre-eclampsia.

**Side-effects** Side-effects of the beta<sub>2</sub> agonists include nausea, vomiting, pulmonary oedema (see Cautions above and under Ritodrine dose), palpitation, tachycardia, arrhythmias, myocardial ischaemia, peripheral vasodilation, headache, tremor, hyperglycaemia, hypokalaemia (see Cautions), muscle cramps and tension, and hypersensitivity reactions (including angioedema, urticaria, rash, bronchospasm, hypotension, and collapse).

**RITODRINE HYDROCHLORIDE**

**Indications** uncomplicated premature labour (see notes above)

**Cautions** see notes above; **interactions:** Appendix 1 (sympathomimetics and sympathomimetics, beta<sub>2</sub>)

**Contra-indications** see notes above

**Side-effects** see notes above; also reported flushing, sweating; salivary gland enlargement; leucopenia and agranulocytosis on prolonged administration (several weeks); liver function abnormalities (including increased transaminases and hepatitis)

**Dose**

- **By intravenous infusion** (**important:** minimum fluid volume, see below), initially 50 micrograms/minute, increased gradually according to response by 50 micrograms/minute every 10 minutes until contractions stop or maternal heart rate reaches 140 beats per minute; continue for 12–48 hours after

contractions cease (usual rate 150–350 micrograms/minute); max. rate 350 micrograms/minute; or **by intramuscular injection**, 10 mg every 3–8 hours continued for 12–48 hours after contractions have ceased; then **by mouth** (but see notes above), 10 mg 30 minutes before termination of intravenous infusion, repeated every 2 hours for 24 hours, followed by 10–20 mg every 4–6 hours, max. oral dose 120 mg daily **Important** Manufacturer states that although *fatal pulmonary oedema* associated with ritodrine infusion is almost certainly multifactorial in origin, evidence suggests that **fluid overload** may be the most important single factor. The volume of infusion should therefore be kept to a minimum; for further guidance see Appendix 6. For specific guidance on infusion rates, consult product literature

**Yutopar®** (Durbin) (PAM)

**Tablets**  yellow, scored, ritodrine hydrochloride 10 mg, net price 90-tab pack = £30.40

**Injection**, ritodrine hydrochloride 10 mg/mL, net price 5-mL amp = £3.55

**SALBUTAMOL**

(Albuterol)

**Indications** uncomplicated premature labour (see notes above); asthma (section 3.1.1)

**Cautions** see notes above; **interactions:** Appendix 1 (sympathomimetics, beta<sub>2</sub>)

**Contra-indications** see notes above

**Side-effects** see notes above

**Dose**

- **By intravenous infusion**, initially 10 micrograms/minute, rate increased gradually according to response at 10-minute intervals until contractions diminish then increase rate slowly until contractions cease (max. rate 45 micrograms/minute); maintain rate for 1 hour after contractions have stopped, then gradually reduce by 50% every 6 hours; then **by mouth** (but see notes above), 4 mg every 6–8 hours

**Preparations**

Section 3.1.1.1

**TERBUTALINE SULPHATE**

**Indications** uncomplicated premature labour (see notes above); asthma (section 3.1.1)

**Cautions** see notes above; **interactions:** Appendix 1 (sympathomimetics, beta<sub>2</sub>)

**Contra-indications** see notes above

**Side-effects** see notes above; also reported sleep disturbances and behavioural disturbances

**Dose**

- **By intravenous infusion**, 5 micrograms/minute for 20 minutes, increased every 20 minutes in steps of 2.5 micrograms/minute until contractions have ceased (more than 10 micrograms/minute should **seldom** be given—20 micrograms/minute should not be exceeded), continue for 1 hour then decrease every 20 minutes in steps of 2.5 micrograms/minute to lowest dose that maintains suppression, continue at this level for 12 hours then **by mouth** (but see notes above), 5 mg every 8 hours for as long as is desirable to prolong pregnancy (or alternatively follow the intravenous infusion **by subcutaneous injection** 250 micrograms every 6 hours for a few days then **by mouth** as above)

**Preparations**

Section 3.1.1.1

## 7.2 Treatment of vaginal and vulval conditions

### 7.2.1 Preparations for vaginal and vulval changes

#### 7.2.2 Vaginal and vulval infections

Symptoms are often restricted to the vulva, but infections almost invariably involve the vagina which should also be treated. Applications to the vulva alone are likely to give only symptomatic relief without cure.

*Aqueous medicated douches* may disturb normal vaginal acidity and bacterial flora.

*Topical anaesthetic agents* give only symptomatic relief and may cause sensitivity reactions. They are indicated only in cases of pruritus where specific local causes have been excluded.

*Systemic drugs* are required in the treatment of infections such as gonorrhoea and syphilis (section 5.1).

### 7.2.1 Preparations for vaginal and vulval changes

#### Topical HRT for vaginal atrophy

A cream containing an oestrogen may be applied on a short-term basis to improve the vaginal epithelium in *menopausal atrophic vaginitis*. It is **important** to bear in mind that topical oestrogens should be used in the **smallest effective** amount to minimise systemic effects. Modified-release vaginal tablets and an impregnated vaginal ring are now also available.

The risk of endometrial hyperplasia and carcinoma is increased when *systemic* oestrogens are administered alone for prolonged periods (section 6.4.1.1). The endometrial safety of long-term or repeated use of *topical* vaginal oestrogens is uncertain; treatment should be reviewed at least annually, with special consideration given to any symptoms of endometrial hyperplasia or carcinoma.

Topical oestrogens are also used in postmenopausal women before vaginal surgery for prolapse when there is epithelial atrophy.

For a general comment on hormone replacement therapy, including the role of topical oestrogens, see section 6.4.1.1.

## OESTROGENS, TOPICAL

**Indications** see notes above

**Cautions** see notes above; see also Oestrogens for HRT (section 6.4.1.1); interrupt treatment periodically to assess need for continued treatment

**Contra-indications** see notes above; see also Oestrogens for HRT (section 6.4.1.1)

**Hepatic impairment** see Combined Hormonal Contraceptives, section 7.3.1

**Pregnancy** see Combined Hormonal Contraceptives, section 7.3.1

**Breast-feeding** avoid; adverse effects on lactation; see also Combined Hormonal Contraceptives, section 7.3.1

**Side-effects** see notes above; see also Oestrogens for HRT (section 6.4.1.1); local irritation

**Gynest®** (Marlborough) (P<sub>M</sub>)

**Intravaginal cream**, estriol 0.01%, net price 80 g with applicator = £4.67

**Excipients** include arachis (peanut) oil

**Condoms** may damage latex condoms and diaphragms

**Dose** insert 1 applicatorful daily, preferably in the evening until improvement occurs, reduced to 1 applicatorful twice a week; attempts to discontinue should be made at 3–6 month intervals with re-examination

**Ortho-Gynest®** (Janssen-Cilag) (P<sub>M</sub>)

**Pessaries**, estriol 500 micrograms, net price 15 pessaries = £4.73

**Excipients** include butylated hydroxytoluene

**Condoms** damages latex condoms and diaphragms

**Dose** insert 1 pessary daily, preferably in the evening, until improvement occurs; maintenance 1 pessary twice a week; attempts to reduce or discontinue should be made at 3–6 month intervals with re-examination

**Ovestin®** (Organon) (P<sub>M</sub>)

**Intravaginal cream**, estriol 0.1%, net price 15 g with applicator = £4.45

**Excipients** include cetyl alcohol, polysorbates, stearyl alcohol

**Condoms** effect on latex condoms and diaphragms not yet known

**Dose** insert 1 applicator-dose daily for 2–3 weeks, then reduce to twice a week (discontinue every 2–3 months for 4 weeks to assess need for further treatment); vaginal surgery, 1 applicator-dose daily for 2 weeks before surgery, resuming 2 weeks after surgery

**Vagifem®** (Novo Nordisk) (P<sub>M</sub>)

**Vaginal tablets**, f/c, estradiol 10 micrograms in disposable applicators, net price 24-applicator pack = £16.72; estradiol 25 micrograms in disposable applicators, 15-applicator pack = £9.50

**Excipients** none as listed in section 13.1.3

**Condoms** no evidence of damage to latex condoms and diaphragms

**Dose** insert 1 vaginal tablet daily for 2 weeks then reduce to 1 tablet twice weekly; initiate therapy with 10 microgram vaginal tablets, increased after 3 months to 25 microgram vaginal tablet if response inadequate

#### ▲ Vaginal ring

**Estring®** (Pharmacia) (P<sub>M</sub>)

**Vaginal ring**, releasing estradiol approx. 7.5 micrograms/24 hours, net price 1-ring pack = £31.42. Label: 10, patient information leaflet

**Dose** for postmenopausal urogenital conditions (not suitable for vasomotor symptoms or osteoporosis prophylaxis), to be inserted into upper third of vagina and worn continuously; replace after 3 months; max. duration of continuous treatment 2 years

## Non-hormonal preparations for vaginal atrophy

*Replens MD®* and *Sylk®* are acidic, non-hormonal vaginal moisturisers; *Replens MD®* provides a high moisture content for up to 3 days.

## 7.2.2 Vaginal and vulval infections

Effective specific treatments are available for the common vaginal infections.

### Fungal infections

*Candidal vulvitis* can be treated locally with cream, but is almost invariably associated with vaginal infection which should also be treated. *Vaginal candidiasis* is treated primarily with antifungal pessaries or cream inserted high into the vagina (including during menstruation). Single-dose preparations offer an advantage when compliance is a problem. Local irritation may occur on application of vaginal antifungal products.

**Imidazole** drugs (clotrimazole, econazole, fenticonazole, and miconazole) are effective against candida in short courses of 1 to 14 days according to the preparation used; treatment can be repeated if initial course fails to control symptoms or if symptoms recur. Vaginal applications may be supplemented with antifungal cream for vulvitis and to treat other superficial sites of infection.

Oral treatment of vaginal infection with **fluconazole** or **itraconazole** (section 5.2.1) is also effective; oral ketoconazole has been associated with fatal hepatotoxicity (see section 5.2.2).

**Vulvovaginal candidiasis in pregnancy** Vulvovaginal candidiasis is common during pregnancy and can be treated with vaginal application of an imidazole (such as clotrimazole), and a topical imidazole cream for vulvitis. Pregnant women need a longer duration of treatment, usually about 7 days, to clear the infection. Oral antifungal treatment should be avoided during pregnancy.

**Recurrent vulvovaginal candidiasis** Recurrence of vulvovaginal candidiasis is particularly likely if there are predisposing factors such as antibacterial therapy, pregnancy, diabetes mellitus and possibly oral contraceptive use. Reservoirs of infection may also lead to recontamination and should be treated; these include other skin sites such as the digits, nail beds, and umbilicus as well as the gastro-intestinal tract and the bladder. The partner may also be the source of re-infection and, if symptomatic, should be treated with cream at the same time.

Treatment against candida may need to be extended for 6 months in recurrent vulvovaginal candidiasis. Some recommended regimens [all unlicensed] include:

- initially, fluconazole (section 5.2.1) by mouth 150 mg every 72 hours for 3 doses, then 150 mg once every week for 6 months;
- initially, vaginal application of a topical imidazole for 10–14 days, then clotrimazole vaginally 500-mg pessary once every week for 6 months;
- initially, vaginal application of a topical imidazole for 10–14 days, then itraconazole (section 5.2.1) by mouth 50–100 mg daily for 6 months.

## PREPARATIONS FOR VAGINAL AND VULVAL CANDIDIASIS

**Indications** see notes above

**Pregnancy** see notes above

**Side-effects** occasional local irritation

### Dose

- See under preparations below

#### Clotrimazole (Non-proprietary)

**Cream** (topical), clotrimazole 1%, net price 20 g = £1.52 50 g = £4.12

**Condoms** check with manufacturer of cream for effect on latex condoms and diaphragms

**Dose** apply to anogenital area 2–3 times daily

**Pessary**, clotrimazole 500 mg, net price 1 pessary with applicator = £3.13

**Dose** insert 1 pessary at night as a single dose; can be repeated once if necessary

#### Canesten® (Bayer Consumer Care)

**Cream** (topical), clotrimazole 1%, net price 20 g = £2.14; 50 g = £3.50

**Excipients** include benzyl alcohol, cetostearyl alcohol, polysorbates

**Condoms** damages latex condoms and diaphragms

**Dose** apply to anogenital area 2–3 times daily

**Thrush Cream** (topical), clotrimazole 2%, net price 20 g = £3.99

**Excipients** include benzyl alcohol, cetostearyl alcohol, polysorbates

**Condoms** damages latex condoms and diaphragms

**Dose** apply to anogenital area 2–3 times daily

**Intravaginal cream (10% VC®)** (POM), clotrimazole 10%, net price 5-g applicator pack = £4.50

**Excipients** include benzyl alcohol, cetostearyl alcohol, polysorbates

**Condoms** damages latex condoms and diaphragms

**Dose** insert 5 g at night as a single dose; can be repeated once if necessary

**Note** Brands for sale to the public include *Canesten® Internal Cream*

**Cream Combi**, clotrimazole 10% vaginal cream and 2% topical cream, net price 5-g vaginal cream (with applicator) and 10-g topical cream = £6.81

**Excipients** include benzyl alcohol, cetostearyl alcohol, polysorbates

**Condoms** damages latex condoms and diaphragms

**Dose** see under individual components

**Pessaries**, clotrimazole 100 mg, net price 6 pessaries with applicator = £3.63; 200 mg, 3 pessaries with applicator = £3.63

**Condoms** damages latex condoms and diaphragms

**Dose** insert 200 mg for 3 nights or 100 mg for 6 nights; course can be repeated once if necessary

**Pessary**, clotrimazole 500 mg, net price 1 pessary with applicator = £2.00

**Excipients** none as listed in section 13.1.3

**Condoms** damages latex condoms and diaphragms

**Dose** insert 1 pessary at night as a single dose; can be repeated once if necessary

**Combi**, clotrimazole 500-mg pessary and cream (topical) 2%, net price 1 pessary and 10-g cream = £5.21

**Condoms** damages latex condoms and diaphragms

**Dose** see under individual components

#### Gyno-Daktarin® (Janssen-Cilag) (POM)

**Intravaginal cream**, miconazole nitrate 2%, net price 78 g with applicators = £4.33

**Excipients** include butylated hydroxyanisole

**Condoms** damages latex condoms and diaphragms

**Dose** insert 5-g applicatorful once daily for 10–14 days or twice daily for 7 days; course can be repeated once if necessary; *topical*, apply to anogenital area twice daily

**Ovule** (= vaginal capsule) (*Gyno-Daktarin 1\**), miconazole nitrate 1.2 g in a fatty basis, net price 1 ovule = £2.94

**Excipients** include hydroxybenzoates (parabens)  
**Condoms** damages latex condoms and diaphragms

**Dose** insert 1 ovule at night as a single dose; can be repeated once if necessary

#### **Gyno-Pevaryl\*** (Janssen-Cilag) (POM)

**Cream**, econazole nitrate 1%, net price 15 g = £1.32; 30 g = £3.02

**Excipients** none as listed in section 13.1.3  
**Condoms** damages latex condoms and diaphragms

**Dose** insert 5-g applicatorful **intravaginally** and apply to vulva at night for at least 14 nights; course can be repeated once if necessary

**Note** Applicator available separately from Marlborough

**Pessaries**, econazole nitrate 150 mg, net price 3 pessaries = £2.78

**Excipients** none as listed in section 13.1.3  
**Condoms** damages latex condoms and diaphragms

**Dose** **ADULT** and **CHILD** over 16 years, insert 1 pessary for 3 nights; course can be repeated once if necessary

**Pessary** (*Gyno-Pevaryl 1\**), econazole nitrate 150 mg, formulated for single-dose therapy, net price 1 pessary with applicator = £2.95

**Excipients** none as listed in section 13.1.3  
**Condoms** damages latex condoms and diaphragms  
**Dose** **ADULT** and **CHILD** over 16 years, insert 1 pessary at night as a single dose; can be repeated once if necessary

#### **Gynoxin\*** (Recordati) (POM)

**Intravaginal cream**, fenticonazole nitrate 2%, net price 30 g with applicator = £3.74

**Excipients** include cetyl alcohol, hydrogenated wool fat, propylene glycol  
**Condoms** damages latex condoms and diaphragms

**Dose** insert 5-g applicatorful intravaginally twice daily for 3 days  
**Vaginal capsule**, fenticonazole nitrate 200 mg, net price 3 vaginal capsules = £2.42

**Excipients** include hydrobenzoates (parabens)  
**Condoms** damages latex condoms and diaphragms

**Dose** insert 1 vaginal capsule at night for 3 nights

**Vaginal capsule**, fenticonazole nitrate 600 mg, net price 1 vaginal capsule = £2.62

**Excipients** include hydrobenzoates (parabens)  
**Condoms** damages latex condoms and diaphragms  
**Dose** insert 1 vaginal capsule at night as a single dose

#### **Nizoral\*** (Janssen-Cilag) (POM)

**Cream** (topical), ketoconazole 2%, net price 30 g = £3.40

**Excipients** include polysorbates, propylene glycol, stearyl alcohol  
**Condoms** effect on latex condoms and diaphragms not yet known  
**Dose** apply to anogenital area once or twice daily

## Other infections

*Trichomonal infections* commonly involve the lower urinary tract as well as the genital system and need systemic treatment with metronidazole or tinidazole (section 5.1.11).

*Bacterial infections* with Gram-negative organisms are particularly common in association with gynaecological operations and trauma. Metronidazole is effective against certain Gram-negative organisms, especially *Bacteroides* spp. and can be used prophylactically in gynaecological surgery.

Clindamycin cream and metronidazole gel are indicated for bacterial vaginosis.

Vaginal preparations intended to restore normal acidity may prevent recurrence of vaginal infections and permit the re-establishment of the normal vaginal flora.

The antiviral drugs aciclovir, famciclovir, and valaciclovir can be used in the treatment of genital infection due to *herpes simplex virus*, the HSV type 2 being a major cause of genital ulceration; they have a beneficial effect on virus shedding and healing, generally giving relief from pain and other symptoms. See section 5.3.2.1 for systemic preparations, and section 13.10.3 for topical preparations.

## PREPARATIONS FOR OTHER VAGINAL INFECTIONS

#### **Dalacin\*** (Pharmacia) (POM)

**Cream**, clindamycin 2% (as phosphate), net price 40-g pack with 7 applicators = £10.86

**Excipients** include benzyl alcohol, cetostearyl alcohol, polysorbates, propylene glycol  
**Condoms** damages latex condoms and diaphragms

**Side-effects** irritation, cervicitis, and vaginitis; poorly absorbed into the blood—low risk of systemic effects, see section 5.1.6

**Dose** bacterial vaginosis, insert 5-g applicatorful at night for 3–7 nights

#### **Zidoval\*** (Meda) (POM)

**Vaginal gel**, metronidazole 0.75%, net price 40-g pack with 5 applicators = £4.31

**Excipients** include disodium edetate, hydroxybenzoates (parabens), propylene glycol

**Cautions** not recommended during menstruation; some absorption may occur, see section 5.1.11 for systemic effects

**Side-effects** local effects including irritation, candidiasis, abnormal discharge, pelvic discomfort

**Dose** bacterial vaginosis, insert 5-g applicatorful at night for 5 nights

#### **Relactagel\*** (KoRa)

**Vaginal gel**, lactic acid 4.5%, glycogen 0.1%, net price 7 × 5 mL-tube = £5.25

**Excipients** include propylene glycol

**Cautions** not recommended if trying to conceive

**Side-effects** mild irritation

**Dose** prevention of bacterial vaginosis, **ADULT** over 18 years insert contents of 1 tube at night for 2–3 nights after menstruation

## 7.3 Contraceptives

### 7.3.1 Combined hormonal contraceptives

### 7.3.2 Progestogen-only contraceptives

### 7.3.3 Spermicidal contraceptives

### 7.3.4 Contraceptive devices

### 7.3.5 Emergency contraception

The Fraser Guidelines<sup>1</sup> should be followed when prescribing contraception for women under 16 years. The UK Medical Eligibility Criteria for Contraceptive Use (available at [www.fsrh.org](http://www.fsrh.org)) is published by the Faculty of Sexual and Reproductive Healthcare; it categorises the risks of using contraceptive methods with pre-existing medical conditions.

**Hormonal contraception** is the most effective method of fertility control, but can have major and minor side-effects, especially for certain groups of women.

**Intra-uterine devices** are a highly effective method of contraception but may produce undesirable local side-effects. They may be used in women of all ages irre-

1. See Department of Health Guidance (July 2004): Best practice guidance for doctors and other health professionals on the provision of advice and treatment to young people under 16 on contraception, sexual and reproductive health. Available at [www.dh.gov.uk](http://www.dh.gov.uk)

spective of parity, but are less appropriate for those with an increased risk of pelvic inflammatory disease.

**Barrier methods** alone (condoms, diaphragms, and caps) are less effective but can be reliable for well-motivated couples if used in conjunction with a **spermicide**. Occasionally sensitivity reactions occur. A female condom (*Femidom*®) is also available; it is prelubricated but does not contain a spermicide.

be used with care if an increased plasma-potassium concentration might be hazardous.

The progestogen norelgestromin is combined with ethinylestradiol in a transdermal patch (*Evrá*®).

The vaginal contraceptive ring contains the progestogen etonogestrel combined with ethinylestradiol (*NuvaRing*®).

## 7.3.1 Combined hormonal contraceptives

Oral contraceptives containing an oestrogen and a progestogen ('combined oral contraceptives') are effective preparations for general use. Advantages of combined oral contraceptives include:

- reliable and reversible;
- reduced dysmenorrhoea and menorrhagia;
- reduced incidence of premenstrual tension;
- less symptomatic fibroids and functional ovarian cysts;
- less benign breast disease;
- reduced risk of ovarian and endometrial cancer;
- reduced risk of pelvic inflammatory disease.

Combined oral contraceptives containing a fixed amount of an oestrogen and a progestogen in each active tablet are termed 'monophasic'; those with varying amounts of the two hormones are termed 'phasic'. A transdermal patch and a vaginal ring, both containing an oestrogen with a progestogen, are also available.

**Choice** The majority of combined oral contraceptives contain ethinylestradiol as the oestrogen component; mestranol and estradiol valerate are also used. The ethinylestradiol content of combined oral contraceptives ranges from 20 to 40 micrograms. Generally a preparation with the lowest oestrogen and progestogen content which gives good cycle control and minimal side-effects in the individual woman is chosen.

- **Low strength preparations** (containing ethinylestradiol 20 micrograms) are particularly appropriate for women with risk factors for circulatory disease, provided a combined oral contraceptive is otherwise suitable. It is recommended that the combined oral contraceptive is not continued beyond 50 years of age since more suitable alternatives exist.
- **Standard strength preparations** (containing ethinylestradiol 30 or 35 micrograms or in 30–40 microgram *phased* preparations) are appropriate for standard use—but see Risk of Venous Thromboembolism below. *Phased* preparations are generally reserved for women who *either* do not have withdrawal bleeding *or* who have breakthrough bleeding with monophasic products.

The progestogens desogestrel, drospirenone, and gestodene (in combination with ethinylestradiol) may be considered for women who have side-effects (such as acne, headache, depression, weight gain, breast symptoms, and breakthrough bleeding) with other progestogens. However, women should be advised that desogestrel and gestodene have also been associated with an increased risk of *venous thromboembolism*. Drospirenone, a derivative of spironolactone, has anti-androgenic and anti-mineralocorticoid activity; it should

**Risk of venous thromboembolism** There is an increased risk of venous thromboembolic disease (particularly during the first year) in users of oral contraceptives, but this risk is considerably smaller than that associated with pregnancy (about 60 cases of venous thromboembolic disease per 100 000 pregnancies). In all cases the risk of venous thromboembolism increases with age and in the presence of other risk factors for venous thromboembolism, such as obesity.

The incidence of venous thromboembolism in healthy, non-pregnant women who are not taking an oral contraceptive is about 5–10 cases per 100 000 women per year. For those using combined oral contraceptives containing second-generation progestogens, such as levonorgestrel, this incidence is about 15 per 100 000 women per year of use. The risk of venous thromboembolism with transdermal patches may be slightly increased compared with combined oral contraceptives that contain levonorgestrel. Some studies have reported a greater risk of venous thromboembolism in women using combined oral contraceptives containing the third-generation progestogens desogestrel and gestodene; the incidence in these women is about 25 per 100 000 women per year of use. The absolute risk of venous thromboembolism in women using combined oral contraceptives containing these third-generation progestogens is very small and well below the risk associated with pregnancy. The risk of venous thromboembolism in women using a combined oral contraceptive containing drospirenone may be between that associated with combined oral contraceptives containing second-generation progestogens and those containing third-generation progestogens. The risk of venous thromboembolism associated with vaginal ring use compared to the risk with other combined hormonal contraceptives is unknown.

Provided that women are informed of the relative risks of venous thromboembolism and accept them, the choice of oral contraceptive is for the woman together with the prescriber jointly to make in light of her individual medical history and any contra-indications.

**Travel** Women taking oral contraceptives or using the patch or vaginal ring are at an increased risk of deep-vein thrombosis during travel involving long periods of immobility (over 5 hours). The risk may be reduced by appropriate exercise during the journey and possibly by wearing graduated compression hosiery.

**Missed pill** The critical time for loss of contraceptive protection is when a pill is omitted at the *beginning* or *end* of a cycle (which lengthens the pill-free interval).

If a woman forgets to take a pill, it should be taken as soon as she remembers, and the next one taken at the normal time (even if this means taking 2 pills together). A missed pill is one that is 24 or more hours late; for women taking *Qlaira*®, see below. If a woman misses only one pill, she should take an active pill as soon as

she remembers and then resume normal pill-taking. No additional precautions are necessary.

If a woman misses 2 or more pills (especially from the first 7 in a packet), she may not be protected. She should take an active pill as soon as she remembers and then resume normal pill-taking. In addition, she must either abstain from sex or use an additional method of contraception such as a condom for the next 7 days. If these 7 days run beyond the end of the packet, the next packet should be started at once, omitting the pill-free interval (or, in the case of *everyday* (ED) pills, omitting the 7 inactive tablets).

A missed pill for a woman taking *Qlaira*® is one that is 12 hours or more late; for information on how to manage missed pills in women taking *Qlaira*®, refer to product literature.

Emergency contraception (section 7.3.5) is recommended if 2 or more combined oral contraceptive tablets are missed from the first 7 tablets in a packet and unprotected intercourse has occurred since finishing the last packet.

**Note** The Faculty of Sexual and Reproductive Healthcare offers 2 different types of missed pill advice depending on the ethinylestradiol content of the contraceptive pill. The missed pill information above offers the same advice regardless of the ethinylestradiol content of the contraceptive pill; it is a simplified, more cautious version of advice issued by the Faculty of Sexual and Reproductive Healthcare.

**Delayed application or detached patch** If a patch is partly detached for less than 24 hours, reapply to the same site or replace with a new patch immediately; no additional contraception is needed and the next patch should be applied on the usual 'change day'. If a patch remains detached for more than 24 hours or if the user is not aware when the patch became detached, then stop the current contraceptive cycle and start a new cycle by applying a new patch, giving a new 'Day 1'; an additional non-hormonal contraceptive must be used concurrently for the first 7 days of the new cycle.

If application of a new patch at the start of a new cycle is delayed, contraceptive protection is lost. A new patch should be applied as soon as remembered giving a new 'Day 1'; additional non-hormonal methods of contraception should be used for the first 7 days of the new cycle. If intercourse has occurred during this extended patch-free interval, a possibility of fertilisation should be considered. If application of a patch in the middle of the cycle is delayed (i.e. the patch is not changed on day 8 or day 15):

- for up to 48 hours, apply a new patch immediately; next patch 'change day' remains the same and no additional contraception is required;
- for more than 48 hours, contraceptive protection may have been lost. Stop the current cycle and start a new 4-week cycle immediately by applying a new patch giving a new 'Day 1'; additional non-hormonal contraception should be used for the first 7 days of the new cycle.

If the patch is not removed at the end of the cycle (day 22), remove it as soon as possible and start the next cycle on the usual 'change day', the day after day 28; no additional contraception is required.

**Expulsion, delayed insertion or removal, or broken vaginal ring** If the vaginal ring is expelled for less than 3 hours, rinse the ring with cool water and reinsert immediately; no additional contraception is needed.

If the ring remains outside the vagina for more than 3 hours or if the user does not know when the ring was expelled, contraceptive protection may be reduced:

- If ring expelled during week 1 or 2 of cycle, rinse ring with cool water and reinsert; use additional precautions (barrier methods) for next 7 days;
- If ring expelled during week 3 of cycle, either insert a new ring to start a new cycle or allow a withdrawal bleed and insert a new ring no later than 7 days after ring was expelled; latter option only available if ring was used continuously for at least 7 days before expulsion.

If insertion of a new ring at the start of a new cycle is delayed, contraceptive protection is lost. A new ring should be inserted as soon as possible; additional precautions (barrier methods) should be used for the first 7 days of the new cycle. If intercourse occurred during the extended ring-free interval, pregnancy should be considered.

No additional contraception is required if removal of the ring is delayed by up to 1 week (4 weeks of continuous use). The 7-day ring-free interval should be observed and subsequently a new ring should be inserted. Contraceptive protection may be reduced with continuous use of the ring for more than 4 weeks—pregnancy should be ruled out before inserting a new ring.

If the ring breaks during use, remove it and insert a new ring immediately; additional precautions (barrier methods) should be used for the first 7 days of the new cycle.

**Diarrhoea and vomiting** Vomiting and persistent, severe diarrhoea can interfere with the absorption of combined oral contraceptives. If vomiting occurs within 2 hours of taking a combined oral contraceptive another pill should be taken as soon as possible. In cases of persistent vomiting or severe diarrhoea lasting more than 24 hours, additional precautions should be used during and for 7 days (9 days for *Qlaira*®) after recovery (see also under Missed pill, above). If the vomiting and diarrhoea occurs during the last 7 tablets, the next pill-free interval should be omitted (in the case of ED tablets the inactive ones should be omitted).

**Interactions** The effectiveness of combined oral contraceptives, *progestogen-only* oral contraceptives (section 7.3.2.1), contraceptive patches, and vaginal rings can be considerably reduced by interaction with drugs that induce hepatic enzyme activity (e.g. carbamazepine, eslicarbazepine, modafinil, nelfinavir, nevirapine, oxcarbazepine, phenytoin, phenobarbital, primidone, ritonavir, St John's Wort, topiramate, and, above all, rifabutin and rifampicin). A condom together with a long-acting method, such as an injectable contraceptive, may be more suitable for patients with HIV infection or at risk of HIV infection; advice on the possibility of interaction with antiretroviral drugs should be sought from HIV specialists.

For a short course of an enzyme-inducing drug, the dose of combined oral contraceptives should be adjusted to provide ethinylestradiol 50 micrograms or more daily [unlicensed use]; furthermore, additional contraceptive precautions should be taken whilst taking the enzyme-inducing drug and for 4 weeks after stopping it. Additional contraceptive precautions are also required for women using contraceptive patches and vaginal rings whilst taking the enzyme-inducing drug and for 4 weeks after stopping. If concomitant administration runs

beyond the 3 weeks of patch or vaginal ring use, a new treatment cycle should be started immediately without a patch-free or ring-free break.

Women requiring a *long-term course of an enzyme-inducing drug* should be encouraged to consider a contraceptive method that is unaffected by the interacting drug. In women unable to use an alternative method of contraception (for rifampicin and rifabutin see also below), a regimen of combined oral contraceptives should be taken which provides a daily intake of ethinylestradiol 50 micrograms or more [unlicensed use]; 'tricycling' (i.e. taking 3 or 4 packets of monophasic tablets without a break followed by a short tablet-free interval of 4 days) may be recommended. **Rifampicin** and **rifabutin** are such potent enzyme-inducing drugs that an alternative method of contraception (such as an IUD) is **always** recommended. Since enzyme activity does not return to normal for several weeks after stopping an enzyme-inducing drug, appropriate contraceptive measures are required for 4 to 8 weeks after stopping. Contraceptive patches and vaginal rings are not recommended for women taking enzyme-inducing drugs over a long period.

In the past there have been concerns that some antibacterials that do not induce liver enzymes (e.g. ampicillin, doxycycline) reduce the efficacy of *combined* oral contraceptives by impairing the bacterial flora responsible for recycling ethinylestradiol from the large bowel. However, there is a lack of evidence to support this interaction. Current recommendations are that no additional contraceptive precautions are required when *combined* oral contraceptives are used with antibacterials that do not induce liver enzymes, unless diarrhoea or vomiting occur (see above).

It is also currently recommended that no additional contraceptive precautions are required when contraceptive patches or vaginal rings are used with antibacterials that do not induce liver enzymes.

**Surgery** Oestrogen-containing contraceptives should preferably be discontinued (and adequate alternative contraceptive arrangements made) 4 weeks before major elective surgery and all surgery to the legs or surgery which involves prolonged immobilisation of a lower limb; they should normally be recommenced at the first menses occurring at least 2 weeks after full mobilisation. A progestogen-only contraceptive may be offered as an alternative and the oestrogen-containing contraceptive restarted after mobilisation, as above. When discontinuation of an oestrogen-containing contraceptive is not possible, e.g. after trauma or if a patient admitted for an elective procedure is still on an oestrogen-containing contraceptive, thromboprophylaxis (with unfractionated or low molecular weight heparin and graduated compression hosiery) is advised. These recommendations do not apply to minor surgery with short duration of anaesthesia, e.g. laparoscopic sterilisation or tooth extraction, or to women using oestrogen-free hormonal contraceptives.

**Reason to stop immediately** Combined hormonal contraceptives or hormone replacement therapy (HRT) should be stopped (pending investigation and treatment), if any of the following occur:

- sudden severe chest pain (even if not radiating to left arm);
- sudden breathlessness (or cough with blood-stained sputum);

- unexplained swelling or severe pain in calf of one leg;
- severe stomach pain;
- serious neurological effects including unusual severe, prolonged headache especially if first time or getting progressively worse or sudden partial or complete loss of vision or sudden disturbance of hearing or other perceptual disorders or dysphasia or bad fainting attack or collapse or first unexplained epileptic seizure or weakness, motor disturbances, very marked numbness suddenly affecting one side or one part of body;
- hepatitis, jaundice, liver enlargement;
- blood pressure above systolic 160 mmHg or diastolic 95 mmHg;
- prolonged immobility after surgery or leg injury;
- detection of a risk factor which contra-indicates treatment (see Cautions and Contra-indications under Combined Hormonal Contraceptives below or under Oestrogens for HRT (section 6.4.1.1)).

## COMBINED HORMONAL CONTRACEPTIVES

**Indications** contraception; menstrual symptoms (section 6.4.1.2)

**Cautions** see notes above; risk factors for venous thromboembolism (see below and also notes above), arterial disease and migraine, see below; personal or family history of hypertriglyceridaemia (increased risk of pancreatitis); hyperprolactinaemia (seek specialist advice); history of severe depression especially if induced by hormonal contraceptive; undiagnosed breast mass; gene mutations associated with breast cancer (e.g. BRCA 1); sickle-cell disease; inflammatory bowel disease including Crohn's disease; reduced efficacy of contraceptive patch in women with body-weight  $\geq 90$  kg; active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice; **interactions:** see above and Appendix 1 (oestrogens, progestogens)

**Risk factors for venous thromboembolism** See also notes above. Use with **caution** if any of following factors present but **avoid** if two or more factors present:

- *family history of venous thromboembolism* in first-degree relative aged under 45 years (avoid contraceptive containing desogestrel or gestodene, or avoid if known prothrombotic coagulation abnormality e.g. factor V Leiden or antiphospholipid antibodies (including lupus anticoagulant));
- *obesity*—body mass index  $\geq 30$  kg/m<sup>2</sup> (avoid if body mass index  $\geq 35$  kg/m<sup>2</sup> unless no suitable alternative);
- *long-term immobilisation* e.g. in a wheelchair (avoid if confined to bed or leg in plaster cast);
- *history of superficial thrombophlebitis*;
- *age over 35 years* (avoid if over 50 years);
- *smoking*.

**Risk factors for arterial disease** Use with **caution** if any of following factors present but **avoid** if two or more factors present:

- *family history of arterial disease* in first degree relative aged under 45 years (avoid if atherogenic lipid profile);
- *diabetes mellitus* (avoid if diabetes complications present);
- *hypertension*—blood pressure above *systolic 140 mmHg or diastolic 90 mmHg* (avoid if blood pressure above *systolic 160 mmHg or diastolic 95 mmHg*);
- *smoking* (avoid if smoking 40 or more cigarettes daily);
- *age over 35 years* (avoid if over 50 years);
- *obesity* (avoid if body mass index  $\geq 35$  kg/m<sup>2</sup> unless no suitable alternative);

- *migraine without aura* (avoid if *migraine with aura* (focal symptoms), or severe migraine frequently lasting over 72 hours despite treatment, or migraine treated with ergot derivatives).

**Migraine** Women should report any increase in headache frequency or onset of focal symptoms (discontinue immediately and refer urgently to neurology expert if focal neurological symptoms not typical of aura persist for more than 1 hour—see also Reason To Stop Immediately in notes above)

**Contra-indications** see notes above; personal history of venous or arterial thrombosis, severe or multiple risk factors for arterial disease or for venous thromboembolism (see above), heart disease associated with pulmonary hypertension or risk of embolus; sclerosing treatment for varicose veins; migraine with aura (see also above); transient cerebral ischaemic attacks without headaches; systemic lupus erythematosus with (or unknown) antiphospholipid antibodies; acute porphyria (section 9.8.2); gallstones; history of haemolytic uraemic syndrome or history during pregnancy of pruritus, cholestatic jaundice, chorea, pemphigoid gestationis; history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal methods unacceptable; undiagnosed vaginal bleeding

**Hepatic impairment** avoid in active liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), and liver tumours

**Pregnancy** not known to be harmful

**Breast-feeding** avoid until weaning or for 6 months after birth (adverse effects on lactation)

**Side-effects** see notes above; also nausea, vomiting, abdominal cramps, changes in body-weight, liver impairment, hepatic tumours; fluid retention, thrombosis (more common when factor V Leiden present or in blood groups A, B, and AB; see also notes above), hypertension, changes in lipid metabolism; headache, depression, chorea, nervousness, irritability; changes in libido, breast tenderness, enlargement, and secretion; reduced menstrual loss, 'spotting' in early cycles, absence of withdrawal bleeding, amenorrhoea after discontinuation, changes in vaginal discharge, cervical erosion; contact lenses may irritate, visual disturbances; leg cramps; skin reactions, chloasma, photosensitivity; rarely gallstones and systemic lupus erythematosus

**Breast cancer** There is a small increase in the risk of having breast cancer diagnosed in women taking the combined oral contraceptive pill; this relative risk may be due to an earlier diagnosis. In users of combined oral contraceptive pills the cancers are more likely to be localised to the breast. The most important factor for diagnosing breast cancer appears to be the age at which the contraceptive is stopped rather than the duration of use; any increase in the rate of diagnosis diminishes gradually during the 10 years after stopping and disappears by 10 years

**Cervical cancer** Use of combined oral contraceptives for 5 years or longer is associated with a small increased risk of cervical cancer; the risk diminishes after stopping and disappears by about 10 years. The risk of cervical cancer with transdermal patches and vaginal rings is not yet known

**Note** The possible small increase in the risk of breast cancer and cervical cancer should be weighed against the protective effect against cancers of the ovary and endometrium

#### Dose

- **By mouth**, each tablet should be taken at approximately same time each day; if delayed, contraceptive protection may be lost (see missed pill)

**21-day combined (monophasic) preparations**, 1 tablet daily for 21 days; subsequent courses repeated after a 7-day interval (during which withdrawal

bleeding occurs); first course usually started on day 1 of cycle—if starting on day 4 of cycle or later, additional precautions (barrier methods) necessary during first 7 days

**Every day (ED) combined (monophasic) preparations**, 1 active tablet starting on day 1 of cycle (see also under preparations below)—if starting on day 4 of cycle or later, additional precautions (barrier methods) necessary during first 7 days; withdrawal bleeding occurs when inactive tablets being taken; subsequent courses repeated without interval

**Phasic preparations**, see under individual preparations below

**Changing to combined preparation containing different progestogen** **21-day combined preparations**: continue current pack until last tablet and start first tablet of new brand the next day. If a 7-day break is taken before starting new brand, additional precautions (barrier methods) should be used during first 7 days (9 days for *Qlaira*®) of taking the new brand

**Every Day (ED) combined preparations**: start the new brand (first tablet of a 21-day preparation or the first active tablet of an ED preparation) the day after taking the last active tablet of previous brand (omitting the inactive tablets)

**Changing from progestogen-only tablet** Start on day 1 of menstruation or any day if amenorrhoea present and pregnancy has been excluded

**Secondary amenorrhoea (exclude pregnancy)** Start any day, additional precautions (barrier methods) necessary during first 7 days (9 days for *Qlaira*®)

**After childbirth (not breast-feeding)** Start 3 weeks after birth (increased risk of thrombosis if started earlier); later than 3 weeks postpartum additional precautions (barrier methods) necessary for first 7 days (9 days for *Qlaira*®)

**After abortion or miscarriage** Start same day

- **By transdermal application**, apply first patch on day 1 of cycle, change patch on days 8 and 15; remove third patch on day 22 and apply new patch after 7-day patch-free interval to start subsequent contraceptive cycle

**Note** If first patch applied later than day 1, additional precautions (abstinence or barrier methods) should be used for the next 7 days

**Changing from combined oral contraception** Apply patch on the first day of withdrawal bleeding; if no withdrawal bleeding within 5 days of taking last active tablet, rule out pregnancy before applying first patch. Unless patch is applied on first day of withdrawal bleeding, additional precautions (barrier methods) should be used concurrently for first 7 days

**Changing from progestogen-only method** From an implant, apply first patch on the day implant removed; from an injection, apply first patch when next injection due; from oral progestogen, first patch may be started on any day after stopping pill. For all methods additional precautions (barrier methods) should be used concurrently for first 7 days

**After childbirth (not breast-feeding)** Start 4 weeks after birth; if started later than 4 weeks after birth additional precautions (barrier methods) should be used for first 7 days

**After abortion or miscarriage** Before 20 weeks' gestation start immediately; no additional contraception required if started immediately. After 20 weeks' gestation start on day 21 after abortion or on the first day of first spontaneous menstruation; additional precautions (barrier methods) should be used for first 7 days after applying the patch

- **By vagina**, insert ring into vagina on day 1 of cycle and leave in for 3 weeks; remove ring on day 22; subsequent courses repeated after 7-day ring-free interval (during which withdrawal bleeding occurs)

**Note** If first ring inserted later than day 1, additional precautions (barrier methods) should be used for the next 7 days

**Changing from combined hormonal contraception** Insert ring at the latest on the day after the usual tablet-free, patch-free, or placebo-tablet interval. If previous con-

traceptive used correctly and pregnancy unlikely, can switch to ring on any day of cycle

**Changing from progestogen-only method** From an implant or intra-uterine progestogen-only device, insert ring on the day implant or intra-uterine progestogen-only device removed; from an injection, insert ring when next injection due; from oral preparation, first ring may be inserted on any day after stopping pill. For all methods additional precautions (barrier methods) should be used concurrently for first 7 days

**After first trimester abortion** Start immediately

**After childbirth (not breast-feeding) or second trimester abortion** Start 4 weeks after birth or abortion; if started later than 4 weeks after birth or abortion, additional precautions (barrier methods) should be used for first 7 days

## Oral (low and standard strength)

For information on these preparations, see Combined Oral Contraceptives table, below

## Transdermal (standard strength)

### ■ Ethinylestradiol with Norelgestromin

See Risk of Venous Thromboembolism in notes above before prescribing

**Evra®** (Janssen-Cilag) <sup>(POM)</sup>

**Patches**, self-adhesive (releasing ethinylestradiol approx. 33.9 micrograms/24 hours and norelgestromin approx. 203 micrograms/24 hours); net price 9-patch pack = £16.70. Counselling, administration

**Dose** 1 patch to be applied once weekly for three weeks, followed by a 7-day patch-free interval; subsequent courses repeated after 7-day patch-free interval (during which withdrawal bleeding occurs); for starting routines see under Dose above

**Note** Adhesives or bandages should not be used to hold patch in place. If patch no longer sticky do not reapply but use a new patch.

The *Scottish Medicines Consortium* has advised (September 2003) that *Evra®* patches should be restricted for use in women who are likely to comply poorly with combined oral contraceptives

	Estradiol valerate 2 mg	Dienogest 3 mg	17 active			
	Estradiol valerate 1 mg		2 active			
			2 inactive			

- Dose 1 tablet daily for 28 days, starting on day 1 of cycle with first active tablet (withdrawal bleeding occurs when inactive tablets being taken); subsequent courses repeated without interval; for starting routines see under Dose above
- Dose 1 tablet daily for 21 days starting on day 1 of cycle; subsequent courses repeated after 7-day tablet-free interval (during which withdrawal bleeding occurs); for starting routines see under Dose above

## Vaginal (low strength)

### ▲ Ethinylestradiol with Etonogestrel

See Risk of Venous Thromboembolism in notes above before prescribing

### NuvaRing® (Organon) ▼ (P<sub>MI</sub>)

Vaginal ring, releasing ethinylestradiol approx.

15 micrograms/24 hours and etonogestrel approx.

120 micrograms/24 hours, net price 3-ring pack =

£27.00. Counselling, administration

**Dose** 1 ring to be inserted into the vagina, removed on day 22; subsequent courses repeated after 7-day ring-free interval (during which withdrawal bleeding occurs); for starting routines see under Dose above

**Counselling** The presence of the ring should be checked regularly. In case of expulsion see Expulsion, Delayed Insertion or Removal, or Broken Vaginal Ring, p. 495

## 7.3.2 Progestogen-only contraceptives

### 7.3.2.1 Oral progestogen-only contraceptives

### 7.3.2.2 Parenteral progestogen-only contraceptives

### 7.3.2.3 Intra-uterine progestogen-only device

### 7.3.2.1 Oral progestogen-only contraceptives

Oral progestogen-only preparations may offer a suitable alternative when oestrogens are contra-indicated (including those patients with venous thrombosis or a past history or predisposition to venous thrombosis), but may have a higher failure rate than combined preparations. They are suitable for older women, for heavy smokers, and for those with hypertension, valvular heart disease, diabetes mellitus, and migraine. Menstrual irregularities (oligomenorrhoea, menorrhagia) are more common but tend to resolve on long-term treatment.

**Interactions** Effectiveness of oral progestogen-only preparations is not affected by antibacterials that do not induce liver enzymes. The efficacy of oral progestogen-only preparations is, however, reduced by enzyme-inducing drugs and an additional or alternative contraceptive method is recommended during treatment with an enzyme-inducing drug and for at least 4 weeks afterwards—see p. 495 and Appendix 1 (progestogens).

**Surgery** All progestogen-only contraceptives (including those given by injection) are suitable for use as an alternative to combined oral contraceptives before major elective surgery, before all surgery to the legs, or before surgery which involves prolonged immobilisation of a lower limb.

**Starting routine** One tablet daily, on a continuous basis, starting on day 1 of cycle and taken at the same time each day (if delayed by longer than 3 hours (12 hours for *Cerazette*®) contraceptive protection may be lost). Additional contraceptive precautions are not necessary when initiating treatment.

**Changing from a combined oral contraceptive** Start on the day following completion of the combined oral

contraceptive course without a break (or in the case of ED tablets omitting the inactive ones).

**After childbirth** Start any time after 3 weeks postpartum (increased risk of breakthrough bleeding if started earlier).

**Missed pill** The following advice is now recommended by family planning organisations:

'If you forget a pill, take it as soon as you remember and carry on with the next pill at the right time. If the pill was more than 3 hours (12 hours for *Cerazette*®) overdue you are not protected. Continue normal pill-taking but you must also use another method, such as the condom, for the next 2 days.'

The Faculty of Sexual and Reproductive Healthcare recommends emergency contraception (see p. 505) if one or more progestogen-only contraceptive tablets are missed or taken more than 3 hours (12 hours for *Cerazette*®) late and unprotected intercourse has occurred before 2 further tablets have been correctly taken.

**Diarrhoea and vomiting** Vomiting and persistent, severe diarrhoea can interfere with the absorption of oral progestogen-only contraceptives. If vomiting occurs within 2 hours of taking an oral progestogen-only contraceptive, another pill should be taken as soon as possible. If a replacement pill is not taken within 3 hours (12 hours for *Cerazette*®) of the normal time for taking the progestogen-only pill, or in cases of persistent vomiting or very severe diarrhoea, additional precautions should be used during illness and for 2 days after recovery (see also under Missed pill above).

## ORAL PROGESTOGEN-ONLY CONTRACEPTIVES (Progestogen-only pill, 'POP')

**Indications** contraception

**Cautions** arterial disease; sex-steroid dependent cancer; past ectopic pregnancy; malabsorption syndromes; active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice; systemic lupus erythematosus with positive (or unknown) anti-phospholipid antibodies; functional ovarian cysts; history of jaundice in pregnancy; **interactions:** see notes above and Appendix 1 (progestogens)

**Other conditions** The product literature advises caution in patients with history of thromboembolism, hypertension, diabetes mellitus and migraine; evidence for caution in these conditions is unsatisfactory

**Contra-indications** undiagnosed vaginal bleeding; severe arterial disease; acute porphyria (section 9.8.2); history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable

**Hepatic impairment** caution in severe liver disease and recurrent cholestatic jaundice; avoid in liver tumour

**Pregnancy** not known to be harmful

**Breast-feeding** progestogen-only contraceptives do not affect lactation; see also After Childbirth above

**Side-effects** menstrual irregularities (see also notes above); nausea, vomiting, headache, dizziness, breast discomfort, depression, skin disorders, disturbance of appetite, weight changes, changes in libido

**Breast cancer** There is a small increase in the risk of having breast cancer diagnosed in women using, or who have

recently used, a progestogen-only contraceptive pill; this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess risk by 10 years. A possible small increase in the risk of breast cancer should be weighed against the benefits

#### Dose

- 1 tablet daily at same time each day, starting on day 1 of cycle then continuously; if administration delayed for 3 hours (12 hours for *Cerazette*<sup>®</sup>) or more it should be regarded as a 'missed pill', see notes above

#### **Cerazette**<sup>®</sup> (Organon) (PoM)

**Tablets**, f/c, desogestrel 75 micrograms, net price 3 × 28-tab pack = £8.68

The *Scottish Medicines Consortium* has advised (September 2003) that *Cerazette*<sup>®</sup> should be restricted for use in women who cannot tolerate oestrogen-containing contraceptives or in whom such preparations are contra-indicated

#### **Femulen**<sup>®</sup> (Pharmacia) (PoM)

**Tablets**, etynodiol diacetate 500 micrograms, net price 3 × 28-tab pack = £3.31

#### **Micronor**<sup>®</sup> (Janssen-Cilag) (PoM)

**Tablets**, norethisterone 350 micrograms, net price 3 × 28-tab pack = £1.66

#### **Norgeston**<sup>®</sup> (Bayer Schering) (PoM)

**Tablets**, s/c, levonorgestrel 30 micrograms, net price 35-tab pack = 92p

#### **Noriday**<sup>®</sup> (Pharmacia) (PoM)

**Tablets**, norethisterone 350 micrograms, net price 3 × 28-tab pack = £2.10

- In adolescents, medroxyprogesterone acetate (*Depo-Provera*<sup>®</sup>) should be used only when other methods of contraception are inappropriate;
- in all women, the benefits of using medroxyprogesterone acetate beyond 2 years should be evaluated against the risks;
- in women with risk factors for osteoporosis, a method of contraception other than medroxyprogesterone acetate should be considered.

**Norethisterone enantate** (*Noristera*<sup>®</sup>) is a long-acting progestogen given as an oily injection which provides contraception for 8 weeks; it is used as short-term interim contraception e.g. before vasectomy becomes effective.

**Nexplanon**<sup>®</sup> is a highly effective long-acting contraceptive, consisting of an **etonogestrel-releasing implant** that is inserted subdermally into the lower surface of the upper arm and provides contraception for up to 3 years. The manufacturer advises that in heavier women, blood etonogestrel concentrations are lower and therefore the implant may not provide effective contraception during the third year; they advise that earlier replacement may be considered in such patients—however, evidence to support this recommendation is lacking. Local reactions such as bruising and itching can occur at the insertion site. The contraceptive effect of etonogestrel is rapidly reversed on removal of the implant. *The doctor or nurse administering (or removing) the system should be fully trained in the technique and should provide full counselling reinforced by the patient information leaflet.*

**Implanon**<sup>®</sup>, also an etonogestrel-releasing implant, has been discontinued (October 2010), but some women may have the implant in place until 2013.

The cautions, contra-indications, and side-effects of oral progestogen-only contraceptives apply to parenteral progestogen-only contraceptives, except that parenteral preparations reliably inhibit ovulation and therefore protect against ectopic pregnancy and functional ovarian cysts.

**Interactions** Effectiveness of parenteral progestogen-only contraceptives is not affected by antibacterials that do not induce liver enzymes. However, effectiveness of norethisterone and etonogestrel (but not depot medroxyprogesterone acetate) may be reduced by enzyme-inducing drugs; additional contraceptive precautions should be taken whilst taking the enzyme-inducing drug and for 4 weeks after stopping it or an alternative contraceptive method should be considered if *long-term* use of the enzyme-inducing drug is contemplated.

### 7.3.2.2 Parenteral progestogen-only contraceptives

**Medroxyprogesterone acetate** (*Depo-Provera*<sup>®</sup>) is a long-acting progestogen given by intramuscular injection; it is as effective as the combined oral preparations but because of its prolonged action it should never be given without *full counselling backed by the patient information leaflet*. It may be used as a short-term or long-term contraceptive for women who have been counselled about the likelihood of menstrual disturbance and the potential for a delay in return to full fertility. Delayed return of fertility and irregular cycles may occur after discontinuation of treatment but there is no evidence of permanent infertility. Heavy bleeding has been reported in patients given medroxyprogesterone acetate in the immediate puerperium; delaying the first injection until 6 weeks after birth may minimise bleeding problems. If the woman is not breast-feeding, the first injection may be given within 5 days postpartum (she should be warned that the risk of heavy or prolonged bleeding may be increased). The manufacturer advises that in women who are breast-feeding, the first dose should be delayed until 6 weeks after birth; however, evidence suggests no harmful effect to infant if given earlier. The benefits of using medroxyprogesterone acetate in breast-feeding women outweigh any risks.

Reduction in bone mineral density and, rarely, osteoporosis and osteoporotic fractures have also been reported with medroxyprogesterone acetate. The reduction in bone mineral density occurs in the first 2–3 years of use and then stabilises. See also below.

## PARENTERAL PROGESTOGEN-ONLY CONTRACEPTIVES

**Indications** contraception, see also notes above and under preparations (roles vary according to preparation)

**Cautions** see notes above and under preparations; possible risk of breast cancer, see oral progestogen-only contraceptives (section 7.3.2.1); history during pregnancy of pruritus or of deterioration of oto-

sclerosis, disturbances of lipid metabolism; **interactions:** see notes above and Appendix 1 (progestogens) **Counselling** Full counselling backed by *patient information leaflet* required before administration

**Contra-indications** see notes above; history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable

**Hepatic impairment** see Oral Progestogen-only Contraceptives, section 7.3.2.1

**Pregnancy** not known to be harmful; for *Implanon*<sup>®</sup> or *Nexplanon*<sup>®</sup> if pregnancy occurs remove implant

**Breast-feeding** progestogen-only contraceptives do not affect lactation; see also notes above and under preparations

**Side-effects** see notes above; injection-site reactions **Cervical cancer** Use of injectable progestogen-only contraceptives may be associated with a small increased risk of cervical cancer, similar to that seen with combined oral contraceptives, see p. 496. The risk of cervical cancer with other progestogen-only contraceptives is not yet known.

#### Dose

- See under preparations

#### Injectable preparations

**Depo-Provera**<sup>®</sup> (Pfizer) (PoM)

**Injection** (aqueous suspension), medroxyprogesterone acetate 150 mg/mL, net price 1-mL prefilled syringe = £6.01, 1-mL vial = £6.01. Counselling, see patient information leaflet

**Dose** by deep intramuscular injection, 150 mg within first 5 days of cycle or within first 5 days after parturition (delay until 6 weeks after parturition if breast-feeding); for long-term contraception, repeated every 12 weeks (if interval greater than 12 weeks and 5 days, rule out pregnancy before next injection and advise patient to use additional contraceptive measures (e.g. barrier) for 14 days after the injection)

**Noristerat**<sup>®</sup> (Bayer Schering) (PoM)

**Injection** (oily), norethisterone enantate 200 mg/mL, net price 1-mL amp = £3.38. Counselling, see patient information leaflet

**Dose** by deep intramuscular injection given very slowly into gluteal muscle, short-term contraception, 200 mg within first 5 days of cycle or immediately after parturition (duration 8 weeks); may be repeated once after 8 weeks (withhold breast-feeding for neonates with severe or persistent jaundice requiring medical treatment)

#### Implants

**Nexplanon**<sup>®</sup> (Organon) (PoM)

**Implant**, containing etonorgestrel 68 mg in radiopaque flexible rod, net price = £79.46. Counselling, see patient information leaflet

**Dose** by subdermal implantation, no hormonal contraceptive use in previous month, 1 implant inserted during first 5 days of cycle; postpartum, 1 implant inserted 21–28 days after delivery; in breast-feeding mothers, 1 implant inserted after 28 days postpartum; abortion or miscarriage in the second trimester, 1 implant inserted 21–28 days after abortion or miscarriage; abortion or miscarriage in first trimester, 1 implant inserted within 5 days; changing from other hormonal contraceptive, consult product literature; remove implant within 3 years of insertion

replacement therapy. This may therefore be a contraceptive method of choice for women who have excessively heavy menses.

The effects of the progestogen-only intra-uterine system are mainly local and hormonal including prevention of endometrial proliferation, thickening of cervical mucus, and suppression of ovulation in some women (in some cycles). In addition to the progestogenic activity, the intra-uterine system itself may contribute slightly to the contraceptive effect. Return of fertility after removal is rapid and appears to be complete.

Advantages of the progestogen-only intra-uterine system over copper intra-uterine devices are that there may be an improvement in any dysmenorrhoea and a reduction in blood loss; there is also evidence that the frequency of pelvic inflammatory disease may be reduced (particularly in the youngest age groups who are most at risk).

In primary menorrhagia, menstrual bleeding is reduced significantly within 3–6 months of inserting the progestogen-only intra-uterine system, probably because it prevents endometrial proliferation. Another treatment should be considered if menorrhagia does not improve within this time (section 6.4.1.2).

**Cautions and contra-indications** Generally the cautions and contra-indications for the progestogen-only intra-uterine system are as for standard intra-uterine devices (section 7.3.4), but the risk of ectopic pregnancy is considerably smaller. Although the progestogen-only intra-uterine system produces little systemic progestogenic activity, it is usually avoided for 5 years after any evidence of breast cancer. However, the system can be considered for a woman in long-term remission from breast cancer who has menorrhagia and requires effective contraception. Since levonorgestrel is released close to the site of the main contraceptive action (on cervical mucus and endometrium) progestogenic side-effects and interactions are less likely; in particular, enzyme-inducing drugs are unlikely to significantly reduce the contraceptive effect of the progestogen-only intra-uterine system and additional contraceptive precautions are not required.

**Side-effects** Initially, changes in the pattern and duration of menstrual bleeding (spotting or prolonged bleeding) are common; endometrial disorders should be ruled out before insertion and the patient should be fully counselled (and provided with a patient information leaflet). Improvement in progestogenic side-effects, such as mastalgia and in the bleeding pattern usually occurs a few months after insertion and bleeding may often become very light or absent. Functional ovarian cysts (usually asymptomatic) can occur and usually resolve spontaneously (ultrasound monitoring recommended).

## INTRA-UTERINE PROGESTOGEN-ONLY SYSTEM

**Indications** see under preparation

**Cautions** see notes above; history of depression; advanced uterine atrophy; systemic lupus erythematosus with positive (or unknown) antiphospholipid antibodies; not suitable for emergency contraception; **interactions:** see notes above and Appendix 1 (progestogens)

### 7.3.2.3 Intra-uterine progestogen-only device

The progestogen-only intra-uterine system, *Mirena*<sup>®</sup>, releases **levonorgestrel** directly into the uterine cavity. It is licensed for use as a contraceptive, for the treatment of primary menorrhagia and for the prevention of endometrial hyperplasia during oestrogen

**Contra-indications** see notes above

**Hepatic impairment** see Oral Progestogen-only Contraceptives, section 7.3.2.1

**Pregnancy** avoid; if pregnancy occurs remove system

**Breast-feeding** progestogen-only contraceptives do not affect lactation

**Side-effects** see notes above; also abdominal pain; peripheral oedema; depression (sometimes severe), nervousness; salpingitis and pelvic inflammatory disease; pelvic pain, back pain; rarely hirsutism, hair loss, pruritus, migraine, rash

#### Dose

- See under preparation

**Mirena®** (Bayer Schering) (POM)

**Intra-uterine system**, T-shaped plastic frame (impregnated with barium sulphate and with threads attached to base) with polydimethylsiloxane reservoir releasing levonorgestrel 20 micrograms/24 hours, net price = £85.66. Counselling, see patient information leaflet

**Dose** contraception and menorrhagia, insert into uterine cavity within 7 days of onset of menstruation or any time if replacement, or any time if reasonably certain woman is not pregnant and there is no risk of conception (additional precautions (e.g. barrier methods) necessary for next 7 days), or immediately after first-trimester termination by curettage; postpartum insertions should be delayed until at least 4 weeks after delivery; effective for 5 years.

Prevention of endometrial hyperplasia during oestrogen replacement therapy, insert during last days of menstruation or withdrawal bleeding or any time if amenorrhoeic; effective for 4 years

**Note** When system is removed (and not immediately replaced), if pregnancy is not desired, remove during the first few days of the onset of menstruation, otherwise additional contraceptive measures should be used for at least 7 days before removal

## 7.3.3 Spermicidal contraceptives

Spermicidal contraceptives are useful additional safeguards but do **not** give adequate protection if used alone unless fertility is already significantly diminished (section 6.4.1.1). They have two components: a spermicide and a vehicle which itself may have some inhibiting effect on sperm activity. They are suitable for use with barrier methods, such as diaphragms or caps; however, spermicidal contraceptives are not generally recommended for use with condoms, as there is no evidence of any additional protection compared with non-spermicidal lubricants.

Spermicidal contraceptives are not suitable for use in those with or at high risk of sexually transmitted infections (including HIV); high frequency use of the spermicide nonoxinol '9' has been associated with genital lesions, which may increase the risk of acquiring these infections.

Products such as petroleum jelly (*Vaseline®*), baby oil and oil-based vaginal and rectal preparations are likely to damage condoms and contraceptive diaphragms made from latex rubber, and may render them less effective as a barrier method of contraception and as a protection from sexually transmitted infections (including HIV).

**Gygel®** (Marlborough)

**Gel**, nonoxinol '9' 2%, net price 30 g = £4.25

**Excipients** include hydroxybenzoates (parabens), propylene glycol, sorbic acid

**Condoms** no evidence of harm to latex condoms and diaphragms

**Breast-feeding** present in milk in *animal* studies

## 7.3.4 Contraceptive devices

### Intra-uterine devices

The intra-uterine device (IUD) is a suitable contraceptive for women of all ages irrespective of parity; however, it is less appropriate for those with an increased risk of pelvic inflammatory disease (see below). The most effective intra-uterine devices have at least 380 mm<sup>2</sup> of copper and have banded copper on the arms.

Smaller devices have been introduced to minimise side-effects; these consist of a plastic carrier wound with copper wire or fitted with copper bands; some also have a central core of silver to prevent fragmentation of the copper. Fertility declines with age and therefore a copper intra-uterine device which is fitted in a woman over the age of 40, may remain in the uterus until menopause.

A frameless, copper-bearing intra-uterine device (*GyneFix®*) is also available. It consists of a knotted, polypropylene thread with 6 copper sleeves; the device is anchored in the uterus by inserting the knot into the uterine fundus. The intra-uterine devices *Multiload® Cu250* and *Multiload® Cu250 Short* (Organon) have been discontinued, but some women may have the devices in place until 2011.

The timing and technique of fitting an intra-uterine device are critical for its subsequent performance. *The healthcare professional inserting (or removing) the device should be fully trained in the technique and should provide full counselling backed, where available, by the patient information leaflet.* Devices should not be fitted during the heavy days of the period; they are best fitted after the end of menstruation and before the calculated time of implantation. The main excess risk of infection occurs in the first 20 days after insertion and is believed to be related to existing carriage of a sexually transmitted infection. Women are considered to be at a higher risk of sexually transmitted infections if:

- they are under 25 years old *or*
- they are over 25 years old *and*
  - have a new partner *or*
  - have had more than one partner in the past year *or*
  - their regular partner has other partners.

In these women, pre-insertion screening (for chlamydia and, depending on sexual history and local prevalence of disease, *Neisseria gonorrhoeae*) should be performed. If results are unavailable at the time of fitting an intra-uterine device for emergency contraception, appropriate prophylactic antibacterial cover should be given. The woman should be advised to attend *as an emergency* if she experiences sustained pain during the next 20 days.

An intra-uterine device should not be removed in mid-cycle unless an additional contraceptive was used for

the previous 7 days. If removal is essential post-coital contraception should be considered.

If an intra-uterine device fails and the woman wishes to continue to full-term the device should be removed in the first trimester if possible.

## INTRA-UTERINE CONTRACEPTIVE DEVICES

**Indications** see notes above

**Cautions** see notes above; also anaemia, menorrhagia (progestogen intra-uterine system might be preferable, section 7.3.2.3), endometriosis, severe primary dysmenorrhoea, history of pelvic inflammatory disease, diabetes, fertility problems, nulliparity and young age, severely scarred uterus (including after endometrial resection) or severe cervical stenosis; drug- or disease-induced immunosuppression (risk of infection—avoid if marked immunosuppression); epilepsy (risk of seizure at time of insertion); increased risk of expulsion if inserted before uterine involution; gynaecological examination before insertion, 6–8 weeks after then annually but counsel women to see doctor promptly in case of significant symptoms, especially pain; anticoagulant therapy (avoid if possible)

**Contra-indications** severe anaemia, recent sexually transmitted infection (if not fully investigated and treated), unexplained uterine bleeding, distorted or small uterine cavity, genital malignancy, active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration), pelvic inflammatory disease, established or marked immunosuppression; *copper devices*: copper allergy, Wilson's disease, medical diathermy

**Pregnancy** remove device; if pregnancy occurs, increased likelihood that it may be ectopic

**Breast-feeding** not known to be harmful

**Side-effects** uterine or cervical perforation, displacement, expulsion; pelvic infection may be exacerbated, menorrhagia, dysmenorrhoea, allergy; *on insertion*: pain (alleviated by NSAID such as ibuprofen 30 minutes before insertion) and bleeding, occasionally epileptic seizure and vasovagal attack

### Cu-Safe® T300 (Williams)

**Intra-uterine device**, copper wire, wound on vertical stem of T-shaped plastic carrier, surface area approx. 300 mm<sup>2</sup>, impregnated with barium sulphate for radio-opacity, monofilament thread attached to base of vertical stem; preloaded in inserter, net price = £9.11

For uterine length over 5 cm; replacement every 5 years (see also notes above)

### Flexi-T® 300 (Durbin)

**Intra-uterine device**, copper wire, wound on vertical stem of T-shaped plastic carrier, surface area approx. 300 mm<sup>2</sup>, impregnated with barium sulphate for radio-opacity, monofilament thread attached to base of vertical stem; preloaded in inserter, net price = £9.47

For uterine length over 5 cm; replacement every 5 years (see also notes above)

### Flexi-T® + 380 (Durbin)

**Intra-uterine device**, copper wire, wound on vertical stem of T-shaped plastic carrier with copper sleeve on each arm, total surface area approx. 380 mm<sup>2</sup>, impregnated with barium sulphate for radio-opacity, monofilament thread attached to base of vertical stem, preloaded in inserter, net price = £10.06

For uterine length over 6 cm; replacement every 5 years (see also notes above)

### GyneFix® (Williams)

**Intra-uterine device**, 6 copper sleeves with surface area of 330 mm<sup>2</sup> on polypropylene thread, net price = £26.64  
Suitable for all uterine sizes; replacement every 5 years

### Load® 375 (Durbin)

**Intra-uterine device**, copper wire, wound on vertical stem of U-shaped plastic carrier, surface area approx. 375 mm<sup>2</sup>, impregnated with barium sulphate for radio-opacity, monofilament thread attached to base of vertical stem; preloaded in inserter, net price = £8.52

For uterine length over 7 cm; replacement every 5 years (see also notes above)

### Mini TT 380® Slimline (Durbin)

**Intra-uterine device**, copper wire, wound on vertical stem of T-shaped plastic carrier with copper sleeves fitted flush on to distal portion of each horizontal arm, total surface area approx. 380 mm<sup>2</sup>, impregnated with barium sulphate for radio-opacity, thread attached to base of vertical stem; easy-loading system, no capsule, net price = £12.46

For minimum uterine length 5 cm; replacement every 5 years (see also notes above)

### Multiload® Cu375 (Organon)

**Intra-uterine device**, as *Load® 375*, with copper surface area approx. 375 mm<sup>2</sup> and vertical stem length 3.5 cm, net price = £9.24

For uterine length 6–9 cm; replacement every 5 years (see also notes above)

### Multi-Safe® 375 (Williams)

**Intra-uterine device**, copper wire, wound on vertical stem of U-shaped plastic carrier, surface area approx. 375 mm<sup>2</sup>, impregnated with barium sulphate for radio-opacity, monofilament thread attached to base of vertical stem; preloaded in inserter, net price = £8.80

For uterine length over 6–9 cm; replacement every 5 years (see also notes above)

### Multi-Safe® 375 Short Stem (Williams)

**Intra-uterine device**, copper wire, wound on vertical stem of U-shaped plastic carrier, surface area approx. 375 mm<sup>2</sup>, impregnated with barium sulphate for radio-opacity, monofilament thread attached to base of vertical stem; preloaded in inserter, net price = £8.80

For uterine length 5–7 cm; replacement every 5 years (see also notes above)

### Neo-Safe® T380 (Williams)

**Intra-uterine device**, copper wire, wound on vertical stem of T-shaped plastic carrier, surface area approx. 380 mm<sup>2</sup>, impregnated with barium sulphate for radio-opacity, threads attached to base of vertical stem, net price = £13.80

For uterine length 6.5–9 cm; replacement every 5 years (see also notes above)

### Nova-T® 380 (Bayer Schering)

**Intra-uterine device**, copper wire with silver core, wound on vertical stem of T-shaped plastic carrier, surface area approx. 380 mm<sup>2</sup>, impregnated with barium sulphate for radio-opacity, threads attached to base of vertical stem, net price = £12.97

For uterine length 6.5–9 cm; replacement every 5 years (see also notes above)

### T-Safe® 380A QuickLoad (Williams)

**Intra-uterine device**, copper wire, wound on vertical stem of T-shaped plastic carrier with copper collar on the distal portion of each arm, total surface area approx. 380 mm<sup>2</sup>, impregnated with barium sulphate for radio-opacity, threads attached to base of vertical stem, quick-loading system, net price = £10.29; also available with a capsule loading device (*T-Safe® 380A Capped *), net price = £10.29

For uterine length 6.5–9 cm; replacement every 10 years (see also notes above)

### TT 380® Slimline (Durbin)

**Intra-uterine device**, copper wire, wound on vertical stem of T-shaped plastic carrier, with copper sleeves fitted flush on to distal portion of each horizontal arm, total surface area approx. 380 mm<sup>2</sup>, impregnated with barium sulphate for

radio-opacity, thread attached to base of vertical stem; easy-loading system, no capsule, net price = £12.46

For uterine length 6.5–9 cm; replacement every 10 years (see also notes above)

#### UT 380 Short® (Durbin)

**Intra-uterine device**, copper wire, wound on vertical stem of T-shaped plastic carrier, surface area approx. 380 mm<sup>2</sup>, impregnated with barium sulphate for radio-opacity, thread attached to base of vertical stem; net price = £11.22

For uterine length 5–7 cm; replacement every 5 years (see also notes above)

#### UT 380 Standard® (Durbin)

**Intra-uterine device**, copper wire, wound on vertical stem of T-shaped plastic carrier, surface area approx. 380 mm<sup>2</sup>, impregnated with barium sulphate for radio-opacity, thread attached to base of vertical stem; net price = £11.22

For uterine length 6.5–9 cm; replacement every 5 years (see also notes above)

## Other contraceptive devices

### ▲ Rubber contraceptive caps

#### Type A Contraceptive Pessary

Opaque rubber, sizes 1 (50 mm), 2 (55 mm), 3 (60 mm), 4 (65 mm), 5 (75 mm), net price = £6.85

#### Type B Contraceptive Pessary

Opaque rubber, sizes 22 to 31 mm (rising in steps of 3 mm), net price = £8.46

#### Type C Contraceptive Pessary

Opaque rubber, sizes 1 to 3 (42, 48, and 54 mm), net price = £7.26

### ▲ Silicone contraceptive caps

#### Silicone Contraceptive Pessary

Silicone, sizes 22, 26, and 30 mm, net price = £15.00

Brands include *FemCap*®

### ▲ Rubber contraceptive diaphragms

#### Type A Diaphragm with Flat Metal Spring

Transparent rubber with flat metal spring, sizes 55–95 mm (rising in steps of 5 mm), net price = £5.78

Brands include *Reflexions*®

#### Type B Diaphragm with Coiled Metal Spring

Opaque rubber with coiled metal spring, sizes 60–100 mm (rising in steps of 5 mm), net price = £6.79

#### Type C Arcing Spring Diaphragm

Opaque rubber with arcing spring, sizes 60–95 mm (rising in steps of 5 mm), net price = £7.72

### ▲ Silicone contraceptive diaphragms

#### Type B Diaphragm with Coiled Metal Spring

Silicone with coiled metal spring, sizes 60–90 mm (rising in steps of 5 mm), net price = £8.35

Brands include *Millex Omniflex*®

#### Type C Arcing Spring Diaphragm

Silicone with arcing spring, sizes 60–90 mm (rising in steps of 5 mm), net price = £8.35

Brands include *Millex Arcing Style*®, *Ortho All-flex*®

## 7.3.5 Emergency contraception

### Hormonal methods

Hormonal emergency contraceptives include **levonorgestrel** and **ulipristal**; either drug should be taken as soon as possible after unprotected intercourse to increase efficacy.

Levonorgestrel is effective if taken within 72 hours (3 days) of unprotected intercourse and may also be used

between 72 and 120 hours after unprotected intercourse [unlicensed use], but efficacy decreases with time. Ulipristal, a progesterone receptor modulator, is effective if taken within 120 hours (5 days) of unprotected intercourse.

Levonorgestrel is less effective than insertion of an intra-uterine device (see below). Ulipristal is as effective as levonorgestrel, but its efficacy compared to an intra-uterine device is not yet known.

If vomiting occurs within 2 hours of taking levonorgestrel or within 3 hours of taking ulipristal, a replacement dose should be given. If an antiemetic is required domperidone is preferred.

When prescribing hormonal emergency contraception the doctor should explain:

- that the next period may be early or late;
- that a barrier method of contraception needs to be used until the next period;
- the need to return promptly if any lower abdominal pain occurs because this could signify an ectopic pregnancy (and also in 3 to 4 weeks if the subsequent menstrual bleed is abnormally light, heavy or brief, or is absent, or if she is otherwise concerned).

**Interactions** The effectiveness of levonorgestrel, and possibly ulipristal, is reduced in women taking enzyme-inducing drugs (and possibly for 4 weeks after stopping); a copper intra-uterine device can be offered instead or the dose of levonorgestrel should be increased to a total of 3 mg taken as a single dose [unlicensed dose—advise women accordingly]. There is no need to increase the dose for emergency contraception if the patient is taking antibacterials that are not enzyme inducers.

## LEVONORGESTREL

**Indications** emergency contraception

**Cautions** see notes above; past ectopic pregnancy; severe malabsorption syndromes; active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice; **interactions:** see notes above and Appendix 1 (progestogens)

**Contra-indications** acute porphyria (section 9.8.2)

**Pregnancy** not known to be harmful

**Breast-feeding** progestogen-only contraceptives do not affect lactation

**Side-effects** menstrual irregularities (see also notes above), nausea, low abdominal pain, fatigue, headache, dizziness, breast tenderness, vomiting

### Dose

- 1.5 mg as a single dose as soon as possible after coitus (preferably within 12 hours but no later than after 72 hours)

#### 1 Levonelle® One Step (Bayer Schering)

**Tablets**, levonorgestrel 1.5 mg, net price 1-tab pack = £13.83

1. Can be sold to women over 16 years; when supplying emergency contraception to the public, pharmacists should refer to guidance issued by the Royal Pharmaceutical Society of Great Britain

#### Levonelle® 1500 (Bayer Schering) (FOM)

**Tablets**, levonorgestrel 1.5 mg, net price 1-tab pack = £5.20

## ULIPRISTAL ACETATE

**Indications** emergency contraception

**Cautions** see notes above; uncontrolled severe asthma; effectiveness of combined hormonal and progestogen-only contraceptives may be reduced—additional precautions (barrier methods) required; repeated use within a menstrual cycle; **interactions:** see notes above and Appendix 1 (ulipristal)

**Hepatic impairment** manufacturer advises avoid in severe impairment—no information available

**Pregnancy** limited information available

**Breast-feeding** manufacturer advises avoid for at least 36 hours—no information available

**Side-effects** gastro-intestinal disturbances (including nausea, vomiting, diarrhoea, and abdominal pain); dizziness, fatigue, headache; menstrual irregularities (see notes above); back pain, muscle spasms; *less commonly* tremor, hot flushes, uterine spasm, breast tenderness, dry mouth, blurred vision, pruritus, and rash

**Dose**

- 30 mg as a single dose as soon as possible after coitus, but no later than after 120 hours

ellaOne® (HRA Pharma) ▼ (POM)

Tablets, ulipristal acetate 30 mg, net price 1-tab pack = £16.95

## Intra-uterine device

Insertion of an intra-uterine device is more effective than oral levonorgestrel for emergency contraception. A copper intra-uterine contraceptive device (section 7.3.4) can be inserted up to 120 hours (5 days) after unprotected intercourse; sexually transmitted infections should be tested for and insertion of the device should usually be covered by antibacterial prophylaxis (e.g. azithromycin 1 g as a single dose). If intercourse has occurred more than 5 days previously, the device can still be inserted up to 5 days after the earliest likely calculated ovulation (i.e. within the minimum period before implantation), regardless of the number of episodes of unprotected intercourse earlier in the cycle.

## 7.4 Drugs for genito-urinary disorders

7.4.1 Drugs for urinary retention

7.4.2 Drugs for urinary frequency, enuresis, and incontinence

7.4.3 Drugs used in urological pain

7.4.4 Bladder instillations and urological surgery

7.4.5 Drugs for erectile dysfunction

For drugs used in the treatment of urinary-tract infections see section 5.1.13.

## 7.4.1 Drugs for urinary retention

*Acute retention* is painful and is treated by catheterisation.

*Chronic retention* is painless and often long-standing. Catheterisation is unnecessary unless there is deterioration of renal function. After the cause has initially been established and treated, drugs may be required to increase detrusor muscle tone.

*Benign prostatic hyperplasia* is treated either surgically or medically with alpha-blockers (see below). Dutasteride and finasteride (section 6.4.2) are alternatives to alpha-blockers, particularly in men with a significantly enlarged prostate.

## Alpha-blockers

The alpha<sub>1</sub>-selective alpha blockers, **alfuzosin**, **doxazosin**, **indoramin**, **prazosin**, **tamsulosin** and **terazosin** relax smooth muscle in benign prostatic hyperplasia producing an increase in urinary flow-rate and an improvement in obstructive symptoms.

**Cautions** Since alpha<sub>1</sub>-selective alpha blockers reduce blood pressure, patients receiving antihypertensive treatment may require reduced dosage and specialist supervision. Caution is required in the elderly and in patients undergoing cataract surgery (risk of intra-operative floppy iris syndrome). For **interactions**, see Appendix 1 (alpha-blockers).

**Contra-indications** Alpha-blockers should be avoided in patients with a history of postural hypotension and micturition syncope.

**Side-effects** Side-effects of alpha<sub>1</sub>-selective alpha blockers include drowsiness, hypotension (notably postural hypotension), syncope, asthenia, dizziness, depression, headache, dry mouth, gastro-intestinal disturbances, oedema, blurred vision, intra-operative floppy iris syndrome (most strongly associated with tamsulosin), rhinitis, erectile disorders (including priapism), tachycardia, and palpitations. Hypersensitivity reactions including rash, pruritus and angioedema have also been reported.

## ALFUZOSIN HYDROCHLORIDE

**Indications** benign prostatic hyperplasia

**Cautions** see notes above; discontinue if angina worsens

**Driving** May affect performance of skilled tasks e.g. driving

**Contra-indications** see notes above

**Hepatic impairment** initial dose 2.5 mg once daily, adjusted according to response to 2.5 mg twice daily in mild to moderate impairment—avoid if severe; avoid modified-release preparations

**Renal impairment** initial dose 2.5 mg twice daily and adjust according to response; manufacturers advise use modified-release preparations with caution in severe impairment as limited experience

**Side-effects** see notes above; also *less commonly* flushes and chest pain; *also reported* liver damage and cholestasis

**Dose**

- 2.5 mg 3 times daily, max. 10 mg daily; **ELDERLY** initially 2.5 mg twice daily

**First dose effect** First dose may cause collapse due to hypotensive effect (therefore should be taken on retiring to bed). Patient should be warned to lie down if symptoms such as dizziness, fatigue or sweating develop, and to remain lying down until they abate completely

**Alfuzosin hydrochloride** (Non-proprietary) (POM)

**Tablets**, f/c, alfuzosin hydrochloride 2.5 mg, net price 60-tab pack = £20.37. Counselling, initial dose, driving, see above

**Xatral**® (Sanofi-Aventis) (POM)

**Tablets**, f/c, alfuzosin hydrochloride 2.5 mg, net price 60-tab pack = £20.37. Counselling, initial dose, driving, see above

▲ **Modified release****Besavar**® XL (Winthrop) (POM)

**Tablets**, m/r, yellow/white, alfuzosin hydrochloride 10 mg, net price 30-tab pack = £12.51. Label: 21, 25, counselling, initial dose, driving, see above

**Dose** benign prostatic hyperplasia 10 mg once daily

Acute urinary retention associated with benign prostatic hyperplasia in men over 65 years, 10 mg once daily for 2–3 days during catheterisation and for one day after removal; max. 4 days

**Vasran**® XL (Ranbaxy) (POM)

**Tablets**, m/r, alfuzosin hydrochloride 10 mg, net price 30-tab pack = £11.48. Label: 21, 25, counselling, initial dose, driving, see above

**Dose** benign prostatic hyperplasia 10 mg once daily

**Xatral**® XL (Sanofi-Aventis) (POM)

**Tablets**, m/r, yellow/white, alfuzosin hydrochloride 10 mg, net price 10-tab pack = £4.17, 30-tab pack = £12.51. Label: 21, 25, counselling, initial dose, driving, see above

**Dose** benign prostatic hyperplasia 10 mg once daily

Acute urinary retention associated with benign prostatic hyperplasia in men over 65 years, 10 mg once daily for 2–3 days during catheterisation and for one day after removal; max. 4 days

**DOXAZOSIN**

**Indications** benign prostatic hyperplasia; hypertension (section 2.5.4)

**Cautions** see notes above and section 2.5.4

**Contra-indications** see notes above

**Hepatic impairment** section 2.5.4

**Side-effects** see notes above and section 2.5.4

**Dose**

- Initially 1 mg daily; dose may be doubled at intervals of 1–2 weeks according to response, up to max. 8 mg daily; usual maintenance 2–4 mg daily

▲ **Preparations**

Section 2.5.4

**INDORAMIN**

**Indications** benign prostatic hyperplasia; hypertension (section 2.5.4)

**Cautions** see notes above and section 2.5.4

**Contra-indications** see notes above and section 2.5.4

**Hepatic impairment** section 2.5.4

**Renal impairment** section 2.5.4

**Side-effects** see notes above and section 2.5.4

**Dose**

- 20 mg twice daily; increased if necessary by 20 mg every 2 weeks to max. 100 mg daily in divided doses; **ELDERLY**, 20 mg at night may be adequate

**Doralese**® (Chemidex) (POM)

**Tablets**, yellow, f/c, indoramin 20 mg, net price 60-tab pack = £25.85. Label: 2

**PRAZOSIN**

**Indications** benign prostatic hyperplasia; hypertension, congestive heart failure and Raynaud's syndrome (section 2.5.4)

**Cautions** see notes above and section 2.5.4

**Contra-indications** see notes above and section 2.5.4

**Hepatic impairment** section 2.5.4

**Renal impairment** section 2.5.4

**Side-effects** see notes above and section 2.5.4

**Dose**

- Initially 500 micrograms twice daily for 3–7 days, subsequently adjusted according to response; usual maintenance (and max.) 2 mg twice daily; **ELDERLY** initiate with lowest possible dose

**First dose effect** First dose may cause collapse due to hypotensive effect (therefore should be taken on retiring to bed). Patient should be warned to lie down if symptoms such as dizziness, fatigue or sweating develop, and to remain lying down until they abate completely

▲ **Preparations**

Section 2.5.4

**TAMSULOSIN HYDROCHLORIDE**

**Indications** benign prostatic hyperplasia

**Cautions** see notes above

**Driving** May affect performance of skilled tasks e.g. driving

**Contra-indications** see notes above

**Hepatic impairment** avoid in severe impairment

**Renal impairment** use with caution if eGFR less than 10 mL/minute/1.73 m<sup>2</sup>

**Side-effects** see notes above

**Dose**

- 400 micrograms daily

1 **Tamsulosin hydrochloride** (Non-proprietary) (POM)

**Capsules**, m/r, tamsulosin hydrochloride 400 micrograms, net price 30-cap pack = £4.62. Label: 25, counselling, driving

**Brands include** *Bazetham*® MR, *Contiflo*® XL, *Diffundox*® XL, *Pinexel*® PR, *Stronazon*® MR, *Tabphyn*® MR

1. Tamsulosin hydrochloride 400 microgram capsules can be sold to the public for the treatment of functional symptoms of benign prostatic hyperplasia in men aged 45–75 years to be taken for up to 6 weeks before clinical assessment by a doctor; a proprietary brand *Flomax Relief*® MR is on sale to the public

**Flomaxtra**® XL (Astellas) (POM)

**Tablets**, m/r, tamsulosin hydrochloride 400 micrograms, net price 30-tab pack = £10.47. Label: 25, counselling, driving

▲ **With dutasteride**

For prescribing information on dutasteride, see section 6.4.2

**Combodart**® (GSK) ▼ (POM)

**Capsules**, m/r, brown/orange, tamsulosin hydrochloride 400 micrograms, dutasteride 500 micrograms, net price 30-cap pack = £19.80. Label: 25, counselling, driving

**Dose** benign prostatic hyperplasia, 1 capsule daily

**TERAZOSIN**

**Indications** benign prostatic hyperplasia; hypertension (section 2.5.4)

**Cautions** see notes above and section 2.5.4

**Driving** May affect performance of skilled tasks e.g. driving

**Contra-indications** see notes above

**Side-effects** see notes above and section 2.5.4

**Dose**

- Initially 1 mg at bedtime; if necessary dose may be doubled at intervals of 1–2 weeks according to response, up to max. 10 mg once daily; usual maintenance 5–10 mg daily

**First dose effect** First dose may cause collapse due to hypotensive effect (therefore should be taken on retiring to bed). Patient should be warned to lie down if symptoms such as dizziness, fatigue or sweating develop, and to remain lying down until they abate completely

**Terazosin** (Non-proprietary) (POM)

**Tablets**, terazosin (as hydrochloride) 2 mg, net price 28-tab pack = £2.16; 5 mg, 28-tab pack = £2.58; 10 mg, 28-tab pack = £7.88. Counselling, initial dose, driving

**Hytrin**<sup>®</sup> (Amdipharm) (POM)

**Tablets**, terazosin (as hydrochloride) 2 mg (yellow) net price, 28-tab pack = £2.29; 5 mg (tan), 28-tab pack = £4.29; 10 mg (blue), 28-tab pack = £8.57; starter pack (for benign prostatic hyperplasia) of 7 × 1-mg tab with 14 × 2-mg tab and 7 × 5-mg tab = £10.97. Label: 3, counselling, see dose above

**Parasympathomimetics**

The parasympathomimetic **bethanechol** increases detrusor muscle contraction. However, it has only a limited role in the relief of urinary retention; its use has been superseded by catheterisation.

**Distigmine** inhibits the breakdown of acetylcholine. It may help patients with an upper motor neurone neurogenic bladder.

**BETHANECHOL CHLORIDE**

**Indications** urinary retention, but see notes above

**Cautions** autonomic neuropathy (use lower initial dose); **interactions:** Appendix 1 (parasympathomimetics)

**Contra-indications** peptic ulcer; intestinal or urinary obstruction; conditions where increased motility of the urinary or gastro-intestinal tract could be harmful; cardiovascular disorders (including recent myocardial infarction, bradycardia, and heart block); hypotension; obstructive airways disease; epilepsy; parkinsonism; hyperthyroidism

**Pregnancy** manufacturer advises avoid—no information available

**Breast-feeding** manufacturer advises avoid; gastro-intestinal disturbances in infant reported

**Side-effects** nausea, vomiting, diarrhoea, abdominal pain, increased salivation, eructation; flushing, hypotension, bradycardia; bronchoconstriction, rhinorrhoea; headache; increased lacrimation; increased sweating

**Dose**

- 10–25 mg 3–4 times daily half an hour before food

**Myotonine**<sup>®</sup> (Glenwood) (POM)

**Tablets**, scored, bethanechol chloride 10 mg, net price 100-tab pack = £5.07; 25 mg, 100-tab pack = £6.48. Label: 22

**DISTIGMINE BROMIDE**

**Indications** postoperative urinary retention (see notes above), neurogenic bladder; myasthenia gravis (section 10.2.1)

**Cautions** peptic ulcer; conditions where increased motility of the urinary or gastro-intestinal tract could be harmful; oesophagitis; cardiovascular disease; bronchospasm; epilepsy; parkinsonism; **interactions:** Appendix 1 (parasympathomimetics)

**Contra-indications** intestinal or urinary obstruction; severe circulatory insufficiency; asthma

**Pregnancy** manufacturer advises avoid (may stimulate uterine contractions)

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** abdominal pain, diarrhoea, increased salivation; bradycardia, AV block, hypotension; dyspnoea; muscle twitching; increased lacrimation, miosis; increased sweating

**Dose**

- Urinary retention, 5 mg daily, half an hour before breakfast
- Neurogenic bladder, 5 mg daily or on alternate days, half an hour before breakfast

**Upretid**<sup>®</sup> (Sanofi-Aventis) (POM)

**Tablets**, scored, distigmine bromide 5 mg, net price 30-tab pack = £41.22. Label: 22

**7.4.2 Drugs for urinary frequency, enuresis, and incontinence****Urinary incontinence**

Incontinence in adults which arises from detrusor instability is managed by combining drug therapy with conservative methods for managing urge incontinence such as pelvic floor exercises and bladder training; stress incontinence is generally managed by non-drug methods. **Duloxetine**, an inhibitor of serotonin and noradrenaline re-uptake can be added and is licensed for the treatment of moderate to severe stress incontinence in women; it may be more effective when used as an adjunct to pelvic floor exercises.

Antimuscarinic drugs reduce symptoms of urgency and urge incontinence and increase bladder capacity. **Oxybutynin** also has a direct relaxant effect on urinary smooth muscle. Side-effects limit the use of oxybutynin, but they may be reduced by starting at a lower dose. A modified-release preparation of oxybutynin is effective and has fewer side-effects; a transdermal patch is also available. The efficacy and side-effects of **tolterodine** are comparable to those of modified-release oxybutynin. **Flavoxate** has less marked side-effects but it is also less effective. **Darifenacin**, **fesoterodine**, **propiverine**,

**solifenacin**, and **tropium** are newer antimuscarinic drugs licensed for urinary frequency, urgency, and incontinence. The need for continuing antimuscarinic drug therapy should be reviewed every 4–6 weeks until symptoms stabilise, and then every 6–12 months.

The *Scottish Medicines Consortium* (p. 4) has advised (June 2008) that fesoterodine (*Toviaz*®) is accepted for restricted use within NHS Scotland as a second-line treatment for overactive bladder syndrome.

Propantheline and tricyclic antidepressants were used for urge incontinence but they are little used now because of their side-effects. The use of imipramine is limited by its potential to cause cardiac side-effects.

Purified bovine collagen implant (*Contigen*®, Bard) is indicated for *urinary incontinence* caused by intrinsic sphincter deficiency (poor or non-functioning bladder outlet mechanism). The implant should be inserted only by surgeons or physicians trained in the technique for injection of the implant.

**Cautions** Antimuscarinic drugs should be used with caution in the elderly (especially if frail), in those with autonomic neuropathy, and in those susceptible to angle-closure glaucoma. They should also be used with caution in hiatus hernia with reflux oesophagitis. Antimuscarinics can worsen hyperthyroidism, coronary artery disease, congestive heart failure, hypertension, prostatic hyperplasia, arrhythmias, and tachycardia. For **interactions**, see Appendix 1 (antimuscarinics).

**Contra-indications** Antimuscarinic drugs should be avoided in patients with myasthenia gravis, significant bladder outflow obstruction or urinary retention, severe ulcerative colitis, toxic megacolon, and in gastro-intestinal obstruction or intestinal atony.

**Side-effects** Side-effects of antimuscarinic drugs include dry mouth, gastro-intestinal disturbances including constipation, flatulence, taste disturbances, blurred vision, dry eyes, drowsiness, dizziness, fatigue, difficulty in micturition (less commonly urinary retention), palpitation, and skin reactions (including dry skin, rash, and photosensitivity); also headache, diarrhoea, angioedema, arrhythmias, and tachycardia. Central nervous system stimulation, such as restlessness, disorientation, hallucination, and convulsion may occur; children are at higher risk of these effects. Antimuscarinic drugs can reduce sweating, leading to heat sensations and fainting in hot environments or in patients with fever, and *very rarely* may precipitate angle-closure glaucoma.

## DARIFENACIN

**Indications** urinary frequency, urgency, and incontinence

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** max. 7.5 mg daily in moderate impairment; avoid in severe impairment

**Pregnancy** manufacturer advises avoid—toxicity in *animal* studies

**Breast-feeding** present in milk in *animal* studies—manufacturer advises caution

**Side-effects** see notes above; also *less commonly* ulcerative stomatitis, oedema, hypertension, dys-

pnoea, cough, rhinitis, weakness, insomnia, impotence, and vaginitis

### Dose

- **ADULT** over 18 years, 7.5 mg once daily, increased if necessary after 2 weeks to 15 mg once daily

**Emselex**® (Novartis) (POM)

**Tablets**, m/r, darifenacin (as hydrobromide) 7.5 mg (white), net price 28-tab pack = £20.90; 15 mg (peach), 28-tab pack = £20.90. Label: 3, 25

## DULOXETINE

**Indications** moderate to severe stress urinary incontinence in women; major depressive disorder (section 4.3.4); diabetic neuropathy (section 4.3.4); generalised anxiety disorder (section 4.3.4)

**Cautions** elderly; cardiac disease; hypertension (avoid if uncontrolled); history of mania; history of seizures; raised intra-ocular pressure, susceptibility to angle-closure glaucoma; bleeding disorders or concomitant use of drugs that increase risk of bleeding; **interactions**: Appendix 1 (duloxetine)

**Withdrawal** Nausea, vomiting, headache, anxiety, dizziness, paraesthesia, sleep disturbances, and tremor are the most common features of abrupt withdrawal or marked reduction of the dose; dose should be reduced over at least 1–2 weeks

**Hepatic impairment** manufacturer advises avoid

**Renal impairment** avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** toxicity in *animal* studies—avoid in patients with stress urinary incontinence; risk of neonatal withdrawal symptoms if used near term

**Breast-feeding** present in milk—manufacturer advises avoid

**Side-effects** nausea, vomiting, dyspepsia, constipation, diarrhoea, abdominal pain, weight changes, decreased appetite, flatulence, dry mouth; palpitation, hot flush; insomnia, abnormal dreams, paraesthesia, drowsiness, anxiety, headache, dizziness, fatigue, weakness, tremor, nervousness, anorexia; sexual dysfunction; visual disturbances; sweating, pruritus; *less commonly* gastritis, halitosis, hepatitis, bruxism, tachycardia, hypertension, postural hypotension, syncope, raised cholesterol, vertigo, taste disturbance, cold extremities, impaired temperature regulation, impaired attention, movement disorders, muscle twitching, musculoskeletal pain, thirst, stomatitis, hypothyroidism, urinary disorders, and photosensitivity; *rarely* mania; *very rarely* angle-closure glaucoma; *also reported* supraventricular arrhythmia, chest pain, hallucinations, suicidal behaviour (see Suicidal Behaviour and Antidepressant Therapy, p. 233), seizures, hypersensitivity reactions including urticaria, angioedema, rash (including Stevens-Johnson syndrome) and anaphylaxis, hyponatraemia (see Hyponatraemia and Antidepressant Therapy, p. 233)

### Dose

- **ADULT** over 18 years, 40 mg twice daily, assess for benefit and tolerability after 2–4 weeks

**Note** Initial dose of 20 mg twice daily for 2 weeks can minimise side-effects

**Yentreve**® (Lilly) ▼ (POM)

**Capsules**, duloxetine (as hydrochloride) 20 mg (blue), net price 28-cap pack = £18.48, 56-cap pack = £30.80; 40 mg (orange/blue), 56-cap pack = £36.96. Label: 2

**Cymbalta®** (Lilly) ▼ (PoM)

Section 4.3.4 (major depressive episode, generalised anxiety disorder, and diabetic neuropathy)

**FESOTERODINE FUMARATE**

**Indications** urinary frequency, urgency, and urge incontinence

**Cautions** see notes above; gastro-oesophageal reflux

**Contra-indications** see notes above

**Hepatic impairment** manufacturer advises increase dose cautiously; max. 4 mg daily in moderate impairment; avoid in severe impairment; consult product literature before concomitant use of cytochrome P450 enzyme inhibitors

**Renal impairment** increase dose cautiously if eGFR 30–80 mL/minute/1.73 m<sup>2</sup>; max. 4 mg daily if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>; consult product literature before concomitant use of cytochrome P450 enzyme inhibitors

**Pregnancy** manufacturer advises avoid—toxicity in animal studies

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** see notes above; also insomnia; *less commonly* nasal dryness, pharyngolaryngeal pain, cough, and vertigo

**Dose**

• **ADULT** over 18 years, 4 mg once daily, increased if necessary to max. 8 mg once daily

**Note** Max. 4 mg daily with concomitant atazanavir, clarithromycin, indinavir, itraconazole, ketoconazole, nelfinavir, ritonavir, saquinavir, or telithromycin; in patients with hepatic or renal impairment, consult product literature before concomitant use with amprenavir, aprepitant, atazanavir, clarithromycin, diltiazem, erythromycin, fluconazole, fosamprenavir, indinavir, itraconazole, ketoconazole, nelfinavir, ritonavir, saquinavir, telithromycin, verapamil, or grapefruit juice

**Toviaz®** (Pfizer) ▼ (PoM)

**Tablets**, m/r, f/c, fesoterodine fumarate 4 mg (light blue), net price 28-tab pack = £25.78; 8 mg (blue), 28-tab pack = £25.78. Label: 3, 25

**FLAVOXATE HYDROCHLORIDE**

**Indications** urinary frequency and incontinence, dysuria, urgency; bladder spasms due to catheterisation, cystoscopy, or surgery

**Cautions** see notes above

**Contra-indications** see notes above; gastro-intestinal haemorrhage

**Pregnancy** manufacturer advises avoid unless no safer alternative

**Breast-feeding** manufacturer advises caution—no information available

**Side-effects** see notes above; also vertigo, eosinophilia, leucopenia, urticaria, erythema, and pruritus

**Dose**

• **ADULT** and **CHILD** over 12 years, 200 mg 3 times daily

**Urispas 200®** (Recordati) (PoM)

**Tablets**, f/c, flavoxate hydrochloride 200 mg, net price 90-tab pack = £11.67

**OXYBUTYNYN HYDROCHLORIDE**

**Indications** urinary frequency, urgency and incontinence, neurogenic bladder instability, and nocturnal enuresis associated with overactive bladder

**Cautions** see notes above; acute porphyria (section 9.8.2)

**Contra-indications** see notes above

**Hepatic impairment** manufacturer advises caution

**Renal impairment** manufacturer advises caution

**Pregnancy** manufacturers advise avoid unless essential—toxicity in animal studies

**Breast-feeding** manufacturers advise avoid—present in milk

**Side-effects** see notes above; also *less commonly* anorexia, facial flushing; *rarely* night terrors; application site reactions with *patches*; also reported cognitive impairment

**Dose**

• **ADULT** and **CHILD** over 12 years, initially 5 mg 2–3 times daily, increased if necessary to max. 5 mg 4 times daily; **ELDERLY** initially 2.5–3 mg twice daily, increased to 5 mg twice daily according to response and tolerance; **CHILD** 5–12 years, neurogenic bladder instability, 2.5–3 mg twice daily, increased to 5 mg 2–3 times daily; **CHILD** under 5 years, see *BNF for Children*; **CHILD** 7–18 years, nocturnal enuresis associated with overactive bladder, 2.5–3 mg twice daily increased to 5 mg 2–3 times daily (last dose before bedtime)

**Oxybutynin Hydrochloride** (Non-proprietary) (PoM)

**Tablets**, oxybutynin hydrochloride 2.5 mg, net price 56-tab pack = £6.58; 3 mg, 56-tab pack = £9.15; 5 mg, 56-tab pack = £5.53, 84-tab pack = £12.50. Label: 3

**Cystrin®** (Sanofi-Aventis) (PoM)

**Tablets**, oxybutynin hydrochloride 3 mg, net price 56-tab pack = £9.15; 5 mg (scored), 84-tab pack = £21.99. Label: 3

**Dirופן®** (Sanofi-Aventis) (PoM)

**Tablets**, both blue, scored, oxybutynin hydrochloride 2.5 mg, net price 84-tab pack = £6.59; 5 mg, 84-tab pack = £12.82. Label: 3

**Elixir**, oxybutynin hydrochloride 2.5 mg/5 mL, net price 150-mL pack = £6.88. Label: 3

**Modified release****Lyrinel® XL** (Janssen-Cilag) (PoM)

**Tablets**, m/r, oxybutynin hydrochloride 5 mg (yellow), net price 30-tab pack = £10.81; 10 mg (pink), 30-tab pack = £21.62. Label: 3, 25

**Dose** initially 5 mg once daily, adjusted according to response in steps of 5 mg at weekly intervals; max. 20 mg once daily; **CHILD** over 6 years, neurogenic bladder instability, initially 5 mg once daily, adjusted according to response in steps of 5 mg at weekly intervals; max. 15 mg once daily

**Note** Patients taking immediate-release oxybutynin may be transferred to the nearest equivalent daily dose of *Lyrinel® XL*.

**Transdermal preparations****Kentera®** (Orion) (PoM)

**Patches**, self-adhesive, oxybutynin 36 mg (releasing oxybutynin approx. 3.9 mg/24 hours), net price 8-patch pack = £27.20. Label: 3, counselling, administration

**Dose** **ADULT** over 18 years, urinary frequency, urgency and incontinence, apply 1 patch twice weekly to clean, dry, unbroken skin on abdomen, hip or buttock, remove after every 3–4 days and

site replacement patch on a different area (avoid using same area for 7 days)

**Note** The *Scottish Medicines Consortium* has advised (July 2005) that *Kentera*® should be restricted for use in patients who benefit from oral oxybutynin but cannot tolerate its side-effects

## PROPANTHELINE BROMIDE

**Indications** adult enuresis

**Cautions** see notes above; ulcerative colitis

**Contra-indications** see notes above

**Hepatic impairment** manufacturer advises caution

**Renal impairment** manufacturer advises caution

**Pregnancy** manufacturer advises avoid—no information available

**Breast-feeding** may suppress lactation

**Side-effects** see notes above; also facial flushing

### Dose

- Initially 15 mg 3 times daily at least one hour before food and 30 mg at bedtime, subsequently adjusted according to response (max. 120 mg daily)

### Preparations

Section 1.2

## PROPIVERINE HYDROCHLORIDE

**Indications** urinary frequency, urgency and incontinence; neurogenic bladder instability

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** avoid in moderate to severe impairment

**Renal impairment** doses above 30 mg daily should be used with caution if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** manufacturer advises avoid (restriction of skeletal development in animals)

**Breast-feeding** manufacturer advises avoid—present in milk in animal studies

**Side-effects** see notes above

### Dose

- ADULT over 18 years, 15 mg 1–3 times daily, increased if necessary to max. 15 mg 4 times daily

**Detronorm**® (Amdipharm) (POM)

Tablets, pink, s/c, propiverine hydrochloride 15 mg, net price 56-tab pack = £18.00. Label: 3

### Modified release

**Detronorm**® XL (Amdipharm) (POM)

Capsules, orange/white, m/r, propiverine hydrochloride 30 mg, net price 28-cap pack = £24.45. Label: 3, 25

**Dose** ADULT over 18 years, urinary frequency, urgency, and incontinence, 30 mg once daily

## SOLIFENACIN SUCCINATE

**Indications** urinary frequency, urgency and urge incontinence

**Cautions** see notes above; neurogenic bladder disorder

**Contra-indications** see notes above

**Hepatic impairment** max. 5 mg daily in moderate impairment; avoid in moderate impairment in those

already taking itraconazole, ketoconazole, nelfinavir, or ritonavir; avoid in severe impairment

**Renal impairment** max. 5 mg daily if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>; avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup> in those already taking itraconazole, ketoconazole, nelfinavir, or ritonavir

**Pregnancy** manufacturer advises caution—no information available

**Breast-feeding** manufacturer advises avoid—present in milk in animal studies

**Side-effects** see notes above; also gastro-oesophageal reflux, oedema

### Dose

- ADULT over 18 years, 5 mg daily, increased if necessary to 10 mg once daily

**Note** Max. 5 mg daily with concomitant itraconazole, ketoconazole, nelfinavir, or ritonavir

**Vesicare**® (Astellas) (POM)

Tablets, f/c, solifenacin succinate 5 mg (yellow), net price 30-tab pack = £27.62; 10 mg (pink), 30-tab pack = £35.91. Label: 3

## TOLTERODINE TARTRATE

**Indications** see under Dose

**Cautions** see notes above; history of QT-interval prolongation; concomitant use with other drugs known to prolong QT interval

**Contra-indications** see notes above

**Hepatic impairment** reduce dose to 1 mg twice daily; avoid *Detrusitol*® XL

**Renal impairment** reduce dose to 1 mg twice daily if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>; avoid *Detrusitol*® XL if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** manufacturer advises avoid—toxicity in animal studies

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** see notes above; also chest pain, peripheral oedema; sinusitis, bronchitis; paraesthesia, fatigue, vertigo, weight gain; flushing also reported

### Dose

- Urinary frequency, urgency, and incontinence, ADULT over 18 years, 2 mg twice daily; reduce to 1 mg twice daily if necessary to minimise side-effects; CHILD 2–18 years, see *BNF for Children*
- Nocturnal enuresis associated with overactive bladder, CHILD 7–18 years, see *BNF for Children*

**Detrusitol**® (Pharmacia) (POM)

Tablets, f/c, tolterodine tartrate 1 mg, net price 56-tab pack = £29.03; 2 mg, 56-tab pack = £30.56. Label: 3

### Modified release

**Detrusitol**® XL (Pharmacia) (POM)

Capsules, blue, m/r, tolterodine tartrate 4 mg, net price 28-cap pack = £25.78. Label: 3, 25

**Dose** urinary frequency, urgency and incontinence, ADULT over 18 years, 4 mg once daily

## TROSPIMUM CHLORIDE

**Indications** urinary frequency, urgency and incontinence

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** manufacturer advises caution in mild to moderate impairment; avoid in severe impairment

**Renal impairment** use with caution; reduce dose to 20 mg once daily or 20 mg on alternate days if eGFR 10–30 mL/minute/1.73 m<sup>2</sup>; avoid *Regurin*<sup>®</sup> *XL*

**Pregnancy** manufacturer advises caution

**Breast-feeding** manufacturer advises caution

**Side-effects** see notes above; *rarely* chest pain, dyspnoea, and asthenia; *very rarely* myalgia and arthralgia

#### Dose

- **ADULT** and **CHILD** over 12 years, 20 mg twice daily before food

**Trospium chloride** (Non-proprietary) (Pom)

Tablets, f/c, trospium chloride 20 mg, net price 60-tab pack = £18.20. Label: 23  
Brands include *Flotros*<sup>®</sup>

**Regurin**<sup>®</sup> (Speciality European) (Pom)

Tablets, brown-yellow, f/c, trospium chloride 20 mg, net price 60-tab pack = £26.00. Label: 23

#### Modified release

**Regurin**<sup>®</sup> **XL** (Speciality European) (Pom)

Capsules, orange/white, m/r, trospium chloride 60 mg, net price 28-cap pack = £23.05. Label: 23, 25  
Dose **ADULT** over 18 years, 60 mg once daily

## Nocturnal enuresis

*Nocturnal enuresis* is common in young children, but persists in as many as 5% by 10 years of age. Treatment is not appropriate in children under 5 years and it is usually not needed in those aged under 7 years and in cases where the child and parents are not anxious about the bedwetting; however, children over 10 years usually require prompt treatment. An **enuresis alarm** should be first-line treatment for well-motivated, well-supported children aged over 7 years because alarms have a lower relapse rate than drug treatment when discontinued. Use of an alarm can be combined with drug therapy if either method alone is unsuccessful.

Drug therapy is not usually appropriate for children under 7 years of age; it can be used when alternative measures have failed, preferably on a short-term basis, for example to cover periods away from home, or if the child and family are anxious about the condition.

**Desmopressin** (section 6.5.2), an analogue of vasopressin, is used for nocturnal enuresis; it is given by oral or by sublingual administration. Particular care is needed to avoid fluid overload. Treatment should not be continued for longer than 3 months without interrupting treatment for 1 week for full re-assessment. Desmopressin should not be given intranasally for nocturnal enuresis due to an increased incidence of side-effects.

Tricyclic antidepressants (section 4.3.1) such as **imipramine**, and rarely **amitriptyline** and **nortriptyline**, are used but behavioural disturbances can occur and relapse is common after withdrawal. Treatment should not normally exceed 3 months unless a full physical examination is made and the child is fully re-assessed; toxicity following overdosage with tricyclics is of particular concern.

Nocturnal enuresis associated with daytime symptoms (overactive bladder) can be managed by antimuscarinic drugs (see Urinary incontinence, p. 508), with the addition of desmopressin if necessary.

## 7.4.3 Drugs used in urological pain

The acute pain of *ureteric colic* may be relieved with **pethidine** (section 4.7.2). **Diclofenac** by injection or as suppositories (section 10.1.1) is also effective and compares favourably with pethidine; other non-steroidal anti-inflammatory drugs are occasionally given by injection.

**Lidocaine gel** is a useful topical application in *urethral pain* or to relieve the discomfort of catheterisation (section 15.2).

## Alkalinisation of urine

*Alkalinisation* of urine can be undertaken with **potassium citrate**. The alkalinising action may relieve the discomfort of *cystitis* caused by lower urinary tract infections. **Sodium bicarbonate** is used as a urinary alkalinising agent in some metabolic and renal disorders (section 9.2.1.3).

## POTASSIUM CITRATE

**Indications** relief of discomfort in mild urinary-tract infections; alkalinisation of urine

**Cautions** cardiac disease; elderly; **interactions:** Appendix 1 (potassium salts)

**Renal impairment** close monitoring required—high risk of hyperkalaemia; avoid in severe impairment

**Side-effects** hyperkalaemia on prolonged high dosage, mild diuresis

#### Dose

- See under preparation

### Potassium Citrate Mixture BP

(Potassium Citrate Oral Solution)

**Oral solution**, potassium citrate 30%, citric acid monohydrate 5% in a suitable vehicle with a lemon flavour. Extemporaneous preparations should be recently prepared according to the following formula: potassium citrate 3 g, citric acid monohydrate 500 mg, syrup 2.5 mL, quillaia tincture 0.1 mL, lemon spirit 0.05 mL, double-strength chloroform water 3 mL, water to 10 mL. Contains about 28 mmol K<sup>+</sup>/10 mL. Label: 27

**Dose** 10 mL 3 times daily well diluted with water

Proprietary brands of potassium citrate are on sale to the public for the relief of discomfort in mild urinary-tract infections

## SODIUM BICARBONATE

**Indications** relief of discomfort in mild urinary-tract infections; alkalinisation of urine

**Cautions** cardiac disease; patients on sodium-restricted diet; elderly; avoid prolonged use; **interactions:** Appendix 1 (antacids)

**Hepatic impairment** section 11.1.1

**Renal impairment** avoid; specialised role in some forms of renal disease, see section 9.2.1.3

**Pregnancy** use with caution

**Side-effects** eructation, alkalosis on prolonged use

**Dose**

- 3 g in water every 2 hours until urinary pH exceeds 7; maintenance of alkaline urine 5–10 g daily

▣ **Preparations**

Section 9.2.1.3

## SODIUM CITRATE

**Indications** relief of discomfort in mild urinary-tract infections

**Cautions** cardiac disease; hypertension; patients on a sodium-restricted diet; elderly; **interactions:** Appendix 1 (sodium citrate)

**Renal impairment** section 1.1.1.3

**Pregnancy** use with caution

**Side-effects** mild diuresis

**Note** Proprietary brands of sodium citrate are on sale to the public for the relief of discomfort in mild urinary-tract infections

## Other preparations for urinary disorders

A terpene mixture (*Rowatinox*®) is claimed to be of benefit in *uroolithiasis* for the expulsion of calculi.

**Rowatinox**® (Rowa) 

**Capsules**, yellow, e/c, anethol 4 mg, borneol 10 mg, camphene 15 mg, cineole 3 mg, fenchone 4 mg, pinene 31 mg, net price 50 = £7.35. Label: 25

**Dose** 1–2 capsules 3–4 times daily before food; **CHILD** not recommended

## 7.4.4 Bladder instillations and urological surgery

**Bladder infection** Various solutions are available as irrigations or washouts.

Aqueous **chlorhexidine** (section 13.11.2) can be used in the management of common infections of the bladder but it is ineffective against most *Pseudomonas* spp. Solutions containing chlorhexidine 1 in 5000 (0.02%) are used but they may irritate the mucosa and cause burning and haematuria (in which case they should be discontinued); sterile **sodium chloride solution 0.9%** (physiological saline) is usually adequate and is preferred as a mechanical irrigant.

Continuous bladder irrigation with **amphotericin** 50 micrograms/mL (section 5.2.3) may be of value in mycotic infections.

**Dissolution of blood clots** Clot retention is usually treated by irrigation with sterile **sodium chloride solution 0.9%** but sterile **sodium citrate solution for bladder irrigation 3%** may also be helpful.

**Bladder cancer** Bladder instillations of **doxorubicin** (section 8.1.2), **mitomycin** (section 8.1.2), and **thiotepa** (section 8.1.1) are used for recurrent superficial bladder tumours. Such instillations reduce systemic side-effects; adverse effects on the bladder (e.g. micturition disorders and reduction in bladder capacity) may occur.

Instillation of **epirubicin** (section 8.1.2) is used for treatment and prophylaxis of certain forms of superficial bladder cancer; instillation of **doxorubicin** (section 8.1.2) is also used for some papillary tumours.

Instillation of **BCG** (*Bacillus Calmette-Guérin*), a live attenuated strain derived from *Mycobacterium bovis* (section 8.2.4), is licensed for the treatment of primary or recurrent bladder carcinoma *in-situ* and for the prevention of recurrence following transurethral resection.

**Interstitial cystitis** **Dimethyl sulfoxide** may be used for symptomatic relief in patients with interstitial cystitis (Hunner's ulcer). 50 mL of a 50% solution (*Rimso-50*®—available from 'special-order' manufacturers or specialist importing companies, p. 988) is instilled into the bladder, retained for 15 minutes, and voided by the patient. Treatment is repeated at intervals of 2 weeks. Bladder spasm and hypersensitivity reactions may occur and long-term use requires ophthalmic, renal, and hepatic assessment at intervals of 6 months. **Interactions:** see Appendix 1 (dimethyl sulfoxide).

## SODIUM CITRATE

**Indications** bladder washouts, see notes above

**Sterile Sodium Citrate Solution for Bladder Irrigation**

sodium citrate 3%, dilute hydrochloric acid 0.2%, in purified water, freshly boiled and cooled, and sterilised

## Urological surgery

There is a high risk of fluid absorption from the irrigant used in endoscopic surgery within the urinary tract; if this occurs in excess, hypervolaemia, haemolysis, and renal failure may result. **Glycine irrigation solution 1.5%** is the irrigant of choice for transurethral resection of the prostate gland and bladder tumours; **sterile sodium chloride solution 0.9%** (physiological saline) is used for percutaneous renal surgery.

## GLYCINE

**Indications** bladder irrigation during urological surgery; see notes above

**Cautions** see notes above

**Side-effects** see notes above

**Glycine Irrigation Solution** (Non-proprietary)

**Irrigation solution**, glycine 1.5% in water for injections

## Maintenance of indwelling urinary catheters

The deposition which occurs in catheterised patients is usually chiefly composed of phosphate and to minimise this the catheter (if latex) should be changed at least as often as every 6 weeks. If the catheter is to be left for longer periods a silicone catheter should be used together with the appropriate use of catheter maintenance solutions. Repeated blockage usually indicates that the catheter needs to be changed.

## CATHETER PATENCY SOLUTIONS

### Chlorhexidine 0.02%

Brands include *Uro-Tainer Chlorhexidine*®, 100-mL sachet = £2.60

### Sodium chloride 0.9%

Brands include *OptiFlo S*®, 50- and 100-mL sachets = £3.20; *Uriflex S*®, 100-mL sachet = £2.40; *Uriflex SP*®, with integral drug additive port, 100-mL sachet = £2.40; *Uro-Tainer Sodium Chloride*®, 50- and 100-mL sachets = £3.25; *Uro-Tainer M*®, with integral drug additive port, 50- and 100-mL sachets = £2.90

### Solution G

Citric acid 3.23%, magnesium oxide 0.38%, sodium bicarbonate 0.7%, disodium edetate 0.01%. Brands include *OptiFlo G*®, 50- and 100-mL sachets = £3.40; *Uriflex G*®, 100-mL sachet = £2.40; *Uro-Tainer Twin Suby G, 2* × 30-mL = £4.46

### Solution R

Citric acid 6%, gluconolactone 0.6%, magnesium carbonate 2.8%, disodium edetate 0.01%. Brands include *OptiFlo R*®, 50- and 100-mL sachets = £3.40; *Uriflex R*®, 100-mL sachet = £2.40; *Uro-Tainer Twin Solutio R, 2* × 30-mL = £4.46

## 7.4.5 Drugs for erectile dysfunction

Reasons for failure to produce a satisfactory erection include *psychogenic, vascular, neurogenic, and endocrine abnormalities*; impotence can also be drug-induced. Intracavernosal injection or urethral application of vasoactive drugs under careful medical supervision is used for both diagnostic and therapeutic purposes.

Erectile disorders may also be treated with drugs given by mouth which increase the blood flow to the penis. Drugs should be used with caution if the penis is deformed (e.g. in angulation, cavernosal fibrosis, and Peyronie's disease).

**Priapism** If priapism occurs with alprostadil, treatment should not be delayed more than 6 hours and is as follows:

Initial therapy by penile aspiration—using aseptic technique a 19–21 gauge butterfly needle inserted into the corpus cavernosum and 20–50 mL of blood aspirated; if necessary the procedure may be repeated on the opposite side.

If initial aspiration is unsuccessful a second 19–21 gauge butterfly needle can be inserted into the opposite corpus cavernosum and sterile physiological saline introduced through the first needle and drained through the second.

If aspiration and lavage of corpora are unsuccessful, *cautious* intracavernosal injection of a sympathomimetic (section 2.7.2) with action on alpha-adrenergic receptors, continuously monitoring blood pressure and pulse (*extreme caution*: coronary heart disease, hypertension, cerebral ischaemia or if taking antidepressant) as follows:

- intracavernosal injections of phenylephrine 100–200 micrograms (0.5–1 mL of a 10 mg/mL solution) every 5–10 minutes; max. total dose 1 mg [unlicensed indication] [*important*: if suitable

strength of phenylephrine injection not available may be specially prepared by diluting 0.1 mL of the phenylephrine 1% (10 mg/mL) injection (section 2.7.2) to 5 mL with sodium chloride 0.9%;

*alternatively*

- intracavernosal injections of adrenaline 10–20 micrograms (0.5–1 mL of a 20 microgram/mL solution) every 5–10 minutes; max. total dose 100 micrograms [unlicensed indication] [*important*: if suitable strength of adrenaline not available may be specially prepared by diluting 0.1 mL of the adrenaline 1 in 1000 (1 mg/mL, section 3.4.3) injection to 5 mL with sodium chloride 0.9%]; *alternatively*
- intracavernosal injection of metaraminol (*caution: has been associated with fatal hypertensive crises*); metaraminol 1 mg (0.1 mL of 10 mg/mL metaraminol injection, section 2.7.2) is diluted to 50 mL with sodium chloride injection 0.9% and given carefully by slow injection into the corpora in 5-mL injections every 15 minutes [unlicensed indication].

If necessary the sympathomimetic injections can be followed by further aspiration of blood through the same butterfly needle.

If sympathomimetics unsuccessful, urgent surgical referral for management (possibly including shunt procedure).

**Prescribing on the NHS** Drug treatments for erectile dysfunction may only be prescribed on the NHS under certain circumstances (see individual preparations). The Department of Health (England) has recommended that treatment should also be available from specialist services (commissioned by Health Authorities and Primary Care Groups, and operating under local agreement) when the condition is causing severe distress; specialist centres should use form FP10(HP) or form HBP in Scotland or form WP10HP in Wales and endorse them 'SLS' if the treatment is to be dispensed in the community. The following criteria should be considered when assessing distress:

- significant disruption to normal social and occupational activities;
- a marked effect on mood, behaviour, social and environmental awareness;
- a marked effect on interpersonal relationships.

## Alprostadil

**Alprostadil** (prostaglandin E<sub>1</sub>) is given by intracavernosal injection or intraurethral application for the management of erectile dysfunction (after exclusion of treatable medical causes); it is also used as a diagnostic test.

### ALPROSTADIL

**Indications** erectile dysfunction (including aid to diagnosis)

**Cautions** priapism—patients should be instructed to report any erection lasting 4 hours or longer—for management, see section 7.4.5; anatomical deformations of penis (painful erection more likely)—follow up

regularly to detect signs of penile fibrosis (consider discontinuation if angulation, cavernosal fibrosis or Peyronie's disease develop); **interactions:** Appendix 1 (prostaglandins)

**Contra-indications** predisposition to prolonged erection (as in sickle cell anaemia, multiple myeloma or leukaemia); not for use with other agents for erectile dysfunction, in patients with penile implants or when sexual activity medically inadvisable; urethral application also contra-indicated in urethral stricture, severe hypospadias, severe curvature, balanitis, urethritis

**Side-effects** hypotension, hypertension; dizziness, headache; penile pain, other localised pain (blisters, leg, testicular, abdominal); influenza-like syndrome; urethral burning, urethral bleeding; injection site reactions including penile fibrosis, penile oedema, penile rash, haematoma, haemosiderin deposits; *less commonly* nausea, dry mouth, vasodilatation, syncope, supraventricular extrasystole, rapid pulse, asthenia, leg cramps, pelvic pain, scrotal or testicular oedema, scrotal erythema, testicular thickening, micruration difficulties, haematuria, mydriasis, and sweating; local reactions including penile warmth, pruritus, irritation, penile numbness or sensitivity, balanitis, phimosis, priapism (see section 7.4.5 and under Cautions), abnormal ejaculation; *rarely* vertigo, urinary-tract infection, and hypersensitivity reactions (including rash, erythema, urticaria, and anaphylaxis)

#### Dose

- See under preparations below

#### ▲ Intracavernosal injection

##### 1 **Caverject**® (Pharmacia) (POM) (JMS)

**Injection**, powder for reconstitution, alprostadil, net price 5-microgram vial = £7.73; 10-microgram vial = £9.24; 20-microgram vial = £11.94; 40-microgram vial = £21.58 (all with diluent-filled syringe, needles and swabs)

**Caverject**® **Dual Chamber**, double-chamber cartridges (containing alprostadil and diluent), net price 10-microgram cartridge (for doses 2.5–10 micrograms) = £7.35; 20-microgram cartridge (for doses 5–20 micrograms) = £9.50 (both with needles)

**Dose** by direct intracavernosal injection, **ADULT** over 18 years, erectile dysfunction, first dose 2.5 micrograms, second dose 5 micrograms (if some response to first dose) or 7.5 micrograms (if no response to first dose), increasing in steps of 5–10 micrograms to obtain dose suitable for producing erection lasting not more than 1 hour (neurological dysfunction, first dose 1.25 micrograms, second dose 2.5 micrograms, third dose 5 micrograms, increasing in steps of 5–10 micrograms to obtain suitable dose); if no response to dose then next higher dose can be given within 1 hour, if there is a response the next dose should not be given for at least

1. (JMS) except to treat erectile dysfunction in men who:

- have diabetes, multiple sclerosis, Parkinson's disease, poliomyelitis, prostate cancer, severe pelvic injury, single gene neurological disease, spina bifida, or spinal cord injury;
- are receiving dialysis for renal failure;
- have had radical pelvic surgery, prostatectomy (including transurethral resection of the prostate), or kidney transplant;
- were receiving *Caverject*®, *Erecnos*®, *MUSE*®, *Viagra*®, or *Viridal*® for erectile dysfunction, at the expense of the NHS, on 14 September 1998;
- are suffering severe distress as a result of impotence (prescribed in specialist centres only, see notes above).

The prescription must be endorsed 'SLS'.

24 hours; usual dose 5–20 micrograms; max. 60 micrograms; max. frequency of injection not more than 3 times per week with at least 24 hour interval between injections

**Note** The first dose must be given by medically trained personnel; self-administration may only be undertaken after proper training  
Aid to diagnosis, 10–20 micrograms as a single dose (where evidence of neurological dysfunction, initially 5 micrograms and max. 10 micrograms)—consult product literature for details

##### 1 **Viridal**® **Duo** (UCB Pharma) (POM) (JMS)

**Starter Pack** (hosp. only), contents as for *Continuation Pack* below plus *Duoject* applicator, 10-microgram starter pack = £20.13, 20-microgram starter pack = £24.54, 40-microgram starter pack = £29.83; *Continuation Pack*, 2 double-chamber cartridges (containing alprostadil and diluent), 2 needles, swabs, 10-microgram continuation pack = £16.55, 20-microgram continuation pack = £21.39, 40-microgram continuation pack = £27.22; replacement *Duoject*® applicators available from UCB Pharma

**Dose** by direct intracavernosal injection, **ADULT** over 18 years, erectile dysfunction, initially 5 micrograms (2.5 micrograms in neurogenic erectile dysfunction) increasing in steps of 2.5–5 micrograms to obtain dose suitable for producing erection not lasting more than 1 hour; usual range 10–20 micrograms; max. 40 micrograms; max. frequency of injection not more than 2–3 times per week with at least 24 hour interval between injections; reduce dose if erection lasts longer than 2 hours

**Note** The first dose must be given by medically trained personnel; self-administration may only be undertaken after proper training

#### ▲ Urethral application

**Counselling** If partner pregnant barrier contraception should be used

##### 1 **MUSE**® (Meda) (POM) (JMS)

**Urethral application**, alprostadil, net price 125-microgram single-use applicator = £9.89, 250-microgram single-use applicator = £11.30, 500-microgram single-use applicator = £11.30, 1-mg single-use applicator = £10.89 (all strengths also available in packs of 6 applicators)

**Condoms** no evidence of harm to latex condoms and diaphragms

**Dose** by direct urethral application, **ADULT** over 18 years, erectile dysfunction, initially 250 micrograms adjusted according to response (usual range 0.125–1 mg); max. 2 doses in 24 hours and 7 doses in 7 days)

**Note** During initiation of treatment *MUSE*® should be used under medical supervision; self-administration may only be undertaken after proper training

Aid to diagnosis, 500 micrograms as a single dose

## Phosphodiesterase type-5 inhibitors

**Sildenafil**, **tadalafil** and **varденаfil** are phosphodiesterase type-5 inhibitors licensed for the treatment of erectile dysfunction; they are not recommended for use with other treatments for erectile dysfunction. The patient should be assessed appropriately before prescribing sildenafil, tadalafil or vardenafil. Since these drugs are given by mouth there is a potential for drug interactions.

**Cautions** Sildenafil, tadalafil, and vardenafil should be used with caution in cardiovascular disease, left ventricular outflow obstruction, anatomical deformation of the penis (e.g. angulation, cavernosal fibrosis, Peyronie's disease), and in those with a predisposition to priapism (e.g. in sickle-cell disease, multiple myeloma, or leukaemia). Concomitant treatment with a phosphodiesterase type-5 inhibitor and an alpha-blocker (section 2.5.4 and section 7.4.1) can increase the risk of postural hypotension—initiate treatment with a phosphodiesterase type-5 inhibitor (at a low dose) only once the

patient is stable on the alpha-blocker; see also **interactions**: Appendix 1 (sildenafil, tadalafil, vardenafil).

**Contra-indications** Sildenafil, tadalafil, and vardenafil are contra-indicated in patients receiving nitrates, in patients in whom vasodilation or sexual activity are inadvisable, or in patients with a previous history of non-arteritic anterior ischaemic optic neuropathy. In the absence of information, manufacturers contra-indicate these drugs in hypotension (avoid if systolic blood pressure below 90 mmHg), recent stroke, unstable angina, and myocardial infarction.

**Side-effects** The side-effects of sildenafil, tadalafil, and vardenafil include dyspepsia, nausea, vomiting, headache (including migraine), flushing, dizziness, myalgia, back pain, visual disturbances (non-arteritic anterior ischaemic optic neuropathy has been reported—stop drug if sudden visual impairment occurs), and nasal congestion. *Less common* side-effects include painful red eyes, palpitation, tachycardia, hypotension, hypertension, epistaxis. Other side-effects reported rarely include syncope, hypersensitivity reactions (including rash, facial oedema, and Stevens-Johnson syndrome), and priapism. Serious cardiovascular events (including arrhythmia, unstable angina, and myocardial infarction), seizures, sudden hearing loss (discontinue drug and seek medical advice), and retinal vascular occlusion have also been reported.

## SILDENAFIL

**Indications** erectile dysfunction; pulmonary hypertension (section 2.5.1)

**Cautions** see notes above; also bleeding disorders or active peptic ulceration; **interactions**: Appendix 1 (sildenafil)

**Contra-indications** see notes above; also hereditary degenerative retinal disorders

**Hepatic impairment** initial dose 25 mg; manufacturer advises avoid in severe impairment

**Renal impairment** initial dose 25 mg if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>

**Side-effects** see notes above; also *less commonly* chest pain, drowsiness, hypoaesthesia, vertigo, tinnitus, dry mouth, fatigue; *rarely* cerebrovascular accident and atrial fibrillation

### Dose

- **ADULT** over 18 years initially 50 mg approx. 1 hour before sexual activity, subsequent doses adjusted according to response to 25–100 mg as a single dose as needed; max. 1 dose in 24 hours (max. single dose 100 mg)

**Note** Onset of effect may be delayed if taken with food

1. **MS** except to treat erectile dysfunction in men who:

- have diabetes, multiple sclerosis, Parkinson's disease, poliomyelitis, prostate cancer, severe pelvic injury, single gene neurological disease, spina bifida, or spinal cord injury;
- are receiving dialysis for renal failure;
- have had radical pelvic surgery, prostatectomy (including transurethral resection of the prostate), or kidney transplant;
- were receiving *Caverject*<sup>®</sup>, *Erecnos*<sup>®</sup>, *MUSE*<sup>®</sup>, *Viagra*<sup>®</sup>, or *Viridal*<sup>®</sup> for erectile dysfunction, at the expense of the NHS, on 14 September 1998;
- are suffering severe distress as a result of impotence (prescribed in specialist centres only, see notes above).

The prescription must be endorsed 'SLS'.

**1 Viagra**<sup>®</sup> (Pfizer) **POM** **JMS**

**Tablets**, all blue, f/c, sildenafil (as citrate), 25 mg, net price 4-tab pack = £16.59, 8-tab pack = £33.19; 50 mg, 4-tab pack = £19.34, 8-tab pack = £38.67; 100 mg, 4-tab pack = £23.50, 8-tab pack = £46.99

**Revatio**<sup>®</sup> (Pfizer) **▼** **POM**

Section 2.5.1 (pulmonary hypertension)

## TADALAFIL

**Indications** erectile dysfunction; pulmonary hypertension (section 2.5.1)

**Cautions** see notes above; **interactions**: Appendix 1 (tadalafil)

**Contra-indications** see notes above; also moderate heart failure, uncontrolled arrhythmias, uncontrolled hypertension

**Hepatic impairment** max. dose 10 mg; manufacturer advises monitor patient in severe impairment

**Renal impairment** max. dose 10 mg if eGFR less than 30 mL/minute/1.73 m<sup>2</sup> (avoid regular once-daily dosing)

**Side-effects** see notes above; also increased sweating, abdominal pain, and transient amnesia reported

### Dose

- **ADULT** over 18 years, initially 10 mg at least 30 minutes before sexual activity, subsequent doses adjusted according to response, up to 20 mg as a single dose; max. 1 dose in 24 hours (but daily dose of 10–20 mg not recommended); for patients who anticipate sexual activity at least twice weekly, 5 mg once daily can be taken, reduced to 2.5 mg once daily according to response

**Note** Effect of intermittent dosing may persist for longer than 24 hours

**1 Cialis**<sup>®</sup> (Lilly) **POM** **JMS**

**Tablets**, f/c, tadalafil 2.5 mg (orange), net price 28-tab pack = £54.99; 5 mg (light yellow), 28-tab pack = £54.99; 10 mg (light yellow), 4-tab pack = £26.99; 20 mg (yellow), 4-tab pack = £26.99; 8-tab pack = £53.98

## VARDENAFIL

**Indications** erectile dysfunction

**Cautions** see notes above; also elderly; bleeding disorders or active peptic ulceration; susceptibility to prolongation of QT interval (including concomitant use of drugs which prolong QT interval); **interactions**: Appendix 1 (vardenafil)

**Contra-indications** see notes above; also hereditary degenerative retinal disorders

**Hepatic impairment** initial dose 5 mg in mild to moderate impairment, increased subsequently according to response (max. 10 mg in moderate impairment); manufacturer advises avoid in severe impairment

**Renal impairment** initial dose 5 mg if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>

**Side-effects** see notes above; also *less commonly* drowsiness, dyspnoea, increased lacrimation, photosensitivity; *rarely* anxiety, transient amnesia, hypertension, and raised intra-ocular pressure

**Dose**

- **ADULT** over 18 years, initially 10 mg (patients on alpha-blocker therapy 5 mg) approx. 25–60 minutes before sexual activity, subsequent doses adjusted according to response up to max. 20 mg as a single dose; max. 1 dose in 24 hours

**Note** Onset of effect may be delayed if taken with high-fat meal

<sup>1</sup>**Levitra**® (Bayer Schering)  

**Tablets**, all orange, f/c, vardenafil (as hydrochloride trihydrate) 5 mg, net price 4-tab pack = £7.56, 8-tab pack = £15.12; 10 mg, 4-tab pack = £14.08, 8-tab pack = £28.16; 20 mg, 4-tab pack = £23.48, 8-tab pack = £46.96

---

## Papaverine and phentolamine

Although not licensed the smooth muscle relaxant **papaverine** has also been given by intracavernosal injection for erectile dysfunction. Patients with neurological or psychogenic impotence are more sensitive to the effect of papaverine than those with vascular abnormalities. **Phentolamine** is added if the response is inadequate [unlicensed indication].

Persistence of the erection for longer than 4 hours is an emergency, see advice in section 7.4.5.

---

1.  except to treat erectile dysfunction in men who:

- have diabetes, multiple sclerosis, Parkinson's disease, poliomyelitis, prostate cancer, severe pelvic injury, single gene neurological disease, spina bifida, or spinal cord injury;
- are receiving dialysis for renal failure;
- have had radical pelvic surgery, prostatectomy (including transurethral resection of the prostate), or kidney transplant;
- were receiving *Caverject*®, *Erecnos*®, *MUSE*®, *Viagra*®, or *Viridal*® for erectile dysfunction, at the expense of the NHS, on 14 September 1998;
- are suffering severe distress as a result of impotence (prescribed in specialist centres only, see notes above).

The prescription must be endorsed 'SLS'.

# 8 Malignant disease and immunosuppression

<b>8.1 Cytotoxic drugs</b>	<b>518</b>

8.3.4.3 Somatostatin analogues	574

## 8.1 Cytotoxic drugs

8.1.1 Alkylating drugs	
8.1.2 Anthracyclines and other cytotoxic antibiotics	
8.1.3 Antimetabolites	
8.1.4 Vinca alkaloids and etoposide	
8.1.5 Other antineoplastic drugs	

The chemotherapy of cancer is complex and should be confined to specialists in oncology. Cytotoxic drugs have both anti-cancer activity and the potential to damage normal tissue; most cytotoxic drugs are teratogenic. Chemotherapy may be given with a curative intent or it may aim to prolong life or to palliate symptoms. In an increasing number of cases chemotherapy may be combined with radiotherapy or surgery or both as either neoadjuvant treatment (initial chemotherapy aimed at shrinking the primary tumour, thereby rendering local therapy less destructive or more effective) or as adjuvant treatment (which follows definitive treatment of the primary disease, when the risk of sub-clinical metastatic disease is known to be high). All cytotoxic drugs cause side-effects and a balance has to be struck between likely benefit and acceptable toxicity.

### Guidelines for handling cytotoxic drugs

- Trained personnel should reconstitute cytotoxics;
- Reconstitution should be carried out in designated pharmacy areas;
- Protective clothing (including gloves, gowns, and masks) should be worn;
- The eyes should be protected and means of first aid should be specified;
- Pregnant staff should avoid exposure to cytotoxic drugs (all females of child-bearing age should be informed of the reproductive hazard);
- Use local procedures for dealing with spillages and safe disposal of waste material, including syringes, containers, and absorbent material;
- Staff exposure to cytotoxic drugs should be monitored.

Combinations of cytotoxic drugs, as continuous or pulsed cycles of treatment, are frequently more toxic than single drugs but have the advantage in certain tumours of enhanced response, reduced development of drug resistance and increased survival. However for some tumours, single-agent chemotherapy remains the treatment of choice.

Cytotoxic drugs fall into a number of classes, each with characteristic antitumour activity, sites of action, and

toxicity. A knowledge of sites of metabolism and excretion is important because impaired drug handling as a result of disease is not uncommon and may result in enhanced toxicity.

### Intrathecal chemotherapy

A Health Service Circular (HSC 2008/001) provides guidance on the introduction of safe practice in NHS Trusts where intrathecal chemotherapy is administered; written local guidance covering all aspects of national guidance should be available. Support for training programmes is also available. Copies, and further information may be obtained from:

Department of Health

PO Box 777

London SE1 6XH

Fax: 01623 724524

It is also available from the Department of Health website ([www.dh.gov.uk](http://www.dh.gov.uk))

**Safe systems for cytotoxic medicines** NHS cancer networks have been established across the UK to bring together all stakeholders in all sectors of care, to work collaboratively to plan and deliver high quality cancer services for a given population. NHS cancer networks have websites containing information on local chemotherapy services and treatment (see [www.cancer.nhs.uk/networks.htm](http://www.cancer.nhs.uk/networks.htm)).

Safe system requirements:

- cytotoxic drugs for the treatment of cancer should be given as part of a wider pathway of care coordinated by a multidisciplinary team;
- cytotoxic drugs should be prescribed, dispensed, and administered only in the context of a written protocol or treatment plan;
- injectable cytotoxic drugs should only be dispensed if they are prepared for administration
- oral cytotoxic medicines should be dispensed with clear directions for use

### Risks of incorrect dosing of oral anti-cancer medicines

The National Patient Safety Agency has advised (January 2008) that the prescribing and use of oral cytotoxic medicines should be carried out to the same standard as parenteral cytotoxic therapy. Standards to be followed to achieve this include:

- non-specialists who prescribe or administer ongoing oral cytotoxic medication should have access to written protocols and treatment plans, including guidance on the monitoring and treatment of toxicity
- staff dispensing oral cytotoxic medicines should confirm that the prescribed dose is appropriate for the patient. Patients should have written information that includes details of the intended oral anti-cancer regimen, the treatment plan, and arrangements for monitoring, taken from the original protocol from the initiating hospital. Staff dispensing oral cytotoxic medicines should also have access to this information, and to advice from an experienced cancer pharmacist in the initiating hospital

### Doses

Doses of cytotoxic drugs are determined using a variety of different methods including body-surface area or body-weight. Alternatively, doses may be fixed. Doses may be further adjusted following consideration of a patient's neutrophil count, renal and hepatic function, and history of previous adverse effects to the cytotoxic drug. Doses may also differ depending on whether a drug is used alone or in combination.

Because of the complexity of dosage regimens in the treatment of malignant disease, dose statements have been omitted from some of the drug entries in this chapter. However, even where dose statements have been provided, detailed specialist literature, individual hospital chemotherapy protocols, or local cancer networks ([www.cancer.nhs.uk/networks.htm](http://www.cancer.nhs.uk/networks.htm)) should be consulted prior to prescribing, dispensing, or administering cytotoxic drugs.

Prescriptions should **not** be repeated except on the instructions of a specialist.

### Side-effects of cytotoxic drugs

Side-effects common to most cytotoxic drugs are discussed below whilst side-effects characteristic of a particular drug or class of drugs (e.g. neurotoxicity with vinca alkaloids) are mentioned in the appropriate sections. Manufacturers' product literature, hospital-trust protocols, and cancer-network protocols should be consulted for full details of side-effects associated with individual drugs and specific chemotherapy regimens.

Many side-effects of cytotoxic drugs often do not occur at the time of administration, but days or weeks later. It is therefore important that patients and healthcare professionals can identify symptoms that cause concern and can contact an expert for advice. Toxicities should be accurately recorded using a recognised scoring system such as the Common Toxicity Criteria for Adverse Events (CTCAE) developed by the National Cancer Institute.

**Extravasation of intravenous drugs** A number of cytotoxic drugs will cause severe local tissue necrosis if leakage into the extravascular compartment occurs. To reduce the risk of extravasation injury it is recommended that cytotoxic drugs are administered by appropriately trained staff. For information on the prevention and management of extravasation injury, see section 10.3.

**Oral mucositis** A sore mouth is a common complication of cancer chemotherapy; it is most often associated with fluorouracil, methotrexate, and the anthracyclines. It is best to prevent the complication. Good oral hygiene (rinsing the mouth frequently and effective brushing of the teeth with a soft brush 2–3 times daily) is probably beneficial. For fluorouracil, sucking ice chips during short infusions of the drug is also helpful.

Once a sore mouth has developed, treatment is much less effective. Saline mouthwashes should be used but there is no good evidence to support the use of anti-septic or anti-inflammatory mouthwashes. In general, mucositis is self-limiting but with poor oral hygiene it can be a focus for blood-borne infection.

**Tumour lysis syndrome** Tumour lysis syndrome occurs secondary to spontaneous or treatment-related rapid destruction of malignant cells. Patients at risk of tumour lysis syndrome include those with non-Hodgkin's lymphoma (especially if high grade and bulky disease), Burkitt's lymphoma, acute lymphoblastic leukaemia and acute myeloid leukaemia (particularly if high white blood cell counts or bulky disease), and occasionally those with solid tumours. Pre-existing hyperuricaemia, dehydration, and renal impairment are also predisposing factors. Features include hyperkalaemia, hyperuricaemia (see below), and hyperphosphataemia with hypocalcaemia; renal damage and arrhythmias can follow. Early identification of patients at risk, and initiation of prophylaxis or therapy for tumour lysis syndrome, is essential.

**Hyperuricaemia** Hyperuricaemia, which may be present in high-grade lymphoma and leukaemia, can be markedly worsened by chemotherapy and is associated with acute renal failure. Allopurinol (section 10.1.4) should be started 24 hours before treating such tumours and patients should be adequately hydrated. The dose of mercaptopurine or azathioprine should be reduced if allopurinol needs to be given concomitantly (see Appendix 1).

Rasburicase (section 10.1.4), a recombinant urate oxidase, is licensed for hyperuricaemia in patients with haematological malignancy, for details, see p. 657. It rapidly reduces plasma uric acid and may be of particular value in preventing complications following treatment of leukaemias or bulky lymphomas.

**Nausea and vomiting** Nausea and vomiting cause considerable distress to many patients who receive chemotherapy and to a lesser extent abdominal radiotherapy, and may lead to refusal of further treatment; prophylaxis of nausea and vomiting is therefore extremely important. Symptoms may be acute (occurring within 24 hours of treatment), delayed (first occurring more than 24 hours after treatment), or anticipatory (occurring prior to subsequent doses). Delayed and anticipatory symptoms are more difficult to control than acute symptoms and require different management.

Patients vary in their susceptibility to drug-induced nausea and vomiting; those affected more often include women, patients under 50 years of age, anxious patients, and those who experience motion sickness. Susceptibility also increases with repeated exposure to the cytotoxic drug.

Drugs may be divided according to their emetogenic potential and some examples are given below, but the symptoms vary according to the dose, to other drugs administered and to individual susceptibility.

*Mildly emetogenic treatment*—fluorouracil, etoposide, methotrexate (less than 100 mg/m<sup>2</sup>), the vinca alkaloids, and abdominal radiotherapy.

*Moderately emetogenic treatment*—the taxanes, doxorubicin, intermediate and low doses of cyclophosphamide, mitoxantrone, and high doses of methotrexate (0.1–1.2 g/m<sup>2</sup>).

*Highly emetogenic treatment*—cisplatin, dacarbazine, and high doses of cyclophosphamide.

**Prevention of acute symptoms.** For patients at *low risk of emesis*, pretreatment with domperidone or with

metoclopramide, continued for up to 24 hours after chemotherapy, is often effective (section 4.6). If metoclopramide or domperidone are not sufficiently effective, additional drugs such as dexamethasone (6–10 mg by mouth) or lorazepam (1–2 mg by mouth) may be used.

For patients at *high risk of emesis* or when other treatment is inadequate, a specific (5HT<sub>3</sub>) serotonin antagonist (section 4.6), usually given by mouth, is often highly effective, particularly when used with dexamethasone; adding the neurokinin receptor antagonist, aprepitant (section 4.6) can improve control of cisplatin-related nausea and vomiting.

**Prevention of delayed symptoms.** Dexamethasone, given by mouth, is the drug of choice for preventing delayed symptoms; it is used alone or with metoclopramide or prochlorperazine. The 5HT<sub>3</sub> antagonists may be less effective for delayed symptoms.

**Prevention of anticipatory symptoms.** Good symptom control is the best way to prevent anticipatory symptoms. Lorazepam can be helpful for its amnesic, sedative, and anxiolytic effects.

**Bone-marrow suppression** All cytotoxic drugs except vincristine and bleomycin cause bone-marrow depression. This commonly occurs 7 to 10 days after administration, but is delayed for certain drugs, such as carmustine, lomustine, and melphalan. Peripheral blood counts must be checked before each treatment, and doses should be reduced or therapy delayed if bone-marrow has not recovered.

Fever in a neutropenic patient (neutrophil count less than  $1.0 \times 10^9$ /litre) requires immediate broad-spectrum antibacterial therapy. Appropriate bacteriological investigations should be conducted as soon as possible. All patients should initially be investigated and treated under the supervision of the appropriate oncology or haematology specialist.

In selected patients, the duration and the severity of neutropenia can be reduced by the use of amifostine, p. 522 or recombinant human granulocyte-colony stimulating factors, section 9.1.6.

Symptomatic anaemia is usually treated with red blood cell transfusions. For guidance on the use of erythropoietins in patients with cancer, see MHRA/CHM advice (p. 582) and NICE guidance (p. 583).

For advice on the use of live vaccines in individuals with impaired immune response, see section 14.1.

**Alopecia** Reversible hair loss is a common complication, although it varies in degree between drugs and individual patients. No pharmacological methods of preventing this are available.

**Reproductive function** Most cytotoxic drugs are teratogenic and should not be administered during pregnancy, especially during the first trimester. Considerable caution is necessary if a pregnant woman presents with cancer requiring chemotherapy, and specialist advice should always be sought.

Contraceptive advice should be offered where appropriate before cytotoxic therapy begins (and should cover the duration of contraception required after therapy has ended). Regimens that do not contain an alkylating drug may have less effect on fertility, but those with an alkylating drug carry the risk of causing permanent

male sterility (there is no effect on potency). Pre-treatment counselling and consideration of sperm storage may be appropriate. Women are less severely affected, though the span of reproductive life may be shortened by the onset of a premature menopause. No increase in fetal abnormalities or abortion-rate has been recorded in patients who remain fertile after cytotoxic chemotherapy.

**Thromboembolism** Venous thromboembolism can be a complication of cancer itself, but chemotherapy increases the risk.

## Treatment for cytotoxic-induced side-effects

### Anthracycline side-effects

**Anthracycline-induced cardiotoxicity** The anthracycline cytotoxic drugs are associated with dose-related, cumulative, and potentially life-threatening cardiotoxic side-effects.

**Dexrazoxane**, an iron chelator, is licensed for the prevention of chronic cumulative cardiotoxicity caused by doxorubicin or epirubicin treatment in advanced or metastatic cancer patients who have previously received anthracycline therapy. Patients receiving dexrazoxane should still be monitored for cardiac toxicity. The myelosuppressive effects of dexrazoxane may be additive to those of chemotherapy.

**Anthracycline extravasation** Dexrazoxane is licensed for the treatment of anthracycline extravasation. The first dose should be given as soon as possible and within six hours after the injury. For further information on the prevention and management of extravasation injury, see section 10.3.

Local guidelines for the management of extravasation should be followed or specialist advice sought.

### DEXRAZOXANE

**Indications** see notes above and under preparations

**Cautions** see notes above; monitor full blood count

**Hepatic impairment** monitor liver function

**Renal impairment** use with caution—risk of accumulation; manufacturer of *Cardioxane*<sup>®</sup> advises reduce dose by 50% if creatinine clearance less than 40 mL/minute

**Pregnancy** avoid unless essential (toxicity in animal studies); ensure effective contraception during and for at least 3 months after treatment in men and women

**Breast-feeding** discontinue breast-feeding

**Side-effects** nausea, vomiting, dyspepsia, abdominal pain, diarrhoea, stomatitis, dry mouth, anorexia; dyspnoea; dizziness, syncope, asthenia, paraesthesia, tremor, fatigue, drowsiness; pyrexia; vaginal haemorrhage; myalgia; blood disorders (including anaemia, leucopenia, neutropenia, and thrombocytopenia); alopecia, pruritus; peripheral oedema, injection-site reactions including phlebitis

#### Dose

- See under preparations

### Cardioxane<sup>®</sup> (Novartis) ▼ [PwM]

**Intravenous infusion**, powder for reconstitution, dexrazoxane (as hydrochloride), net price 500-mg vial = £156.57

**Dose** prevention of anthracycline-induced cardiotoxicity, **ADULT** over 18 years, by **intravenous infusion** (30 minutes prior to anthracycline administration), 20 times the doxorubicin-equivalent dose or 10 times the epirubicin-equivalent dose

### Savene<sup>®</sup> (SpePharm) ▼ [PwM]

**Intravenous infusion**, powder for reconstitution, dexrazoxane (as hydrochloride), net price 10 x 500-mg vials (with diluent) = £6750.00

**Dose** anthracycline extravasation, **ADULT** over 18 years, by **intravenous infusion**, 1 g/m<sup>2</sup> (max. 2 g) daily for 2 days, then 500 mg/m<sup>2</sup> for 1 day

**Note** Local coolants such as ice packs should be removed at least 15 minutes before administration

## Chemotherapy-induced mucositis and myelosuppression

**Folinic acid** (given as calcium folinate) is used to counteract the folate-antagonist action of methotrexate and thus speed recovery from methotrexate-induced mucositis or myelosuppression ('folinic acid rescue').

Folinic acid is also used in the management of methotrexate overdose, together with other measures to maintain fluid and electrolyte balance, and to manage possible renal failure.

Folinic acid does not counteract the antibacterial activity of folate antagonists such as trimethoprim.

When folinic acid and fluorouracil are used together in metastatic colorectal cancer the response-rate improves compared to that with fluorouracil alone.

The calcium salt of **levofolinic acid**, a single isomer of folinic acid, is also used for rescue therapy following methotrexate administration, for cases of methotrexate overdose, and for use with fluorouracil for colorectal cancer. The dose of calcium levofolinate is generally half that of calcium folinate.

The disodium salts of folinic acid and levofolinic acid are also used for rescue therapy following methotrexate therapy, and for use with fluorouracil for colorectal cancer.

**Palifermin**, a human keratinocyte growth factor, is licensed for the management of oral mucositis in patients with haematological malignancies receiving myeloablative radiochemotherapy with autologous haematopoietic stem-cell support.

### FOLINIC ACID

**Indications** see notes above

**Cautions** avoid simultaneous administration of methotrexate; **not** indicated for pernicious anaemia or other megaloblastic anaemias caused by vitamin B<sub>12</sub> deficiency; **interactions:** Appendix 1 (folates)

**Contra-indications** intrathecal injection

**Pregnancy** not known to be harmful; benefit outweighs risk

**Breast-feeding** presence in milk unknown but benefit outweighs risk

**Side-effects** *rarely* pyrexia after parenteral use; insomnia, agitation, and depression after high doses

**▲ Calcium folinate**

(Calcium leucovorin)

**Calcium Folate** (Non-proprietary) (POM)

Tablets, scored, folic acid (as calcium salt) 15 mg, net price 10-tab pack = £39.20, 30-tab pack = £85.74  
Brands include *Refolinon*<sup>®</sup>

**Note** Not all strengths and pack sizes are available from all manufacturers

**Injection**, folic acid (as calcium salt) 3 mg/mL, net price 1-mL amp = £4.00, 10-mL amp = £4.62; 7.5 mg/mL, net price 2-mL amp = £7.80; 10 mg/mL, net price 5-mL vial = £19.41, 10-mL vial = £35.09, 30-mL vial = £94.69, 35-mL vial = £90.98

Brands include *Refolinon*<sup>®</sup>

**Note** Not all strengths and pack sizes are available from all manufacturers

**Injection**, powder for reconstitution, folic acid (as calcium salt), net price 15-mg vial = £4.46; 30-mg vial = £8.36

**Dose**

**Note** Doses expressed as folic acid

Prevention of methotrexate-induced adverse effects, usually started 12–24 hours after start of methotrexate infusion, by intramuscular injection, or by intravenous injection, or by intravenous infusion, 15 mg, repeated every 6 hours for 24 hours (may be continued by mouth); consult local treatment protocol for further information

Suspected methotrexate overdose, by intravenous injection or by intravenous infusion (at a max. rate of 160 mg/minute), initial dose equal to or exceeding dose of methotrexate; consult poisons information service (p. 32) for advice on continuing management  
Adjunct to fluorouracil in colorectal cancer, consult product literature

**▲ Disodium folinate****Sodiolfolin**<sup>®</sup> (Medac) (POM)

**Injection**, folic acid (as disodium salt) 50 mg/mL, net price 2-mL vial = £35.09, 8-mL vial = £126.25, 18-mL vial = £284.07

**Dose** as an antidote to methotrexate, by intravenous injection or infusion, consult product literature

Adjunct to fluorouracil in colorectal cancer, consult product literature

**LEVOFOLINIC ACID**

**Note** Levofolinic acid is an isomer of folic acid

**Indications** see notes above

**Cautions** see Folic acid

**Contra-indications** see Folic acid

**Pregnancy** see Folic acid

**Breast-feeding** see Folic acid

**Side-effects** see Folic acid

**▲ Calcium levofolinate****Calcium Levofolinate** (Non-proprietary) (POM)

**Injection**, levofolinic acid (as calcium salt) 10 mg/mL, net price 17.5-mL vial = £84.63

**Isovorin**<sup>®</sup> (Wyeth) (POM)

**Injection**, levofolinic acid (as calcium salt) 10 mg/mL, net price 2.5-mL vial = £11.62, 17.5-mL vial = £81.33

**Dose**

**Note** Doses expressed as levofolinic acid

Prevention of methotrexate-induced adverse effects, (usually started 12–24 hours after beginning of methotrexate infusion), by intramuscular injection, or by intravenous injection or by intravenous infusion, usually 7.5 mg every 6 hours for 10 doses

Suspected methotrexate overdose, by intravenous injection or by intravenous infusion (at a max. rate of 160 mg/minute), initial dose at least 50% of the dose of methotrexate; consult poisons information service (p. 32) for advice on continuing management  
Adjunct to fluorouracil in colorectal cancer, consult product literature

**▲ Disodium levofolinate****Levofolinic Acid** (Non-proprietary) (POM)

**Injection**, levofolinic acid (as disodium salt) 50 mg/mL, net price 1-mL vial = £24.70, 4-mL vial = £80.40

**Dose** as an antidote to methotrexate, by intravenous injection or infusion, consult product literature

Adjunct to fluorouracil in colorectal cancer, consult product literature

**PALIFERMIN**

**Indications** see notes above

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** oral paraesthesia, taste disturbance, thickening and discoloration of tongue; fever; oedema; arthralgia; rash, pruritus, erythema, skin hyperpigmentation

**Dose**

• By intravenous injection, 60 micrograms/kg once daily for 3 doses (third dose given 24–48 hours before myeloablative therapy) then 3 further doses at least 24 hours after myeloablative therapy, and more than 4 days after most recent palifermin injection, starting on same day as (but after) stem-cell infusion; CHILD not recommended

**Ke pivance**<sup>®</sup> (Swedish Orphan) (POM)

**Injection**, powder for reconstitution, palifermin, net price 6.25-mg vial = £544.24

**Chemotherapy-induced neutropenic infection and nephrotoxicity**

**Amifostine** is licensed for the reduction of risk of infection associated with cisplatin- and cyclophosphamide-induced neutropenia in advanced ovarian carcinoma, and for the reduction of nephrotoxicity caused by cisplatin use in advanced solid tumours of non-germ-cell origin. Amifostine is also licensed for protection against xerostomia during radiotherapy for head and neck cancer.

Other drugs for the reduction of risk of infection associated with neutropenia include granulocyte-colony stimulating factors (section 9.1.6).

**AMIFOSTINE**

**Indications** see under Dose

**Cautions** ensure adequate hydration before treatment; infuse with patient supine and monitor arterial blood pressure (interrupt infusion if blood pressure decreases significantly, consult product literature); during chemotherapy interrupt antihypertensive therapy 24 hours before treatment with amifostine and monitor closely; during radiotherapy monitor closely if concomitant antihypertensive therapy; monitor serum-calcium concentration in patients at risk of hypocalcaemia; patients at risk of renal impairment; caution in handling—risk of cutaneous reactions

**Hepatic impairment** avoid—no information available

**Renal impairment** avoid—no information available

**Pregnancy** toxicity in animal studies; avoid

**Breast-feeding** avoid—no information available

**Side-effects** nausea, vomiting, hiccups; hypotension (managed by infusion of sodium chloride 0.9% and

postural management), hypertension, flushing, arrhythmias (including *rarely* atrial fibrillation, supraventricular tachycardia); sneezing; drowsiness, dizziness, syncope; hypocalcaemia; *rarely* chest pain, apnoea, seizures, serious skin reactions (including Stevens-Johnson syndrome, toxic epidermal necrolysis, and *very rarely* exfoliative and bullous dermatitis, toxicoderma), and renal failure; *very rarely* myocardial infarction, laryngeal oedema, and respiratory arrest

#### Dose

- Reduction of neutropenia-related risk of infection due to cyclophosphamide and cisplatin treatment in patients with advanced ovarian carcinoma, by **intravenous infusion** over 15 minutes, **ADULT** under 70 years, 910 mg/m<sup>2</sup> started within 30 minutes before chemotherapy (reduced to 740 mg/m<sup>2</sup> for subsequent cycles if full dose could not be given first time due to hypotension lasting more than 5 minutes after interruption, consult product literature)
- Reduction of nephrotoxicity associated with cisplatin in patients with advanced solid tumours of non-germ-cell origin, consult product literature
- Prevention of xerostomia during radiotherapy for head and neck cancer, consult product literature

#### Ethylol<sup>®</sup> (Genopharm) (P<sub>oM</sub>)

**Intravenous infusion**, powder for reconstitution, amifostine, net price 500-mg vial = £225.00

### Urothelial toxicity

Haemorrhagic cystitis is a common manifestation of urothelial toxicity which occurs with the oxazaphosphorines, cyclophosphamide and ifosfamide; it is caused by the metabolite acrolein. **Mesna** reacts specifically with this metabolite in the urinary tract, preventing toxicity. Mesna is used routinely (preferably by mouth) in patients receiving ifosfamide, and in patients receiving cyclophosphamide by the intravenous route at a high dose (e.g. more than 2 g) or in those who experienced urothelial toxicity when given cyclophosphamide previously.

### MESNA

**Indications** see notes above

**Cautions** false positive urinary ketones; false positive or false negative urinary erythrocytes

**Contra-indications** hypersensitivity to thiol-containing compounds

**Pregnancy** not known to be harmful; see also Reproductive Function, p. 520

**Side-effects** nausea, vomiting, colic, diarrhoea, fatigue, headache, limb and joint pains, depression, irritability, rash, hypotension and tachycardia; *rarely* hypersensitivity reactions (more common in patients with auto-immune disorders)

#### Dose

- Calculated according to oxazaphosphorine (cyclophosphamide or ifosfamide) treatment—consult product literature

#### Mesna (Baxter) (P<sub>oM</sub>)

**Tablets**, f/c, mesna 400 mg, net price 10-tab pack = £42.90; 600 mg, 10-tab pack = £61.10

**Injection**, mesna 100 mg/mL, net price 4-mL amp = £3.95; 10-mL amp = £9.77

**Note** For oral administration contents of ampoules are taken in a flavoured drink such as orange juice or cola which may be stored in a refrigerator for up to 24 hours in a sealed container

## 8.1.1 Alkylating drugs

Extensive experience is available with these drugs, which are among the most widely used in cancer chemotherapy. They act by damaging DNA, thus interfering with cell replication. In addition to the side-effects common to many cytotoxic drugs (section 8.1), there are two problems associated with prolonged usage. Firstly, gametogenesis is often severely affected (section 8.1). Secondly, prolonged use of these drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia.

**Cyclophosphamide** is used mainly in combination with other agents for treating a wide range of malignancies, including some leukaemias, lymphomas, and solid tumours. It is given by mouth or intravenously; it is inactive until metabolised by the liver. A urinary metabolite of cyclophosphamide, acrolein, can cause haemorrhagic cystitis; this is a rare but serious complication; increased fluid intake for 24–48 hours after intravenous injection, can prevent this complication. When high-dose therapy (e.g. more than 2 g intravenously) is used or when the patient is considered to be at high risk of cystitis (e.g. because of pelvic irradiation) mesna (given initially intravenously then by mouth) can also help prevent cystitis—see under Urothelial Toxicity (section 8.1).

**Ifosfamide** is related to cyclophosphamide and is given intravenously; mesna (section 8.1) is routinely given with it to reduce urothelial toxicity.

**Chlorambucil** is used either alone or in combination therapy for some lymphomas and chronic leukaemias. It is given by mouth. Side-effects, apart from bone-marrow suppression, are uncommon. However, patients occasionally develop severe widespread rashes which can progress to Stevens-Johnson syndrome or to toxic epidermal necrolysis. If a rash occurs further chlorambucil is contra-indicated and cyclophosphamide is substituted.

**Melphalan** is licensed for the treatment of multiple myeloma, polycythaemia vera, childhood neuroblastoma, advanced ovarian adenocarcinoma, and advanced breast cancer. However, in practice, melphalan is rarely used for ovarian adenocarcinoma; it is no longer used for advanced breast cancer. Melphalan is also licensed for regional arterial perfusion in localised malignant melanoma of the extremities and localised soft-tissue sarcoma of the extremities. Interstitial pneumonitis and life-threatening pulmonary fibrosis are rarely associated with melphalan.

**Busulfan** is given by mouth to treat chronic myeloid leukaemia. Busulfan given by mouth or intravenously, followed by cyclophosphamide, is also licensed as conditioning treatment before haematopoietic stem-cell transplantation in adults and children. Frequent blood tests are necessary because excessive myelosuppression may result in irreversible bone-marrow aplasia. Rarely, progressive pulmonary fibrosis is associated

with busulfan. Skin hyperpigmentation is a common side-effect of oral therapy.

**Lomustine** is a lipid-soluble nitrosourea and is given by mouth. It is used mainly to treat Hodgkin's disease resistant to conventional therapy, malignant melanoma and certain solid tumours. Bone-marrow toxicity is delayed, and the drug is therefore given at intervals of 4 to 6 weeks. Permanent bone-marrow damage can occur with prolonged use. Nausea and vomiting are common and moderately severe.

**Bendamustine** given intravenously is licensed for the treatment of chronic lymphocytic leukaemia, non-Hodgkin's lymphoma, and for the treatment of multiple myeloma.

**Carmustine** given intravenously has similar activity to lomustine; it is given to patients with multiple myeloma, non-Hodgkin's lymphomas, and brain tumours. Cumulative renal damage and delayed pulmonary fibrosis may occur with intravenous use. Carmustine implants are licensed for intralesional use in adults for the treatment of recurrent glioblastoma multiforme as an adjunct to surgery. Carmustine implants are also licensed for high-grade malignant glioma as adjunctive treatment to surgery and radiotherapy.

NICE guidance (carmustine implants and temozolomide for the treatment of newly diagnosed high-grade glioma)  
See p. 540

**Estramustine** is a combination of an oestrogen and chlormethine used predominantly in prostate cancer. It is given by mouth and has both an antimitotic effect and (by reducing testosterone concentration) a hormonal effect.

**Treosulfan** is given by mouth or by intravenous or intraperitoneal administration and is used to treat ovarian cancer. Skin pigmentation is a common side-effect and allergic alveolitis, pulmonary fibrosis and haemorrhagic cystitis occur rarely.

**Thiotepa** is usually used as an intracavitary drug for the treatment of malignant effusions or bladder cancer (section 7.4.4). It is also occasionally used to treat breast cancer, but requires parenteral administration.

**Mitobronitol** is occasionally used to treat chronic myeloid leukaemia; it is available on a named-patient basis from specialist importing companies, see p. 988.

## BENDAMUSTINE HYDROCHLORIDE

**Indications** see notes above

**Cautions** see section 8.1; cardiac disorders—monitor serum potassium and ECG; avoid in acute porphyria (but see section 9.8.2); **interactions:** see Appendix 1 (bendamustine)

**Contra-indications** jaundice; severe bone marrow suppression, low leucocyte or platelet count; major surgery less than 30 days before start of treatment

**Hepatic impairment** consider a 30% dose reduction in moderate impairment; avoid in severe impairment

**Renal impairment** no information available on use in patients with creatinine clearance less than 10 mL/minute

**Pregnancy** avoid (teratogenic and mutagenic in animal studies); effective contraception required during

treatment in men or women, and for 6 months after treatment in men; see also Reproductive function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1; also anorexia, diarrhoea, constipation, haemorrhage, hypotension, hypertension, palpitation, angina, arrhythmias, respiratory dysfunction, insomnia, pain, chills, malaise, infection, pyrexia, amenorrhoea, dehydration, electrolyte disturbances (including hypokalaemia); *less commonly* pericardial effusion; *rarely* acute circulatory failure, drowsiness, voice changes, sweating; *very rarely* taste disturbance, tachycardia, myocardial infarction, cardiac failure, pulmonary fibrosis, paraesthesia, peripheral neuropathy, neurological disorders, ataxia, anticholinergic syndrome, encephalitis, phlebitis, multiple organ failure, haemolysis; *also reported* secondary tumours, Stevens-Johnson syndrome, toxic epidermal necrolysis

**Levact®** (Napp) ▼ (Pom)

**Injection**, powder for reconstitution, bendamustine hydrochloride, net price 25-mg vial = £69.45; 100-mg vial = £275.81

## BUSULFAN

(Busulphan)

**Indications** see notes above

**Cautions** see section 8.1 and notes above; monitor cardiac function; previous radiation therapy; avoid in acute porphyria (but see section 9.8.2); **interactions:** Appendix 1 (busulfan)

**Hepatic impairment** manufacturer advises monitor liver function—no information available

**Pregnancy** avoid (teratogenic in animals); manufacturers advise effective contraception during and for 6 months after treatment in men or women; see also Reproductive Function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above; also hepatotoxicity (including hepatic veno-occlusive disease, hyperbilirubinaemia, jaundice and fibrosis); cardiac tamponade in thalassaemia; pneumonia; skin hyperpigmentation

### Dose

- Chronic myeloid leukaemia, induction of remission, **by mouth**, 60 micrograms/kg daily (max. 4 mg); maintenance, usually 0.5–2 mg daily
- Conditioning treatment before haematopoietic stem-cell transplantation, **by mouth or by intravenous infusion**, consult product literature

**Myleran®** (GSK) (Pom)

**Tablets**, f/c, busulfan 2 mg, net price 25-tab pack = £5.20

**Busilvex®** (Fabre) ▼ (Pom)

**Concentrate for intravenous infusion**, busulfan 6 mg/mL, net price 10-mL vial = £201.25

## CARMUSTINE

**Indications** see notes above

**Cautions** see section 8.1 and notes above; avoid in acute porphyria (but see section 9.8.2); **interactions:** Appendix 1 (carmustine)

**Pregnancy** avoid (teratogenic and embryotoxic in animals); manufacturer advises effective contra-

ception during treatment in men or women; see also Reproductive Function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above; irritant to tissues

**Gliadel®** (Archimedes) (POM)

Implant, carmustine 7.7 mg, net price = £585.34

## CHLORAMBUCIL

**Indications** see notes above

**Cautions** see section 8.1 and notes above; history of epilepsy and children with nephrotic syndrome (increased risk of seizures); avoid in acute porphyria (but see section 9.8.2)

**Hepatic impairment** manufacturer advises consider dose reduction in severe impairment—limited information available

**Pregnancy** avoid; manufacturer advises effective contraception during treatment in men or women; see also Reproductive Function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above

**Leukeran®** (GSK) (POM)

Tablets, f/c, brown, chlorambucil 2 mg, net price 25-tab pack = £8.36

## CYCLOPHOSPHAMIDE

**Indications** see notes above; rheumatoid arthritis (section 10.1.3)

**Cautions** see section 8.1 and notes above; previous or concurrent mediastinal irradiation—risk of cardiotoxicity; diabetes mellitus; avoid in acute porphyria (but see section 9.8.2); **interactions:** Appendix 1 (cyclophosphamide)

**Contra-indications** haemorrhagic cystitis

**Hepatic impairment** reduce dose—consult local treatment protocol for details

**Renal impairment** reduce dose if serum creatinine concentration greater than 120 micromol/litre

**Pregnancy** avoid (manufacturer advises effective contraception during and for at least 3 months after treatment in men or women); see also Reproductive Function, p. 520

**Breast-feeding** discontinue breast-feeding during and for 36 hours after stopping treatment

**Side-effects** see section 8.1 and notes above; also anorexia; pancreatitis; cardiotoxicity at high doses; interstitial pulmonary fibrosis; inappropriate secretion of anti-diuretic hormone, disturbances of carbohydrate metabolism; urothelial toxicity; pigmentation of palms, nails, and soles: *rarely* hepatotoxicity and renal dysfunction

**Cyclophosphamide** (Non-proprietary) (POM)

Tablets, s/c, cyclophosphamide (anhydrous) 50 mg, net price 100 = £20.20. Label: 25, 27

Injection, powder for reconstitution, cyclophosphamide, net price 500-mg vial = £5.66; 1-g vial = £10.66

## ESTRAMUSTINE PHOSPHATE

**Indications** prostate cancer

**Cautions** see section 8.1; congestive heart failure; diabetes; hypertension; epilepsy; hypercalcaemia;

avoid in acute porphyria (but see section 9.8.2);

**interactions:** Appendix 1 (estramustine)

**Contra-indications** peptic ulceration, severe cardiovascular disease

**Hepatic impairment** manufacturer advises caution and regular liver function tests; avoid in severe impairment

**Renal impairment** manufacturer advises caution

**Side-effects** see section 8.1; also diarrhoea; congestive heart failure, ischaemic heart disease, myocardial infarction; oedema (rarely angioneurotic) impotence, gynaecomastia; altered liver function

**Dose**

• 0.14–1.4 g daily in divided doses (usual initial dose 560–840 mg daily)

**Counselling** Each dose should be taken not less than 1 hour before or 2 hours after meals and should not be taken with dairy products

**Estracyl®** (Pharmacia) (POM)

Capsules, estramustine phosphate 140 mg (as disodium salt), net price 100-cap pack = £171.28. Label: 23, counselling, see above

## IFOSFAMIDE

**Indications** see notes above

**Cautions** see section 8.1 and notes above; ensure satisfactory electrolyte balance and renal function before each course (risk of tubular dysfunction, Fanconi's syndrome or diabetes insipidus if renal toxicity not treated promptly); diabetes mellitus; avoid in acute porphyria (but see section 9.8.2); **interactions:** Appendix 1 (ifosfamide)

**Contra-indications** urinary-tract obstruction; acute infection (including urinary-tract infection); urothelial damage

**Hepatic impairment** avoid

**Renal impairment** avoid if serum creatinine concentration greater than 120 micromol/litre

**Pregnancy** avoid (teratogenic and carcinogenic in animals); manufacturer advises adequate contraception during and for at least 6 months after treatment in men or women; see also Reproductive Function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above; also drowsiness, confusion, disorientation, restlessness, psychosis; urothelial toxicity, renal toxicity (see Cautions above); *less commonly* severe encephalopathy; *rarely* diarrhoea, constipation, convulsions, anorexia, *very rarely* jaundice, thrombophlebitis, syndrome of inappropriate antidiuretic hormone secretion; acute pancreatitis, arrhythmias, and heart failure also reported

**Ifosfamide** (Non-proprietary) (POM)

Injection, powder for reconstitution, ifosfamide, net price 1-g vial = £43.53; 2-g vial = £88.62 (hosp. only)

## LOMUSTINE

**Indications** see notes above

**Cautions** see section 8.1 and notes above; avoid in acute porphyria (but see section 9.8.2); **interactions:** Appendix 1 (lomustine)

**Contra-indications** coeliac disease

**Renal impairment** avoid in severe impairment

**Pregnancy** avoid (manufacturer advises effective contraception during and for at least 6 months after treatment in men or women); see also Reproductive Function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above

**Dose**

- Used alone, 120–130 mg/m<sup>2</sup> body-surface every 6–8 weeks

**Lomustine** (Medac) (POM)

Capsules, blue/clear, lomustine 40 mg, net price 20-cap pack = £455.62

**Note** The brand name *CCNU*<sup>®</sup> has been used for lomustine capsules

**Pregnancy** avoid; see also Reproductive Function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above

**Dose**

- Consult product literature

**Treosulfan** (Medac) (POM)

Capsules, treosulfan 250 mg, net price 100-cap pack = £435.03 Label: 25

**Injection**, powder for reconstitution, treosulfan, net price 1 g = £39.44; 5 g = £152.41 (both in infusion bottle with transfer needle)

## MELPHALAN

**Indications** see notes above

**Cautions** see section 8.1 and notes above; avoid in acute porphyria (but see section 9.8.2); **interactions:** Appendix 1 (melphalan)

**Renal impairment** reduce dose initially (consult product literature)

**Pregnancy** avoid (manufacturer advises adequate contraception during treatment in men or women); see also Reproductive Function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above

**Dose**

- **By mouth**, multiple myeloma, dose may vary according to regimen; typical dose 150 micrograms/kg daily for 4 days, repeated every 6 weeks  
Polycythaemia vera, initially, 6–10 mg daily reduced after 5–7 days to 2–4 mg daily until satisfactory response then further reduce to 2–6 mg **per week**
- **By intravenous injection or infusion and regional arterial perfusion**, consult product literature

**Alkeran**<sup>®</sup> (GSK) (POM)

Tablets, melphalan 2 mg, net price 25 = £13.75

**Injection**, powder for reconstitution, melphalan 50 mg (as hydrochloride), net price 50-mg vial (with solvent-diluent) = £33.13

## THIOTEPA

**Indications** see notes above and section 7.4.4

**Cautions** see section 8.1; avoid in acute porphyria (but see section 9.8.2); **interactions:** Appendix 1 (thiotepa)

**Pregnancy** avoid (teratogenic and embryotoxic in animals); see also Reproductive Function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1

**Thiotepa** (Goldshield) (POM)

**Injection**, powder for reconstitution, thiotepa, net price 15-mg vial = £5.20

**Tepadina**<sup>®</sup> (Intrapharm) (POM)

**Injection**, powder for reconstitution, thiotepa, net price 15-mg vial = £123.00; 100-mg vial = £736.00

## TREOSULFAN

**Indications** see notes above

**Cautions** see section 8.1; avoid in acute porphyria (but see section 9.8.2)

## 8.1.2 Anthracyclines and other cytotoxic antibiotics

Drugs in this group are widely used. Many cytotoxic antibiotics act as radiomimetics and simultaneous use of radiotherapy should be **avoided** as it may result in markedly enhanced toxicity.

**Daurorubicin, doxorubicin, epirubicin and idarubicin** are anthracycline antibiotics. Mitoxantrone is an anthracycline derivative.

**Doxorubicin** is used to treat the acute leukaemias, Hodgkin's and non-Hodgkin's lymphomas, paediatric malignancies, and some solid tumours including breast cancer. It is given by injection into a fast-running infusion, commonly at 21-day intervals. Extravasation can cause severe tissue necrosis. Doxorubicin is largely excreted in the bile and an elevated bilirubin concentration is an indication for reducing the dose. Diarrhoea, dehydration, and red coloration of the urine can commonly occur, and renal damage has been reported. Supraventricular tachycardia related to drug administration is an uncommon complication. Higher cumulative doses are associated with cardiomyopathy and it is usual to limit total cumulative doses to 450 mg/m<sup>2</sup> because symptomatic and potentially fatal heart failure is common above this dose. Patients should be assessed before treatment by echocardiography; the elderly, and those with cardiac disease, hypertension, or who have received myocardial irradiation, should be treated cautiously. Cardiac monitoring may assist in determining safe dosage. Some evidence suggests that weekly low-dose administration may be less cardiotoxic. Doxorubicin is also given by bladder instillation for the treatment of transitional cell carcinoma, papillary bladder tumours and carcinoma *in-situ*.

Liposomal formulations of doxorubicin for intravenous use are also available. They may reduce the incidence of cardiotoxicity and lower the potential for local necrosis, but infusion reactions, sometimes severe, may occur. Hand-foot syndrome (painful, macular reddening skin eruptions) occurs commonly with liposomal doxorubicin and may be dose limiting. It can occur after 2–3 treatment cycles and may be prevented by cooling hands and feet and avoiding socks, gloves, or tight-fitting footwear for 4–7 days after treatment.

NICE guidance (paclitaxel, pegylated liposomal doxorubicin and topotecan for second-line or subsequent treatment of advanced ovarian cancer)

See p. 542

**Epirubicin** is structurally related to doxorubicin and clinical trials suggest that it is as effective in the treatment of breast cancer. A maximum cumulative dose of 0.9–1 g/m<sup>2</sup> is recommended to help avoid cardiotoxicity. Like doxorubicin it is given intravenously and by bladder instillation. Hyperpigmentation of skin, nails, and oral mucosa, and red coloration of the urine, may occur.

**Idarubicin** has general properties similar to those of doxorubicin; it is mostly used in the treatment of haematological malignancies. Diarrhoea, abdominal pain, haemorrhage, cardiac disorders, rash, and red pigmentation of the urine are commonly reported. Skin and nail hyperpigmentation have been reported less frequently. Idarubicin is given intravenously and it may also be given by mouth.

**Daurorubicin** also has general properties similar to those of doxorubicin. It should be given by intravenous infusion and is indicated for acute leukaemias. A liposomal formulation for intravenous use is licensed for AIDS-related Kaposi's sarcoma.

#### Use with trastuzumab

Concomitant use of anthracyclines with trastuzumab (section 8.1.5) is associated with cardiotoxicity; for details, see p. 552.

**Mitoxantrone** is structurally related to doxorubicin; it is used for metastatic breast cancer. Mitoxantrone is also licensed for treatment of non-Hodgkin's lymphoma, adult acute non-lymphocytic leukaemia, and non-resectable primary hepatocellular carcinoma. It is given intravenously and is well tolerated, but myelosuppression and dose-related cardiotoxicity occur; cardiac examinations are recommended after a cumulative dose of 160 mg/m<sup>2</sup>.

**Bleomycin** is given intravenously or intramuscularly to treat metastatic germ cell cancer and, in some regimens, non-Hodgkin's lymphoma. It causes little bone-marrow suppression but dermatological toxicity is common and increased pigmentation particularly affecting the flexures and subcutaneous sclerotic plaques may occur. Mucositis is also relatively common and an association with Raynaud's phenomenon is reported. Hypersensitivity reactions manifest by chills and fevers commonly occur a few hours after drug administration and may be prevented by simultaneous administration of a corticosteroid, for example hydrocortisone intravenously. The principal problem associated with the use of bleomycin is progressive pulmonary fibrosis. This is dose-related, occurring more commonly at cumulative doses greater than 300 000 units (see Bleomycin, below) and in the elderly. Basal lung crepitations or suspicious chest X-ray changes are an indication to stop therapy with this drug. Patients who have received extensive treatment with bleomycin (e.g. cumulative dose more than 100 000 units—see Bleomycin below) may be at risk of developing respiratory failure if a general anaesthetic is given with high inspired oxygen concentrations. Anaesthetists should be warned of this.

**Dactinomycin** is principally used to treat paediatric cancers; it is given intravenously. Its side-effects are similar to those of doxorubicin, except that cardiac toxicity is not a problem.

**Mitomycin** is given intravenously to treat upper gastrointestinal and breast cancers and by bladder instillation for superficial bladder tumours. It causes delayed bone-

marrow toxicity and therefore it is usually administered at 6-weekly intervals. Prolonged use may result in permanent bone-marrow damage. It may also cause lung fibrosis and renal damage.

## BLEOMYCIN

**Indications** squamous cell carcinoma; see also notes above

**Cautions** see section 8.1 and notes above; caution in handling—irritant to tissues; **interactions:** Appendix 1 (bleomycin)

**Renal impairment** reduce dose by half if serum-creatinine 177–354 micromol/litre; reduce dose further if serum-creatinine greater than 354 micromol/litre

**Pregnancy** avoid (teratogenic and carcinogenic in animal studies); see also Reproductive Function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above

**Bleomycin** (Non-proprietary) (POM)

**Injection**, powder for reconstitution, bleomycin (as sulphate), net price 15 000-unit vial = £15.56

**Note** To conform to the European Pharmacopoeia vials previously labelled as containing '15 units' of bleomycin are now labelled as containing 15 000 units. The amount of bleomycin in the vial has not changed.

Brands include *Bleo-Kyowa*®

## DACTINOMYCIN

(Actinomycin D)

**Indications** see notes above

**Cautions** see section 8.1 and notes above; caution in handling—irritant to tissues

**Pregnancy** avoid (teratogenic in animal studies); see also Reproductive Function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above

**Cosmegen Lyovac**® (Ovation) (POM)

**Injection**, powder for reconstitution, dactinomycin, net price 500-microgram vial = £6.75

## DAUNORUBICIN

**Indications** see notes above

**Cautions** see section 8.1 and notes above; caution in handling—irritant to tissues

**Hepatic impairment** reduce dose according to serum bilirubin concentration—consult local protocol for details

**Renal impairment** reduce dose by 25% if serum creatinine 105–265 micromol/litre and by 50% if serum creatinine greater than 265 micromol/litre

**Pregnancy** avoid (teratogenic and carcinogenic in animal studies); see also Reproductive Function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above

**Daurorubicin** (Non-proprietary) (POM)

**Injection**, powder for reconstitution, daunorubicin (as hydrochloride), net price 20-mg vial = £55.00

**Note** The brand name *Cerubidin*® was formerly used.

**Lipid formulation****DaunoXome**® (Gilead) (POM)

Concentrate for intravenous infusion, daunorubicin encapsulated in liposomes. For dilution before use, net price 50-mg vial = £137.67

For advanced AIDS-related Kaposi's sarcoma

**DOXORUBICIN HYDROCHLORIDE****Indications** see notes above and section 7.4.4**Cautions** see section 8.1 and notes above; caution in handling—irritant to tissues; **interactions:** Appendix 1 (doxorubicin)**Contra-indications** see notes above; ; severe myocardial insufficiency, recent myocardial infarction, severe arrhythmias; previous treatment with maximum cumulative doses of doxorubicin or other anthracyclines; intravesical use in urinary infections, bladder inflammation, and in urethral stenosis with catheterisation difficulties**Hepatic impairment** reduce dose according to bilirubin concentration; avoid in severe impairment**Pregnancy** avoid (teratogenic and toxic in *animal* studies); manufacturer of liposomal product advises effective contraception during and for at least 6 months after treatment in men or women; see also Reproductive Function, p. 520**Breast-feeding** discontinue breast-feeding**Side-effects** see section 8.1 and notes above**Doxorubicin** (Non-proprietary) (POM)

**Injection**, powder for reconstitution, doxorubicin hydrochloride, net price 10-mg vial = £18.72; 50-mg vial = £96.86

**Note** The brand name *Adriamycin*® was formerly used

**Injection**, doxorubicin hydrochloride 2 mg/mL, net price 5-mL vial = £20.60, 25-mL vial = £103.00, 100-mL vial = £275.00

**Lipid formulation****Caelyx**® (Schering-Plough) (POM)

Concentrate for intravenous infusion, pegylated doxorubicin hydrochloride 2 mg/mL encapsulated in liposomes. For dilution before use, net price 10-mL vial = £360.23, 25-mL vial = £712.49

For AIDS-related Kaposi's sarcoma in patients with low CD4 count and extensive mucocutaneous or visceral disease, for advanced ovarian cancer when platinum-based chemotherapy has failed, for progressive multiple myeloma (in combination with bortezomib) in patients who have received at least one prior therapy and who have undergone or are unsuitable for bone-marrow transplantation, and as monotherapy for metastatic breast cancer in patients with increased cardiac risk

**Myocet**® (Cephalon) ▼ (POM)

**Injection**, powder for reconstitution, doxorubicin hydrochloride (as doxorubicin-citrate complex) encapsulated in liposomes, net price 50-mg vial (with vials of liposomes and buffer) = £455.68

For use with cyclophosphamide for metastatic breast cancer

**EPIRUBICIN HYDROCHLORIDE****Indications** see notes above and section 7.4.4**Cautions** see section 8.1 and notes above; caution in handling—irritant to tissues; **interactions:** Appendix 1 (epirubicin)**Hepatic impairment** reduce dose according to bilirubin concentration**Pregnancy** avoid (carcinogenic in *animal* studies); see also Reproductive Function, p. 520**Breast-feeding** discontinue breast-feeding**Side-effects** see section 8.1 and notes above**Epirubicin** (Non-proprietary) (POM)

**Injection**, epirubicin hydrochloride 2 mg/mL, net price 5-mL vial = £18.31, 25-mL vial = £92.13, 50-mL vial = £95.54, 100-mL vial = £306.20

**Pharmorubicin**® Solution for Injection (Pharmacia)

**Injection**, epirubicin hydrochloride 2 mg/mL, net price 5-mL vial = £19.31, 25-mL vial = £96.54, 100-mL vial = £386.16

**IDARUBICIN HYDROCHLORIDE****Indications** acute leukaemias (see notes above); advanced breast cancer after failure of first-line chemotherapy (not including anthracyclines)**Cautions** see section 8.1 and notes above; caution in handling—irritant to tissues; **interactions:** Appendix 1 (idarubicin)**Contra-indications** severe myocardial insufficiency; recent myocardial infarction; severe arrhythmias**Hepatic impairment** reduce dose according to serum-bilirubin concentration; avoid in severe impairment**Renal impairment** reduce dose; avoid in severe impairment**Pregnancy** avoid (teratogenic and toxic in *animal* studies); see also Reproductive Function, p. 520**Breast-feeding** discontinue breast-feeding**Side-effects** see section 8.1 and notes above**Dose**

- **By mouth**, acute non-lymphocytic leukaemia, monotherapy, 30 mg/m<sup>2</sup> daily for 3 days or in combination therapy, 15–30 mg/m<sup>2</sup> daily for 3 days  
Advanced breast cancer, monotherapy, 45 mg/m<sup>2</sup> as a single dose or 15 mg/m<sup>2</sup> daily for 3 consecutive days; repeat every 3–4 weeks

**Note** Max. cumulative dose **by mouth** (for all indications) 400 mg/m<sup>2</sup>

- **By intravenous administration**, consult product literature

**Zavedos**® (Pharmacia) (POM)

**Capsules**, idarubicin hydrochloride, 5 mg (red), net price 1-cap pack = £41.47; 10 mg (red/white), 1-cap pack = £69.12. Label: 25

**Injection**, powder for reconstitution, idarubicin hydrochloride, net price 5-mg vial = £87.36; 10-mg vial = £174.72

**MITOMYCIN****Indications** see notes above and section 7.4.4**Cautions** see section 8.1 and notes above; caution in handling—irritant to tissues**Pregnancy** avoid (teratogenic in *animal* studies); see also Reproductive Function, p. 520**Breast-feeding** discontinue breast-feeding**Side-effects** see section 8.1 and notes above**Mitomycin C Kyowa**® (Kyowa Hakko) (POM)

**Injection**, powder for reconstitution, mitomycin, net price 2-mg vial = £5.89; 10-mg vial = £19.37; 20-mg vial = £36.94; 40-mg vial = £73.88 (hosp. only)

## MITOXANTRONE (Mitoxantrone)

**Indications** see notes above

**Cautions** see section 8.1 and notes above; intrathecal administration not recommended; **interactions:** Appendix 1 (mitoxantrone)

**Hepatic impairment** manufacturer advises use with caution in severe impairment; manufacturer advises avoid if serum bilirubin concentration 60 micromol/litre or greater

**Renal impairment** manufacturer advises use with caution in severe impairment

**Pregnancy** avoid; manufacturer advises effective contraception during and for at least 6 months after treatment in men or women; see also Reproductive Function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above, anorexia, diarrhoea, abdominal pain, gastro-intestinal bleeding, constipation, dyspnoea, drowsiness, confusion, paraesthesia, anxiety, amenorrhoea, and transient blue-green discoloration of urine and blue discoloration of skin and nails also reported

**Mitoxantrone** (Non-proprietary) (P<sub>M</sub>)  
Concentrate for intravenous infusion, mitoxantrone (as hydrochloride) 2 mg/mL, net price 10-mL vial = £100.00

**Onkotrone**<sup>®</sup> (Baxter) (P<sub>M</sub>)  
Concentrate for intravenous infusion, mitoxantrone (as hydrochloride) 2 mg/mL, net price 10-mL vial = £121.85, 12.5-mL vial = £152.33, 15-mL vial = £203.04

### 8.1.3 Antimetabolites

Antimetabolites are incorporated into new nuclear material or combine irreversibly with cellular enzymes, preventing normal cellular division.

**Methotrexate** inhibits the enzyme dihydrofolate reductase, essential for the synthesis of purines and pyrimidines. It is given by mouth, intravenously, intramuscularly, or intrathecally.

Methotrexate is used as maintenance therapy for childhood acute lymphoblastic leukaemia. Other uses include choriocarcinoma, non-Hodgkin's lymphoma, and a number of solid tumours. Intrathecal methotrexate is used in the CNS prophylaxis of childhood acute lymphoblastic leukaemia, and as a therapy for established meningeal cancer or lymphoma.

Methotrexate causes myelosuppression, mucositis, and rarely pneumonitis. It is **contra-indicated** in significant renal impairment because it is excreted primarily by the kidney. It is also contra-indicated in patients with severe hepatic impairment. It should also be **avoided** in the presence of significant pleural effusion or ascites because it can accumulate in these fluids, and its subsequent return to the circulation may cause myelosuppression. Systemic toxicity may follow intrathecal administration and blood counts should be carefully monitored.

Folinic acid (section 8.1) following methotrexate administration helps to prevent methotrexate-induced mucositis or myelosuppression.

**Capecitabine**, which is metabolised to fluorouracil, is given by mouth. It is licensed as monotherapy or com-

bination therapy for adjuvant treatment of advanced colon cancer following surgery, for monotherapy or combination therapy of metastatic colorectal cancer, and for first-line treatment of advanced gastric cancer in combination with a platinum-based regimen. Capecitabine is also licensed for second-line treatment of locally advanced or metastatic breast cancer either in combination with docetaxel (where previous therapy included an anthracycline) or alone (after failure of a taxane and anthracycline regimen or where further anthracycline treatment is not indicated). For the role of capecitabine in the treatment of breast cancer, see section 8.3.4.1.

#### NICE guidance

##### Capecitabine and oxaliplatin in the adjuvant treatment of stage III (Dukes' C) colon cancer (April 2006)

Capecitabine alone or oxaliplatin combined with fluorouracil and folinic acid are options for adjuvant treatment following surgery for stage III (Dukes' C) colon cancer.

#### NICE guidance

##### Capecitabine and tegafur with uracil for metastatic colorectal cancer (May 2003)

Capecitabine or tegafur with uracil (in combination with folinic acid) is an option for the first-line treatment of metastatic colorectal cancer.

**Cytarabine** acts by interfering with pyrimidine synthesis. It is given subcutaneously, intravenously, or intrathecally. Its predominant use is in the induction of remission of acute myeloblastic leukaemia. It is a potent myelosuppressant and requires careful haematological monitoring. A liposomal formulation of cytarabine for intrathecal use is licensed for lymphomatous meningitis.

**Fludarabine** is licensed for the initial treatment of advanced B-cell chronic lymphocytic leukaemia (CLL) or after first-line treatment in patients with sufficient bone-marrow reserves; it is usually given by mouth, but can be given by intravenous injection or infusion. Fludarabine is well tolerated but it does cause myelosuppression, which may be cumulative. Immunosuppression is also common (see panel on cladribine and fludarabine below), and co-trimoxazole is used to prevent pneumocystis infection. Immune-mediated haemolytic anaemia, thrombocytopenia, and neutropenia are less common side-effects.

The *Scottish Medicines Consortium* (p. 4) has advised (October 2006) that fludarabine is accepted for restricted use for the treatment of B-cell chronic lymphocytic leukaemia (CLL) in patients with sufficient bone marrow reserves. First-line treatment should only be initiated in patients with advanced disease, Rai stages III/IV (Binet stage C), or Rai stages I/II (Binet stage A/B) where the patient has disease-related symptoms or evidence of progressive disease.

#### NICE guidance

##### Fludarabine monotherapy for the first-line treatment of chronic lymphocytic leukaemia (February 2007)

Fludarabine monotherapy, is **not** recommended for the first-line treatment of chronic lymphocytic leukaemia.

**Cladribine** is given by intravenous infusion for the treatment of hairy cell leukaemia. It is also given for chronic lymphocytic leukaemia in patients who have failed to respond to standard regimens containing an alkylating agent. Cladribine produces severe myelosuppression, with neutropenia, anaemia, and thrombocytopenia; haemolytic anaemia has also been reported. High doses of cladribine have been associated with acute renal failure and severe neurotoxicity.

**Cladribine** and **fludarabine** have a potent and prolonged immunosuppressive effect. Patients treated with cladribine or fludarabine are more prone to serious bacterial, opportunistic fungal, and viral infections, and prophylactic therapy is recommended in those at risk. To prevent potentially fatal transfusion-related graft-versus-host reaction, only irradiated blood products should be administered. Prescribers should consult specialist literature when using highly immunosuppressive drugs.

**Clofarabine** is licensed for the treatment of acute lymphoblastic leukaemia in patients aged 1 to 21 years who have relapsed or are refractory after receiving at least two previous regimens. It is given by intravenous infusion.

**Nelarabine** is licensed for the treatment of T-cell acute lymphoblastic leukaemia and T-cell lymphoblastic lymphoma in patients who have relapsed or who are refractory after receiving at least two previous regimens. It is given by intravenous infusion. Neurotoxicity is common with nelarabine and close monitoring for neurological adverse events is strongly recommended—discontinue if neurotoxicity occurs.

The *Scottish Medicines Consortium* (p. 4) has advised (March 2008) that the use of nelarabine (*Atriance*®) within NHS Scotland is restricted to bridging treatment before stem cell transplantation.

**Gemcitabine** is used intravenously; it is given alone for elderly patients or for palliative treatment, or with cisplatin as first-line treatment for locally advanced or metastatic non-small cell lung cancer. It is also used in the treatment of locally advanced or metastatic pancreatic cancer (see NICE guidance below). Combined with cisplatin, gemcitabine is also licensed for the treatment of advanced bladder cancer. Combined with carboplatin, gemcitabine is licensed for the treatment of locally advanced or metastatic epithelial ovarian cancer which has relapsed after a recurrence-free interval of at least 6 months following previous platinum-based therapy. Combined with paclitaxel, gemcitabine is also licensed for the treatment of metastatic breast cancer which has relapsed after previous chemotherapy including an anthracycline (see NICE guidance below). Gemcitabine is generally well tolerated but it can cause mild gastro-intestinal side-effects, musculoskeletal pain, influenza-like symptoms and rashes; renal impairment and pulmonary toxicity have also been reported. Haemolytic uraemic syndrome has been reported rarely and gemcitabine should be discontinued if signs of microangiopathic haemolytic anaemia occur.

The *Scottish Medicines Consortium* has advised (November 2006) that gemcitabine is accepted for restricted use for the treatment of metastatic breast cancer, which has relapsed following previous chemotherapy including an anthracycline (unless contra-indicated).

#### NICE guidance

##### Gemcitabine for the treatment of metastatic breast cancer (January 2007)

Gemcitabine, in combination with paclitaxel, is an option for the treatment of metastatic breast cancer only when docetaxel monotherapy or docetaxel plus capecitabine are also considered appropriate.

#### NICE guidance

##### Gemcitabine for the treatment of pancreatic cancer (May 2001)

Gemcitabine is an option for first-line chemotherapy for patients with advanced or metastatic adenocarcinoma of the pancreas and a Karnofsky score of at least 50 [Karnofsky score is a measure of the ability to perform ordinary tasks].

Gemcitabine is not recommended for patients who can have potentially curative surgery. There is insufficient evidence about its use for second-line treatment of pancreatic adenocarcinoma.

**Fluorouracil** is usually given intravenously because absorption following oral administration is unpredictable. It is used to treat a number of solid tumours, including gastro-intestinal tract cancers and breast cancer. It is commonly used with folinic acid in advanced colorectal cancer. It may also be used topically for certain malignant and pre-malignant skin lesions. Toxicity is unusual, but may include myelosuppression, mucositis, and rarely a cerebellar syndrome. On prolonged infusion, a desquamative hand-foot syndrome may occur.

**Pemetrexed** inhibits thymidylate transferase and other folate-dependent enzymes. It is licensed for use with cisplatin for the treatment of unresectable malignant pleural mesothelioma which has not previously been treated with chemotherapy (see NICE guidance, below). Pemetrexed is also licensed for use with cisplatin for the first-line treatment of locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology (see NICE guidance, below), and as monotherapy for its second-line treatment (but see NICE guidance, below). It is also licensed as monotherapy for maintenance treatment in locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology that has not progressed immediately following combination therapy of a platinum compound with either gemcitabine, paclitaxel, or docetaxel. Pemetrexed is given by intravenous infusion.

The *Scottish Medicines Consortium* (p. 4) has advised (July 2005) that pemetrexed (*Alimta*®) in combination with cisplatin is accepted for restricted use within NHS Scotland for previously untreated patients with stage III/IV unresectable malignant pleural mesothelioma.

The *Scottish Medicines Consortium* (p. 4) has advised (January 2010) that pemetrexed (*Alimta*®) is accepted for restricted use within NHS Scotland in combination with cisplatin for the first-line treatment of locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology; it is restricted to patients in whom the histology of the tumour has been confirmed as adenocarcinoma or large cell carcinoma.

The *Scottish Medicines Consortium* (p. 4) has advised (August 2008) that pemetrexed (*Alimta*®) is accepted for restricted use within NHS Scotland as monotherapy for the second-line treatment of locally advanced or metastatic non-small cell lung cancer without predominantly squamous cell histology; it is restricted for use in patients with good performance status who would otherwise be eligible for docetaxel treatment.

#### NICE guidance

##### Pemetrexed for the treatment of malignant pleural mesothelioma (January 2008)

Pemetrexed is an option for the treatment of malignant pleural mesothelioma only in patients who have a WHO performance status of 0 or 1 [WHO performance status is a measure of the ability to perform ordinary tasks], who are considered to have advanced disease and for whom surgical resection is considered inappropriate.

#### NICE guidance

##### Pemetrexed for the first-line treatment of non-small cell lung cancer (September 2009)

Pemetrexed, in combination with cisplatin, is an option for the first-line treatment of locally advanced or metastatic non-small cell lung cancer only if the histology of the tumour has been confirmed as adenocarcinoma or large-cell carcinoma.

#### NICE guidance

##### Pemetrexed for the treatment of non-small cell lung cancer (August 2007)

Pemetrexed is **not** recommended for the treatment of locally advanced or metastatic non-small cell lung cancer which has previously been treated with chemotherapy.

#### NICE guidance

##### Pemetrexed for the treatment of non-small cell lung cancer (June 2010)

Pemetrexed is an option for the maintenance treatment of locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology that has not progressed immediately following combination therapy of a platinum compound with either gemcitabine, paclitaxel, or docetaxel.

**Raltitrexed**, a thymidylate synthase inhibitor, is given intravenously for palliation of advanced colorectal cancer when fluorouracil and folinic acid cannot be used. It is probably of similar efficacy to fluorouracil. Raltitrexed is generally well tolerated, but can cause marked myelosuppression and gastro-intestinal side-effects.

#### NICE guidance (irinotecan, oxaliplatin and raltitrexed for advanced colorectal cancer)

See p. 542

**Mercaptopurine** is used as maintenance therapy for the acute leukaemias and in the management of ulcerative colitis and Crohn's disease (section 1.5.3). Azathioprine,

which is metabolised to mercaptopurine, is generally used as an immunosuppressant (section 8.2.1 and section 10.1.3). The dose of both drugs should be reduced if the patient is receiving allopurinol since it interferes with their metabolism.

**Tegafur** (in combination with uracil) is given by mouth, together with calcium folinate, in the management of metastatic colorectal cancer. Tegafur is a prodrug of fluorouracil; uracil inhibits the degradation of fluorouracil. Tegafur (with uracil) has been shown to be of similar efficacy as a combination of fluorouracil and folinic acid for metastatic colorectal cancer. For NICE guidance on capecitabine and tegafur with uracil for metastatic colorectal cancer, see above.

**Tioguanine** is given by mouth for the treatment of acute leukaemias and chronic myeloid leukaemia. It can be given at various stages of treatment in short-term cycles. Tioguanine has a lower incidence of gastro-intestinal side-effects than mercaptopurine. Long-term therapy is no longer recommended because of the high risk of liver toxicity; treatment with tioguanine should be discontinued if liver toxicity develops.

**Azacitidine** is a pyrimidine analogue that is given by subcutaneous injection. It is used in the treatment of intermediate-2 and high-risk myelodysplastic syndromes, chronic myelomonocytic leukaemia, and acute myeloid leukaemia, in adults who are not eligible for haematopoietic stem cell transplantation.

## AZACITIDINE

**Indications** see notes above

**Cautions** see section 8.1; history of severe congestive heart failure, unstable cardiac or pulmonary disease; monitor for bleeding

**Contra-indications** advanced malignant hepatic tumour

**Hepatic impairment** caution in severe impairment

**Renal impairment** delay next treatment cycle if serum-creatinine or blood urea nitrogen greater than twice baseline value and above the upper level of normal until values return to normal or baseline, and then reduce dose by 50% on the next treatment cycle. Reduce dose by 50% on the next treatment cycle if serum-bicarbonate concentration less than 20 mmol/litre

**Pregnancy** avoid (toxicity in *animal* studies); manufacturer advises effective contraception during and for 3 months after treatment in men or women; see also Reproductive Function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1; also gastro-intestinal disturbances (including diarrhoea, constipation, abdominal pain, and dyspepsia), anorexia; hypertension, hypotension; dyspnoea, pneumonia; anxiety, insomnia, dizziness, headache, drowsiness; haematuria; hypokalaemia; arthralgia, myalgia; injection-site reactions, rash, haematoma; haemorrhage (including cerebral haemorrhage); *less commonly* hypersensitivity reactions (including anaphylactic reactions); hepatic coma and renal failure also reported

**Vidaza**® (Celgene) ▼ (POM)

**Injection**, powder for reconstitution, azacitidine, net price 100-mg vial = £321.00

**CAPECITABINE****Indications** see notes above**Cautions** see section 8.1; history of significant cardiovascular disease, arrhythmias; monitor plasma-calcium concentration; diabetes mellitus; **interactions:** Appendix 1 (fluorouracil)**Hepatic impairment** manufacturer advises avoid in severe impairment**Renal impairment** reduce starting dose of 1.25 g/m<sup>2</sup> to 75% if creatinine clearance 30–50 mL/minute; avoid if creatinine clearance less than 30 mL/minute**Pregnancy** avoid (teratogenic in *animal* studies); see also Reproductive Function, p. 520**Breast-feeding** discontinue breast-feeding**Side-effects** see section 8.1; hand-foot (desquamative) syndrome; diarrhoea**Dose**

- Stage III colon cancer, adjuvant following surgery, monotherapy, **ADULT** over 18 years 1.25 g/m<sup>2</sup> twice daily for 14 days, subsequent courses repeated after a 7-day interval; recommended duration of treatment 6 months
- Stage III colon cancer, adjuvant following surgery, in combination therapy, **ADULT** over 18 years 0.8–1 g/m<sup>2</sup> twice daily for 14 days, subsequent courses repeated after a 7-day interval; recommended duration of treatment 6 months
- Metastatic colorectal cancer, monotherapy, **ADULT** over 18 years 1.25 g/m<sup>2</sup> twice daily for 14 days, subsequent courses repeated after a 7-day interval
- Metastatic colorectal cancer, in combination therapy, **ADULT** over 18 years 0.8–1 g/m<sup>2</sup> twice daily for 14 days, subsequent courses repeated after a 7-day interval
- Advanced gastric cancer, in combination with a platinum-based regimen, **ADULT** over 18 years 0.8–1 g/m<sup>2</sup> twice daily for 14 days, subsequent courses repeated after a 7-day interval **or** 625 mg/m<sup>2</sup> twice daily given continuously
- Locally advanced or metastatic breast cancer, monotherapy or in combination with docetaxel, **ADULT** over 18 years 1.25 g/m<sup>2</sup> twice daily for 14 days, subsequent courses repeated after a 7-day interval

**Note** Adjust dose according to tolerability—consult product literature**Xeloda**® (Roche) (POM)

Tablets, f/c, peach, capecitabine 150 mg, net price 60-tab pack = £40.02; 500 mg, 120-tab pack = £265.55. Label: 21

**CLADRIBINE****Indications** see notes above and under preparations**Cautions** see section 8.1 and notes above; use irradiated blood only**Hepatic impairment** regular monitoring recommended**Renal impairment** regular monitoring recommended**Pregnancy** avoid (teratogenic in *animal* studies); manufacturer advises that men should not father children during and for 6 months after treatment; see also Reproductive Function, p. 520**Breast-feeding** discontinue breast-feeding**Side-effects** see section 8.1 and notes above; also constipation, diarrhoea, abdominal pain, flatulence; oedema, tachycardia; cough, dyspnoea; dizziness,

insomnia, anxiety, headache; chills, asthenia, malaise; myalgia, arthralgia; sweating, rash, pruritus, and purpura

**Leustat**® (Janssen-Cilag) (POM)**Concentrate for intravenous infusion**, cladribine 1 mg/mL. For dilution and use as an infusion, net price 10-mL vial = £159.70

For hairy cell leukaemia and for B-cell chronic lymphocytic leukaemia in patients who have failed to respond to standard regimens containing an alkylating agent

**Litak**® (Lipomed) (POM)**Injection** (for subcutaneous use only—no dilution required), cladribine 2 mg/mL, net price 5-mL vial = £165.00

For hairy cell leukaemia

**CLOFARABINE****Indications** see notes above**Cautions** see section 8.1 and notes above; cardiac disease**Hepatic impairment** manufacturer advises caution in mild to moderate impairment; avoid in severe impairment**Renal impairment** manufacturer advises caution in mild to moderate impairment; avoid in severe impairment**Pregnancy** manufacturer advises avoid (teratogenic in *animal* studies); see also Reproductive Function, p. 520**Breast-feeding** discontinue breast-feeding**Side-effects** see section 8.1; also diarrhoea, abdominal pain, jaundice; tachycardia, flushing, hypotension, pericardial effusion, oedema, haematoma; dyspnoea, cough; anxiety, agitation, dizziness, drowsiness, headache, paraesthesia, peripheral neuropathy, restlessness; haematuria; arthralgia, myalgia; rash, pruritus, hand-foot (desquamative) syndrome, sweating; pancreatitis also reported**Evoltra**® (Genzyme) (POM)**Concentrate for intravenous infusion**, clofarabine 1 mg/mL, net price 20-mL vial = £1153.20  
Electrolytes Na<sup>+</sup> 3.08 mmol/vial**CYTARABINE****Indications** see notes above**Cautions** see section 8.1 and notes above; **interactions:** Appendix 1 (cytarabine)**Hepatic impairment** reduce dose**Pregnancy** avoid (teratogenic in *animal* studies); see also Reproductive Function, p. 520**Breast-feeding** discontinue breast-feeding**Side-effects** see section 8.1 and notes above**Cytarabine** (Non-proprietary) (POM)**Injection** (for intravenous, subcutaneous, or intrathecal use), cytarabine 20 mg/mL, net price 5-mL vial = £4.00**Injection** (for intravenous or subcutaneous use), cytarabine 20 mg/mL, net price 5-mL vial = £3.90, 25-mL vial = £19.50; 100 mg/mL, 1-mL vial = £4.00, 5-mL vial = £20.00, 10-mL vial = £39.00, 20-mL vial = £77.50

### ▲Lipid formulation for intrathecal use

#### DepoCyte® (Napp) <sup>(POM)</sup>

**Intrathecal injection**, cytarabine encapsulated in liposomes, net price 50-mg vial = £1223.75

For lymphomatous meningitis

**Note** The *Scottish Medicines Consortium* (p. 4) has advised (July 2007) that liposomal cytarabine suspension (DepoCyte®) is not recommended for use within NHS Scotland for the intrathecal treatment of lymphomatous meningitis

## FLUDARABINE PHOSPHATE

**Indications** see notes above

**Cautions** see section 8.1 and notes above; monitor for signs of haemolysis; monitor for neurological toxicity; worsening of existing and increased susceptibility to skin cancer; **interactions:** Appendix 1 (fludarabine)

**Contra-indications** haemolytic anaemia

**Renal impairment** reduce dose by up to 50% if creatinine clearance 30–70 mL/minute; avoid if creatinine clearance less than 30 mL/minute

**Pregnancy** avoid (embryotoxic and teratogenic in animal studies); manufacturer advises effective contraception during and for at least 6 months after treatment in men or women; see also Reproductive Function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above; also diarrhoea, anorexia; oedema; pneumonia, cough; peripheral neuropathy, visual disturbances; chills, fever, malaise, weakness; rash

#### Dose

- By mouth, ADULT 40 mg/m<sup>2</sup> for 5 days every 28 days usually for 6 cycles
- By intravenous injection or infusion, consult product literature

#### Fludarabine (Non-proprietary) <sup>(POM)</sup>

**Injection**, powder for reconstitution, fludarabine phosphate, net price 50-mg vial = £140.40

#### Fludara® (Genzyme) <sup>(POM)</sup>

**Tablets**, f/c, pink, fludarabine phosphate 10 mg, net price 15-tab pack = £268.12, 20-tab pack = £350.70

**Injection**, powder for reconstitution, fludarabine phosphate, net price 50-mg vial = £147.07

## FLUOROURACIL

**Indications** see notes above; pre-malignant and malignant skin lesions (section 13.8.1)

**Cautions** see section 8.1 and notes above; caution in handling—irritant to tissues; **interactions:** Appendix 1 (fluorouracil)

**Hepatic impairment** manufacturer advises caution

**Pregnancy** avoid (teratogenic); see also Reproductive Function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above; also local irritation with topical preparation

#### Dose

- By mouth, maintenance 15 mg/kg weekly; max. in one day 1 g
- By intravenous injection or infusion or by intra-arterial infusion, consult product literature

#### Fluorouracil (Non-proprietary) <sup>(POM)</sup>

**Capsules**, fluorouracil 250 mg.

Available from 'special-order' manufacturers or specialist importing companies, p. 988

**Injection**, fluorouracil (as sodium salt) 25 mg/mL, net price 10-mL vial = £3.20, 20-mL vial = £6.40, 100-mL vial = £32.00; 50 mg/mL, 10-mL vial = £6.40, 20-mL vial = £12.80, 50-mL vial = £32.00, 100-mL vial = £64.00

## GEMCITABINE

**Indications** see notes above

**Cautions** see section 8.1 and notes above; **interactions:** Appendix 1 (gemcitabine)

**Hepatic impairment** manufacturer advises caution

**Renal impairment** manufacturer advises caution

**Pregnancy** avoid (teratogenic in animal studies); manufacturer advises effective contraception during treatment; men must avoid fathering a child during and for 6 months after treatment; see also Reproductive Function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above

#### Gemcitabine (Non-proprietary) <sup>(POM)</sup>

**Injection**, powder for reconstitution, gemcitabine (as hydrochloride), net price 200-mg vial = £32.00, 1-g vial = £162.00, 1.5-g vial = £213.93, 2-g vial = £324.00

#### Gemzar® (Lilly) <sup>(POM)</sup>

**Injection**, powder for reconstitution, gemcitabine (as hydrochloride), net price 200-mg vial = £32.55; 1-g vial = £162.76

## MERCAPTOPURINE

(6-Mercaptopurine)

**Indications** acute leukaemias and chronic myeloid leukaemia; inflammatory bowel disease [unlicensed indication] (section 1.5.3)

**Cautions** see section 8.1 and notes above; monitor liver function; **interactions:** Appendix 1 (mercaptopurine)

**Hepatic impairment** may need dose reduction

**Renal impairment** reduce dose

**Pregnancy** avoid (teratogenic); see also Reproductive Function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above; also hepatotoxicity; rarely intestinal ulceration, pancreatitis; very rarely lymphoma

#### Dose

- Initially 2.5 mg/kg daily

#### Puri-Nethol® (GSK) <sup>(POM)</sup>

**Tablets**, yellow, scored, mercaptopurine 50 mg, net price 25-tab pack = £22.54

## METHOTREXATE

**Indications** see notes above and under Dose; Crohn's disease [unlicensed indication] (section 1.5.3); rheumatoid arthritis (section 10.1.3); psoriasis (section 13.5.3)

**Cautions** see section 8.1, notes above and section 10.1.3; **interactions:** Appendix 1 (methotrexate)

**Hepatic impairment** avoid in severe impairment

**Renal impairment** reduce dose; risk of nephrotoxicity at high doses; avoid in severe impairment

**Pregnancy** avoid (teratogenic; fertility may be reduced during therapy but this may be reversible); manufacturer advises effective contraception during and for at least 3 months after treatment in men or women; see also Reproductive Function, p. 520

**Breast-feeding** discontinue breast-feeding—present in milk

**Side-effects** see section 8.1, notes above and section 10.1.3

#### Dose

- By mouth, leukaemia in children (maintenance), 15 mg/m<sup>2</sup> weekly in combination with other drugs

#### Important

Note that the above dose is a **weekly** dose.

- By intravenous injection or infusion, or by intra-arterial infusion, or by intramuscular injection, or intrathecal administration, consult product literature

**Methotrexate** (Non-proprietary) (POM)

**Injection**, methotrexate (as sodium salt) 2.5 mg/mL, net price 2-mL vial = £1.68; 25 mg/mL, 2-mL vial = £3.00, 20-mL vial = £30.00

**Injection**, methotrexate 100 mg/mL (not for intrathecal use), net price 10-mL vial = £78.33, 50-mL vial = £380.07

#### Oral preparations

Section 10.1.3

## NELARABINE

**Indications** see notes above

**Cautions** see section 8.1 and notes above; previous or concurrent intrathecal chemotherapy or craniospinal irradiation (increased risk of neurotoxicity)

**Driving** May affect performance of skilled tasks (e.g. driving)

**Pregnancy** avoid (toxicity in *animal* studies); manufacturer advises effective contraception during and for at least 3 months after treatment in men and women; see also Reproductive Function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1; also abdominal pain, constipation, taste disturbance, anorexia, diarrhoea; hypotension, oedema; pleural effusion, wheezing, dyspnoea, cough; confusion, seizures, amnesia, drowsiness, peripheral neurological disorders, hypoesthesia, paraesthesia, ataxia, demyelination, tremor, dizziness, headache, asthenia, fatigue; pyrexia; electrolyte disturbances; blurred vision; muscle weakness, myalgia, arthralgia; benign and malignant tumours also reported

**Atriance**® (GSK) (POM)

**Intravenous infusion**, nelarabine 5 mg/mL, net price 50-mL vial = £222.00  
Electrolytes Na<sup>+</sup> 3.75 mmol/vial

## PEMETREXED

**Indications** see notes above

**Cautions** see section 8.1 and notes above; history of cardiovascular disease; diabetes; prophylactic folic acid and vitamin B<sub>12</sub> supplementation required (consult product literature); concomitant nephrotoxic drugs including non-steroidal anti-inflammatory

drugs (consult product literature); **interactions:** Appendix 1 (pemetrexed)

**Renal impairment** manufacturer advises avoid if creatinine clearance less than 45 mL/minute—no information available

**Pregnancy** avoid (toxicity in *animal* studies); manufacturer advises effective contraception during treatment; men must avoid fathering a child during and for 6 months after treatment; see also Reproductive Function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1; also gastro-intestinal disturbances; oedema; neuropathy; dehydration; conjunctivitis, increased lacrimation; skin disorders; less commonly colitis, arrhythmias, and interstitial pneumonitis; rarely hepatitis; peripheral ischaemia and acute renal failure also reported

**Alimta**® (Lilly) (POM)

**Injection**, powder for reconstitution, pemetrexed (as disodium), net price 100-mg vial = £160.00; 500-mg vial = £800.00

Electrolytes Na<sup>+</sup> <0.5 mmol/vial

## RALTITREXED

**Indications** see notes above

**Cautions** see section 8.1 and notes above; **interactions:** Appendix 1 (raltitrexed)

**Hepatic impairment** caution in mild to moderate impairment; avoid if severe

**Renal impairment** reduce dose and increase dosing interval if creatinine clearance less than 65 mL/minute (consult product literature); avoid if creatinine clearance less than 25 mL/minute

**Pregnancy** pregnancy must be excluded before treatment; ensure effective contraception during and for at least 6 months after treatment in men or women; see also Reproductive Function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above

**Tomudex**® (Hospira) (POM)

**Injection**, powder for reconstitution, raltitrexed, net price 2-mg vial = £152.33

## TEGAFUR WITH URACIL

**Indications** see notes above

**Cautions** see section 8.1; cardiac disease; **interactions:** Appendix 1 (fluorouracil)

**Hepatic impairment** manufacturer advises monitor liver function in mild to moderate impairment and avoid in severe impairment

**Renal impairment** use with caution

**Pregnancy** avoid; manufacturer advises effective contraception during and for 3 months after treatment in men or women; see also Reproductive Function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above

#### Dose

- **ADULT**, tegafur 300 mg/m<sup>2</sup> (with uracil 672 mg/m<sup>2</sup>) daily in 3 divided doses for 28 days; subsequent courses repeated after 7-day interval; for dose adjustment due to toxicity, consult product literature

**Uftoral®** (Merck Serono) (POM)

**Capsules**, tegafur 100 mg, uracil 224 mg, net price 36-cap pack = £96.12, 120-cap pack = £320.40. Label: 23

## TIOGUANINE

(Thioguanine)

**Indications** see notes above

**Cautions** see section 8.1 and notes above; monitor liver function weekly—discontinue if liver toxicity develops; **interactions:** Appendix 1 (tioguanine)

**Hepatic impairment** reduce dose

**Renal impairment** reduce dose

**Pregnancy** avoid (teratogenicity reported when men receiving tioguanine have fathered children); ensure effective contraception during treatment in men or women; see also Reproductive Function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1; also stomatitis and hepatotoxicity; *rarely* intestinal necrosis and perforation

### Dose

- 100–200 mg/m<sup>2</sup> daily

**Lanvis®** (GSK) (POM)

**Tablets**, yellow, scored, tioguanine 40 mg, net price 25-tab pack = £54.49

## 8.1.4 Vinca alkaloids and etoposide

The vinca alkaloids, **vinblastine**, **vincristine**, and **vindesine**, are used to treat a variety of cancers including leukaemias, lymphomas, and some solid tumours (e.g. breast and lung cancer). **Vinorelbine** is a semi-synthetic vinca alkaloid; it is given intravenously or orally for the treatment of advanced breast cancer and for advanced non-small cell lung cancer. For the role of vinorelbine in the treatment of breast cancer, see section 8.3.4.1. **Vinflunine** is licensed as monotherapy for the treatment of advanced or metastatic transitional cell carcinoma of the urothelial tract after failure of a platinum-containing regimen.

Neurotoxicity, usually as peripheral or autonomic neuropathy, occurs with all vinca alkaloids and is a limiting side-effect of vincristine; it occurs less often with vindesine, vinblastine, vinorelbine, and vinflunine. Patients with neurotoxicity commonly have peripheral paraesthesia, loss of deep tendon reflexes, abdominal pain, and constipation; ototoxicity has been reported. If symptoms of neurotoxicity are severe, doses should be reduced. Motor weakness can also occur, and increasing motor weakness calls for dose reduction or discontinuation of these drugs. Recovery from neurotoxic effects is usually slow but complete.

Myelosuppression is a dose-limiting side-effect of vinblastine, vindesine, vinorelbine, and vinflunine; vincristine causes negligible myelosuppression. The vinca alkaloids cause severe local irritation and care must be taken to avoid extravasation. Severe bronchospasm has been reported following administration of the vinca alkaloids (more commonly when used in combination with mitomycin-C).

### Important

Vinblastine, vincristine, vindesine, vinflunine, and vinorelbine injections are for **intravenous administration only**. Inadvertent intrathecal administration can cause severe neurotoxicity, which is usually fatal.

The National Patient Safety Agency has advised (August 2008) that adult and teenage patients treated in an adult or adolescent unit should receive their vinca alkaloid dose in a 50 mL minibag. Teenagers and children treated in a child unit may receive their vinca alkaloid dose in a syringe.

**Etoposide** may be given orally or by slow intravenous infusion, the oral dose being double the intravenous dose. A preparation containing etoposide phosphate can be given by intravenous injection or infusion. Etoposide is usually given daily for 3–5 days and courses should not be repeated more frequently than at intervals of 21 days. It has particularly useful activity in small cell carcinoma of the bronchus, the lymphomas, and testicular cancer.

## ETOPOSIDE

**Indications** see notes above

**Cautions** see section 8.1 and notes above; **interactions:** Appendix 1 (etoposide)

**Contra-indications** see section 8.1 and notes above

**Hepatic impairment** avoid in severe impairment

**Renal impairment** consider dose reduction—consult local treatment protocol for details

**Pregnancy** avoid (teratogenic in *animal* studies); see also Reproductive Function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1; irritant to tissues

### Dose

- **By mouth**, 120–240 mg/m<sup>2</sup> daily for 5 days
- **By intravenous infusion**, consult product literature

**Etoposide** (Non-proprietary) (POM)

**Concentrate for intravenous infusion**, etoposide 20 mg/mL, net price 5-mL vial = £12.15, 10-mL vial = £29.00, 25-mL vial = £60.75  
**Brands include** *Eposin*®

**Etopophos®** (Bristol-Myers Squibb) (POM)

**Injection**, powder for reconstitution, etoposide (as phosphate), net price 100-mg vial = £26.17 (hosp. only)

**Vepesin®** (Bristol-Myers Squibb) (POM)

**Capsules**, both pink, etoposide 50 mg, net price 20 = £99.82; 100 mg, 10-cap pack = £87.23 (hosp. only). Label: 23

## VINBLASTINE SULPHATE

**Indications** see notes above

**Cautions** see section 8.1 and notes above; caution in handling; **interactions:** Appendix 1 (vinblastine)

**Contra-indications** see section 8.1 and notes above

**Important** Intrathecal injection **contra-indicated**

**Hepatic impairment** dose reduction may be necessary

**Pregnancy** avoid (limited experience suggests fetal harm; teratogenic in *animal* studies); see also Reproductive Function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above; irritant to tissues

**Vinblastine** (Non-proprietary) (POM)

**Injection**, vinblastine sulphate 1 mg/mL, net price 10-mL vial = £13.09

**Velbe**<sup>®</sup> (Genus) (POM)

**Injection**, powder for reconstitution, vinblastine sulphate, net price 10-mg amp = £14.15

## VINCRIStINE SULPHATE

**Indications** see notes above

**Cautions** see section 8.1 and notes above; neuro-muscular disease; caution in handling; **interactions:** Appendix 1 (vincristine)

**Contra-indications** see section 8.1 and notes above

**Important** Intrathecal injection **contra-indicated**

**Hepatic impairment** dose reduction may be necessary

**Pregnancy** avoid (teratogenicity and fetal loss in *animal* studies); see also Reproductive Function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above; also rarely inappropriate secretion of antidiuretic hormone; diarrhoea, intestinal necrosis, paralytic ileus, seizures, urinary retention, muscle wasting, and eye disorders also reported; irritant to tissues

**Vincristine** (Non-proprietary) (POM)

**Injection**, vincristine sulphate 1 mg/mL, net price 1-mL vial = £13.47; 2-mL vial = £26.66; 5-mL vial = £44.16

**Oncovin**<sup>®</sup> (Genus) (POM)

**Injection**, vincristine sulphate 1 mg/mL, net price 1-mL vial = £14.18; 2-mL vial = £28.05

## VINDESINE SULPHATE

**Indications** see notes above

**Cautions** see section 8.1 and notes above; neuro-muscular disease; caution in handling

**Contra-indications** see section 8.1 and notes above

**Important** Intrathecal injection **contra-indicated**

**Hepatic impairment** dose reduction may be necessary

**Pregnancy** avoid (teratogenic in *animal* studies); see also Reproductive Function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above; irritant to tissues

**Eldisine**<sup>®</sup> (Genus) (POM)

**Injection**, powder for reconstitution, vindesine sulphate, net price 5-mg vial = £78.30 (hosp. only)

## VINFLUNINE

**Indications** see notes above

**Cautions** see section 8.1 and notes above; cardiovascular disease; QT-interval prolongation (avoid hypokalaemia or concomitant use of drugs that prolong QT-interval); **interactions:** Appendix 1 (vinflunine)

**Contra-indications** see notes above

**Important** Intrathecal injection **contra-indicated**

**Hepatic impairment** reduce dose—consult product literature

**Renal impairment** reduce dose if creatinine clearance less than 60 mL/minute—consult product literature

**Pregnancy** avoid unless essential—teratogenicity and embryotoxicity in *animal* studies; manufacturer advises effective contraception during and for up to 3 months after treatment; see also Reproductive Function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above; also anorexia, diarrhoea, dyspepsia; tachycardia, hypertension, hypotension, thrombosis; oedema; insomnia, fatigue; dehydration; cutaneous reactions, sweating; less commonly increased weight, myocardial infarction, renal failure; also reported QT-interval prolongation, inappropriate anti-diuretic hormone secretion, blurred vision

**Jalvor**<sup>®</sup> (Fabre) (POM)

**Concentrate for intravenous infusion**, vinflunine (as ditartrate) 25 mg/mL, net price 2-mL vial = £212.50, 10-mL vial = £1062.50

## VINORELBINE

**Indications** see notes above

**Cautions** see section 8.1 and notes above; ischaemic heart disease; caution in handling; **interactions:** Appendix 1 (vinorelbine)

**Contra-indications** see section 8.1 and notes above; with capsules previous significant surgical resection of stomach or small bowel, long-term oxygen therapy, concurrent radiotherapy if treating the liver **Important** Intrathecal injection **contra-indicated**

**Hepatic impairment** reduce oral dose in moderate impairment, avoid oral use in severe impairment; reduce intravenous dose in severe impairment; consult product literature

**Pregnancy** avoid unless essential (teratogenicity, and fetal loss in *animal* studies); manufacturer advises effective contraception during and for 3 months after treatment; men must avoid fathering a child during and for 3 months after treatment; see also Reproductive Function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above; also rarely pancreatitis; inappropriate secretion of antidiuretic hormone also reported; irritant to tissues

### Dose

- **By mouth**, 60 mg/m<sup>2</sup> once weekly for 3 weeks, increased if tolerated to 80 mg/m<sup>2</sup> once weekly; max. 160 mg once weekly
- **By intravenous injection or infusion**, consult product literature

**Vinorelbine** (Non-proprietary) (POM)

**Concentrate for intravenous infusion**, vinorelbine (as tartrate) 10 mg/mL, net price 1-mL vial = £29.00, 5-mL vial = £139.00

**Navelbine**<sup>®</sup> (Fabre) (POM)

**Concentrate for intravenous infusion**, vinorelbine (as tartrate) 10 mg/mL, net price 1-mL vial = £29.75; 5-mL vial = £139.98

**Capsules**, vinorelbine (as tartrate) 20 mg (brown), net price 1-cap pack = £43.98; 30 mg (pink), 1-cap pack = £65.98; 80 mg (yellow), 1-cap pack = £175.92. Label: 21, 25

## 8.1.5 Other antineoplastic drugs

### Amsacrine

**Amsacrine** has an action and toxic effects similar to those of doxorubicin (section 8.1.2) and is given *intravenously*. It is occasionally used in acute myeloid leukaemia. Side-effects include myelosuppression and mucositis; electrolytes should be monitored as fatal arrhythmias have occurred in association with hypokalaemia.

### AMSACRINE

**Indications** see notes above

**Cautions** see section 8.1 and notes above; also caution in handling—irritant to skin and tissues

**Hepatic impairment** manufacturer advises reduce initial dose by 20–30%

**Renal impairment** manufacturer advises reduce initial dose by 20–30%

**Pregnancy** avoid (teratogenic and toxic in *animal* studies); may reduce fertility; see also Reproductive Function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above

**Amsidine**<sup>®</sup> (Goldshield) (POM)

Concentrate for intravenous infusion, amsacrine 5 mg (as lactate)/mL, when reconstituted by mixing two solutions, net price 1.5-mL (75-mg) amp with 13.5-mL diluent vial = £54.08 (hosp. only)  
**Note** Use glass apparatus for reconstitution

### Arsenic trioxide

**Arsenic trioxide** is licensed for acute promyelocytic leukaemia in patients who have relapsed or failed to respond to previous treatment with a retinoid and chemotherapy.

### ARSENIC TRIOXIDE

**Indications** see notes above

**Cautions** see section 8.1; correct electrolyte abnormalities before treatment; ECG required before and during treatment—consult product literature; avoid concomitant administration with drugs causing QT interval prolongation, hypokalaemia, and hypomagnesaemia; previous treatment with anthracyclines (increased risk of QT interval prolongation); **interactions**: Appendix 1 (arsenic trioxide)

**Hepatic impairment** manufacturer advises caution—limited information available

**Renal impairment** manufacturer advises caution—limited information available

**Pregnancy** avoid (teratogenic and embryotoxic in *animal* studies); manufacturer advises effective contraception during treatment in men and women; see also Reproductive function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1; diarrhoea, leucocyte activation syndrome (unexplained fever, dyspnoea, weight gain, pulmonary infiltrates, pleural or pericardial effusions, with or without leucocytosis—treat with high dose corticosteroids, consult product literature); hyperglycaemia, hypokalaemia, QT interval prolongation, atrial fibrillation, atrial flutter, haemorrhage, pleuritic pain, musculoskeletal pain, paraesthesia, fatigue; *less commonly* abdominal pain, tachycardia, vasculitis, hypotension, oedema, pneumonitis, seizures, renal failure, blurred vision, and rash

**Trisenex**<sup>®</sup> (Cephalon) (POM)

Concentrate for intravenous infusion, arsenic trioxide 1 mg/mL, net price 10-mL amp = £250.90

### Bevacizumab

**Bevacizumab** is a monoclonal antibody that inhibits vascular endothelial growth factor. It is licensed for the treatment of metastatic colorectal cancer in combination with fluoropyrimidine-based chemotherapy (but see NICE guidance below). It is also licensed for first-line treatment of metastatic breast cancer in combination with paclitaxel, or docetaxel, and also for advanced or metastatic renal cell carcinoma in combination with interferon alfa-2a (but see NICE Guidance, p. 545). Bevacizumab, in combination with platinum-based chemotherapy, is licensed for first-line treatment of unresectable advanced, metastatic or recurrent non-small cell lung cancer other than predominantly squamous cell histology. Bevacizumab is given by intravenous infusion.

**MHRA/CHM advice**

**Bevacizumab and sunitinib: risk of osteonecrosis of the jaw (January 2011)**

Treatment with bevacizumab or sunitinib may be a risk factor for the development of osteonecrosis of the jaw.

Patients treated with bevacizumab or sunitinib, who have previously received bisphosphonates, or are treated concurrently with bisphosphonates, may be particularly at risk.

Dental examination and appropriate preventive dentistry should be considered before treatment with bevacizumab or sunitinib.

If possible, invasive dental procedures should be avoided in patients treated with bevacizumab or sunitinib who have previously received, or who are currently receiving, intravenous bisphosphonates.

**NICE guidance**

**Bevacizumab and cetuximab for the treatment of metastatic colorectal cancer (January 2007)**

- Bevacizumab in combination with fluorouracil plus folinic acid, with or without irinotecan, is **not** recommended for the first-line treatment of metastatic colorectal cancer;
- Cetuximab in combination with irinotecan is **not** recommended for the second-line or subsequent treatment of metastatic colorectal cancer after the failure of an irinotecan-containing chemotherapy regimen.

**BEVACIZUMAB****Indications** see notes above**Cautions** see section 8.1; intra-abdominal inflammation (risk of gastro-intestinal perforation); increased risk of fistulas (discontinue permanently if tracheo-oesophageal or grade 4 fistula develops); withhold treatment for elective surgery and avoid for at least 28 days after major surgery or until wound fully healed; history of hypertension (increased risk of proteinuria—discontinue if nephrotic syndrome); uncontrolled hypertension; monitor blood pressure; history of arterial thromboembolism; history of cardiovascular disease (increased risk of cardiovascular events especially in the elderly); monitor for congestive heart failure; increased risk of haemorrhage (especially tumour-associated haemorrhage); monitor for reversible posterior leucoencephalopathy syndrome (presenting as seizures, headache, altered mental status, visual disturbance or cortical blindness, with or without hypertension); untreated CNS metastases; consider dental check-up before initiating treatment (risk of osteonecrosis of the jaw, see MHRA/CHM advice, above)**Pregnancy** avoid—toxicity in *animal* studies; effective contraception required during and for at least 6 months after treatment in women; see also Reproductive Function, p. 520**Breast-feeding** manufacturer advises avoid breast-feeding during and for at least 6 months after treatment**Side-effects** see section 8.1; gastro-intestinal perforation, intestinal obstruction, abdominal pain, diarrhoea, constipation, taste disturbances; mucocutaneous bleeding, haemorrhage, hypoxia, arterial thromboembolism, congestive heart failure, syncope, supraventricular tachycardia, hypertension (see also Cautions); dyspnoea, rhinitis; anorexia, drowsiness, headache, peripheral neuropathy, asthenia, lethargy; pyrexia; proteinuria; dehydration; eye disorders; fistulas, pulmonary hypertension, impaired wound healing, osteonecrosis of the jaw (see MHRA/CHM advice, above), hand-foot syndrome, exfoliative dermatitis, dry skin, skin discoloration, and hypersensitivity reactions (including flushing, rash, hypotension, chest pain, and rigors) also reported**Avastin**<sup>®</sup> (Roche) ▼ (Pom)**Concentrate for intravenous infusion**, bevacizumab 25 mg/mL, net price 4-mL (100-mg) vial = £242.66, 16-mL (400-mg) vial = £924.40**Bexarotene****Bexarotene** is an agonist at the retinoid X receptor, which is involved in the regulation of cell differentiation and proliferation. It is associated with little myelosuppression or immunosuppression. Bexarotene can cause regression of cutaneous T-cell lymphoma. The main adverse effects are hyperlipidaemia, hypothyroidism, leucopenia, headache, rash, and pruritus.The *Scottish Medicines Consortium* (p. 4) has advised (November 2002) that bexarotene is recommended for restricted use as a second-line treatment for patients with advanced cutaneous T-cell lymphoma.**BEXAROTENE****Indications** skin manifestations of cutaneous T-cell lymphoma refractory to previous systemic treatment**Cautions** see section 8.1 and notes above; hyperlipidaemia (avoid if uncontrolled), hypothyroidism (avoid if uncontrolled); hypersensitivity to retinoids; avoid in acute porphyria (section 9.8.2); **interactions:** Appendix 1 (bexarotene)**Contra-indications** see section 8.1 and notes above; history of pancreatitis, hypervitaminosis A**Hepatic impairment** avoid**Pregnancy** avoid; manufacturer advises effective contraception during and for at least 1 month after treatment in men or women; see also Reproductive Function, p. 520**Breast-feeding** discontinue breast-feeding**Side-effects** see section 8.1 and notes above**Dose**

- Initially 300 mg/m<sup>2</sup> daily as a single dose with a meal; adjust dose according to response

**Targetin**<sup>®</sup> (Cephalon) (Pom)**Capsules**, bexarotene 75 mg in a liquid suspension, net price 100-cap pack = £937.50**Bortezomib****Bortezomib**, a proteasome inhibitor, is licensed as monotherapy for the treatment of multiple myeloma that has progressed despite the use of at least one therapy, and where the patient has already had, or is unable to have, bone-marrow transplantation. It is also licensed for use in combination with melphalan and prednisolone for the treatment of previously untreated multiple myeloma in patients who are not eligible for high-dose chemotherapy with bone marrow transplantation. Bortezomib is given by intravenous injection.**NICE guidance****Bortezomib monotherapy for relapsed multiple myeloma (October 2007)**

Bortezomib monotherapy is an option for the treatment of progressive multiple myeloma in patients who are at first relapse having received one prior therapy and who have undergone, or are unsuitable for, bone-marrow transplantation, under the following circumstances:

- the response to bortezomib is measured using serum M protein after a maximum of four cycles of treatment, and treatment is continued only in patients who have a reduction in serum M protein of 50% or more (where serum M protein is not measurable, an appropriate alternative biochemical measure of response should be used) **and**
- the manufacturer rebates the full cost of bortezomib if there is an inadequate response (as defined above) after four cycles of treatment.

**BORTEZOMIB****Indications** see notes above**Cautions** see section 8.1; cardiovascular disease; pulmonary disease (chest x-ray recommended before treatment—discontinue if interstitial lung disease develops); consider antiviral prophylaxis for herpes

zoster infection; history of seizures; amyloidosis; risk of neuropathy—consult product literature; monitor blood-glucose concentration in patients on oral anti-diabetics; **interactions:** Appendix 1 (bortezomib)

**Contra-indications** acute diffuse infiltrative pulmonary disease; pericardial disease

**Hepatic impairment** manufacturer advises caution in mild to moderate impairment—consider dose reduction; avoid in severe impairment

**Renal impairment** no information available for creatinine clearance less than 20 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** manufacturer advises effective contraception during and for 3 months after treatment in men or women—toxicity in *animal* studies; see also Reproductive Function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1; also gastro-intestinal disturbances including constipation (cases of ileus reported), taste disturbance, dry mouth, decreased appetite; postural hypotension, hypertension, haematoma, phlebitis, chest pain, oedema; dyspnoea, cough; confusion, depression, insomnia, anxiety, peripheral neuropathy, paraesthesia, headache, dizziness, tremor, asthenia, fatigue; reactivation of herpes zoster infection, influenza-like symptoms; renal impairment, dysuria; dehydration, hypokalaemia, hyperglycaemia; muscle cramps, arthralgia, bone pain; blurred vision, eye pain; epistaxis; urticaria, pruritus, erythema, dry skin, eczema, rash, increased sweating; *less commonly* syncope, seizures; reversible posterior leucoencephalopathy syndrome (discontinue treatment), toxic epidermal necrolysis, Sweet's syndrome, and vasculitic rash also reported

**Velcade**<sup>®</sup> (Janssen-Cilag) ▼ (POM)

**Injection**, powder for reconstitution, bortezomib (as mannitol boronic ester), net price 3.5-mg vial = £762.38

## Cetuximab

**Cetuximab** is licensed for the treatment of metastatic colorectal cancer in patients with tumours expressing epidermal growth factor receptor, as combination therapy, or as monotherapy if oxaliplatin- and irinotecan-based therapy has failed or if irinotecan is not tolerated (but see NICE guidance below, and under Bevacizumab on p. 537). Cetuximab is also licensed, in combination with radiotherapy, for the treatment of locally advanced squamous cell cancer of the head and neck and in combination with platinum-based chemotherapy for recurrent or metastatic squamous cell cancer of the head and neck (but see NICE guidance below).

Cetuximab is given by intravenous infusion. Patients must receive an antihistamine and a corticosteroid before infusion. Resuscitation facilities should be available and treatment should be initiated by a specialist.

The *Scottish Medicines Consortium* (p. 4) has advised (January 2010) that cetuximab (*Erbiximab*<sup>®</sup>) is accepted for restricted use within NHS Scotland, in combination with chemotherapy, for metastatic colorectal cancer in patients with tumours expressing epidermal growth factor; it is restricted to patients with non-resectable metastases confined to the liver, who have not previously received chemotherapy.

### NICE guidance

#### Cetuximab for the treatment of locally advanced squamous cell cancer of the head and neck (June 2008)

Cetuximab in combination with radiotherapy is an option for the treatment of locally advanced squamous cell cancer of the head and neck in patients who have a Karnofsky performance status of 90% or greater and when all forms of platinum-based chemoradiotherapy treatment are contra-indicated.

### NICE guidance

#### Cetuximab for the treatment of recurrent or metastatic squamous cell cancer of the head and neck (June 2009)

Cetuximab in combination with platinum-based chemotherapy is **not** recommended for the treatment of recurrent or metastatic squamous cell cancer of the head and neck.

### NICE guidance

#### Cetuximab for the first-line treatment of metastatic colorectal cancer (August 2009)

Cetuximab in combination with fluorouracil, folinic acid and oxaliplatin is an option for the first-line treatment of metastatic colorectal cancer under the following circumstances:

- the primary tumour has been resected or is potentially operable;
- the metastatic disease is confined to the liver and is unresectable; and
- the patient is fit to undergo surgery to resect the primary colorectal tumour and to undergo liver surgery if the metastases become resectable after treatment with cetuximab.

In patients unable to tolerate oxaliplatin, or in whom oxaliplatin is contra-indicated, cetuximab in combination with fluorouracil, folinic acid and irinotecan can be used as an alternative.

In addition, the manufacturer is required to rebate 16% of the amount of cetuximab used per patient when used in combination with fluorouracil, folinic acid, and oxaliplatin.

Patients who meet the above criteria should receive cetuximab for no more than 16 weeks. At 16 weeks, cetuximab should be stopped and the patient should be assessed for resection of liver metastases.

## CETUXIMAB

**Indications** see notes above and product literature

**Cautions** cardiovascular disease, cardiopulmonary disease, pulmonary disease—discontinue if interstitial lung disease

**Contra-indications** KRAS mutated colorectal tumours (avoid if KRAS tumour status unknown)

**Pregnancy** use only if potential benefit outweighs risk—no information available; see also Reproductive Function, p. 520

**Breast-feeding** avoid breast-feeding during and for 2 months after treatment—no information available

**Side-effects** infusion-related reactions including dyspnoea, dizziness, chills, fever, and hypersensitivity reactions (possibly delayed onset) such as rash, urti-

caria, bronchospasm, hypotension, hypertension, and shock; nausea, vomiting, diarrhoea; headache; skin reactions including acne, pruritus, dry skin, desquamation, hypertrichosis, and nail disorders; conjunctivitis; hypomagnesaemia, hypocalcaemia

**Erbitux®** (Merck Serono) (POM)

**Intravenous infusion**, cetuximab 5 mg/mL, net price 20-mL vial = £178.10, 100-mL vial = £890.50

## Crisantaspase

**Crisantaspase** is the enzyme asparaginase produced by *Erwinia chrysanthemi*. It is given *intramuscularly*, *intravenously*, or *subcutaneously* almost exclusively in acute lymphoblastic leukaemia. Facilities for the management of anaphylaxis should be available.

## CRISANTASPASE

**Indications** see notes above

**Cautions** see notes above

**Contra-indications** history of pancreatitis related to asparaginase therapy

**Pregnancy** avoid; see also Reproductive Function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1; also liver dysfunction, pancreatitis, diarrhoea; coagulation disorders; lethargy, drowsiness, confusion, dizziness, neurotoxicity, convulsions, headache; *less commonly* changes in blood lipids, anaphylaxis, hyperglycaemia; *rarely* CNS depression; *very rarely* myalgia; abdominal pain and hypertension also reported

**Erwinase®** (EUSA Pharma) (POM)

**Injection**, powder for reconstitution, crisantaspase, net price 10 000-unit vial = £301.70

## Dacarbazine and temozolomide

**Dacarbazine** is used to treat metastatic melanoma and, in combination therapy, soft tissue sarcomas. It is also a component of a commonly used combination for Hodgkin's disease (ABVD—doxorubicin [previously *Adriamycin®*], bleomycin, vinblastine, and dacarbazine). It is given *intravenously*. The predominant side-effects are myelosuppression and severe nausea and vomiting.

**Temozolomide** is structurally related to dacarbazine. It is given by mouth and is licensed for the treatment of newly diagnosed glioblastoma multiforme in adults (in combination with radiotherapy) and subsequently as monotherapy. It is also licensed for second-line treatment of malignant glioma in adults and children over 3 years.

### NICE guidance

**Temozolomide for the treatment of recurrent malignant glioma (brain cancer) (April 2001)**

Temozolomide may be considered for the treatment of recurrent malignant glioma, which has not responded to first-line chemotherapy.

### NICE guidance

**Carmustine implants and temozolomide for the treatment of newly diagnosed high-grade glioma (June 2007)**

Temozolomide is an option for the treatment of newly diagnosed glioblastoma multiforme in patients with a WHO performance status of 0 or 1. Carmustine implants are an option for the treatment of newly diagnosed high-grade (Grade 3 or 4) glioma **only** for patients in whom at least 90% of the tumour has been resected.

Carmustine implants should only be used within specialist centres.

## DACARBAZINE

**Indications** see notes above

**Cautions** see section 8.1; caution in handling; **interactions:** Appendix 1 (dacarbazine)

**Hepatic impairment** dose reduction may be required in combined renal and hepatic impairment; avoid in severe impairment

**Renal impairment** dose reduction may be required in combined renal and hepatic impairment; avoid in severe impairment

**Pregnancy** avoid (carcinogenic and teratogenic in *animal* studies); ensure effective contraception during and for at least 6 months after treatment in men or women; see also Reproductive Function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above; *rarely* liver necrosis due to hepatic vein thrombosis; irritant to skin and tissues

**Dacarbazine** (Non-proprietary) (POM)

**Injection**, powder for reconstitution, dacarbazine (as citrate), net price 100-mg vial = £5.05; 200-mg vial = £7.16; 500-mg vial = £16.50; 600-mg vial = £22.50; 1-g vial = £31.80

## TEMOZOLOMIDE

**Indications** see notes above

**Cautions** see section 8.1; **interactions:** Appendix 1 (temozolomide)

**Hepatic impairment** use with caution in severe impairment—no information available

**Renal impairment** manufacturer advises caution—no information available

**Pregnancy** avoid (teratogenic and embryotoxic in *animal* studies); manufacturer advises adequate contraception during treatment; men should avoid fathering a child during and for at least 6 months after treatment; see also Reproductive Function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1

### Dose

- Consult product literature; **CHILD** under 3 years not recommended

**Temozolomide** (Non-proprietary) (POM)

**Capsules**, temozolomide 5 mg, net price 5-cap pack = £13.58; 20 mg, 5-cap pack = £54.30; 100 mg, 5-cap pack = £271.52; 140 mg, 5-cap pack = £380.18; 180 mg, 5-cap pack = £488.74; 250 mg, 5-cap pack = £678.80. Label: 23, 25  
Brands include *Temomedac®*

**Temodal®** (Schering-Plough) (POM)

**Capsules**, temozolomide 5 mg (green/white), net price 5-cap pack = £16.29; 20 mg (yellow/white), 5-cap pack = £65.16; 100 mg (pink/white), 5-cap pack = £325.80; 140 mg (blue/white), 5-cap pack = £456.12; 180 mg (orange/white), 5-cap pack = £586.44; 250 mg (white), 5-cap pack = £814.50. Label: 23, 25

**Hydroxycarbamide**

**Hydroxycarbamide** is an orally active drug used mainly in the treatment of chronic myeloid leukaemia. It is also licensed for the treatment of cancer of the cervix in conjunction with radiotherapy. It is occasionally used for polycythaemia (the usual treatment is venesection). Myelosuppression, nausea, and skin reactions are the most common toxic effects.

**HYDROXYCARBAMIDE**

(Hydroxyurea)

**Indications** see notes above; sickle-cell disease (section 9.1.3)

**Cautions** see section 8.1 and notes above; **interactions:** Appendix 1 (hydroxycarbamide)

**Hepatic impairment** use with caution

**Renal impairment** use with caution

**Pregnancy** avoid (teratogenic in *animal* studies); manufacturer advises effective contraception before and during treatment; see also Reproductive Function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above

**Dose**

● 20–30 mg/kg daily *or* 80 mg/kg every third day

**Hydroxycarbamide** (Non-proprietary) (POM)

**Capsules**, hydroxycarbamide 500 mg, net price 100-cap pack = £10.47

**Hydrea®** (Squibb) (POM)

**Capsules**, pink/green, hydroxycarbamide 500 mg, net price 100-cap pack = £10.47

**Mitotane**

**Mitotane** is licensed for the symptomatic treatment of advanced or inoperable adrenocortical carcinoma. It selectively inhibits the activity of the adrenal cortex, necessitating corticosteroid replacement therapy (section 6.3.1); the dose of glucocorticoid should be increased in case of shock, trauma, or infection.

Gastro-intestinal side-effects such as anorexia, nausea, and vomiting, and endocrine side-effects, such as hypogonadism and thyroid disorders, are very common with mitotane; neurotoxicity occurs in many patients.

**MITOTANE**

**Indications** see notes above

**Cautions** see section 8.1 and notes above; risk of accumulation in overweight patients; monitor plasma-mitotane concentration—consult product literature; **interactions:** Appendix 1 (mitotane)

**Driving** CNS effects may affect performance of skilled tasks (e.g. driving)

**Counselling** Warn patient to contact doctor immediately if injury, infection, or illness occurs (because of risk of acute adrenal insufficiency)

**Hepatic impairment** manufacturer advises caution in mild to moderate impairment—monitoring of plasma-

mitotane concentration recommended; avoid in severe impairment

**Renal impairment** manufacturer advises caution in mild to moderate impairment—monitoring of plasma-mitotane concentration recommended; avoid in severe impairment

**Pregnancy** manufacturer advises avoid—women of childbearing age should use effective contraception during and after treatment; see also Reproductive Function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above; also gastro-intestinal disturbances (including nausea, vomiting, diarrhoea, epigastric discomfort), anorexia, liver disorders; hypercholesterolaemia, hypertriglyceridaemia; ataxia, confusion, asthenia, myasthenia, paraesthesia, drowsiness, neuropathy, cognitive impairment, movement disorder, dizziness, headache; gynaecostasia; prolonged bleeding time, leucopenia, thrombocytopenia, anaemia; rash; *rarely* hypersalivation, hypertension, postural hypotension, flushing, pyrexia, haematuria, proteinuria, haemorrhagic cystitis, hypouricaemia, visual disturbances, and ocular disorders

**Dose**

● **ADULT** over 18 years, initially 2–3 g daily, (up to 6 g daily in severe illness) in 2–3 divided doses, adjusted according to plasma-mitotane concentration; reduce dose or interrupt treatment if signs of toxicity; discontinue if inadequate response after 3 months

**Note** Plasma-mitotane concentration for optimum response 14–20 mg/litre

**Lysodren®** (HRA Pharma) (POM)

**Tablets**, scored, mitotane 500 mg, net price 100-tab pack = £590.97. Label: 2, 10, 21, counselling, driving, adrenal suppression

**Panitumumab**

**Panitumumab** is a monoclonal antibody that binds to the epidermal growth factor receptor (EGFR). It is indicated as monotherapy for the treatment of EGFR expressing metastatic colorectal cancer with non-mutated *KRAS* gene after failure of fluoropyrimidine-, oxaliplatin-, and irinotecan-containing chemotherapy regimens. Panitumumab is given by intravenous infusion.

**PANITUMUMAB**

**Indications** see notes above

**Cautions** monitor for dermatological reactions (may require temporary or permanent discontinuation—consult product literature); pulmonary disease—discontinue if pneumonitis or lung infiltrates occur; monitor for hypomagnesaemia and hypocalcaemia

**Contra-indications** interstitial pulmonary disease

**Pregnancy** avoid (toxicity in *animal* studies); manufacturer advises effective contraception during and for 6 months after treatment; see also Reproductive Function, p. 520

**Breast-feeding** manufacturer advises avoid breast-feeding during and for 3 months after treatment

**Side-effects** see section 8.1; also infusion-related reactions including hypertension, hypotension, tachycardia, and severe hypersensitivity reactions (possibly delayed onset); diarrhoea, abdominal pain, constipation, dry mouth and nose; dyspnoea, cough,

embolism; fatigue, dizziness, headache; hypomagnesaemia, hypocalcaemia, hypokalaemia, dehydration; ocular disorders (including conjunctivitis, increased lacrimation, dry eyes, ocular hyperaemia); skin reactions (including rash, erythema, pruritus, dry skin, acne, hand-foot syndrome and exfoliation), mucosal inflammation, hypertrichosis, and nail disorders

**Vectibix®** (Amgen) ▼ (POM)

Concentrate for intravenous infusion, panitumumab 20 mg/mL, net price 5-mL vial = £379.29, 20-mL vial = £1517.16

Electrolytes Na<sup>+</sup> 0.75 mmol/vial

## Pentostatin

**Pentostatin** is active in hairy cell leukaemia. It is given *intravenously* on alternate weeks and can induce prolonged complete remission. It can cause myelosuppression, immunosuppression, and a number of other side-effects that may be severe. Treatment should be withheld in patients who develop a severe rash, and withheld or discontinued in patients showing signs of neurotoxicity. Its use should be confined to specialist centres.

### PENTOSTATIN

**Indications** see notes above

**Cautions** see section 8.1 and notes above; **interactions:** Appendix 1 (pentostatin)

**Hepatic impairment** manufacturer advises caution—limited information available

**Renal impairment** avoid if creatinine clearance less than 60 mL/minute

**Pregnancy** avoid (teratogenic in *animal* studies); manufacturer advises that men should not father children during and for 6 months after treatment; see also Reproductive Function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above

**Nipent®** (Hospira) (POM)

**Injection**, powder for reconstitution, pentostatin, net price 10-mg vial = £863.78

## Platinum compounds

**Carboplatin** is widely used in the treatment of advanced ovarian cancer and lung cancer (particularly the small cell type). It is given *intravenously*. The dose of carboplatin is determined according to renal function rather than body surface area. Carboplatin can be given on an outpatient basis and is better tolerated than cisplatin; nausea and vomiting are reduced in severity and nephrotoxicity, neurotoxicity, and ototoxicity are much less of a problem than with cisplatin. It is, however, more myelosuppressive than cisplatin.

**Cisplatin** is used alone or in combination for the treatment of testicular, lung, cervical, bladder, head and neck, and ovarian cancer (but carboplatin is preferred for ovarian cancer). It is given *intravenously*. Cisplatin requires intensive intravenous hydration and treatment may be complicated by severe nausea and vomiting. Cisplatin is toxic, causing nephrotoxicity (monitoring of renal function is essential), ototoxicity, peripheral neuropathy, hypomagnesaemia and myelosuppression. It is, however, increasingly given in a day-care setting.

**Oxaliplatin** is licensed in combination with fluorouracil and folinic acid, for the treatment of metastatic colorectal cancer and as adjuvant treatment of colon cancer after resection of the primary tumour; it is given by intravenous infusion. Neurotoxic side-effects (including sensory peripheral neuropathy) are dose limiting. Other side-effects include gastro-intestinal disturbances, ototoxicity, and myelosuppression. If unexplained respiratory symptoms occur, oxaliplatin should be discontinued until investigations exclude interstitial lung disease and pulmonary fibrosis.

### NICE guidance

#### Irinotecan, oxaliplatin, and raltitrexed for advanced colorectal cancer (August 2005)

A combination of fluorouracil and folinic acid with either irinotecan or oxaliplatin are options for first-line treatment for advanced colorectal cancer.

Irinotecan alone or fluorouracil and folinic acid with oxaliplatin are options for patients who require further treatment subsequently.

Raltitrexed is **not** recommended for the treatment of advanced colorectal cancer. Its use should be confined to clinical studies.

### NICE guidance (capecitabine and oxaliplatin in the adjuvant treatment of stage III (Dukes' C) colon cancer)

See p. 529

### NICE guidance

#### Paclitaxel for ovarian cancer (January 2003)

*Either* paclitaxel in combination with a platinum compound (cisplatin or carboplatin) *or* a platinum compound alone are alternatives for the first-line treatment of ovarian cancer (usually following surgery).

### NICE guidance

#### Paclitaxel, pegylated liposomal doxorubicin, and topotecan for second-line or subsequent treatment of advanced ovarian cancer (May 2005)

Paclitaxel, combined with a platinum compound (carboplatin or cisplatin), is an option for advanced cancer that relapses 6 months or more after completing initial platinum-based chemotherapy. Paclitaxel alone is an option for advanced ovarian cancer that does not respond to, or relapses within 6 months of completing initial platinum-based chemotherapy.

Pegylated liposomal doxorubicin is an option for advanced ovarian cancer that does not respond to, or relapses within 12 months of completing initial platinum-based chemotherapy.

Paclitaxel alone or pegylated liposomal doxorubicin are options for advanced ovarian cancer in patients who are allergic to platinum compounds. Topotecan alone is an option only for advanced ovarian cancer that does not respond to, or relapses within 6 months of completing initial platinum-based chemotherapy or in those allergic to platinum compounds *and* for whom paclitaxel alone or pegylated liposomal doxorubicin are inappropriate.

## CARBOPLATIN

**Indications** see notes above

**Cautions** see section 8.1 and notes above; **interactions:** Appendix 1 (platinum compounds)

**Renal impairment** reduce dose and monitor haematological parameters and renal function; avoid if creatinine clearance less than 20 mL/minute

**Pregnancy** avoid (teratogenic and embryotoxic in *animal* studies); see also Reproductive Function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above

**Carboplatin** (Non-proprietary) (POM)

**Injection**, carboplatin 10 mg/mL, net price 5-mL vial = £22.04, 15-mL vial = £56.92, 45-mL vial = £168.85, 60-mL vial = £260.00

## CISPLATIN

**Indications** see notes above

**Cautions** see section 8.1 and notes above; **interactions:** Appendix 1 (platinum compounds)

**Renal impairment** avoid if possible; nephrotoxic

**Pregnancy** avoid (teratogenic and toxic in *animal* studies); see also Reproductive Function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above

**Cisplatin** (Non-proprietary) (POM)

**Injection**, cisplatin 1 mg/mL, net price 10-mL vial = £5.85, 50-mL vial = £24.50, 100-mL vial = £50.22

**Injection**, powder for reconstitution, cisplatin, net price 50-mg vial = £17.00

## OXALIPLATIN

**Indications** metastatic colorectal cancer in combination with fluorouracil and folinic acid; colon cancer—see notes above

**Cautions** see section 8.1 and notes above; **interactions:** Appendix 1 (platinum compounds)

**Contra-indications** see section 8.1; peripheral neuropathy with functional impairment

**Renal impairment** manufacturer advises avoid if creatinine clearance less than 30 mL/minute

**Pregnancy** manufacturer advises avoid—toxicity in *animal* studies; effective contraception required during and for 4 months after treatment in women and 6 months after treatment in men; see also Reproductive Function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above

**Oxaliplatin** (Non-proprietary) (POM)

**Injection**, powder for reconstitution, oxaliplatin, net price 50-mg vial = £150.00, 100-mg vial = £299.50

**Eloxatin**<sup>®</sup> (Sanofi-Aventis) (POM)

**Concentrate for intravenous infusion**, oxaliplatin 5 mg/mL, net price 10-mL vial = £158.57, 20-mL vial = £317.13, 40-mL vial = £634.26

## Porfimer sodium and temoporfin

Porfimer sodium and temoporfin are used in the photodynamic treatment of various tumours. The

drugs accumulate in malignant tissue and are activated by laser light to produce a cytotoxic effect.

Porfimer sodium is licensed for photodynamic therapy of non-small cell lung cancer and obstructing oesophageal cancer. Temoporfin is licensed for photodynamic therapy of advanced head and neck cancer.

## PORFIMER SODIUM

**Indications** non-small cell lung cancer; oesophageal cancer; see notes above

**Cautions** see section 8.1; avoid exposure of skin and eyes to direct sunlight or bright indoor light for at least 30 days

**Contra-indications** see section 8.1; tracheo-oesophageal or broncho-oesophageal fistula; acute porphyria (section 9.8.2)

**Hepatic impairment** avoid in severe impairment

**Pregnancy** manufacturer advises avoid unless essential

**Breast-feeding** no information available—manufacturer advises avoid

**Side-effects** see section 8.1; photosensitivity (see Cautions above—sunscreens offer no protection), constipation

**Photofrin**<sup>®</sup> (Axcan) (POM)

**Injection**, powder for reconstitution, porfimer sodium, net price 15-mg vial = £154.00; 75-mg vial = £770.00

## TEMOPORFIN

**Indications** advanced head and neck squamous cell carcinoma refractory to, or unsuitable for, other treatments

**Cautions** see section 8.1; avoid exposure of skin and eyes to direct sunlight or bright indoor light for at least 15 days after administration; avoid prolonged exposure of injection site arm to direct sunlight for 6 months after administration, if extravasation occurs protect area from light for at least 3 months; **interactions:** Appendix 1 (temoporfin)

**Contra-indications** see section 8.1; acute porphyria (section 9.8.2) or other diseases exacerbated by light; elective surgery or ophthalmic slit-lamp examination for 30 days after administration; concomitant photosensitising treatment

**Pregnancy** toxicity in *animal* studies—manufacturer advises avoid pregnancy for at least 3 months after treatment; see also Reproductive Function, p. 520

**Breast-feeding** manufacturer advises avoid breast-feeding for at least 1 month after treatment—no information available

**Side-effects** see section 8.1; also constipation, dysphagia; haemorrhage, oedema; giddiness, trismus, facial pain; injection site pain, blistering, scarring, erythema, skin necrosis, hyperpigmentation, photosensitivity (see Cautions above; sunscreens ineffective)

**Foscan**<sup>®</sup> (Biolitec) (POM)

**Injection**, temoporfin 1 mg/mL, net price 1-mL vial = £900.00, 3-mL vial = £1800.00, 6-mL vial = £3400.00

## Procarbazine

**Procarbazine** is most often used in Hodgkin's disease. It is given *by mouth*. Toxic effects include nausea, myelosuppression, and a hypersensitivity rash preventing further use of this drug. It is a mild monoamine-oxidase inhibitor and dietary restriction is rarely considered necessary. Alcohol ingestion may cause a disulfiram-like reaction.

### PROCARBAZINE

**Indications** see notes above

**Cautions** see section 8.1 and notes above; cardiovascular or cerebrovascular disease; phaeochromocytoma; epilepsy; **interactions:** Appendix 1 (procarbazine)

**Hepatic impairment** caution in mild to moderate impairment; avoid in severe impairment

**Renal impairment** caution in mild to moderate impairment; avoid in severe impairment

**Pregnancy** avoid (teratogenic in *animal* studies and isolated reports in humans); see also Reproductive Function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above; also loss of appetite; jaundice also reported

**Procarbazine** (Non-proprietary) (POM)

**Capsules**, procarbazine (as hydrochloride) 50 mg, net price 50-cap pack = £199.60. Label: 4

## Protein kinase inhibitors

Dasatinib, erlotinib, everolimus, gefitinib, imatinib, lapatinib, nilotinib, pazopanib, sorafenib, sunitinib, and temsirolimus are protein kinase inhibitors.

**Dasatinib**, a tyrosine kinase inhibitor, is licensed for the treatment of chronic myeloid leukaemia in those who have resistance to or intolerance of previous therapy, including imatinib. It is also licensed for acute lymphoblastic leukaemia (Philadelphia chromosome positive) in those who have resistance to or intolerance of previous therapy.

The *Scottish Medicines Consortium* (p. 4) has advised (April 2007) that the use of dasatinib (*Sprycel*®) in NHS Scotland is restricted to patients in the chronic phase of chronic myeloid leukaemia.

**Erlotinib**, a tyrosine kinase inhibitor, is licensed in combination with gemcitabine for the treatment of metastatic pancreatic cancer. It is also licensed for the treatment of locally advanced or metastatic non-small cell lung cancer after failure of previous chemotherapy and as monotherapy for maintenance treatment of locally advanced or metastatic non-small cell lung cancer with stable disease after four cycles of platinum-based chemotherapy.

The *Scottish Medicines Consortium* (p. 4) has advised (May 2006) that erlotinib (*Tarceva*®) is accepted for restricted use within NHS Scotland for the treatment of locally advanced or metastatic non-small cell lung cancer, after failure of at least one chemotherapy regimen. Erlotinib is restricted to use in patients who would otherwise be eligible for treatment with docetaxel monotherapy.

### NICE guidance

#### Erlotinib for non-small-cell lung cancer (November 2008)

Erlotinib is recommended, as an alternative to docetaxel, as second-line treatment for locally advanced or metastatic non-small-cell lung cancer after failure of previous chemotherapy, on the basis that it is provided by the manufacturer at an overall treatment cost equal to that of docetaxel. Erlotinib is **not** recommended in patients for whom docetaxel is unsuitable or as third-line treatment after docetaxel.

**Everolimus**, a protein kinase inhibitor, is licensed for the treatment of advanced renal cell carcinoma when the disease has progressed despite treatment with vascular endothelial growth factor-targeted therapy.

**Gefitinib**, a tyrosine kinase inhibitor, is licensed for the treatment of locally advanced or metastatic non-small cell lung cancer with activating mutations of epidermal growth factor receptor.

**Imatinib**, a tyrosine kinase inhibitor, is licensed for the treatment of newly diagnosed chronic myeloid leukaemia where bone marrow transplantation is not considered first-line treatment, and for chronic myeloid leukaemia in chronic phase after failure of interferon alpha, or in accelerated phase, or in blast crisis (see NICE guidance below). It is also licensed for the treatment of c-kit (CD117)-positive unresectable or metastatic malignant gastro-intestinal stromal tumours (GIST), and as adjuvant treatment following resection of c-kit (CD117)-positive GIST, in patients at significant risk of relapse. Imatinib is licensed for the treatment of newly diagnosed acute lymphoblastic leukaemia in combination with other chemotherapy, and as monotherapy for relapsed or refractory acute lymphoblastic leukaemia. Imatinib is also licensed for the treatment of unresectable dermatofibrosarcoma protuberans and for patients with recurrent or metastatic dermatofibrosarcoma protuberans who cannot have surgery.

Imatinib is also licensed for the treatment of myelodysplastic/myeloproliferative diseases associated with platelet-derived growth factor receptor gene rearrangement and for the treatment of advanced hypereosinophilic syndrome and chronic eosinophilic leukaemia.

The *Scottish Medicines Consortium* (p. 4) has advised (March 2002) that imatinib (*Glivec*®) should be used for chronic myeloid leukaemia only under specialist supervision in accordance with British Society of Haematology guidelines (November 2001).

### NICE guidance

#### Imatinib for chronic myeloid leukaemia (October 2003)

Imatinib is recommended as first-line treatment for Philadelphia-chromosome-positive chronic myeloid leukaemia in the chronic phase and as an option for patients presenting in the accelerated phase or with blast crisis, provided that imatinib has not been used previously.

Where imatinib has failed to stop disease progression from chronic phase to accelerated phase or to blast crisis, continued use is recommended only as part of further clinical study.

**NICE guidance****Imatinib for the adjuvant treatment of gastro-intestinal stromal tumours (August 2010)**

Imatinib is not recommended for the adjuvant treatment of gastro-intestinal stromal tumours after surgery.

**NICE guidance****Imatinib for the treatment of unresectable and/or metastatic gastro-intestinal stromal tumours (October 2004)**

Imatinib 400 mg daily is recommended as first-line management of KIT (CD117)-positive unresectable or metastatic, or both, gastro-intestinal stromal tumours. Continued therapy is recommended only if a response to initial treatment [as defined by Southwest Oncology Group criteria available at [www.nice.org.uk/TA86](http://www.nice.org.uk/TA86)] is achieved within 12 weeks. Patients who have responded should be assessed at 12-week intervals. Discontinue if tumour ceases to respond.

**NICE guidance****Imatinib for the treatment of unresectable and/or metastatic gastro-intestinal stromal tumours (November 2010)**

Imatinib 600 mg daily or 800 mg daily is not recommended for unresectable or metastatic, or both, gastro-intestinal stromal tumours whose disease has progressed after treatment with imatinib 400 mg daily.

**Lapatinib**, a tyrosine kinase inhibitor, is licensed for the treatment of advanced or metastatic breast cancer in patients with tumours that overexpress human epidermal growth factor receptor-2 (HER2). It is indicated, in combination with capecitabine, for patients who have had previous treatment with an anthracycline, a taxane, and trastuzumab, or for postmenopausal women in combination with an aromatase inhibitor section 8.3.4.1.

**Nilotinib**, a tyrosine kinase inhibitor, is licensed for the treatment of chronic myeloid leukaemia in those who have resistance to or intolerance of previous therapy, including imatinib.

The *Scottish Medicines Consortium* (p. 4) has advised (February 2008) that nilotinib (*Tasigna*®) is accepted for restricted use within NHS Scotland for the treatment of chronic-phase chronic myeloid leukaemia in adults resistant to or intolerant of at least one previous therapy, including imatinib.

**Pazopanib**, a tyrosine kinase inhibitor, is licensed for the treatment of advanced renal cell carcinoma, as first-line treatment and for the treatment of patients who have had previous treatment with cytokine therapy for advanced disease.

**Sorafenib**, an inhibitor of multiple kinases, is licensed for the treatment of advanced renal cell carcinoma when treatment with interferon alfa or interleukin-2 has failed or is contra-indicated (but see NICE Guidance below). It is also licensed for the treatment of hepatocellular carcinoma.

**NICE guidance****Sorafenib for the treatment of advanced hepatocellular carcinoma (May 2010)**

Sorafenib is **not** recommended for the treatment of advanced hepatocellular carcinoma in patients for whom surgical or locoregional therapies have failed or are unsuitable.

**Sunitinib**, a tyrosine kinase inhibitor, is licensed for the treatment of advanced or metastatic renal cell carcinoma (but see NICE Guidance, below). It is also licensed for the treatment of unresectable or metastatic malignant gastro-intestinal stromal tumours, after failure of imatinib.

**NICE guidance****Sunitinib for advanced or metastatic renal cell carcinoma (March 2009)**

Sunitinib is recommended as first-line treatment for advanced or metastatic renal cell carcinoma in patients who are suitable for immunotherapy and have an Eastern Cooperative Oncology Group performance status of 0 or 1.

**NICE guidance****Sunitinib for the treatment of gastro-intestinal stromal tumours (September 2009)**

Sunitinib is recommended as an option for treatment in patients with unresectable or metastatic gastro-intestinal tumours if imatinib treatment has failed because of resistance or intolerance, and the cost of sunitinib for the first treatment cycle is met by the manufacturer.

**Nice guidance****Bevacizumab (first-line), sorafenib (first- and second-line), sunitinib (second-line) and temsirolimus (first-line) for the treatment of advanced or metastatic renal cell carcinoma (August 2009)**

Bevacizumab, sorafenib, and temsirolimus are not recommended as first-line treatments for people with advanced or metastatic renal cell carcinoma. Sorafenib and sunitinib are not recommended as second-line treatments for people with advanced or metastatic renal cell carcinoma.

**Temsirolimus** is a protein kinase inhibitor licensed for the first-line treatment of advanced renal cell carcinoma (see NICE Guidance above), and for the treatment of relapsed or refractory mantle cell lymphoma. Hypersensitivity reactions, including some life-threatening and rare fatal reactions, are associated with temsirolimus therapy, usually during administration of the first dose. Symptoms include flushing, chest pain, dyspnoea, apnoea, hypotension, loss of consciousness, and anaphylaxis. Where possible, patients should receive an intravenous dose of antihistamine 30 minutes before starting the temsirolimus infusion. The infusion may have to be stopped temporarily for the treatment of infusion-related effects—consult product literature for appropriate management. If adverse reactions are not managed with dose delays, a dose reduction should be considered—consult product literature.

**DASATINIB****Indications** see notes above**Cautions** see section 8.1; susceptibility to QT-interval prolongation (correct hypokalaemia or hypomagnesaemia before starting treatment); **interactions:** Appendix 1 (dasatinib)**Hepatic impairment** manufacturer advises caution in hepatic impairment**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies; effective contraception required during treatment; see also Reproductive Function, p. 520**Breast-feeding** discontinue breast-feeding**Side-effects** see section 8.1; also diarrhoea, anorexia, weight changes, abdominal pain, taste disturbance, constipation, dyspepsia, colitis, gastritis; arrhythmias, congestive heart failure, hypertension, chest pain, flushing, haemorrhage (including gastro-intestinal and CNS haemorrhage), palpitation; dyspnoea, pulmonary hypertension, cough, oedema (more common in patients over 65 years old), pleural effusion; depression, dizziness, headache, insomnia, neuropathy; influenza-like symptoms; musculoskeletal pain; visual disturbances; tinnitus; acne, dry skin, sweating, pruritus, dermatitis, urticaria; *less commonly* pancreatitis, hepatitis, cholestasis, cholecystitis, oesophagitis, hypotension, transient ischaemic attack, thrombophlebitis, syncope, asthma, seizures, amnesia, tremor, drowsiness, gynaecomastia, irregular menstruation, urinary frequency, proteinuria, hypocalcaemia, rhabdomyolysis, hypersensitivity reactions (including erythema nodosum), photosensitivity, and pigmentation and nail disorders; *rarely* cor pulmonale; thrombosis and interstitial lung disease also reported**Dose**

- Chronic phase chronic myeloid leukaemia, **ADULT** over 18 years 100 mg once daily, increased if necessary to max. 140 mg once daily
- Accelerated and blast phase chronic myeloid leukaemia, acute lymphoblastic leukaemia, **ADULT** over 18 years 140 mg once daily, increased if necessary to max. 180 mg once daily

**Sprycel**® (Bristol-Myers Squibb) ▼ (P<sub>M</sub>)

**Tablets**, f/c, dasatinib (as monohydrate) 20 mg, net price 60-tab pack = £1252.48; 50 mg, 60-tab pack = £2504.96; 70 mg, 60-tab pack = £2504.96; 100 mg, 30-tab pack = £2504.96. Label: 25

**ERLOTINIB****Indications** see notes above**Cautions** see section 8.1; pre-existing liver disease or concomitant use with hepatotoxic drugs—monitor liver function; dose adjustment may be necessary if smoking started or stopped during treatment; **interactions:** Appendix 1 (erlotinib)**Hepatic impairment** manufacturer advises caution in mild to moderate impairment; avoid in severe impairment**Renal impairment** manufacturer advises avoid in severe impairment**Pregnancy** manufacturer advises avoid—toxicity in *animal* studies; effective contraception required during and for at least 2 weeks after treatment; see also Reproductive Function, p. 520**Breast-feeding** manufacturer advises avoid—no information available**Side-effects** see section 8.1 and notes above; also diarrhoea, abdominal pain, dyspepsia, flatulence; anorexia, depression, neuropathy, headache; fatigue, rigor; conjunctivitis; pruritus, dry skin; *less commonly* gastro-intestinal perforation, interstitial lung disease—discontinue if unexplained symptoms such as dyspnoea, cough or fever occur; eyelash changes; *rarely* hepatic failure; *very rarely* corneal perforation or ulceration, Stevens-Johnson syndrome, and toxic epidermal necrolysis**Dose**

- Non-small cell lung cancer, 150 mg once daily
- Pancreatic cancer, 100 mg once daily in combination with gemcitabine

**Tarceva**® (Roche) ▼ (P<sub>M</sub>)

**Tablets**, f/c, white-yellow, erlotinib (as hydrochloride) 25 mg, net price 30-tab pack = £378.33; 100 mg, 30-tab pack = £1324.14; 150 mg, 30-tab pack = £1631.53. Label: 23

**EVEROLIMUS****Indications** see notes above**Cautions** see section 8.1; monitor blood-glucose concentration before treatment and periodically thereafter; reduce dose or discontinue if severe side-effects occur—consult product literature; **interactions:** Appendix 1 (everolimus)**Pneumonitis** Non-infectious pneumonitis reported. Patients should be advised to seek urgent medical advice if new or worsening respiratory symptoms occur**Hepatic impairment** reduce dose to 5 mg daily in moderate impairment; avoid in severe impairment—no information available**Pregnancy** manufacturer advises avoid (toxicity in *animal* studies); effective contraception must be used; see also Reproductive Function, p. 520**Breast-feeding** manufacturer advises avoid**Side-effects** see section 8.1; also diarrhoea, dry mouth, abdominal pain, dysphagia, anorexia, taste disturbance; chest pain, hypertension, hyperlipidaemia, hypercholesterolaemia, peripheral oedema; pneumonitis (including interstitial lung disease); asthenia, fatigue, headache, insomnia; increased susceptibility to infections (including pneumonia, aspergillosis, and candidiasis); hyperglycaemia, dehydration; eyelid oedema; epistaxis; skin and nail disorders (including hand-foot syndrome); *less commonly* congestive heart failure and impaired wound healing; hepatitis B reactivation and haemorrhage also reported**Dose**

- **ADULT** over 18 years, 10 mg once daily

**Afinitor**® (Novartis) ▼ (P<sub>M</sub>)

**Tablets**, white-yellow, everolimus, 5 mg, net price 30-tab pack = £2250.00; 10 mg, 30-tab pack = £2970.00. Label: 25, counselling, pneumonitis

**GEFITINIB****Indications** see notes above**Cautions** monitor liver function—consider discontinuing if severe changes in liver function occur; monitor for worsening of dyspnoea, cough and fever—discontinue if interstitial lung disease confirmed; patients should seek immediate medical advice if they experience any ocular symptoms; **interactions:** Appendix 1 (gefitinib)

**Hepatic impairment** manufacturer advises caution in moderate to severe impairment due to cirrhosis

**Renal impairment** manufacturer advises caution if creatinine clearance less than 20 mL/minute

**Pregnancy** manufacturer advises avoid unless essential—toxicity in *animal* studies; see also Reproductive Function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1; also anorexia, diarrhoea, dry mouth; epistaxis, interstitial lung disease—discontinue if confirmed; asthenia; pyrexia; haematuria, proteinuria; dry eye, conjunctivitis, blepharitis; nail disorder, skin reactions (including dry skin, rash, acne, and pruritus); *less commonly* pancreatitis, corneal erosion; *rarely* hepatitis, toxic epidermal necrolysis

#### Dose

- **ADULT** over 18 years, 250 mg once daily

**Iressa**® (AstraZeneca) ▼ (PoM)

Tablets, f/c, brown, gefitinib 250 mg, net price 30-tab pack = £2167.71

## IMATINIB

**Indications** see notes above

**Cautions** see section 8.1; cardiac disease; monitor for fluid retention; monitor liver function; **interactions:** Appendix 1 (imatinib)

**Hepatic impairment** max. 400 mg daily; reduce dose further if not tolerated

**Renal impairment** max. starting dose 400 mg daily if creatinine clearance less than 60 mL/minute; reduce dose further if not tolerated

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk; effective contraception required during treatment; see also Reproductive Function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1; also abdominal pain, appetite changes, constipation, diarrhoea, flatulence, gastro-oesophageal reflux, taste disturbance, weight changes, dry mouth; oedema (including pulmonary oedema, pleural effusion, and ascites), flushing, haemorrhage; cough, dyspnoea; dizziness, headache, insomnia, hypoaesthesia, paraesthesia, fatigue; influenza-like symptoms; cramps, arthralgia; visual disturbances, increased lacrimation, conjunctivitis, dry eyes; epistaxis; dry skin, sweating, rash, pruritus, photosensitivity; *less commonly* gastric ulceration, pancreatitis, hepatic dysfunction (*rarely* hepatic failure, hepatic necrosis), dysphagia, heart failure, tachycardia, palpitation, syncope, hypertension, hypotension, cold extremities, cough, acute respiratory failure, depression, drowsiness, anxiety, peripheral neuropathy, tremor, migraine, impaired memory, vertigo, gynaecomastia, menorrhagia, irregular menstruation, sexual dysfunction, electrolyte disturbances, renal failure, urinary frequency, gout, tinnitus, hearing loss; skin hyperpigmentation; *rarely* intestinal obstruction, gastro-intestinal perforation, inflammatory bowel disease, arrhythmia, atrial fibrillation, myocardial infarction, angina, pulmonary fibrosis, pulmonary hypertension, increased intracranial pressure, convulsions, confusion, haemolytic anaemia, rhabdomyolysis, myopathy, aseptic necrosis of bone, cataract, glaucoma, angioedema, exfoliative dermatitis, and Stevens-Johnson syndrome

#### Dose

- Chronic phase chronic myeloid leukaemia, **ADULT** 400 mg once daily, increased if necessary to max. 800 mg daily (in 2 divided doses); **CHILD** (chronic and advanced phase) 2–18 years 340 mg/m<sup>2</sup> (max. 800 mg) daily (in 1–2 divided doses), increased to 570 mg/m<sup>2</sup> (max. 800 mg) daily if necessary (consult product literature)
- Accelerated phase and blast crisis chronic myeloid leukaemia, **ADULT** 600 mg once daily, increased if necessary to max. 800 mg daily (in 2 divided doses)
- Acute lymphoblastic leukaemia, **ADULT** 600 mg once daily
- Gastro-intestinal stromal tumours, **ADULT** 400 mg once daily
- Dermatofibrosarcoma protuberans, **ADULT** 800 mg daily in 2 divided doses
- Myelodysplastic/myeloproliferative diseases, **ADULT** 400 mg once daily
- Advanced hyper eosinophilic syndrome and chronic eosinophilic leukaemia, **ADULT** 100–400 mg once daily

**Glivec**® (Novartis) ▼ (PoM)

Tablets, f/c, imatinib (as mesilate) 100 mg (yellow-brown, scored), net price 60-tab pack = £802.04; 400 mg (yellow), 30-tab pack = £1604.08. Label: 21, 27  
**Counselling** Tablets may be dispersed in water or apple juice

## LAPATINIB

**Indications** see notes above

**Cautions** see section 8.1; low gastric pH (reduced absorption); susceptibility to QT-interval prolongation (including concomitant use of drugs that prolong QT-interval and electrolyte disturbances); monitor left ventricular function; monitor for pulmonary toxicity; monitor liver function before treatment and at monthly intervals; **interactions:** Appendix 1 (lapatinib)

**Hepatic impairment** caution in moderate to severe impairment—metabolism reduced

**Renal impairment** caution in severe impairment—no information available

**Pregnancy** avoid unless potential benefit outweighs risk—toxicity in *animal* studies; see also Reproductive Function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1; anorexia, diarrhoea (treat promptly), decreased left ventricular ejection fraction, cardiac failure (fatal cases reported), malaise, rash, nail disorders, hyperbilirubinaemia, hepatotoxicity (discontinue permanently if severe); *less commonly* interstitial lung disease; respiratory failure (including fatal cases) also reported

#### Dose

- In combination with capecitabine, **ADULT** over 18 years, 1.25 g once daily
- In combination with an aromatase inhibitor, **ADULT** over 18 years, 1.5 g once daily

**Counselling** Always take at the same time in relation to food: either one hour before or one hour after food. Patients should report unexpected changes in bowel habit

**Tyverb**® (GSK) ▼ (PoM)

Tablets, yellow, f/c, lapatinib 250 mg, net price 70-tab pack = £804.30, 84 tab-pack = £965.16. Counselling, administration

**NILOTINIB****Indications** see notes above**Cautions** see section 8.1; history of pancreatitis; susceptibility to QT-interval prolongation (including electrolyte disturbances, concomitant use of drugs that prolong QT interval); **interactions:** Appendix 1 (nilotinib)**Hepatic impairment** manufacturer advises caution**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies; effective contraception required during treatment; see also Reproductive Function, p. 520**Breast-feeding** manufacturer advises avoid—present in milk in *animal* studies**Side-effects** see section 8.1; also abdominal pain, constipation, diarrhoea, dyspepsia, flatulence, anorexia, weight changes; palpitation, QT-interval prolongation, hypertension, oedema, flushing; dyspnoea, cough, dysphonia; headache, fatigue, asthenia, dizziness, paraesthesia, insomnia, vertigo; hypomagnesaemia, hyperkalaemia, blood glucose changes; bone pain, arthralgia, muscle spasm; urticaria, erythema, hyperhidrosis, dry skin, rash, pruritus; *less commonly* hepatitis, pancreatitis, dry mouth, chest pain, cardiac failure, arrhythmias, pericardial effusion, coronary artery disease, cardiomegaly, cardiac murmur, bradycardia, hypertensive crisis, haemorrhage, melena, haematoma, pleural effusion, interstitial lung disease, migraine, hypoesthesia, hyperaesthesia, depression, anxiety, tremor, influenza-like symptoms, hyperthyroidism, breast pain, gynaecomastia, erectile dysfunction, dysuria, urinary frequency, hypokalaemia, hyponatraemia, hypocalcaemia, hypophosphataemia, dehydration, decreased visual acuity, conjunctivitis, dry eyes, epistaxis, and ecchymosis**Dose**

Tablets, f/c, red, sorafenib (as tosylate) 200 mg, net price 112-tab pack = £2980.47. Label: 23

## SUNITINIB

**Indications** see notes above

**Cautions** see section 8.1; cardiovascular disease—discontinue if congestive heart failure develops; susceptibility to QT-interval prolongation; hypertension; increased risk of bleeding; monitor for thyroid dysfunction; consider dental check-up before initiating treatment (risk of osteonecrosis of the jaw, see MHRA/CHM advice, p. 537); **interactions:** Appendix 1 (sunitinib)

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies; effective contraception required during treatment; see also Reproductive Function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1; also abdominal pain, diarrhoea, constipation, anorexia, taste disturbance, dehydration; hypertension, oedema; dyspnoea, cough; fatigue, dizziness, headache, insomnia, peripheral neuropathy, paraesthesia; hypothyroidism; arthralgia, myalgia; increased lacrimation; epistaxis; skin, hair, and urine discoloration, hand-foot syndrome, dry skin, and rash; gastro-intestinal perforation, fistula formation (interrupt treatment if occurs) pancreatitis, osteonecrosis of the jaw (see MHRA/CHM advice, p. 537), hepatic failure, proteinuria (*rarely* nephrotic syndrome) and seizures reported

### Dose

- 50 mg daily for 4 weeks, followed by a 2-week treatment-free period to complete 6-week cycle; adjust dose in steps of 12.5 mg according to tolerability; dose range 25–75 mg daily

**Sutent**<sup>®</sup> (Pfizer) (PAM)

**Capsules, sunitinib** (as malate) 12.5 mg (orange), net price 28-cap pack = £784.70; 25 mg (caramel/orange), 28-cap pack = £1569.40; 50 mg (caramel), 28-cap pack = £3138.80. Label: 14

## TEMSIROLIMUS

**Indications** see notes above

**Cautions** see notes above; monitor respiratory function; monitor blood lipids; **interactions:** Appendix 1 (temsirolimus)

**Hepatic impairment** use with caution; in renal cell carcinoma, reduce dose in severe impairment (consult product literature); in mantle cell lymphoma, avoid in moderate or severe impairment

**Renal impairment** manufacturer advises caution in severe impairment—no information available

**Pregnancy** manufacturer advises avoid (toxicity in *animal* studies); ensure effective contraception during treatment in men and women; see also Reproductive Function, p. 520

**Breast-feeding** manufacturer advises discontinue breast-feeding

**Side-effects** see section 8.1; also abdominal pain, diarrhoea, anorexia, taste disturbance, gastro-intestinal haemorrhage, bowel perforation, dysphagia; hypertension, oedema, thrombosis, thrombophlebitis; cough, dyspnoea, chest pain, interstitial lung disease, hypersensitivity reactions (see notes above); insomnia, anxiety, depression, drowsiness, paraesthesia, dizziness, asthenia; increased susceptibility to infec-

tion (including urinary-tract infection and pneumonia), pyrexia; hyperglycaemia; renal failure; hypophosphataemia, hypokalaemia, hypercholesterolaemia, hyperlipidaemia; myalgia, arthralgia; eye disorders; rhinitis, epistaxis; skin disorders (including rash and acne), folliculitis, impaired wound healing; *less commonly* intracerebral bleeding

**Torisel**<sup>®</sup> (Wyeth) (PAM)

**Infusion, temsirolimus** 25 mg/mL, net price 1.2-mL amp (with diluent) = £620.00

**Excipients** include propylene glycol and ethanol

## Taxanes

**Paclitaxel** is a member of the taxane group of drugs. It is given by *intravenous infusion*. Paclitaxel given with carboplatin or cisplatin is used for the treatment of ovarian cancer (see NICE guidance p. 542); the combination is also considered appropriate for women whose ovarian cancer is initially considered inoperable. Paclitaxel is also licensed for the secondary treatment of metastatic breast cancer. There is limited evidence to support its use in non-small cell lung cancer. Routine premedication with a corticosteroid, an antihistamine and a histamine H<sub>2</sub>-receptor antagonist is recommended to prevent severe hypersensitivity reactions; hypersensitivity reactions may occur rarely despite premedication, although more commonly only bradycardia or asymptomatic hypotension occur.

Other side-effects of paclitaxel include myelosuppression, peripheral neuropathy, and cardiac conduction defects with arrhythmias (which are nearly always asymptomatic). It also causes alopecia and muscle pain; nausea and vomiting is mild to moderate.

**Docetaxel** is licensed for use in locally advanced or metastatic breast cancer and non-small cell lung cancer resistant to other cytotoxic drugs or for initial chemotherapy in combination with other cytotoxic drugs. It is also licensed for hormone-resistant prostate cancer, for use with other cytotoxic drugs for gastric adenocarcinoma and head and neck cancer, and for adjuvant treatment of operable node-positive and operable node-negative breast cancer. Its side-effects are similar to those of paclitaxel but persistent fluid retention (commonly as leg oedema that worsens during treatment) can be resistant to treatment; hypersensitivity reactions also occur. Pretreatment with dexamethasone by mouth is recommended for reducing fluid retention and hypersensitivity reactions.

For the role of taxanes in the treatment of breast cancer, see section 8.3.4.1.

The *Scottish Medicines Consortium* (p. 4) has advised that docetaxel (*Taxotere*<sup>®</sup>) in combination with cisplatin and 5-fluorouracil is accepted for restricted use within NHS Scotland for the induction treatment of patients with unresectable (May 2007) and resectable (June 2008) locally advanced squamous cell carcinoma of the head and neck.

**NICE guidance (paclitaxel, pegylated liposomal doxorubicin and topotecan for second-line or subsequent treatment of advanced ovarian cancer)**

See p. 542

**NICE guidance****Docetaxel for the treatment of hormone-refractory metastatic prostate cancer (June 2006)**

Docetaxel is an option for hormone-refractory metastatic prostate cancer and a Karnofsky score of at least 60% [Karnofsky score is a measure of the ability to perform ordinary tasks].

**DOCETAXEL**

**Indications** adjuvant treatment of operable node-positive and operable node-negative breast cancer, in combination with doxorubicin and cyclophosphamide; with doxorubicin for initial chemotherapy of locally advanced or metastatic breast cancer; monotherapy for locally advanced or metastatic breast cancer where cytotoxic chemotherapy with an anthracycline or an alkylating drug has failed; with capecitabine for locally advanced or metastatic breast cancer where cytotoxic chemotherapy with an anthracycline has failed; with trastuzumab for initial chemotherapy of metastatic breast cancer which overexpresses human epidermal growth factor-2; locally advanced or metastatic non-small cell lung cancer where first-line chemotherapy has failed; with cisplatin for unresectable, locally advanced or metastatic non-small cell lung cancer; with prednisolone for hormone-refractory metastatic prostate cancer; with cisplatin and fluorouracil for initial treatment of metastatic gastric adenocarcinoma, including adenocarcinoma of the gastro-oesophageal junction; with cisplatin and fluorouracil for induction treatment of locally advanced squamous cell carcinoma of the head and neck

**Cautions** see section 8.1 and notes above; avoid in acute porphyria (but see section 9.8.2); **interactions:** Appendix 1 (docetaxel)

**Hepatic impairment** monitor liver function—reduce dose according to liver enzymes; avoid in severe impairment

**Pregnancy** avoid (toxicity and reduced fertility in *animal* studies); manufacturer advises effective contraception during and for at least 3 months after treatment; see also Reproductive Function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above

**Docetaxel** (Non-proprietary) (POM)

**Infusion**, docetaxel 10 mg/mL, net price 2-mL vial = £162.75, 8-mL vial = £534.75, 16-mL vial = £1069.50

**Taxotere**<sup>®</sup> (Sanofi-Aventis) (POM)

**Infusion**, docetaxel 20 mg/mL, net price 1-mL vial = £162.75, 4-mL vial = £534.75, 8-mL vial = £1069.50 (hosp. only)

**Note** Contains ethanol

**PACLITAXEL**

**Indications** ovarian cancer (advanced or residual disease following laparotomy) in combination with cisplatin; metastatic ovarian cancer where platinum-containing therapy has failed; locally advanced or metastatic breast cancer (in combination with other cytotoxics or alone if other cytotoxics have failed or are inappropriate); adjuvant treatment of node-positive breast cancer following treatment with anthra-

cycline and cyclophosphamide; non-small cell lung cancer (in combination with cisplatin) when surgery or radiotherapy not appropriate; advanced AIDS-related Kaposi's sarcoma where liposomal anthracycline therapy has failed

**Cautions** see section 8.1 and notes above; avoid in acute porphyria (but see section 9.8.2); **interactions:** Appendix 1 (paclitaxel)

**Contra-indications** see section 8.1 and notes above

**Hepatic impairment** avoid in severe impairment

**Pregnancy** avoid (toxicity in *animal* studies); ensure effective contraception during and for at least 6 months after treatment in men or women; see also Reproductive Function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above

**Paclitaxel** (Non-proprietary) (POM)

**Infusion**, paclitaxel 6 mg/mL, net price 5-mL vial = £66.85, 16.7-mL vial = £200.35, 25-mL vial = £300.52, 50-mL vial = £601.03

**Excipients** include polyoxyl castor oil (risk of anaphylaxis, see Excipients, p. 2)

**Abraxane**<sup>®</sup> (Abraxis) (POM)

**Intravenous infusion**, powder for reconstitution, paclitaxel, net price 100-mg vial = £246.00

**Electrolytes** Contains approx. 18.5 mmol Na<sup>+</sup>/dose

**Taxol**<sup>®</sup> (Bristol-Myers Squibb) (POM)

**Infusion**, paclitaxel 6 mg/mL, net price 5-mL vial = £116.05, 16.7-mL vial = £347.82, 25-mL vial = £521.73, 50-mL vial = £1043.46 (hosp. only)

**Excipients** include polyoxyl castor oil (risk of anaphylaxis, see Excipients, p. 2)

**Topoisomerase I inhibitors**

Irinotecan and topotecan inhibit topoisomerase I, an enzyme involved in DNA replication.

**Irinotecan** is licensed for metastatic colorectal cancer in combination with fluorouracil and folinic acid or as monotherapy when treatment containing fluorouracil has failed. It is also licensed in combination with cetuximab for the treatment of epidermal growth factor receptor-expressing metastatic colorectal cancer after failure of chemotherapy that has included irinotecan. Irinotecan is also licensed in combination with 5-fluorouracil, folinic acid and bevacizumab for the first-line treatment of metastatic carcinoma of the colon or rectum. Irinotecan is also licensed in combination with capecitabine with or without bevacizumab for the first-line treatment of metastatic colorectal carcinoma. Irinotecan is given by intravenous infusion.

**NICE guidance (irinotecan, oxaliplatin and raltitrexed for advanced colorectal cancer)**

See p. 542

**Topotecan** is given by intravenous infusion or orally in relapsed small-cell lung cancer when retreatment with the first-line regimen is considered inappropriate. Topotecan injection is also licensed for metastatic ovarian cancer when first-line or subsequent treatment has failed. Topotecan injection is licensed in combination with cisplatin for treatment of recurrent carcinoma of the cervix, after radiotherapy, and for patients with stage IVB disease.

In addition to dose-limiting myelosuppression, side-effects of irinotecan and topotecan include gastro-intes-

tinal effects (delayed diarrhoea requiring prompt treatment may follow irinotecan treatment), asthenia, alopecia, and anorexia.

The *Scottish Medicines Consortium* (p. 4) has advised (November 2007) that topotecan (*Hycamtin*®) is accepted for restricted use in combination with cisplatin for treatment of recurrent carcinoma of the cervix after radiotherapy and for stage IVB disease; it is restricted to patients who have not previously received cisplatin treatment.

The *Scottish Medicines Consortium* (p. 4) has advised (March 2009) that use of topotecan capsules within NHS Scotland is restricted to patients in whom standard intravenous chemotherapy is inappropriate and who would otherwise receive best supportive care.

#### NICE guidance

##### Topotecan for the treatment of recurrent and stage IVB cervical cancer (October 2009)

Topotecan in combination with cisplatin is recommended as a treatment option for recurrent or stage IVB cervical cancer in patients who have not previously received cisplatin.

#### NICE guidance

##### Topotecan for the treatment of relapsed small-cell lung cancer (November 2009)

Oral topotecan is recommended as an option for treatment in patients with relapsed small-cell lung cancer only if re-treatment with the first-line regimen is not considered appropriate, and the combination of cyclophosphamide, doxorubicin and vincristine is contra-indicated. Intravenous topotecan is not recommended for people with relapsed small-cell lung cancer.

#### NICE guidance (paclitaxel, pegylated liposomal doxorubicin and topotecan for second-line or subsequent treatment of advanced ovarian cancer)

See p. 542

## IRINOTECAN HYDROCHLORIDE

**Indications** see notes above

**Cautions** see section 8.1 and notes above; raised plasma-bilirubin concentration (see under Hepatic impairment); monitor respiratory function; **interactions:** Appendix 1 (irinotecan)

**Contra-indications** see section 8.1 and notes above; also chronic inflammatory bowel disease, bowel obstruction

**Hepatic impairment** monitor closely for neutropenia if plasma-bilirubin concentration 1.5–3 times upper limit of normal range (consult product literature); avoid if plasma-bilirubin concentration greater than 3 times upper limit of normal range

**Renal impairment** manufacturer advises avoid—no information available

**Pregnancy** avoid (teratogenic and toxic in *animal* studies); manufacturer advises effective contraception during and for at least 3 months after treatment; see also Reproductive Function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above; also acute cholinergic syndrome (with early diarrhoea) and delayed diarrhoea (consult product literature); *less commonly* interstitial pulmonary disease

**Irinotecan** (Non-proprietary) (P<sub>o</sub>M)

**Infusion**, irinotecan hydrochloride 20 mg/mL, net price 2-mL vial = £49.03, 5-mL vial = £120.25, 15-mL vial = £370.50, 25-mL vial = £601.25

**Campto**® (Pfizer) (P<sub>o</sub>M)

**Infusion**, irinotecan hydrochloride 20 mg/mL, net price 2-mL vial = £53.00; 5-mL vial = £130.00; 15-mL vial = £390.00

## TOPOTECAN

**Indications** see notes above

**Cautions** see section 8.1 and notes above

**Contra-indications** see section 8.1 and notes above

**Hepatic impairment** avoid in severe impairment

**Renal impairment** reduce dose; avoid infusion if creatinine clearance less than 20 mL/minute; avoid oral route if creatinine clearance less than 60 mL/minute

**Pregnancy** avoid (teratogenicity and fetal loss in *animal* studies); see also Reproductive Function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above

**Hycamtin**® (GSK) (P<sub>o</sub>M)

**Capsules**, topotecan (as hydrochloride) 250 micrograms (white), net price 10-cap pack = £75.00; 1 mg (pink), 10-cap pack = £300.00. Label: 25

**Intravenous infusion**, powder for reconstitution, topotecan (as hydrochloride), net price 1-mg vial = £97.65; 4-mg vial = £290.62

## Trabectedin

**Trabectedin** is licensed for the treatment of advanced soft tissue sarcoma when treatment with anthracyclines and ifosfamide has failed or is contra-indicated and in combination with pegylated liposomal doxorubicin for the treatment of relapsed platinum-sensitive ovarian cancer.

Trabectedin is given by intravenous infusion. A corticosteroid, such as dexamethasone by intravenous infusion, should be given 30 minutes before therapy for its anti-emetic and hepatoprotective effects.

#### NICE guidance

##### Trabectedin for the treatment of advanced soft tissue sarcoma (February 2010)

Trabectedin is an option for advanced soft tissue sarcoma when treatment with anthracyclines and ifosfamide has failed, is inappropriate or is not tolerated. The cost of trabectedin for treatment after the fifth cycle is met by the manufacturer.

## TRABECTEDIN

**Indications** see notes above

**Cautions** see section 8.1 and notes above; measure creatine phosphokinase, renal function and hepatic function before starting (consult product literature);

monitor haematological and hepatic parameters weekly during first 2 cycles and at least once between treatments in subsequent cycles; concomitant use with hepatotoxic drugs (avoid alcohol)

**Hepatic impairment** manufacturer advises caution in impairment—consider dose reduction; avoid in patients with raised bilirubin

**Renal impairment** avoid monotherapy if creatinine clearance less than 30 mL/minute; avoid combination regimens if creatinine clearance less than 60 mL/minute

**Pregnancy** effective contraception recommended during and for at least 3 months after treatment in women and at least 5 months after treatment in men; see also Reproductive Function, p. 520

**Breast-feeding** manufacturer advises avoid breast-feeding during and for 3 months after treatment

**Side-effects** see section 8.1; also abdominal pain, constipation, diarrhoea, dyspepsia, taste disturbance, hepatobiliary disorders; hypotension, oedema, flushing; dyspnoea, cough; headache, insomnia, peripheral neuropathy, paraesthesia, dizziness, anorexia, asthenia, fatigue; pyrexia; hypokalaemia, dehydration, increased blood creatine phosphokinase; myalgia, arthralgia, back pain

**Yondelis**<sup>®</sup> (Pharma Mar) ▼ (P<sub>M</sub>)

**Injection**, powder for reconstitution, trabectedin, net price 250-microgram vial = £363.00; 1-mg vial = £1366.00

## Trastuzumab

**Trastuzumab** is licensed for the treatment of early breast cancer which overexpresses human epidermal growth factor receptor-2 (HER2).

Trastuzumab is also licensed, in combination with paclitaxel or docetaxel, for metastatic breast cancer in patients with HER2-positive tumours who have not received chemotherapy for metastatic breast cancer and in whom anthracycline treatment is inappropriate.

Trastuzumab is also licensed, in combination with an aromatase inhibitor, for metastatic breast cancer in postmenopausal patients with hormone-receptor positive HER2-positive tumours not previously treated with trastuzumab.

Trastuzumab is also licensed as monotherapy for metastatic breast cancer in patients with tumours that overexpress HER2 who have received at least 2 chemotherapy regimens including, where appropriate, an anthracycline and a taxane; women with oestrogen-receptor-positive breast cancer should also have received hormonal therapy.

Trastuzumab is also licensed, in combination with capecitabine or fluorouracil and cisplatin, for metastatic gastric cancer in patients with HER2-positive tumours who have not received treatment for metastatic gastric cancer.

Trastuzumab is given by intravenous infusion. Resuscitation facilities should be available and treatment should be initiated by a specialist. See section 8.3.4.1 for the role of trastuzumab in the treatment of breast cancer.

**Use with anthracyclines** Concomitant use of trastuzumab with anthracyclines (section 8.1.2) is associated with cardiotoxicity. The use of anthracyclines even after stopping trastuzumab can increase the risk

of cardiotoxicity and if possible should be avoided for up to 24 weeks. If an anthracycline needs to be used, cardiac function should be monitored closely.

### NICE guidance

#### Trastuzumab for the treatment of HER2-positive metastatic gastric cancer (November 2010)

Trastuzumab in combination with cisplatin and capecitabine or fluorouracil is recommended for human epidermal growth factor receptor-2-positive metastatic adenocarcinoma of the stomach or gastro-oesophageal junction in patients who:

- have not received treatment for metastatic disease and
- have tumours expressing high levels of HER2 as defined by a positive immunohistochemistry score of 3.

## TRASTUZUMAB

**Indications** see notes above and product literature

**Cautions** see section 8.1 and notes above; symptomatic heart failure, history of hypertension, coronary artery disease, uncontrolled arrhythmias

**Cardiotoxicity** Monitor cardiac function before and during treatment—for details of monitoring and managing cardiotoxicity, consult product literature

**Contra-indications** see section 8.1 and notes above; severe dyspnoea at rest

**Pregnancy** avoid unless potential benefit outweighs risk; oligohydramnios and anhydramnios reported

**Breast-feeding** avoid breast-feeding during treatment and for six months afterwards

**Side-effects** see section 8.1; also infusion-related side-effects including chills, fever, hypersensitivity reactions such as anaphylaxis, urticaria, and angioedema; gastro-intestinal symptoms; cardiotoxicity (see also above), chest pain, hypotension; pulmonary events (possibly delayed onset); headache, taste disturbance, anxiety, malaise, depression, insomnia, drowsiness, dizziness, paraesthesia, tremor, asthenia, peripheral neuropathy, hypertonia; mastitis, urinary-tract infection; ecchymosis, oedema, weight loss; arthralgia, myalgia, arthritis, bone pain, leg cramps; rash, pruritus, sweating, dry skin, alopecia, acne, nail disorders

**Herceptin**<sup>®</sup> (Roche) ▼ (P<sub>M</sub>)

**Intravenous infusion**, powder for reconstitution, trastuzumab, net price 150-mg vial = £407.40

## Tretinoin

**Tretinoin** is licensed for the induction of remission in acute promyelocytic leukaemia. It is used in previously untreated patients as well as in those who have relapsed after standard chemotherapy or who are refractory to it.

## TRETINOIN

**Note** Tretinoin is the acid form of vitamin A

**Indications** see notes above; acne (section 13.6.1); photodamage (section 13.8.1)

**Cautions** exclude pregnancy before starting treatment; monitor haematological and coagulation profile, liver function, serum calcium and plasma lipids

before and during treatment; increased risk of thromboembolism during first month of treatment; **interactions:** Appendix 1 (retinoids)

**Hepatic impairment** reduce dose to 25 mg/m<sup>2</sup>

**Renal impairment** reduce dose to 25 mg/m<sup>2</sup>

**Pregnancy** teratogenic; effective contraception must be used for at least 1 month before oral treatment, during treatment and for at least 1 month after stopping (oral progestogen-only contraceptives not considered effective)

**Breast-feeding** avoid

**Side-effects** retinoic acid syndrome (fever, dyspnoea, acute respiratory distress, pulmonary infiltrates, pleural effusion, hyperleukocytosis, hypotension, oedema, weight gain, hepatic, renal and multi-organ failure) requires immediate treatment—consult product literature; gastro-intestinal disturbances, pancreatitis; arrhythmias, flushing, oedema; headache, benign intracranial hypertension (mainly in children—consider dose reduction if intractable headache in children), shivering, dizziness, confusion, anxiety, depression, insomnia, paraesthesia, visual and hearing disturbances; raised liver enzymes, serum creatinine and lipids; bone and chest pain, alopecia, erythema, rash, pruritus, sweating, dry skin and mucosal membranes, cheilitis; thromboembolism, hypercalcaemia, and genital ulceration reported

#### Dose

- **ADULT** and **CHILD** 45 mg/m<sup>2</sup> daily in 2 divided doses, max. duration of treatment 90 days (consult product literature for details of concomitant chemotherapy)

**Vesanoid®** (Roche) [PwM]

Capsules, yellow/brown, tretinoin 10 mg, net price 100-cap pack = £160.63. Label: 21, 25

## 8.2 Drugs affecting the immune response

- 8.2.1 Antiproliferative immunosuppressants
- 8.2.2 Corticosteroids and other immunosuppressants
- 8.2.3 Anti-lymphocyte monoclonal antibodies
- 8.2.4 Other immunomodulating drugs

### Immunosuppressant therapy

Immunosuppressants are used to suppress rejection in organ transplant recipients and to treat a variety of chronic inflammatory and autoimmune diseases. Solid organ transplant patients are usually maintained on a corticosteroid combined with a calcineurin inhibitor (ciclosporin or tacrolimus), or with an antiproliferative drug (azathioprine or mycophenolate mofetil), or with both. Specialist management is required and other immunomodulators may be used to initiate treatment or to treat rejection.

#### Bioavailability

Different formulations of the same immunosuppressant may vary in bioavailability and to avoid reduced effect or excessive side-effects, it is important not to change formulation except on the advice of a transplant specialist.

**Impaired immune responsiveness** Modification of tissue reactions caused by corticosteroids and other immunosuppressants may result in the rapid *spread of infection*. Corticosteroids may suppress clinical signs of infection and allow diseases such as septicaemia or tuberculosis to reach an advanced stage before being recognised—**important:** for advice on measles exposure, see section 14.5.1, and chickenpox (varicella) exposure, see section 14.5.2. For advice on the use of live vaccines in individuals with impaired immune response, see section 14.1. For general comments and warnings relating to corticosteroids and immunosuppressants, see section 6.3.2.

**Pregnancy** Transplant patients immunosuppressed with azathioprine should not discontinue it on becoming pregnant. However, there have been reports of premature birth and low birth-weight following exposure to azathioprine, particularly in combination with corticosteroids. Spontaneous abortion has been reported following maternal or paternal exposure. Azathioprine is teratogenic in *animal* studies.

There is less experience of ciclosporin in pregnancy but it does not appear to be any more harmful than azathioprine. The use of these drugs during pregnancy needs to be supervised in specialist units.

### 8.2.1 Antiproliferative immunosuppressants

**Azathioprine** is widely used for transplant recipients and it is also used to treat a number of auto-immune conditions, usually when corticosteroid therapy alone provides inadequate control. It is metabolised to mercaptopurine, and doses should be reduced when allopurinol is given concurrently.

Blood tests and monitoring for signs of myelosuppression are essential in long-term treatment with azathioprine. The enzyme thiopurine methyltransferase (TPMT) metabolises azathioprine; the risk of myelosuppression is increased in those with reduced activity of the enzyme, particularly in the few individuals who are deficient for TPMT activity. Consider measuring TPMT activity before starting azathioprine therapy. Patients with deficient TPMT activity should not receive azathioprine; those with reduced TPMT activity may be treated under specialist supervision.

**Mycophenolate mofetil** is metabolised to mycophenolic acid which has a more selective mode of action than azathioprine. It is licensed for the prophylaxis of acute rejection in renal, hepatic or cardiac transplantation when used in combination with ciclosporin and corticosteroids. There is evidence that compared with similar regimens incorporating azathioprine, mycophenolate mofetil reduces the risk of acute rejection episodes; the risk of opportunistic infections (particularly due to tissue-invasive cytomegalovirus) and the occurrence of blood disorders such as leucopenia may be higher. Cases of pure red cell aplasia have been reported with mycophenolate mofetil; dose reduction or discontinuation of mycophenolate mofetil should be considered under specialist supervision.

**Cyclophosphamide** (section 8.1.1) is less commonly prescribed as an immunosuppressant.

## AZATHIOPRINE

**Indications** see notes above; inflammatory bowel disease [unlicensed indication] (section 1.5.3); rheumatoid arthritis (section 10.1.3); severe refractory eczema [unlicensed indication] (section 13.5.3)

**Cautions** see notes above; monitor for toxicity throughout treatment; monitor full blood count weekly (more frequently with higher doses or if severe hepatic or renal impairment) for first 4 weeks (manufacturer advises weekly monitoring for 8 weeks but evidence of practical value unsatisfactory), thereafter reduce frequency of monitoring to at least every 3 months; reduce dose in elderly; **interactions:** Appendix 1 (azathioprine)

**Bone marrow suppression** Patients should be warned to report immediately any signs or symptoms of bone marrow suppression e.g. inexplicable bruising or bleeding, infection

**Contra-indications** see notes above; hypersensitivity to mercaptopurine

**Hepatic impairment** reduce dose; monitor liver function; see also Cautions

**Renal impairment** reduce dose; see also Cautions

**Pregnancy** treatment should not generally be initiated during pregnancy; see also p. 553

**Breast-feeding** present in milk in low concentration; no evidence of harm in small studies—use if potential benefit outweighs risk

**Side-effects** hypersensitivity reactions (including malaise, dizziness, vomiting, diarrhoea, fever, rigors, myalgia, arthralgia, rash, hypotension and interstitial nephritis—calling for immediate withdrawal); dose-related bone marrow suppression (see also Cautions); liver impairment, cholestatic jaundice, hair loss and increased susceptibility to infections and colitis in patients also receiving corticosteroids; nausea; *rarely* pancreatitis, pneumonitis, hepatic veno-occlusive disease, lymphoma

**Dose**

• **By mouth**, or (if oral administration not possible—intravenous solution very irritant, see below) **by intravenous injection** over at least 1 minute (followed by 50 mL sodium chloride intravenous infusion), or **by intravenous infusion**

Autoimmune conditions, 1–3 mg/kg daily, adjusted according to response (consider withdrawal if no improvement within 3 months)

Suppression of transplant rejection, 1–2.5 mg/kg daily adjusted according to response

**Note** Azathioprine doses in BNF may differ from those in product literature

**Note** Intravenous injection is alkaline and very irritant, intravenous route should therefore be used **only** if oral route not feasible, see also Appendix 6

**Azathioprine** (Non-proprietary) (POM)

**Tablets**, azathioprine 25 mg, net price 28-tab pack = £6.67; 50 mg, 56-tab pack = £5.56. Label: 21

Brands include *Azamune*<sup>®</sup>

**Imuran**<sup>®</sup> (Aspen) (POM)

**Tablets**, both f/c, azathioprine 25 mg (orange), net price 100-tab pack = £10.99; 50 mg (yellow), 100-tab pack = £7.99. Label: 21

**Injection**, powder for reconstitution, azathioprine (as sodium salt), net price 50-mg vial = £15.38

## MYCOPHENOLATE MOFETIL

**Indications** prophylaxis of acute renal, cardiac, or hepatic transplant rejection (in combination with ciclosporin and corticosteroids) under specialist supervision

**Cautions** full blood counts every week for 4 weeks then twice a month for 2 months then every month in the first year (consider interrupting treatment if neutropenia develops); exclude pregnancy before starting treatment; elderly (increased risk of infection, gastrointestinal haemorrhage and pulmonary oedema); children (higher incidence of side-effects may call for temporary reduction of dose or interruption); active serious gastro-intestinal disease (risk of haemorrhage, ulceration and perforation); delayed graft function; increased susceptibility to skin cancer (avoid exposure to strong sunlight); **interactions:** Appendix 1 (mycophenolate)

**Bone marrow suppression** Patients should be warned to report immediately any signs or symptoms of bone marrow suppression e.g. infection or inexplicable bruising or bleeding

**Renal impairment** no data available in cardiac or hepatic transplant patients with renal impairment

**Pregnancy** avoid—congenital malformations reported; effective contraception required before treatment, during treatment, and for 6 weeks after discontinuation of treatment

**Breast-feeding** avoid—present in milk in *animal* studies

**Side-effects** taste disturbance, gingival hyperplasia, nausea, constipation, flatulence, anorexia, weight loss, vomiting, abdominal pain, gastro-intestinal inflammation, ulceration, and bleeding, hepatitis, jaundice, pancreatitis, stomatitis, oedema, tachycardia, hypertension, hypotension, vasodilatation, cough, dyspnoea, insomnia, agitation, confusion, depression, anxiety, convulsions, paraesthesia, myasthenic syndrome, tremor, dizziness, headache, influenza-like syndrome, infections, hyperglycaemia, renal impairment, malignancy (particularly of the skin), blood disorders (including leucopenia, anaemia, thrombocytopenia, pancytopenia, and red cell aplasia—see notes above), disturbances of electrolytes and blood lipids, arthralgia, alopecia, acne, skin hypertrophy, and rash; *also reported* intestinal villous atrophy, progressive multifocal leucoencephalopathy, interstitial lung disease, pulmonary fibrosis

**Dose**

• Renal transplantation, **by mouth**, 1 g twice daily starting within 72 hours of transplantation or **by intravenous infusion**, 1 g twice daily starting within 24 hours of transplantation for max. 14 days (then transfer to oral therapy); **CHILD** and **ADOLESCENT** 2–18 years, **by mouth** 600 mg/m<sup>2</sup> twice daily (max. 2 g daily)

**Note** Tablets and capsules not appropriate for dose titration in children with body surface area less than 1.25 m<sup>2</sup>

• Cardiac transplantation, **by mouth**, **ADULT** over 18 years, 1.5 g twice daily starting within 5 days of transplantation

• Hepatic transplantation, **by intravenous infusion**, **ADULT** over 18 years, 1 g twice daily starting within 24 hours of transplantation for 4 days (up to max. 14 days), then **by mouth**, 1.5 g twice daily as soon as is tolerated

**Arzip®** (Winthrop) (POM)

**Capsules**, blue/peach, mycophenolate mofetil 250 mg, net price 100-cap pack = £57.57

**Tablets**, purple, mycophenolate mofetil 500 mg, net price 50-tab pack = £57.57

**Important** See Bioavailability, p. 553

**CellCept®** (Roche) (POM)

**Capsules**, blue/brown, mycophenolate mofetil 250 mg, net price 100-cap pack = £82.26

**Tablets**, lavender, mycophenolate mofetil 500 mg, net price 50-tab pack = £82.26

**Oral suspension**, mycophenolate mofetil 1 g/5 mL when reconstituted with water, net price 175 mL = £115.16.

**Excipients** include aspartame (section 9.4.1)

**Intravenous infusion**, powder for reconstitution, mycophenolate mofetil (as hydrochloride), net price 500-mg vial = £9.13

**Important** See Bioavailability, p. 553

### ▲ Mycophenolic acid

**Myfortic®** (Novartis) (POM)

**Tablets**, e/c, mycophenolic acid (as mycophenolate sodium) 180 mg (green), net price 120-tab pack = £96.72; 360 mg (orange), 120-tab pack = £193.43. Label: 25

**Dose** renal transplantation, 720 mg twice daily starting within 72 hours of transplantation

**Equivalence to mycophenolate mofetil** Mycophenolic acid 720 mg is approximately equivalent to mycophenolate mofetil 1 g but avoid unnecessary switching because of pharmacokinetic differences

## 8.2.2 Corticosteroids and other immunosuppressants

**Prednisolone** (section 6.3.2) is widely used in oncology. It has a marked antitumour effect in acute lymphoblastic leukaemia, Hodgkin's disease, and the non-Hodgkin lymphomas. It has a role in the palliation of symptomatic end-stage malignant disease when it may enhance appetite and produce a sense of well-being (see also Prescribing in Palliative Care, p. 21).

The corticosteroids are also powerful immunosuppressants. They are used to prevent organ transplant rejection, and in high dose to treat rejection episodes.

**Ciclosporin** a calcineurin inhibitor, is a potent immunosuppressant which is virtually non-myelotoxic but markedly nephrotoxic. It has an important role in organ and tissue transplantation, for prevention of graft rejection following bone marrow, kidney, liver, pancreas, heart, lung, and heart-lung transplantation, and for prophylaxis and treatment of graft-versus-host disease.

**Tacrolimus** is also a calcineurin inhibitor. Although not chemically related to ciclosporin it has a similar mode of action and side-effects, but the incidence of neurotoxicity appears to be greater; cardiomyopathy has also been reported. Disturbance of glucose metabolism also appears to be significant.

**Sirolimus** is a non-calcineurin inhibiting immunosuppressant licensed for renal transplantation.

**Basiliximab** is a monoclonal antibody that prevents T-lymphocyte proliferation; it is used for prophylaxis of acute rejection in allogeneic renal transplantation. It is given with ciclosporin and corticosteroid immunosuppression regimens; its use should be confined to specialist centres.

**Antithymocyte immunoglobulin** (rabbit) is licensed for the prophylaxis of organ rejection in renal and heart allograft recipients and for the treatment of corticosteroid-resistant allograft rejection in renal transplantation. Tolerability is increased by pretreatment with an intravenous corticosteroid and antihistamine; an antipyretic drug such as paracetamol may also be beneficial.

### NICE guidance

**Immunosuppressive therapy for renal transplantation in adults (September 2004)**  
**Immunosuppressive therapy for renal transplantation in children and adolescents (April 2006)**

For induction therapy in the prophylaxis of organ rejection, either basiliximab or daclizumab [discontinued] are options for combining with a calcineurin inhibitor. For each individual, ciclosporin or tacrolimus is chosen as the calcineurin inhibitor on the basis of side-effects.

Mycophenolate mofetil [mycophenolic acid also available but not licensed for use in children, see above] is recommended as part of an immunosuppressive regimen only if:

- the calcineurin inhibitor is not tolerated, particularly if nephrotoxicity endangers the transplanted kidney; *or*
  - there is very high risk of nephrotoxicity from the calcineurin inhibitor, requiring a reduction in the dose of the calcineurin inhibitor or its avoidance.
- Sirolimus is recommended as a component of immunosuppressive regimen **only** if intolerance necessitates the withdrawal of a calcineurin inhibitor. These recommendations may not be consistent with the marketing authorisation of some of the products.

### ANTITHYMOCYTE IMMUNOGLOBULIN (RABBIT)

**Indications** see notes above

**Cautions** see notes above; monitor blood count

**Contra-indications** infection

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk—no information available

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** nausea, vomiting, dysphagia, diarrhoea; hypotension; infusion-related reactions (including cytokine release syndrome and anaphylaxis, see notes above), serum sickness; fever, shivering, increased susceptibility to infection; increased susceptibility to malignancy; lymphopenia, neutropenia, thrombocytopenia; myalgia; pruritus, rash

### Dose

- Heart transplantation, by **intravenous infusion** over at least 6 hours, 1–2.5 mg/kg daily for 3–5 days

- Renal transplantation, by intravenous infusion over at least 6 hours, 1–1.5 mg/kg daily for 3–9 days
- Corticosteroid-resistant renal graft rejection, by intravenous infusion over at least 6 hours, 1.5 mg/kg daily for 7–14 days

**Note** To avoid excessive dosage in obese patients, calculate dose on the basis of ideal body weight

**Thymoglobuline®** (Genzyme) ▼ (POM)  
Intravenous infusion, powder for reconstitution, rabbit anti-human thymocyte immunoglobulin, net price 25-mg vial = £158.77

## BASILIXIMAB

**Indications** see notes above

**Pregnancy** avoid—no information available; adequate contraception must be used during treatment and for 16 weeks after last dose

**Breast-feeding** avoid—no information available

**Side-effects** severe hypersensitivity reactions and cytokine release syndrome have been reported

### Dose

- By intravenous injection or by intravenous infusion, 20 mg within 2 hours before transplant surgery and 20 mg 4 days after surgery; withhold second dose if severe hypersensitivity or graft loss occurs; **CHILD** and **ADOLESCENT** 1–17 years, body-weight under 35 kg, 10 mg within 2 hours before transplant surgery and 10 mg 4 days after surgery; body-weight over 35 kg, adult dose

**Simulect®** (Novartis) (POM)  
Injection, powder for reconstitution, basiliximab, net price 10-mg vial = £758.69, 20-mg vial = £842.38 (both with water for injections). For intravenous infusion

## CYCLOSPORIN

(Cyclosporin)

**Indications** see notes above, and under Dose; severe acute ulcerative colitis [unlicensed indication] (section 1.5.3); rheumatoid arthritis (section 10.1.3); atopic dermatitis and psoriasis (section 13.5.3)

**Cautions** monitor kidney function—dose dependent increase in serum creatinine and urea during first few weeks may necessitate dose reduction in transplant patients (exclude rejection if kidney transplant) or discontinuation in non-transplant patients; monitor liver function (see Hepatic Impairment below); monitor blood pressure—discontinue if hypertension develops that cannot be controlled by anti-hypertensives; hyperuricaemia; monitor serum potassium especially in renal dysfunction (risk of hyperkalaemia); monitor serum magnesium; measure blood lipids before treatment and thereafter as appropriate; use with tacrolimus specifically contraindicated; for patients other than transplant recipients, preferably avoid other immunosuppressants (increased risk of infection and malignancies, including lymphoma and skin cancer); avoid excessive exposure to UV light, including sunlight; **interactions:** Appendix 1 (ciclosporin)

**Additional cautions in nephrotic syndrome** *Contra-indicated* in uncontrolled hypertension, uncontrolled infections, and malignancy; in long-term management, perform renal biopsies at yearly intervals

**Hepatic impairment** dosage adjustment based on bilirubin and liver enzymes may be needed

**Renal impairment** dose as in normal renal function but see Cautions above; in nephrotic syndrome reduce dose by 25–50% if serum creatinine more than 30% above baseline on more than one measurement; in patients with nephrotic syndrome and renal impairment initially 2.5 mg/kg daily

**Pregnancy** crosses placenta; see Immunosuppressant Therapy, p. 553

**Breast-feeding** present in milk—manufacturer advises avoid

**Side-effects** anorexia, nausea, vomiting, abdominal pain, diarrhoea, gingival hyperplasia, hepatic dysfunction, hypertension, tremor, headache, paraesthesia, fatigue, renal dysfunction (renal structural changes on long-term administration, see also under Cautions), hyperuricaemia, hyperkalaemia, hypomagnesaemia, hyperlipidaemia, hypercholesterolaemia, muscle cramps, myalgia, hypertrichosis; *less commonly* oedema, weight gain, signs of encephalopathy, anaemia, thrombocytopenia; *rarely* pancreatitis, motor polyneuropathy, menstrual disturbances, gynaecomastia, microangiopathic haemolytic anaemia, haemolytic uraemic syndrome, hyperglycaemia, muscle weakness, myopathy, visual disturbances secondary to benign intracranial hypertension (discontinue); *also reported with infusion* anaphylaxis

### Dose

- Organ transplantation, used alone, **ADULT** and **CHILD** over 3 months 10–15 mg/kg by mouth 4–12 hours before transplantation followed by 10–15 mg/kg daily for 1–2 weeks postoperatively then reduced gradually to 2–6 mg/kg daily for maintenance (dose should be adjusted according to blood-ciclosporin concentration and renal function); dose lower if given concomitantly with other immunosuppressant therapy (e.g. corticosteroids); if necessary one-third corresponding oral dose can be given by intravenous infusion over 2–6 hours
- Bone-marrow transplantation, prevention and treatment of graft-versus-host disease, **ADULT** and **CHILD** over 3 months 3–5 mg/kg daily by intravenous infusion over 2–6 hours from day before transplantation to 2 weeks postoperatively (or 12.5–15 mg/kg daily by mouth) then 12.5 mg/kg daily by mouth for 3–6 months then tailed off (may take up to a year after transplantation)
- Nephrotic syndrome, by mouth, 5 mg/kg daily in 2 divided doses; **CHILD** 6 mg/kg daily in 2 divided doses; maintenance treatment reduce to lowest effective dose according to proteinuria and serum creatinine measurements; discontinue after 3 months if no improvement in glomerulonephritis or glomerulosclerosis (after 6 months in membranous glomerulonephritis)

### Important

Patients should be stabilised on a particular brand of oral ciclosporin because switching between formulations without close monitoring may lead to clinically important changes in blood-ciclosporin concentration. Prescribing and dispensing of ciclosporin should be by brand name to avoid inadvertent switching. If it is necessary to switch a patient to a different brand of ciclosporin, the patient should be monitored closely for changes in blood-ciclosporin concentration, serum creatinine, blood pressure, and transplant function.

**Capimune®** (Mylan) (POM)

**Capsules**, ciclosporin 25 mg (grey), net price 30-cap pack = £13.80; 50 mg (white), 30-cap pack = £27.00; 100 mg (grey), 30-cap pack = £51.50. Counselling, administration

**Excipients** include propylene glycol (see Excipients, p. 2)

**Note** Contains ethanol

**Counselling** Total daily dose should be taken in 2 divided doses

**Dexamune®** (Dexcel) (POM)

**Capsules**, grey, ciclosporin 25 mg, net price 30-cap pack = £13.94; 50 mg 30-cap pack = £27.31; 100 mg 30-cap pack = £51.83. Counselling, administration

**Note** Contains ethyl lactate which is metabolised to ethanol

**Counselling** Total daily dose should be taken in 2 divided doses

**Neoral®** (Novartis) (POM)

**Capsules**, ciclosporin 10 mg (yellow/white), net price 60-cap pack = £18.48; 25 mg (blue/grey), 30-cap pack = £18.59; 50 mg (yellow/white), 30-cap pack = £36.41; 100 mg (blue/grey), 30-cap pack = £69.11. Counselling, administration

**Excipients** include propylene glycol (see Excipients, p. 2)

**Note** Contains ethanol

**Oral solution**, yellow, sugar-free, ciclosporin 100 mg/mL, net price 50 mL = £103.55. Counselling, administration

**Excipients** include propylene glycol (see Excipients, p. 2)

**Note** Contains ethanol

**Counselling** Total daily dose should be taken in 2 divided doses

Mix solution with orange juice (or squash) or apple juice (to improve taste) or with water immediately before taking (and rinse with more to ensure total dose). Do not mix with grapefruit juice. Keep medicine measure away from other liquids (including water)

**Sandimmun®** (Novartis) (POM)

**Concentrate for intravenous infusion** (oily), ciclosporin 50 mg/mL. To be diluted before use, net price 1-mL amp = £1.94; 5-mL amp = £9.17

**Excipients** include polyoxyl castor oil (risk of anaphylaxis, see Excipients, p. 2)

**Note** Contains ethanol

**Note** Observe patients for signs of anaphylaxis for at least 30 minutes after starting infusion and at frequent intervals thereafter

**SIROLIMUS**

**Indications** prophylaxis of organ rejection in kidney allograft recipients (initially in combination with ciclosporin and corticosteroid, then with corticosteroid only); see also under Dose

**Cautions** monitor kidney function when given with ciclosporin; monitor whole blood-sirolimus trough concentration (Afro-Caribbean patients may require higher doses); hyperlipidaemia (monitor lipids); monitor urine proteins; increased susceptibility to infection (especially urinary-tract infection); increased susceptibility to lymphoma and other malignancies, particularly of the skin (limit exposure to UV light); **interactions:** Appendix 1 (sirolimus)

**Hepatic impairment** monitor whole blood-sirolimus level closely and consult local treatment protocol; clearance reduced in mild to moderate impairment; in severe impairment decrease dose by 50% and monitor whole blood-sirolimus trough concentration every 5–7 days until 3 consecutive measurements have shown stable blood-sirolimus concentration

**Pregnancy** avoid unless essential—(toxicity in animal studies); effective contraception must be used during treatment and for 12 weeks after stopping

**Breast-feeding** discontinue breast-feeding

**Side-effects** abdominal pain, constipation, nausea, diarrhoea, ascites, stomatitis; oedema, tachycardia, hypertension, hypercholesterolaemia, hypertriglyceridaemia, venous thromboembolism; pleural effusion, pneumonitis; headache; pyrexia; proteinuria, haemolytic uraemic syndrome; anaemia, thrombocytopenia, thrombotic thrombocytopenic purpura, leucopenia, neutropenia, hypokalaemia, hypophosphataemia, hyperglycaemia, lymphocele; arthralgia, osteonecrosis; epistaxis; acne, rash, impaired healing; *less commonly* pancreatitis, pulmonary embolism, pulmonary haemorrhage, pericardial effusion, nephrotic syndrome, pancytopenia; *rarely* interstitial lung disease, alveolar proteinosis, hepatic necrosis, lymphoedema, and hypersensitivity reactions including anaphylactic reactions, angioedema, exfoliative dermatitis, and hypersensitivity vasculitis; focal segmental glomerulosclerosis and reversible impairment of male fertility also reported

**Dose**

- Initially 6 mg, after surgery (once wound has healed), then 2 mg once daily (dose adjusted according to whole blood-sirolimus trough concentration) in combination with ciclosporin and corticosteroid for 2–3 months (sirolimus given 4 hours after ciclosporin); ciclosporin should then be withdrawn over 4–8 weeks (if not possible, sirolimus should be discontinued and an alternate immunosuppressive regimen used)

**Note** Manufacturer advises pre-dose ('trough') whole blood-sirolimus concentration (using chromatographic assay) when used with ciclosporin should be 4–12 micrograms/litre (local treatment protocols may differ); after withdrawal of ciclosporin pre-dose whole blood-sirolimus concentration should be 12–20 micrograms/litre (local treatment protocols may differ); close monitoring of whole blood-sirolimus concentration required if concomitant treatment with potent inducers or inhibitors of metabolism and after discontinuing them, or if ciclosporin dose reduced significantly or stopped; see also Hepatic Impairment above

When changing between oral solution and tablets, measurement of whole blood 'trough' sirolimus concentration after 1–2 weeks is recommended

**Therapeutic drug monitoring assays** Sirolimus whole-blood concentration is measured using either high performance liquid chromatography (HPLC) or immunoassay. Switching between different immunoassays or between an immunoassay and HPLC can lead to clinically significant differences in results and therefore incorrect dose adjustments. Adjustment to the target therapeutic dose range should be made with knowledge of the assay used and corresponding reference range

**Rapamune®** (Wyeth) (POM)

**Tablets**, coated, sirolimus 0.5 mg (tan), net price 30-tab pack = £69.00; 1 mg (white), 30-tab pack = £86.49; 2 mg (yellow), 30-tab pack = £172.98. Counselling, administration

**Important** The 0.5-mg tablet is not bioequivalent to the 1-mg, 2-mg, and 5-mg tablets. Multiples of 0.5-mg tablets should not be used as a substitute for other tablet strengths

**Oral solution**, sirolimus 1 mg/mL, net price 60 mL = £162.41. Counselling, administration

**Counselling** Food may affect absorption (take at the same time with respect to food). Mix solution with at least 60 mL water or orange juice in a glass or plastic container immediately before taking; refill container with at least 120 mL of water or orange juice and drink immediately (to ensure total dose). Do not mix with any other liquids

## TACROLIMUS

**Indications** prophylaxis of organ rejection in liver, kidney, and heart allograft recipients and allograft rejection resistant to conventional immunosuppressive regimens, see also notes above; moderate to severe atopic eczema (section 13.5.3)

**Cautions** monitor blood pressure, ECG (**important:** see Cardiomyopathy below), fasting blood-glucose concentration, haematological and neurological (including visual) parameters, electrolytes, hepatic and renal function; monitor whole blood-tacrolimus trough concentration (especially during episodes of diarrhoea)—consult local treatment protocol for details; QT-interval prolongation; neurotoxicity; increased risk of infections, malignancies, and lymphoproliferative disorders; avoid excessive exposure to UV light including sunlight; pregnancy (exclude before starting); **interactions:** Appendix 1 (tacrolimus)

**Driving** May affect performance of skilled tasks (e.g. driving)

**Contra-indications** hypersensitivity to macrolides; avoid concurrent administration with ciclosporin (care if patient has previously received ciclosporin)

**Hepatic impairment** dose reduction may be necessary in severe impairment

**Pregnancy** avoid unless potential benefit outweighs risk—risk of premature delivery, intra-uterine growth restriction, and hyperkalaemia; toxicity in *animal* studies

**Breast-feeding** avoid—present in milk

**Side-effects** nausea, vomiting, diarrhoea, constipation, dyspepsia, flatulence, bloating, weight changes, anorexia, gastro-intestinal inflammation, ulceration, and perforation, hepatic dysfunction, jaundice, cholestasis, ascites, bile-duct abnormalities, oedema, tachycardia, hypertension, haemorrhage, thromboembolic and ischaemic events, dyspnoea, pleural effusion, parenchymal lung disorders, sleep disturbances, tremor, headache, peripheral neuropathy, mood changes, depression, confusion, anxiety, psychosis, seizures, paraesthesia, dizziness, renal impairment, renal failure, renal tubular necrosis, urinary abnormalities, hyperglycaemia, electrolyte disturbances (including hyperkalaemia, hypokalaemia, and hyperuricaemia), blood disorders (including anaemia, leucopenia, pancytopenia, and thrombocytopenia), arthralgia, muscle cramp, visual disturbances, photophobia, tinnitus, impaired hearing, alopecia, sweating, acne; *less commonly* paralytic ileus, gastro-intestinal reflux disease, peritonitis, pancreatitis, heart failure, arrhythmia, cardiac arrest, cerebrovascular accident, cardiomyopathy (**important:** see Cardiomyopathy below), palpitation, respiratory failure, coma, speech disorder, amnesia, paralysis, influenza-like symptoms, encephalopathy, coagulation disorders, photosensitivity, cataract, hypoglycaemia, dysmenorrhoea, hypertension, dermatitis; *rarely* pericardial effusion, respiratory distress syndrome, posterior reversible encephalopathy syndrome, dehydration, thrombotic thrombocytopenic purpura, blindness, toxic epidermal necrolysis, hirsutism; *very rarely* myasthenia, haemorrhagic cystitis, Stevens-Johnson syndrome  
**Cardiomyopathy** Cardiomyopathy has been reported in children. Patients should be monitored by echocardiography for hypertrophic changes—consider dose reduction or discontinuation if these occur

### Dose

- See under preparations

### Important

**Adoport<sup>®</sup>, Prograf<sup>®</sup>, Modigraf<sup>®</sup>, and Advagraf<sup>®</sup>** (tacrolimus): serious medication errors

It is important to note the correct use of these medicines:

- **Adoport<sup>®</sup>** is an immediate-release formulation that is taken twice daily, once in the morning and once in the evening;
- **Prograf<sup>®</sup>** is an immediate-release formulation that is taken twice daily, once in the morning and once in the evening;
- **Modigraf<sup>®</sup>** granules are used to prepare an immediate-release suspension which is taken twice daily, once in the morning and once in the evening;
- **Advagraf<sup>®</sup>** is a prolonged-release formulation that is taken once daily in the morning.

Switching between **Adoport<sup>®</sup>, Prograf<sup>®</sup>, Modigraf<sup>®</sup>, and Advagraf<sup>®</sup>** requires careful therapeutic monitoring. Substitution should be made only under the close supervision of a transplant specialist.

### Adoport<sup>®</sup> (Sandoz) (POM)

**Capsules**, tacrolimus (as monohydrate) 500 micrograms (white/ivory), net price 50-cap pack = £50.50; 1 mg (white/brown), 50-cap pack = £65.52, 100-cap pack = £131.02; 5 mg (white/orange), 50-cap pack = £242.05. Label: 23, counselling, driving

**Note** Tacrolimus is incompatible with PVC

**Dose** liver transplantation, starting 12 hours after transplantation, **by mouth**, 100–200 micrograms/kg daily in 2 divided doses; **CHILD** 300 micrograms/kg daily in 2 divided doses

Renal transplantation, starting within 24 hours of transplantation, **by mouth**, 200–300 micrograms/kg daily in 2 divided doses; **CHILD** 300 micrograms/kg daily in 2 divided doses

Heart transplantation with antibody induction, starting within 5 days of transplantation, **by mouth**, 75 micrograms/kg daily in 2 divided doses; **CHILD**, without antibody induction, 300 micrograms/kg daily in 2 divided doses as soon as clinically possible (8–12 hours after discontinuing intravenous infusion); following antibody induction, 100–300 micrograms/kg daily in 2 divided doses

Maintenance treatment, dose adjusted according to response  
Rejection therapy, seek specialist advice

### Modigraf<sup>®</sup> (Astellas) (POM)

**Granules**, tacrolimus (as monohydrate), 200 micrograms, net price 50-sachet pack = £71.30; 1 mg, 50-sachet pack = £356.65. Label: 13, 23, counselling, driving

**Note** Tacrolimus is incompatible with PVC

**Dose** liver transplantation, starting 12 hours after transplantation, **by mouth**, 100–200 micrograms/kg daily in 2 divided doses; **CHILD** 300 micrograms/kg daily in 2 divided doses

Renal transplantation, starting within 24 hours of transplantation, **by mouth**, 200–300 micrograms/kg daily in 2 divided doses; **CHILD** 300 micrograms/kg daily in 2 divided doses

Heart transplantation with antibody induction, starting within 5 days of transplantation, **by mouth**, 75 micrograms/kg daily in 2 divided doses; **CHILD**, without antibody induction, 300 micrograms/kg daily in 2 divided doses as soon as clinically possible (8–12 hours after discontinuing intravenous infusion); following antibody induction, 100–300 micrograms/kg daily in 2 divided doses

Maintenance treatment, dose adjusted according to response  
Rejection therapy, seek specialist advice

### Prograf<sup>®</sup> (Astellas) (POM)

**Capsules**, tacrolimus (as monohydrate) 500 micrograms (yellow), net price 50-cap pack = £61.88; 1 mg (white), 50-cap pack = £80.28, 100-cap pack = £160.54; 5 mg (greyish-red), 50-cap pack = £296.58. Label: 23, counselling, driving

**Note** Tacrolimus is incompatible with PVC

**Concentrate for intravenous infusion, tacrolimus** 5 mg/mL. To be diluted before use. Net price 1-mL amp = £58.46

**Excipients** include polyoxyol castor oil (risk of anaphylaxis, see Excipients, p. 2)

**Note** Tacrolimus is incompatible with PVC

**Dose** liver transplantation, starting 12 hours after transplantation, **by mouth**, 100–200 micrograms/kg daily in 2 divided doses **or by intravenous infusion** over 24 hours, 10–50 micrograms/kg daily for up to 7 days (then transfer to oral therapy); **CHILD by mouth**, 300 micrograms/kg daily in 2 divided doses **or by intravenous infusion** over 24 hours, 50 micrograms/kg daily for up to 7 days (then transfer to oral therapy)

Renal transplantation, starting within 24 hours of transplantation, **by mouth**, 200–300 micrograms/kg daily in 2 divided doses **or by intravenous infusion** over 24 hours, 50–100 micrograms/kg daily for up to 7 days (then transfer to oral therapy); **CHILD by mouth**, 300 micrograms/kg daily in 2 divided doses **or by intravenous infusion** over 24 hours, 75–100 micrograms/kg daily for up to 7 days (then transfer to oral therapy)

Heart transplantation with antibody induction, starting within 5 days of transplantation, **by mouth**, 75 micrograms/kg daily in 2 divided doses **or by intravenous infusion** over 24 hours, 10–20 micrograms/kg daily for up to 7 days (then transfer to oral therapy); **CHILD**, without antibody induction, initially **by intravenous infusion** over 24 hours, 30–50 micrograms/kg daily, then **by mouth**, 300 micrograms/kg daily in 2 divided doses as soon as clinically possible (8–12 hours after discontinuing intravenous infusion); following antibody induction, **by mouth**, 100–300 micrograms/kg daily in 2 divided doses

Maintenance treatment, dose adjusted according to response  
Rejection therapy, seek specialist advice

#### Modified release

**Advagraf®** (Astellas) (POM)

**Capsules, m/r, tacrolimus (as monohydrate)**

500 micrograms (yellow/orange), net price 50-cap pack = £35.79; 1 mg (white/orange), 50-cap pack = £71.59, 100-cap pack = £143.17; 3 mg (orange), 50-cap pack = £214.76; 5 mg (red/orange), 50-cap pack = £266.92. Label: 23, 25, counselling, driving

**Dose** liver transplantation, starting 12–18 hours after transplantation, **by mouth**, 100–200 micrograms/kg once daily in the morning

Renal transplantation, starting within 24 hours of transplantation, **by mouth**, 200–300 micrograms/kg once daily in the morning

Rejection therapy, seek specialist advice

**CHILD** not recommended

## 8.2.3 Anti-lymphocyte monoclonal antibodies

**Rituximab** causes lysis of B lymphocytes. It is licensed for the treatment of chemotherapy-resistant or relapsed stage III–IV follicular non-Hodgkin's lymphoma and, in combination with other chemotherapy, for previously untreated stage III–IV follicular lymphoma, and for previously untreated or relapsed chronic lymphocytic leukaemia (see NICE guidance below). Rituximab is also licensed for maintenance therapy in patients with relapsed or refractory follicular non-Hodgkin's lymphoma that has responded to induction therapy with chemotherapy (with or without rituximab) (see NICE guidance below). It is also licensed for use in combination with other chemotherapy for the treatment of diffuse large B-cell non-Hodgkin's lymphoma (see NICE guidance below). Full resuscitation facilities should be at hand and as with other cytotoxics, treatment should be undertaken under the close supervision of a specialist. See section 10.1.3 for the role of rituximab in rheumatoid arthritis.

Rituximab should be used with caution in patients receiving cardiotoxic chemotherapy or with a history of cardiovascular disease because exacerbation of angina, arrhythmia, and heart failure have been reported. Transient hypotension occurs frequently during infusion and antihypertensives may need to be withheld for 12 hours before infusion. Progressive multifocal leucoencephalopathy (which is usually fatal or causes severe disability) has been reported in association with rituximab; patients should be monitored for cognitive, neurological, or psychiatric signs and symptoms. If progressive multifocal leucoencephalopathy is suspected, suspend treatment until it has been excluded.

Infusion-related side-effects (including cytokine release syndrome) are reported commonly with anti-lymphocyte monoclonal antibodies and occur predominantly during the first infusion; they include fever and chills, nausea and vomiting, allergic reactions (such as rash, pruritus, angioedema, bronchospasm and dyspnoea), flushing and tumour pain. Patients should be given paracetamol and an antihistamine before each dose of anti-lymphocyte monoclonal antibodies to reduce these effects. Premedication with a corticosteroid should also be considered. The infusion may have to be stopped temporarily and the infusion-related effects treated—consult product literature for appropriate management. Evidence of pulmonary infiltration and features of tumour lysis syndrome should be sought if infusion-related effects occur.

Fatalities following severe cytokine release syndrome (characterised by severe dyspnoea) and associated with features of tumour lysis syndrome have occurred after infusions of anti-lymphocyte monoclonal antibodies. Patients with a high tumour burden as well as those with pulmonary insufficiency or infiltration are at increased risk and should be monitored very closely (and a slower rate of infusion considered).

#### NICE guidance

##### Rituximab for the treatment of follicular lymphoma (September 2006)

Rituximab, in combination with cyclophosphamide, vincristine, and prednisolone is an option for the treatment of symptomatic stage III and IV follicular lymphoma in previously untreated patients.

#### NICE guidance

##### Rituximab for the treatment of relapsed or refractory stage III or IV follicular non-Hodgkin's lymphoma (February 2008)

Rituximab, in combination with chemotherapy, is an option for the induction of remission in patients with relapsed stage III or IV follicular non-Hodgkin's lymphoma.

Rituximab monotherapy as maintenance therapy is an option for the treatment of patients with relapsed stage III or IV follicular non-Hodgkin's lymphoma in remission induced with chemotherapy (with or without rituximab).

Rituximab monotherapy is an option for the treatment of patients with relapsed or refractory stage III or IV follicular non-Hodgkin's lymphoma, when all alternative treatment options have been exhausted (that is, if there is resistance to or intolerance of chemotherapy).

**NICE guidance****Rituximab for the first-line treatment of chronic lymphocytic leukaemia (July 2009)**

Rituximab, in combination with fludarabine and cyclophosphamide, is recommended as an option for the first-line treatment of chronic lymphocytic leukaemia.

**NICE guidance****Rituximab for aggressive non-Hodgkin's lymphoma (September 2003)**

Rituximab, in combination with cyclophosphamide, doxorubicin, vincristine, and prednisolone, is recommended for first-line treatment of CD20-positive diffuse large-B-cell lymphoma at clinical stage II, III or IV.

The use of rituximab for localised (stage I) disease should be limited to clinical trials.

**Alemtuzumab** causes lysis of B and C lymphocytes and is licensed for use in patients with chronic lymphocytic leukaemia for whom fludarabine treatment is not appropriate. In common with rituximab, it causes infusion-related side-effects including cytokine release syndrome (see above); premedication with an analgesic, an anti-histamine, and a corticosteroid is recommended.

The *Scottish Medicines Consortium* (p. 4) has advised (August 2008) that alemtuzumab is accepted for restricted use within NHS Scotland for the treatment of B-cell chronic lymphocytic leukaemia (B-CLL) when fludarabine combination chemotherapy is not appropriate. Alemtuzumab is restricted to use in patients with previously untreated B-CLL, with the cytogenetic abnormality 17p-deletion.

**Ofatumumab** causes lysis of B lymphocytes. It is licensed for treatment of chronic lymphocytic leukaemia in patients refractory to fludarabine and alemtuzumab. Infusion-related side-effects (including cytokine release syndrome—see above) have been reported with ofatumumab; premedication with an analgesic, an anti-histamine, and a corticosteroid is recommended.

**ALEMTUZUMAB**

**Indications** see notes above

**Cautions** see notes above—for full details consult product literature

**Contra-indications** for full details consult product literature

**Pregnancy** avoid; use effective contraception during and for 6 months after treatment in men or women

**Breast-feeding** avoid breast-feeding during treatment and for at least 4 weeks after administration

**Side-effects** see notes above—for full details (including monitoring and management of side-effects) consult product literature

**Dose**

- Consult product literature

**MabCampath®** (Genzyme) (PmL)

**Concentrate for intravenous infusion**, alemtuzumab 30 mg/mL, net price 1-mL vial = £264.11

**OFATUMUMAB**

**Indications** see notes above

**Cautions** see notes above—for full details consult product literature

**Contra-indications** consult product literature

**Renal impairment** no information available for creatinine clearance less than 30 mL/minute

**Pregnancy** avoid unless potential benefit outweighs risk; use effective contraception during and for 12 months after treatment

**Breast-feeding** discontinue breast-feeding during and for 12 months after treatment—no information available

**Side-effects** see notes above—for full details (including monitoring and management of side-effects) consult product literature

**Arzerra®** (GSK) (PmL)

**Concentrate for intravenous infusion**, ofatumumab 100 mg/5 mL, net price = £182.00  
**Electrolytes** Na<sup>+</sup> 9.3 mmol/g

**RITUXIMAB**

**Indications** see notes above; severe active rheumatoid arthritis (section 10.1.3)

**Cautions** see notes above—for full details consult product literature

**Pregnancy** avoid unless potential benefit to mother outweighs risk of B-lymphocyte depletion in fetus—effective contraception required during and for 12 months after treatment

**Breast-feeding** avoid breast-feeding during and for 12 months after treatment

**Side-effects** see notes above—but for full details (including monitoring and management of side-effects) consult product literature

**MabThera®** (Roche) (PmL)

**Concentrate for intravenous infusion**, rituximab 10 mg/mL, net price 10-mL vial = £174.63, 50-mL vial = £873.15

**8.2.4 Other immunomodulating drugs****Interferon alfa**

**Interferon alfa** has shown some antitumour effect in certain lymphomas and solid tumours. Interferon alfa preparations are also used in the treatment of chronic hepatitis B, and chronic hepatitis C ideally in combination with ribavirin (section 5.3.3). Side-effects are dose-related, but commonly include anorexia, nausea, diarrhoea, influenza-like symptoms, and lethargy. Ocular side-effects and depression (including suicidal behaviour) have also been reported. Myelosuppression may occur, particularly affecting granulocyte counts. Cardiovascular problems (hypotension, hypertension, palpitation, and arrhythmias), nephrotoxicity and hepatotoxicity have been reported. Hypertriglyceridaemia, sometimes severe, has been observed; monitoring of lipid concentration is recommended. Other side-effects include hypersensitivity reactions, thyroid abnormalities, hyperglycaemia, alopecia, psoriasisiform rash, con-

fusion, coma and seizures (usually with high doses in the elderly).

Polyethylene glycol-conjugated ('pegylated') derivatives of interferon alfa (**peginterferon alfa-2a** and **peginterferon alfa-2b**) are available; pegylation increases the persistence of the interferon in the blood. The peginterferons are licensed for the treatment of chronic hepatitis C, ideally in combination with ribavirin (see section 5.3.3). Peginterferon alfa-2a is also licensed for the treatment of chronic hepatitis B.

NICE guidance (peginterferon alfa, interferon alfa, and ribavirin for chronic hepatitis C)  
See p. 397

## INTERFERON ALFA

**Indications** see under preparations

**Cautions** consult product literature; **interactions:** Appendix 1 (interferons)

**Contra-indications** consult product literature; avoid injections containing benzyl alcohol in neonates (see under preparations below)

**Hepatic impairment** close monitoring in mild to moderate impairment; avoid if severe

**Renal impairment** close monitoring required; avoid in severe impairment

**Pregnancy** avoid unless potential benefit outweighs risk (toxicity in *animal* studies); effective contraception required during treatment—consult product literature

**Breast-feeding** unlikely to be harmful

**Side-effects** see notes above and consult product literature

### Dose

- Consult product literature

**IntronA**<sup>®</sup> (Schering-Plough) (PAM)

**Injection**, interferon alfa-2b (rbe) 10 million units/mL, net price 1-mL vial = £42.35, 2.5-mL vial = £105.95. For subcutaneous injection or intravenous infusion

**Injection pen**, interferon alfa-2b (rbe), net price 15 million units/mL, 1.5-mL cartridge = £76.28; 25 million units/mL, 1.5-mL cartridge = £127.14; 50 million units/mL, 1.5-mL cartridge = £254.28. For subcutaneous injection

**Note** Each 1.5-mL multidose cartridge delivers 12 doses of 0.1 mL i.e. a total of 1.2 mL.

For chronic myelogenous leukaemia (as monotherapy or in combination with cytarabine), hairy cell leukaemia, follicular lymphoma, lymph or liver metastases of carcinoid tumour, chronic hepatitis B, chronic hepatitis C, adjunct to surgery in malignant melanoma and maintenance of remission in multiple myeloma

**Roferon-A**<sup>®</sup> (Roche) (PAM)

**Injection**, interferon alfa-2a (rbe), net price 6 million units/mL, 0.5-mL (3 million-unit) prefilled syringe = £14.20; 9 million units/mL, 0.5-mL (4.5 million-unit) prefilled syringe = £21.29; 12 million units/mL, 0.5-mL (6 million-unit) prefilled syringe = £28.37; 18 million units/mL, 0.5-mL (9 million-unit) prefilled syringe = £42.57; 30 million units/mL, 0.6-mL (18 million-unit) cartridge = £85.15, for use with *Roferon* pen device. For subcutaneous injection (cartridges, vials,

and prefilled syringes) and intramuscular injection (cartridges and vials)

**Excipients** include benzyl alcohol (avoid in neonates, see Excipients, p. 2)

For AIDS-related Kaposi's sarcoma, hairy cell leukaemia, chronic myelogenous leukaemia, advanced renal cell carcinoma, progressive cutaneous T-cell lymphoma, chronic hepatitis B and chronic hepatitis C, follicular non-Hodgkin's lymphoma, adjunct to surgery in malignant melanoma

## PEGINTERFERON ALFA

**Indications** see under preparations

**Cautions** consult product literature; **interactions:** Appendix 1 (interferons)

**Contra-indications** consult product literature

**Hepatic impairment** avoid in severe impairment

**Renal impairment** close monitoring required—reduce dose in moderate to severe impairment; consult product literature

**Pregnancy** manufacturers recommend avoid unless potential benefit outweighs risk (toxicity in *animal* studies); effective contraception required during treatment—consult product literature

**Breast-feeding** manufacturers advise avoid—no information available

**Side-effects** see notes above and consult product literature

### Dose

- Consult product literature

**Pegasys**<sup>®</sup> (Roche) (PAM)

**Injection**, peginterferon alfa-2a, net price 135-microgram prefilled syringe = £107.76, 180-microgram prefilled syringe = £124.40. For subcutaneous injection

**Excipients** include benzyl alcohol (avoid in neonates, see Excipients, p. 2)

Combined with ribavirin for chronic hepatitis C; as monotherapy for chronic hepatitis C if ribavirin not tolerated or contra-indicated (see section 5.3.3); as monotherapy for chronic hepatitis B

**ViraferonPeg**<sup>®</sup> (Schering-Plough) (PAM)

**Injection**, prefilled pen, powder for reconstitution, peginterferon alfa-2b (rbe), net price 50-microgram pen = £66.46, 80-microgram pen = £106.34, 100-microgram pen = £132.92, 120-microgram pen = £159.51, 150-microgram pen = £199.38 (all with needles and swabs). For subcutaneous injection  
Combined with ribavirin for chronic hepatitis C; as monotherapy for chronic hepatitis C if ribavirin not tolerated or contra-indicated (see section 5.3.3)

## Interferon beta

**Interferon beta** is licensed for use in patients with *relapsing, remitting multiple sclerosis* (characterised by at least two attacks of neurological dysfunction over the previous 2 or 3 years, followed by complete or incomplete recovery) who are able to walk unaided. Not all patients respond and a deterioration in the bouts has been observed in some. It is also licensed for use in patients with a single demyelinating event with an active inflammatory process, if it is severe enough to require treatment with an intravenous corticosteroid, and they are at high risk of developing multiple sclerosis. Interferon beta-1b is also licensed for use in patients with *secondary progressive multiple sclerosis* but its role in this condition has not been confirmed.

**Cautions** Caution is advised in those with severe hepatic or renal impairment or a history of cardiac disorders, depressive disorders (avoid in severe depres-

sion or in those with suicidal ideation), seizures, or severe myelosuppression. Patients should be monitored for signs of hepatic injury.

**Contra-indications** Avoid treatment with interferon beta in patients with severe depressive illness or those with decompensated liver disease.

**Side-effects** Side-effects reported most frequently include irritation at injection site (including inflammation, hypersensitivity, necrosis) and influenza-like symptoms (fever, chills, myalgia, or malaise) but these decrease over time; nausea and vomiting occur occasionally. Other side-effects include hypersensitivity reactions (including anaphylaxis and urticaria), blood disorders, menstrual disorders, mood and personality changes, suicide attempts, confusion and convulsions; alopecia, hepatitis, and thyroid dysfunction have been reported rarely with interferon beta-1b.

#### NICE guidance

##### Interferon beta and glatiramer for multiple sclerosis (January 2002)

Interferon beta and glatiramer acetate are **not** recommended for the treatment of multiple sclerosis in the NHS in England and Wales.

Patients who are currently receiving interferon beta or glatiramer acetate for multiple sclerosis, whether as routine therapy or as part of a clinical trial, should have the option to continue treatment until they and their consultant consider it appropriate to stop, having regard to the established criteria for withdrawal from treatment.

##### Provision of disease-modifying therapies for multiple sclerosis

The Department of Health, the National Assembly for Wales, the Scottish Executive, the Northern Ireland Department of Health, Social Services & Public Safety, and the manufacturers have reached agreement on a risk-sharing scheme for the NHS supply of interferon beta and glatiramer acetate for multiple sclerosis. Health Service Circular (HSC 2002/004) explains how patients can participate in the scheme. It is available on the Department of Health website ([www.dh.gov.uk](http://www.dh.gov.uk))

## INTERFERON BETA

**Indications** see notes above and under preparations

**Cautions** see notes above and consult product literature

**Contra-indications** see notes above and consult product literature

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** avoid unless potential benefit outweighs risk (toxicity in *animal* studies); effective contraception required during treatment—consult product literature

**Breast-feeding** avoid—no information available

**Side-effects** see notes above and consult product literature

### Interferon beta-1a

**Avonex**® (Biogen) (POM)

**Injection**, interferon beta-1a 60 micrograms (12 million units)/mL, net price 0.5-mL (30-microgram, 6 million-unit) prefilled syringe = £163.50

**Note** For intramuscular injection

**Injection**, powder for reconstitution, interferon beta-1a, net price 30-microgram (6 million-unit) vial with diluent = £163.50

**Note** For intramuscular injection

**Dose** for relapsing, remitting multiple sclerosis or for a single demyelinating event with an active inflammatory process (if it is severe enough to require intravenous corticosteroid and patient at high risk of developing multiple sclerosis), consult product literature

**Rebif**® (Merck Serono) (POM)

**Injection**, interferon beta-1a, net price 22-microgram (6 million-unit) prefilled syringe = £52.06; 44-microgram (12 million-unit) prefilled syringe = £67.77; starter pack of 6 × 8.8-microgram (2.4 million-unit) prefilled syringes with 6 × 22-microgram (6 million-unit) prefilled syringes = £552.19

**Note** For subcutaneous injection

**Excipients** include benzyl alcohol (avoid in neonates, see Excipients, p. 2)

**Injection**, interferon beta-1a, 44 micrograms (12 million-units/mL), net price 1.5 mL (66-microgram, 18 million-unit) cartridge = £144.48; 88-micrograms (24 million-units/mL), 1.5 mL (132-microgram, 36 million-unit) cartridge = £171.97; starter pack of 2 × 1.5 mL (132-microgram, 36 million-unit) cartridge = £343.93

**Note** Cartridges for use with *RebiSmart*® auto-injector device. For subcutaneous injection

**Excipients** include benzyl alcohol (avoid in neonates, see Excipients, p. 2)

**Injection** (*RebiDose*®), interferon beta-1a, net price 22-microgram (6 million-unit) prefilled pen = £52.06; 44-microgram (12 million-unit) prefilled pen = £67.77; starter pack of 6 × 8.8-microgram (2.4 million-unit) prefilled pens with 6 × 22-microgram (6 million-unit) prefilled pens = £552.19

**Note** For subcutaneous injection

**Excipients** include benzyl alcohol (avoid in neonates, see Excipients, p. 2)

**Dose** for relapsing, remitting multiple sclerosis, consult product literature

### Interferon beta-1b

**Betaferon**® (Bayer Schering) (POM)

**Injection**, powder for reconstitution, interferon beta-1b, net price 300-microgram (9.6 million-unit) vial with diluent = £39.78

**Note** For subcutaneous injection

**Note** An autoinjector device (*Betaject*® *Light*) is available from Bayer Schering

**Dose** for relapsing, remitting multiple sclerosis, for secondary progressive multiple sclerosis with active disease, or for a single demyelinating event with an active inflammatory process (if severe enough to require intravenous corticosteroid and patient at high risk of developing multiple sclerosis), consult product literature

**Extavia**® (Novartis) (POM)

**Injection**, powder for reconstitution, interferon beta-1b. Net price 300-microgram (9.6 million-unit) vial with diluent = £39.78

**Note** for subcutaneous injection

**Dose** for relapsing, remitting multiple sclerosis, for secondary progressive multiple sclerosis with active disease, or for a single demyelinating event with an active inflammatory process (if severe enough to require intravenous corticosteroid and patient at high risk of developing multiple sclerosis), consult product literature

## Interferon gamma

**Interferon gamma-1b** is licensed to reduce the frequency of serious infection in chronic granulomatous disease and in severe malignant osteopetrosis.

### INTERFERON GAMMA-1b (Immune interferon)

**Indications** see notes above

**Cautions** seizure disorders (including seizures associated with fever); cardiac disease (including ischaemia, congestive heart failure, and arrhythmias); monitor before and during treatment: haematological tests (including full blood count, differential white cell count, and platelet count), blood chemistry tests (including renal and liver function tests) and urinalysis; avoid simultaneous administration of foreign proteins including immunological products (risk of exaggerated immune response); **interactions:** Appendix 1 (interferons)

**Driving** May impair ability to drive or operate machinery; effects may be enhanced by alcohol

**Hepatic impairment** manufacturer advises caution in severe impairment—risk of accumulation

**Renal impairment** manufacturer advises caution in severe impairment—risk of accumulation

**Pregnancy** manufacturers recommend avoid unless potential benefit outweighs risk (toxicity in *animal* studies); effective contraception required during treatment—consult product literature

**Breast-feeding** manufacturers advise avoid—no information available

**Side-effects** nausea, vomiting; headache, fatigue, fever; myalgia, arthralgia; rash, injection-site reactions; *rarely* confusion and systemic lupus erythematosus; also reported, neutropenia, thrombocytopenia, and raised liver enzymes

#### Dose

- See under preparation

**Immuken®** (Boehringer Ingelheim) (P<sub>M</sub>)

**Injection**, recombinant human interferon gamma-1b 200 micrograms/mL, net price 0.5-mL vial = £66.67

**Dose** By subcutaneous injection, 50 micrograms/m<sup>2</sup> 3 times a week; patients with body surface area of 0.5 m<sup>2</sup> or less, 1.5 micrograms/kg 3 times a week; not yet recommended for children under 6 months with chronic granulomatous disease

## Aldesleukin

**Aldesleukin** (recombinant interleukin-2) is licensed for metastatic renal cell carcinoma **excluding** patients in whom all three of the following prognostic factors are present: performance status of Eastern Co-operative Oncology Group of 1 or greater, more than one organ with metastatic disease sites, and a period of less than 24 months between initial diagnosis of primary tumour and date of evaluation of treatment. It is usually given by subcutaneous injection. It is now rarely given by intravenous infusion because of an increased risk of capillary leak syndrome, which can cause pulmonary oedema and hypotension. Aldesleukin produces tumour shrinkage in a small proportion of patients, but it has not been shown to increase survival. Bone-marrow, hepatic, renal, thyroid, and CNS toxicity is common. It is for use in **specialist units only**.

## ALDESLEUKIN

**Indications** see notes above

**Cautions** consult product literature; **interactions:** Appendix 1 (aldesleukin)

**Contra-indications** consult product literature

**Pregnancy** use only if potential benefit outweighs risk (toxicity in *animal* studies); ensure effective contraception during treatment in men and women; see also Reproductive Function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1, notes above, and consult product literature

#### Dose

- Consult product literature

**Proleukin®** (Novartis) (P<sub>M</sub>)

**Injection**, powder for reconstitution, aldesleukin. Net price 18-million unit vial = £112.00. For subcutaneous injection or intravenous infusion (but see notes above)

## BCG bladder instillation

**BCG (Bacillus Calmette-Guérin)** is a live attenuated strain derived from *Mycobacterium bovis*. It is licensed as a bladder instillation for the treatment of primary or recurrent bladder carcinoma and for the prevention of recurrence following transurethral resection.

## BACILLUS CALMETTE-GUÉRIN

**Indications** see notes above; BCG immunisation (section 14.4)

**Cautions** screen for active tuberculosis (contra-indicated if tuberculosis confirmed); traumatic catheterisation or urethral or bladder injury (delay administration until mucosal damage healed)

**Contra-indications** impaired immune response, HIV infection, urinary-tract infection, severe haematuria, tuberculosis, fever of unknown origin

**Pregnancy** avoid

**Breast-feeding** avoid

**Side-effects** cystitis, dysuria, urinary frequency, haematuria, malaise, fever, influenza-like syndrome; also systemic BCG infection (with fatalities)—consult product literature; rarely hypersensitivity reactions (such as arthralgia and rash), orchitis, transient urethral obstruction, bladder contracture, renal abscess; ocular symptoms reported

#### Dose

- Consult product literature

**ImmuCyst®** (Alliance) (P<sub>M</sub>)

**Bladder instillation**, freeze-dried powder containing attenuated *Mycobacterium bovis* prepared from the Connaught strain of bacillus of Calmette and Guérin, net price 81-mg vial = £79.23

**OncoTICE®** (Organon) (P<sub>M</sub>)

**Bladder instillation**, freeze-dried powder containing attenuated *Mycobacterium bovis* prepared from the TICE strain of bacillus of Calmette and Guérin, net price 12.5-mg vial = £71.61

## Canakinumab

**Canakinumab** is a recombinant human monoclonal antibody that selectively inhibits interleukin-1 beta receptor binding. It is licensed for the treatment of cryopyrin-associated periodic syndrome, including severe forms of familial cold auto-inflammatory syndrome (or familial cold urticaria), Muckle-Wells syndrome, and neonatal-onset multisystem inflammatory disease (also known as chronic infantile neurological, cutaneous, articular syndrome), which are rare inherited auto-inflammatory disorders.

### CANAKINUMAB

**Indications** see notes above

**Cautions** history of recurrent infection or predisposition to infection; monitor neutrophil count before starting treatment, 1–2 months after starting treatment, and periodically thereafter; patients should receive all recommended vaccinations (including pneumococcal and inactivated influenza vaccine) before starting treatment; avoid live vaccines unless potential benefit outweighs risk—consult product literature for further information and section 14.1 (p. 746)

**Tuberculosis** Patients should be evaluated for latent and active tuberculosis before starting treatment and monitored for signs and symptoms of tuberculosis during and after treatment

**Contra-indications** severe active infection (see also Cautions); neutropenia; concomitant use with tumour necrosis factor inhibitors (possible increased risk of infections)

**Hepatic impairment** no information available

**Renal impairment** limited information available but manufacturer advises no dose adjustment required

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk; effective contraception required during treatment and for up to 3 months after last dose

**Breast-feeding** consider if benefit outweighs risk—not known if present in human milk

**Side-effects** vertigo, increased susceptibility to infection, injection-site reactions

#### Dose

- By **subcutaneous injection**, **ADULT** and **CHILD** over 4 years, body-weight 15–40 kg, 2 mg/kg every 8 weeks. If clinical response not achieved 7 days after starting treatment, a repeat dose of 2 mg/kg can be considered; if a full response is then achieved, subsequent dosing should be 4 mg/kg every 8 weeks; body-weight over 40 kg, 150 mg every 8 weeks. If clinical response not achieved 7 days after starting treatment, a repeat dose of 150 mg can be considered; if full response is then achieved, subsequent dosing should be 300 mg every 8 weeks

**Ilaris**<sup>®</sup> (Novartis) ▼ (PoM)

**Injection**, powder for reconstitution, canakinumab, net price 150-mg vial = £9927.80

## Glatiramer acetate

**Glatiramer** is an immunomodulating drug comprising synthetic polypeptides. It is licensed for treating initial symptoms in patients at high risk of developing multiple sclerosis, and also for reducing the frequency of relapses

in ambulatory patients with relapsing-remitting multiple sclerosis who have had at least 2 clinical relapses in the past 2 years. Initiation of treatment with glatiramer should be supervised by a specialist.

### NICE guidance (interferon beta and glatiramer for multiple sclerosis)

See p. 562

### Provision of disease-modifying therapies for multiple sclerosis

See p. 562

## GLATIRAMER ACETATE

**Indications** see notes above

**Cautions** cardiac disorders

**Renal impairment** no information available—manufacturer advises caution

**Pregnancy** manufacturer advises avoid—no information available

**Breast-feeding** manufacturer advises caution—no information available

**Side-effects** hypersensitivity reactions; flushing, chest pain, palpitation, tachycardia, and dyspnoea may occur within minutes of injection; nausea, constipation, dyspepsia; syncope, anxiety, asthenia, depression, headache, tremor, sweating; oedema, lymphadenopathy; hypertonia, back pain, arthralgia, influenza-like symptoms; injection-site reactions, rash; rarely seizures

#### Dose

- By **subcutaneous injection**, **ADULT** over 18 years, 20 mg daily

**Copaxone**<sup>®</sup> (Teva) (PoM)

**Injection**, glatiramer acetate 20 mg/mL, net price 1-mL pre-filled syringe = £18.73

## Histamine

**Histamine** is licensed for maintenance therapy, in combination with aldesleukin, in patients with acute myeloid leukaemia in first remission.

## HISTAMINE DIHYDROCHLORIDE

**Indications** see notes above

**Cautions** consult product literature; **interactions:** Appendix 1 (histamine)

**Contra-indications** consult product literature

**Hepatic impairment** increased risk of tachycardia and hypotension in moderate to severe impairment

**Renal impairment** increased risk of hypotension in severe impairment

**Pregnancy** manufacturer advises avoid—no information available; ensure effective contraception during treatment in men and women

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** consult product literature

**Ceplene**<sup>®</sup> (Meda) ▼ (PoM)

**Injection**, histamine dihydrochloride 1 mg/mL, net price 0.5-mL vial = £84.38

## Lenalidomide and thalidomide

**Lenalidomide** is an immunomodulating drug with anti-neoplastic, anti-angiogenic, and pro-erythropoietic properties. It is licensed, in combination with dexamethasone, for the treatment of multiple myeloma in patients who have received at least one previous therapy.

The most serious side-effects of lenalidomide are venous thromboembolism and severe neutropenia. Lenalidomide is structurally related to thalidomide and there is a risk of teratogenesis.

The *Scottish Medicines Consortium* (p. 4) has advised (April 2010) that lenalidomide, in combination with dexamethasone, is accepted for restricted use within NHS Scotland for patients with multiple myeloma who have received at least two prior therapies.

### NICE guidance

#### Lenalidomide for the treatment of multiple myeloma (June 2009)

Lenalidomide in combination with dexamethasone is an option for the treatment of multiple myeloma in patients who have received two or more prior therapies. The drug cost of lenalidomide will be met by the manufacturer for patients who remain on treatment for more than 26 cycles.

**Thalidomide** is used in combination with melphalan and prednisolone as first-line treatment for untreated multiple myeloma, in patients aged 65 years and over, or for those not eligible for high-dose chemotherapy (for example, patients with significant co-morbidity such as cardiac risk factors). It has immunomodulatory and anti-inflammatory activity. Thalidomide can cause drowsiness, constipation, and on prolonged use peripheral neuropathy.

**Pregnancy** For women of child-bearing potential, pregnancy must be excluded before starting treatment (perform pregnancy test on initiation or within 3 days prior to initiation). Women must practise effective contraception at least 1 month before, during, and for at least 1 month after treatment (oral combined hormonal contraceptives and copper-releasing intrauterine devices not recommended) and men should use condoms during treatment and for at least 1 week after stopping if their partner is pregnant or is of child-bearing potential and not using effective contraception. Women must comply with a pregnancy prevention programme.

## LENALIDOMIDE

**Indications** see notes above

**Cautions** see notes above; monitor full blood count (including differential white cell count and platelet count) before treatment and every week for the first 8 weeks then every 4 weeks (reduce dose or interrupt treatment if neutropenia or thrombocytopenia develop—consult product literature); concomitant drugs that increase the risk of thromboembolism; high tumour burden—risk of tumour lysis syndrome, see p. 520; monitor thyroid function; risk factors for myocardial infarction; **interactions:** Appendix 1 (lenalidomide)

**Thromboembolism** Patients and their carers should be made aware of the symptoms of thromboembolism and

advised to report sudden breathlessness, chest pain, or swelling of a limb

**Neutropenia and thrombocytopenia** Patients and their carers should be made aware of the symptoms of neutropenia and advised to seek medical advice if symptoms suggestive of neutropenia (such as fever, sore throat) or of thrombocytopenia (such as bleeding) develop

**Renal impairment** starting dose 10 mg once daily if creatinine clearance 30–50 mL/minute; starting dose 15 mg on alternate days if creatinine clearance less than 30 mL/minute

**Pregnancy important: teratogenic risk;** see also notes above

**Breast-feeding** discontinue breast-feeding—no information available

**Side-effects** myocardial infarction, hypotension, deep vein thrombosis; pneumonia, dyspnoea; tremor, hypoaesthesia, fatigue, asthenia; neutropenia, thrombocytopenia, anaemia, lymphopenia, leucopenia; muscle cramp; pruritus, rash; *rarely* Stevens-Johnson syndrome and toxic epidermal necrolysis; interstitial pneumonitis and pancreatitis *also reported*

### Dose

● **ADULT** over 18 years, 25 mg once daily for 21 consecutive days of a 28-day cycle; for doses of dexamethasone, consult product literature

**Revlimid®** (Celgene) ▼ (POM)

**Capsules**, lenalidomide, 5 mg (white), net price 21-cap pack = £3570.00; 10 mg (blue/yellow), 21-cap pack = £3780.00; 15 mg (blue/white), 21-cap pack = £3969.00; 25 mg (white), 21-cap pack = £4368.00. Label: 25, counselling, symptoms of thromboembolism, neutropenia, or thrombocytopenia, patient information leaflet

**Note** Patient, prescriber, and supplying pharmacy must comply with a pregnancy prevention programme. Every prescription must be accompanied by a completed Prescription Authorisation Form, which must be sent to Celgene.

## THALIDOMIDE

**Indications** see notes above

**Cautions** see notes above; high tumour burden—risk of tumour lysis syndrome, see p. 520; concomitant use of drugs which increase risk of peripheral neuropathy or thromboembolism

**Thromboembolism** Thromboprophylaxis is recommended for at least the first 5 months of treatment, especially in patients with additional thrombotic risk factors. Patients and their carers should be made aware of the symptoms of thromboembolism and advised to report sudden breathlessness, chest pain, or swelling of a limb

**Peripheral neuropathy** Monitor patients for signs and symptoms of peripheral neuropathy; patients and their carers should be advised to seek medical advice if symptoms such as paraesthesia, abnormal coordination, or weakness develop. Dose reduction, dose interruption, or treatment discontinuation may be necessary—consult product literature. Patients with pre-existing peripheral neuropathy should not be treated with thalidomide unless the potential clinical benefits outweigh the risk

**Hepatic impairment** caution in severe impairment—no information available

**Renal impairment** caution in severe impairment—no information available

**Pregnancy important teratogenic risk;** see also notes above

**Breast-feeding** avoid—present in milk in *animal* studies

**Side-effects** vomiting, dry mouth, dyspepsia, constipation; bradycardia, cardiac failure, deep vein

thrombosis; dyspnoea, interstitial lung disease, pulmonary embolism, peripheral oedema; asthenia, confusion, depression, dizziness, drowsiness, peripheral neuropathy, dysaesthesia, paraesthesia, syncope, tremor; pyrexia; pneumonia; anaemia, leucopenia, neutropenia, lymphopenia, thrombocytopenia; skin reactions including Stevens-Johnson syndrome; also reported toxic epidermal necrolysis, intestinal obstruction, gastro-intestinal perforation, hypothyroidism, and sexual dysfunction

#### Dose

- **ADULT** over 18 years, 200 mg once daily at bedtime for 6-week cycle; max. 12 cycles

#### Thalidomide Celgene® (Celgene) ▼ (P<sub>o</sub>M)

**Capsules**, thalidomide 50 mg, net price 28-cap pack = £298.48. Label: 2, counselling, symptoms of peripheral neuropathy and thromboembolism (see above)

**Note** Patient, prescriber, and supplying pharmacy must comply with a pregnancy prevention programme. Every prescription must be accompanied by a complete Prescription Authorisation Form.

### Mifamurtide

**Mifamurtide** is licensed for high-grade, resectable, non-metastatic osteosarcoma after complete surgical resection, in patients 2 to 30 years of age at initial diagnosis. It is used in combination with chemotherapy.

## MIFAMURTIDE

**Indications** see notes above

**Cautions** asthma and chronic obstructive pulmonary disease—consider prophylactic bronchodilator therapy; history of autoimmune, inflammatory, or collagen disease; monitor renal function, hepatic function and clotting parameters; monitor patients with history of venous thrombosis, vasculitis, or unstable cardiovascular disorders for persistent or worsening symptoms during administration—consult product literature; **interactions:** Appendix 1 (mifamurtide)

**Hepatic impairment** use with caution—no information available

**Renal impairment** use with caution—no information available

**Pregnancy** avoid; effective contraception required

**Breast-feeding** avoid—no information available

**Side-effects** gastro-intestinal disturbances (including anorexia, nausea, vomiting, diarrhoea, constipation, abdominal pain, dyspepsia); tachycardia, hypertension, palpitations, hypotension, phlebitis, flushing; oedema, respiratory disorders (including dyspnoea, epistaxis, cough, tachypnoea, haemoptysis, pleural effusion); confusion, depression, insomnia, headache, dizziness, paraesthesia, hypoesthesia, tremor, drowsiness, anxiety; hypokalaemia, anaemia, leucopenia, thrombocytopenia, granulocytopenia; haematuria, dysuria, pollakiuria; musculoskeletal pain; blurred vision; vertigo, tinnitus, hearing loss; sweating, alopecia, rash, dry skin

#### Mepact® (Takeda) ▼ (P<sub>o</sub>M)

**Intravenous infusion**, powder for reconstitution, mifamurtide encapsulated in liposomes, net price 4-mg vial = £2375.00

### Natalizumab

**Natalizumab** is a monoclonal antibody that inhibits the migration of leucocytes into the central nervous system, hence reducing inflammation and demyelination. It is licensed for use in patients with highly active *relapsing-remitting multiple sclerosis* despite treatment with interferon beta or those with rapidly evolving severe relapsing-remitting multiple sclerosis. Treatment with natalizumab should be initiated and supervised by a specialist.

Natalizumab is associated with an increased risk of opportunistic infection and progressive multifocal leucoencephalopathy (PML). The risk of developing PML increases after 2 years of therapy; the risk beyond 3 years treatment is not known. A magnetic resonance image (MRI) scan is recommended before starting treatment with natalizumab, and annually thereafter. Patients should be monitored for new or worsening neurological symptoms, and for cognitive and psychiatric signs of PML. Treatment should be suspended until PML has been excluded. If a patient develops an opportunistic infection or PML, natalizumab should be permanently discontinued.

Infusion-related side-effects include nausea, vomiting, flushing, headache, dizziness, fatigue, rigors, pyrexia, arthralgia, urticaria, and pruritus. Patients should be observed for hypersensitivity reactions, including anaphylaxis, during the infusion and for 1 hour after completion of the infusion. Natalizumab should be discontinued permanently if hypersensitivity reaction occurs.

The *Scottish Medicines Consortium* (p. 4) has advised (August 2007) that natalizumab is accepted for restricted use as single disease-modifying therapy in highly active relapsing-remitting multiple sclerosis only in patients with rapidly evolving severe relapsing-remitting multiple sclerosis defined by 2 or more disabling relapses in 1 year and with 1 or more gadolinium-enhancing lesions on brain magnetic resonance imaging (MRI) or a significant increase in T2 lesion load compared with a previous MRI.

#### NICE guidance

##### Natalizumab for the treatment of adults with highly active relapsing-remitting multiple sclerosis (August 2007)

Natalizumab is an option for the treatment only of rapidly evolving severe relapsing-remitting multiple sclerosis (RES). RES is defined by 2 or more disabling relapses in 1 year, and 1 or more gadolinium-enhancing lesions on brain magnetic resonance imaging (MRI) or a significant increase in T2 lesion load compared with a previous MRI.

## NATALIZUMAB

**Indications** see notes above

**Cautions** see notes above and consult product literature; prior treatment with immunosuppressants; monitor liver function (see below)

**Liver toxicity** Liver dysfunction reported; advise patients to seek immediate medical attention if symptoms such as jaundice or dark urine develop; discontinue treatment if significant liver injury occurs

**Progressive multifocal leucoencephalopathy (PML)** Patients should be informed about the risks of PML before starting treatment with natalizumab and again after 2 years;

they should be given an alert card which includes information about the symptoms of PML (see also notes above)

**Hypersensitivity reactions** Patients should be told the importance of uninterrupted dosing, particularly in the early months of treatment (intermittent therapy may increase risk of sensitisation)

**Contra-indications** progressive multifocal leucoencephalopathy; active infection (see notes above); concurrent use of interferon beta or glatiramer acetate; immunosuppression; active malignancies (except cutaneous basal cell carcinoma)

**Pregnancy** avoid unless essential—toxicity in *animal* studies

**Breast-feeding** present in milk in *animal* studies—avoid

**Side-effects** see notes above; also urinary-tract infection, nasopharyngitis, autoantibodies, and arthralgia; *less commonly* hypersensitivity reactions (see above); liver toxicity also reported

#### Dose

- By intravenous infusion, ADULT over 18 years, 300 mg once every 4 weeks; discontinue if no response after 6 months

**Tysabri**<sup>®</sup> (Biogen) ▼ (P<sub>M</sub>)

Concentrate for intravenous infusion, natalizumab 20 mg/mL, net price 15-mL vial = £1130.00. Counselling, liver toxicity, progressive multifocal leucoencephalopathy, and hypersensitivity, patient alert card

## 8.3 Sex hormones and hormone antagonists in malignant disease

### 8.3.1 Oestrogens

### 8.3.2 Progestogens

### 8.3.3 Androgens

### 8.3.4 Hormone antagonists

Hormonal manipulation has an important role in the treatment of breast, prostate, and endometrial cancer, and a more marginal role in the treatment of hypernephroma. These treatments are not curative, but may provide excellent palliation of symptoms in selected patients, sometimes for a period of years. Tumour response, and treatment toxicity should be carefully monitored and treatment changed if progression occurs or side-effects exceed benefit.

### 8.3.1 Oestrogens

**Diethylstilbestrol** is sometimes used to treat prostate cancer, but it is not usually used first-line because of its side-effects. It is occasionally used in postmenopausal women with breast cancer. Toxicity is common and dose-related side-effects include nausea, fluid retention, and venous and arterial thrombosis. Impotence and gynaecomastia always occur in men, and withdrawal bleeding may be a problem in women. Hypercalcaemia and bone pain may also occur in breast cancer.

**Ethinylestradiol** is the most potent oestrogen available; unlike other oestrogens it is only slowly metabolised in the liver. Ethinylestradiol is licensed for the palliative treatment of prostate cancer.

## DIETHYLSTILBESTROL

(Stilboestrol)

**Indications** see notes above

**Cautions** cardiovascular disease

**Hepatic impairment** avoid; see also Combined Hormonal Contraceptives (section 7.3.1)

**Pregnancy** in first trimester, high doses associated with vaginal carcinoma, urogenital abnormalities, and reduced fertility in female offspring; increased risk of hypospadias in male offspring

**Side-effects** sodium retention with oedema, thromboembolism, jaundice, feminising effects in men; see also notes above

#### Dose

- Breast cancer, 10–20 mg daily
- Prostate cancer, 1–3 mg daily

**Diethylstilbestrol** (Non-proprietary) (P<sub>M</sub>)

Tablets, diethylstilbestrol 1 mg, net price 28 = £53.34; 5 mg, 28 = £180.05

## ETHINYLESTRADIOL

(Ethinylestradiol)

**Indications** see notes above; other indications (section 6.4.1.1)

**Cautions** see section 6.4.1.1; **interactions:** Appendix 1 (oestrogens)

**Contra-indications** see section 6.4.1.1

**Hepatic impairment** avoid; see also Combined Hormonal Contraceptives (section 7.3.1)

**Side-effects** see section 6.4.1.1

#### Dose

- Prostate cancer (palliative), 0.15–1.5 mg daily

#### Preparations

Section 6.4.1.1

### 8.3.2 Progestogens

Progestogens have a role in the treatment of endometrial cancer; their use in breast cancer and renal cell cancer has declined. Progestogens are now rarely used to treat prostate cancer. **Medroxyprogesterone** or **megestrol** are usually chosen and can be given orally; high-dose or parenteral treatment cannot be recommended. Side-effects are mild but may include nausea, fluid retention, and weight gain.

## MEDROXYPROGESTERONE ACETATE

**Indications** see notes above; contraception (section 7.3.2.2); other indications (section 6.4.1.2)

**Cautions** see section 6.4.1.2 and notes above; **interactions:** Appendix 1 (progestogens)

**Contra-indications** see section 6.4.1.2 and notes above

**Hepatic impairment** avoid; see also oral Progestogen-only Contraceptives (section 7.3.2.1)

**Pregnancy** avoid—genital malformations and cardiac defects reported; see also Parenteral Progestogen-only Contraceptives (section 7.3.2.2)

**Breast-feeding** present in milk—no adverse effects reported; see also Parenteral Progestogen-only Contraceptives (section 7.3.2.2)

**Side-effects** see section 6.4.1.2 and notes above; glucocorticoid effects at high dose may lead to a cushingoid syndrome

#### Dose

- See preparations below

**Provera**<sup>®</sup> (Pharmacia) [POM]

Tablets, medroxyprogesterone acetate 100 mg (scored), net price 60-tab pack = £29.98, 100-tab pack = £49.94; 200 mg (scored), 30-tab pack = £29.65, 400 mg, 30-tab pack = £58.67

**Dose** endometrial and renal cell cancer, 200–400 mg daily; breast cancer, 400–800 mg daily

Tablets, medroxyprogesterone acetate 2.5 mg, 5 mg and 10 mg, see section 6.4.1.2

## MEGESTROL ACETATE

**Indications** see notes above

**Cautions** see under Medroxyprogesterone acetate (section 6.4.1.2) and notes above; **interactions:** Appendix 1 (progestogens)

**Contra-indications** see under Medroxyprogesterone acetate (section 6.4.1.2) and notes above

**Hepatic impairment** avoid

**Pregnancy** avoid; reversible feminisation of male fetuses reported in *animal* studies; risk of hypospadias in male fetuses and masculinisation of female fetuses

**Breast-feeding** discontinue breast-feeding

**Side-effects** see under Medroxyprogesterone acetate (section 6.4.1.2) and notes above; *also reported* vomiting, carpal tunnel syndrome, Cushing's syndrome, and tumour flare (with or without hypercalcaemia)

#### Dose

- Breast cancer, 160 mg once daily

**Megace**<sup>®</sup> (Bristol-Myers Squibb) [POM]

Tablets, scored, megestrol acetate 160 mg (off-white), 30-tab pack = £19.52

## NORETHISTERONE

**Indications** see notes above; other indications (section 6.4.1.2)

**Cautions** see section 6.4.1.2 and notes above; **interactions:** Appendix 1 (progestogens)

**Contra-indications** see section 6.4.1.2 and notes above

**Hepatic impairment** avoid; see also oral Progestogen-only Contraceptives (section 7.3.2.1)

**Pregnancy** masculinisation of female fetuses and other defects reported; see also oral Progestogen-only Contraceptives (section 7.3.2.1)

**Breast-feeding** higher doses may suppress lactation and alter milk composition—use lowest effective dose; see also oral Progestogen-only Contraceptives (section 7.3.2.1)

**Side-effects** see section 6.4.1.2 and notes above

#### Dose

- Breast cancer, 40 mg daily, increased to 60 mg daily if required

#### Preparations

Section 6.4.1.2

## 8.3.3 Androgens

Testosterone esters (section 6.4.2) have largely been superseded by other drugs for breast cancer.

## 8.3.4 Hormone antagonists

### 8.3.4.1 Breast cancer

The management of patients with breast cancer involves surgery, radiotherapy, drug therapy, or a combination of these.

For operable breast cancer, treatment before surgery (neoadjuvant therapy) reduces the size of the tumour and facilitates breast-conserving surgery; hormone antagonist therapy (e.g. letrozole) is chosen for steroid hormone-receptor-positive breast cancer and chemotherapy for steroid hormone-receptor-negative tumours or for younger women.

**Early breast cancer** All women should be considered for adjuvant therapy following surgical removal of the tumour. Adjuvant therapy is used to eradicate the micrometastases that cause relapses. Choice of adjuvant treatment is determined by the risk of recurrence, steroid hormone-receptor status of the primary tumour, and menopausal status.

Adjuvant therapy comprises cytotoxic chemotherapy and hormone-antagonist therapy. Women with steroid hormone-receptor-positive breast cancer are considered for hormone-antagonist therapy (preceded by cytotoxic chemotherapy if necessary) whilst women with steroid hormone-receptor-negative breast cancer should be considered for cytotoxic chemotherapy.

Aromatase inhibitors act predominantly by blocking the conversion of androgens to oestrogens in the peripheral tissues. They do not inhibit ovarian oestrogen synthesis and should not be used in premenopausal women. **Anastrozole** and **letrozole** are non-steroidal aromatase inhibitors; **exemestane** is a steroidal aromatase inhibitor. Aromatase inhibitors are usually prescribed as initial adjuvant therapy in postmenopausal women with oestrogen-receptor-positive tumours; tamoxifen, an oestrogen-receptor antagonist, is used if an aromatase inhibitor is not appropriate. Adjuvant hormone antagonist therapy should generally be continued for 5 years following removal of the tumour. In postmenopausal women considered for extended adjuvant therapy, 5 years of tamoxifen is followed by letrozole for a further 2–3 years.

Trastuzumab (section 8.1.5) is licensed for use in early breast cancer which overexpresses human epidermal growth factor-2 (HER2) in women who have received surgery, chemotherapy and radiotherapy (as appropriate).

Premenopausal women with oestrogen-receptor-positive breast cancer who decline chemotherapy may benefit from treatment with goserelin (section 8.3.4.2) or ovarian ablation.

**Advanced breast cancer** Treatment of advanced breast cancer depends on the patient's drug history and an assessment of disease severity. Aromatase inhibitors, such as anastrozole or letrozole, are the preferred

treatment in postmenopausal women with oestrogen-receptor-positive advanced breast cancer, a long disease-free interval following treatment for early breast cancer, and disease limited to bone or soft tissues; tamoxifen can be used if aromatase inhibitors are not suitable. Progestogens, such as medroxyprogesterone acetate (section 8.3.2), may be used after aromatase inhibitors and tamoxifen in postmenopausal women.

Tamoxifen should be considered for pre- and perimenopausal women with oestrogen-receptor-positive breast cancer not previously treated with tamoxifen. Ovarian suppression is used in pre- and perimenopausal women who have had disease progression despite treatment with tamoxifen. The gonadorelin analogue goserelin (section 8.3.4.2) is licensed for advanced breast cancer in pre- and perimenopausal women suitable for hormone manipulation.

Cytotoxic chemotherapy is indicated for advanced steroid hormone-receptor-negative tumours and for aggressive disease, particularly when metastases involve visceral sites (e.g. the liver) or if the disease-free interval following treatment for early breast cancer is short.

**Cytotoxic drugs used in breast cancer** An anthracycline combined with fluorouracil (section 8.1.3) and cyclophosphamide (section 8.1.1), and sometimes also with methotrexate (section 8.1.3) is effective. Cyclophosphamide, methotrexate, and fluorouracil can be useful if an anthracycline is inappropriate (e.g. in cardiac disease).

**Metastatic disease** The choice of chemotherapy regimen will be influenced by whether the patient has previously received adjuvant treatment and the presence of any co-morbidity.

For women who have not previously received chemotherapy, an anthracycline (such as doxorubicin or epirubicin) alone or in combination with another cytotoxic drug is the standard initial therapy for metastatic breast disease.

Patients with anthracycline-refractory or resistant disease should be considered for treatment with a taxane (section 8.1.5) either alone or in combination with trastuzumab if they have tumours that overexpress HER2. Other cytotoxic drugs with activity against breast cancer include capecitabine (section 8.1.3), mitoxantrone, mitomycin (both section 8.1.2), and vinorelbine (section 8.1.4). Trastuzumab alone (section 8.1.5) is an option for chemotherapy-resistant cancers that overexpress HER2.

**Other drugs used in breast cancer** Trilostane (section 6.7.3) is licensed for postmenopausal breast cancer. It is quite well tolerated but diarrhoea and abdominal discomfort may be a problem. Trilostane causes adrenal hypofunction and corticosteroid replacement therapy is needed.

The use of **bisphosphonates** (section 6.6.2) in patients with metastatic breast cancer may reduce pain and prevent skeletal complications of bone metastases.

## ANASTROZOLE

**Indications** adjuvant treatment of oestrogen-receptor-positive early invasive breast cancer in postmenopausal women; adjuvant treatment of oestrogen-receptor-positive early breast cancer in postmeno-

pausal women following 2–3 years of tamoxifen therapy; advanced breast cancer in postmenopausal women which is oestrogen-receptor-positive or responsive to tamoxifen

**Cautions** laboratory test for menopause if doubt; susceptibility to osteoporosis (assess bone mineral density before treatment and at regular intervals)

**Contra-indications** not for premenopausal women

**Hepatic impairment** avoid in moderate to severe impairment

**Renal impairment** avoid if creatinine clearance less than 20 mL/minute

**Pregnancy** avoid

**Breast-feeding** avoid

**Side-effects** hot flushes, vaginal dryness, vaginal bleeding, hair thinning, anorexia, nausea, vomiting, diarrhoea, headache, arthralgia, bone fractures, rash (including Stevens-Johnson syndrome); asthenia and drowsiness—may initially affect ability to drive or operate machinery; slight increases in total cholesterol levels reported; very rarely allergic reactions including angioedema and anaphylaxis

### Dose

- 1 mg daily

**Arimidex®** (AstraZeneca) (POM)

Tablets, f/c, anastrozole 1 mg. Net price 28-tab pack = £68.56

The *Scottish Medicines Consortium* (p. 4) has advised (August 2005 and October 2006) that anastrozole (*Arimidex®*) is accepted for restricted use within NHS Scotland, within the licensed indications, for early breast cancer and early invasive breast cancer.

## EXEMESTANE

**Indications** adjuvant treatment of oestrogen-receptor-positive early breast cancer in postmenopausal women following 2–3 years of tamoxifen therapy; advanced breast cancer in postmenopausal women in whom anti-oestrogen therapy has failed

**Cautions interactions:** Appendix 1 (exemestane)

**Contra-indications** not indicated for premenopausal women

**Hepatic impairment** manufacturer advises caution

**Renal impairment** manufacturer advises caution

**Pregnancy** avoid

**Breast-feeding** avoid

**Side-effects** nausea, vomiting, abdominal pain, dyspepsia, constipation, anorexia; dizziness, fatigue, headache, depression, insomnia; hot flushes, sweating; alopecia, rash; *less commonly* drowsiness, asthenia, and peripheral oedema; *rarely* thrombocytopenia, leucopenia

### Dose

- 25 mg daily

**Aromasin®** (Pharmacia) (POM)

Tablets, s/c, exemestane 25 mg, net price 30-tab pack = £88.80, 90-tab pack = £266.40. Label: 21

The *Scottish Medicines Consortium* (p. 4) has advised (October 2005) that exemestane (*Aromasin®*) is accepted for restricted use within NHS Scotland as an adjuvant treatment in postmenopausal women with oestrogen-receptor-positive invasive early breast cancer, following 2–3 years of initial adjuvant tamoxifen therapy.

## FULVESTRANT

**Indications** treatment of oestrogen-receptor-positive metastatic or locally advanced breast cancer in postmenopausal women in whom disease progresses or relapses while on, or after, other anti-oestrogen therapy

**Hepatic impairment** manufacturer advises caution in mild to moderate impairment; avoid in severe impairment

**Renal impairment** manufacturer advises caution if creatinine clearance less than 30 mL/minute—no information available

**Pregnancy** manufacturer advises avoid—increased incidence of fetal abnormalities and death in *animal* studies

**Breast-feeding** manufacturer advises avoid—present in milk in *animal* studies

**Side-effects** nausea, vomiting, diarrhoea; venous thromboembolism; anorexia, headache, asthenia; urinary-tract infections; hot flushes; back pain; rash, injection-site reactions, hypersensitivity reactions; *less commonly* vaginal haemorrhage, vaginal candidiasis, and leucorrhoea

### Dose

- By deep intramuscular injection into buttock, 500 mg every 2 weeks for the first 3 doses, then 500 mg every month

**Note** 500 mg dose should be administered as one 250-mg injection (slowly over 1–2 minutes) into each buttock

**Faslodex®** (AstraZeneca) (PMM)

**Injection** (oily), fulvestrant 50 mg/mL, net price 1 × 5-mL (250-mg) pre-filled syringe = £348.27, 2 × 5-mL (250-mg) pre-filled syringe = £522.41

## LETROZOLE

**Indications** adjuvant treatment of oestrogen-receptor-positive early breast cancer in postmenopausal women; advanced breast cancer in postmenopausal women (including those in whom other anti-oestrogen therapy has failed); early invasive breast cancer in postmenopausal women after standard adjuvant tamoxifen therapy; pre-operative treatment in postmenopausal women with localised hormone-receptor-positive breast cancer to allow subsequent breast conserving surgery

**Cautions** susceptibility to osteoporosis (assess bone mineral density before treatment and at regular intervals)

**Contra-indications** not indicated for premenopausal women

**Hepatic impairment** avoid in severe impairment

**Renal impairment** manufacturer advises caution if creatinine clearance less than 10 mL/minute

**Pregnancy** avoid (toxicity in *animal* studies); manufacturer advises effective contraception required until postmenopausal status fully established

**Breast-feeding** manufacturer advises avoid

**Side-effects** hot flushes, nausea, vomiting, fatigue, dizziness, headache, dyspepsia, constipation, diarrhoea, depression, anorexia, appetite increase, hypercholesterolaemia, alopecia, increased sweating, rash, peripheral oedema, musculoskeletal pain, osteoporosis, bone fracture; *less commonly* hypertension, palpitation, tachycardia, dyspnoea, cough, drowsiness, insomnia, anxiety, memory impairment, dys-

aesthesia, taste disturbance, pruritus, dry skin, urticaria, thrombophlebitis, abdominal pain, urinary frequency, urinary-tract infection, vaginal bleeding, vaginal discharge, breast pain, pyrexia, mucosal dryness, stomatitis, cataract, eye irritation, blurred vision, tumour pain, arthritis, leucopenia, general oedema; *rarely* pulmonary embolism, arterial thrombosis, cerebrovascular infarction

### Dose

- 2.5 mg daily

**Femara®** (Novartis) (PMM)

**Tablets, f/c**, letrozole 2.5 mg. Net price 14-tab pack = £49.90, 28-tab pack = £84.86

## TAMOXIFEN

**Indications** see under Dose and notes above; mastalgia [unlicensed indication] (section 6.7.2)

**Cautions** occasional cystic ovarian swellings in premenopausal women; increased risk of thromboembolic events, especially when used with cytotoxics (see also below); endometrial changes (**important**: see below); porphyria, **interactions**: Appendix 1 (tamoxifen)

**Endometrial changes** Increased endometrial changes, including hyperplasia, polyps, cancer, and uterine sarcoma reported; prompt investigation required if abnormal vaginal bleeding including menstrual irregularities, vaginal discharge, and pelvic pain or pressure in those receiving (or who have received) tamoxifen. Patients should be informed of the risk of endometrial cancer and told to report relevant symptoms promptly

**Contra-indications** treatment of infertility contra-indicated if personal or family history of idiopathic venous thromboembolism or genetic predisposition to thromboembolism

**Pregnancy** avoid—possible effects on fetal development; effective contraception must be used during treatment and for 2 months after stopping

**Breast-feeding** suppresses lactation; avoid unless potential benefit outweighs risk

**Side-effects** hot flushes, vaginal bleeding and vaginal discharge (**important**: see also Endometrial Changes under Cautions), suppression of menstruation in some premenopausal women, pruritus vulvae, gastrointestinal disturbances, headache, light-headedness, tumour flare, decreased platelet counts; occasionally oedema, rarely hypercalcaemia if bony metastases, alopecia, rashes, uterine fibroids; also visual disturbances (including corneal changes, cataracts, retinopathy); leucopenia (sometimes with anaemia and thrombocytopenia), rarely neutropenia; hypertriglyceridaemia reported rarely (sometimes with pancreatitis); thromboembolic events reported (see below); liver enzyme changes (rarely fatty liver, cholestasis, hepatitis); rarely interstitial pneumonitis, hypersensitivity reactions including angioedema, Stevens-Johnson syndrome, bullous pemphigoid; see also notes above

**Risk of thromboembolism** Tamoxifen can increase the risk of thromboembolism particularly during and immediately after major surgery or periods of immobility (consider interrupting treatment to initiate anticoagulant measures). Patients should be made aware of the symptoms of thromboembolism and advised to report sudden breathlessness and any pain in the calf of one leg

### Dose

- Breast cancer, 20 mg daily
- Anovulatory infertility, 20 mg daily on days 2, 3, 4 and 5 of cycle; if necessary the daily dose may be

increased to 40 mg then 80 mg for subsequent courses; if cycles irregular, start initial course on any day, with subsequent course starting 45 days later or on day 2 of cycle if menstruation occurs

#### Tamoxifen (Non-proprietary) <sup>(P<sub>M</sub>)</sup>

**Tablets**, tamoxifen (as citrate) 10 mg, net price 30-tab pack = £3.08; 20 mg, 30-tab pack = £2.09; 40 mg, 30-tab pack = £11.27

**Oral solution**, tamoxifen (as citrate) 10 mg/5 mL, net price 150 mL = £29.61

Brands include *Soltamox*<sup>®</sup>

## TOREMIFENE

**Indications** hormone-dependent metastatic breast cancer in postmenopausal women

**Cautions** hypercalcaemia may occur (especially if bone metastases and usually at beginning of treatment); avoid in acute porphyria (but see section 9.8.2); history of severe thromboembolic disease; **interactions**: Appendix 1 (toremifene)

**Endometrial changes** Increased endometrial changes, including hyperplasia, polyps and cancer reported. Abnormal vaginal bleeding including menstrual irregularities, vaginal discharge and symptoms such as pelvic pain or pressure should be promptly investigated

**Contra-indications** endometrial hyperplasia, QT prolongation (avoid concomitant administration of drugs that prolong QT interval), electrolyte disturbances (particularly uncorrected hypokalaemia), bradycardia, heart failure with reduced left-ventricular ejection fraction, history of arrhythmias

**Hepatic impairment** elimination decreased in hepatic impairment—avoid if severe

**Pregnancy** avoid

**Breast-feeding** avoid

**Side-effects** nausea, vomiting; oedema; depression, dizziness, fatigue; sweating, hot flushes, vaginal bleeding or discharge (**important**: see Cautions); rash; *less commonly* anorexia, constipation, increased weight, thromboembolic events, dyspnoea, insomnia, headache, endometrial hypertrophy; *very rarely* jaundice, transient corneal opacity, and alopecia

#### Dose

- 60 mg daily

#### Fareston<sup>®</sup> (Orion) <sup>(P<sub>M</sub>)</sup>

**Tablets**, toremifene (as citrate) 60 mg. Net price 30-tab pack = £29.08

### 8.3.4.2 Gonadorelin analogues and gonadotrophin-releasing hormone antagonists

Metastatic cancer of the prostate usually responds to hormonal treatment aimed at androgen depletion. Standard treatments include bilateral subcapsular orchidectomy or use of a gonadorelin analogue (**buserelin**, **goserelin**, **histrelin**, **leuprorelin**, or **triptorelin**). The gonadotrophin-releasing hormone antagonist, **degarelix**, (p. 574) is also available. Response in most patients lasts for 12 to 18 months. No entirely satisfactory therapy exists for disease progression despite this treatment (hormone-refractory prostate cancer), but occasional patients respond to other hormone manipulation e.g. with an anti-androgen. Bone disease can often be palliated with irradiation or, if widespread, with strontium or prednisolone (section 6.3.2).

## Gonadorelin analogues

Gonadorelin analogues are as effective as orchidectomy or **diethylstilbestrol** (section 8.3.1) but are expensive and require parenteral administration, at least initially. They cause initial stimulation then depression of luteinising hormone release by the pituitary. During the initial stage (1–2 weeks) increased production of testosterone may be associated with progression of prostate cancer. In susceptible patients this tumour 'flare' may cause spinal cord compression, ureteric obstruction or increased bone pain. When such problems are anticipated, alternative treatments (e.g. orchidectomy) or concomitant use of an anti-androgen such as cyproterone acetate or flutamide (see below) are recommended; anti-androgen treatment should be started before the gonadorelin analogue. Gonadorelin analogues are also used in women for breast cancer (section 8.3.4.1) and other indications (section 6.7.2).

The *Scottish Medicines Consortium* (p. 4) has advised (June 2009) that histrelin (*Vantas*<sup>®</sup>) is accepted for restricted use within NHS Scotland for the palliative treatment of advanced prostate cancer in patients with an anticipated life expectancy of at least one year in whom annual administration will offer advantages.

**Cautions** Men at risk of tumour 'flare' (see above) should be monitored closely during the first month of therapy. Caution is required in patients with metabolic bone disease because reduced bone mineral density can occur. The injection site should be rotated.

**Side-effects** The gonadorelin analogues cause side-effects similar to the menopause in women and orchidectomy in men and include hot flushes and sweating, sexual dysfunction, vaginal dryness or bleeding, and gynaecomastia or changes in breast size. Signs and symptoms of prostate or breast cancer may worsen initially (managed in prostate cancer with anti-androgens, see above). Other side-effects include hypersensitivity reactions (rashes, pruritus, asthma, and rarely anaphylaxis), injection site reactions (see Cautions), headache (rarely migraine), visual disturbances, dizziness, arthralgia and possibly myalgia, hair loss, peripheral oedema, gastro-intestinal disturbances, weight changes, sleep disorders, and mood changes.

## BUSERELIN

**Indications** advanced prostate cancer; other indications (section 6.7.2)

**Cautions** diabetes, hypertension, depression; see also notes above

**Side-effects** see notes above; worsening hypertension, palpitation, glucose intolerance, altered blood lipids, thrombocytopenia, leucopenia, nervousness, fatigue, memory and concentration disturbances, anxiety, increased thirst, hearing disorders, musculoskeletal pain; nasal irritation, nose bleeds and altered sense of taste and smell (spray formulation only)

#### Dose

- By **subcutaneous injection**, 500 micrograms every 8 hours for 7 days, then **intranasally**, 1 spray into each nostril 6 times daily (see also notes above)

**Counselling** Avoid use of nasal decongestants before and for at least 30 minutes after treatment.

#### Suprefact<sup>®</sup> (Sanofi-Aventis) <sup>(P<sub>M</sub>)</sup>

**Injection**, buserelin (as acetate) 1 mg/mL. Net price 2 × 5.5-mL vial = £23.69

Nasal spray, buserelin (as acetate) 100 micrograms/ metered spray. Net price treatment pack of 4 × 10-g bottle with spray pump = £101.87. Counselling, see above

## GOSERELIN

**Indications** locally advanced prostate cancer as an alternative to surgical castration; adjuvant treatment to radiotherapy or radical prostatectomy in patients with high-risk localised or locally advanced prostate cancer; neoadjuvant treatment prior to radiotherapy in patients with high-risk localised or locally advanced prostate cancer; metastatic prostate cancer; advanced breast cancer; oestrogen-receptor-positive early breast cancer (section 8.3.4.1); endometriosis, endometrial thinning, uterine fibroids, assisted reproduction (section 6.7.2)

**Cautions** see notes above; diabetes; risk of ureteric obstruction and spinal cord compression in men

**Contra-indications** undiagnosed vaginal bleeding

**Pregnancy** see Goserelin, section 6.7.2

**Breast-feeding** see Goserelin, section 6.7.2

**Side-effects** see notes above; also transient changes in blood pressure; paraesthesia; *rarely* hypercalcaemia (in patients with metastatic breast cancer)

### Dose

- See under preparations below

**Novgso®** (Genus) (POM)

**Implant**, goserelin (as acetate) 3.6 mg in prefilled syringe, net price = £58.50

**Dose** advanced prostate cancer by *subcutaneous injection* into anterior abdominal wall, 3.6 mg every 28 days

**Zoladex®** (AstraZeneca) (POM)

**Implant**, goserelin (as acetate) 3.6 mg in *SafeSystem®* syringe applicator, net price each = £65.00

**Dose** breast cancer and prostate cancer (see indications above) by *subcutaneous injection* into anterior abdominal wall, 3.6 mg every 28 days

**Zoladex® LA** (AstraZeneca) (POM)

**Implant**, goserelin (as acetate) 10.8 mg in *SafeSystem®* syringe applicator, net price each = £235.00

**Dose** prostate cancer (see indications above), by *subcutaneous injection* into anterior abdominal wall, 10.8 mg every 12 weeks

## HISTRELIN

**Indications** advanced prostate cancer

**Cautions** see notes above; risk of ureteric obstruction and spinal cord compression

**Side-effects** see notes above; also hepatic disorder, dyspnoea, depression, asthenia, elevated blood glucose-concentration, increased urinary frequency, hypertrichosis; *less commonly* hypercholesterolaemia, palpitation, ventricular extrasystole, haematoma, tremor, anaemia, renal failure, nephrolithiasis, hypercalcaemia

### Dose

- By *subcutaneous implantation* into upper arm, 1 implant (50 mg) every 12 months; remove after 12 months of treatment
- Counselling** Avoid wetting arm containing implant for 24 hours and avoid lifting heavy objects or strenuous physical activity for 7 days after implantation

**Vantas®** (Orion) ▼ (POM)

**Implant**, histrelin (as acetate) 50 mg, net price 1 pack (containing implantation device and implant) = £990.00

## LEUPRORELIN ACETATE

**Indications** locally advanced prostate cancer as an alternative to surgical castration; adjuvant treatment to radiotherapy or radical prostatectomy in patients with high-risk localised or locally advanced prostate cancer; metastatic prostate cancer; endometriosis, endometrial thinning, uterine fibroids (section 6.7.2)

**Cautions** see notes above and section 6.7.2; risk of ureteric obstruction and spinal cord compression in men

**Side-effects** see notes above and section 6.7.2; also fatigue, muscle weakness, paraesthesia, hypertension, palpitation, alteration of glucose tolerance and of blood lipids; hypotension, jaundice, thrombocytopenia and leucopenia reported

### Dose

- See under preparations below

**Prostap® SR** (Takeda) (POM)

**Injection** (microsphere powder for reconstitution), leuprorelin acetate, net price 3.75-mg vial with 1-mL vehicle-filled syringe = £75.24

**Dose** prostate cancer (see indications), by *subcutaneous* or by *intramuscular injection*, 3.75 mg every 4 weeks

**Prostap® 3** (Takeda) (POM)

**Injection** (microsphere powder for reconstitution), leuprorelin acetate, net price 11.25-mg vial with 2-mL vehicle-filled syringe = £225.72

**Dose** prostate cancer (see indications), by *subcutaneous injection*, 11.25 mg every three months

## TRIPTORELIN

**Indications** prostate cancer; endometriosis, precocious puberty, reduction in size of uterine fibroids (section 6.7.2)

**Cautions** see notes above; risk of ureteric obstruction and spinal cord compression in men

**Side-effects** see notes above; also dry mouth, transient hypertension, paraesthesia, and increased dysuria

### Dose

- See under preparations below

**Decapeptyl® SR** (Ipsen) (POM)

**Injection** (powder for suspension), m/r, triptorelin (as acetate), net price 3-mg vial (with diluent) = £69.00

**Dose** locally advanced non-metastatic prostate cancer as an alternative to surgical castration, metastatic prostate cancer, by *intramuscular injection*, 3 mg every 4 weeks

**Note** Each vial includes an overage to allow accurate administration of a 3-mg dose

**Injection** (powder for suspension), m/r, triptorelin (as acetate), net price 11.25-mg vial (with diluent) = £207.00

**Dose** locally advanced non-metastatic prostate cancer as an alternative to surgical castration, metastatic prostate cancer, by *intramuscular injection*, 11.25 mg every 3 months (see also notes above)

**Note** Each vial includes an overage to allow accurate administration of an 11.25-mg dose

**Gonapeptyl Depot®** (Ferring) (Pom)

**Injection** (powder for suspension), triptorelin (as acetate), net price 3.75-mg prefilled syringe (with prefilled syringe of vehicle) = £81.69

**Dose** advanced prostate cancer, by **subcutaneous** or **deep intramuscular injection**, 3.75 mg every 4 weeks (see also notes above)

**Anti-androgens**

**Cyproterone acetate**, **flutamide** and **bicalutamide** are anti-androgens that inhibit the tumour 'flare' which may occur after commencing gonadorelin analogue administration. Cyproterone acetate and flutamide are also licensed for use alone in patients with metastatic prostate cancer refractory to gonadorelin analogue therapy. Bicalutamide is used for prostate cancer either alone or as an adjunct to other therapy, according to the clinical circumstances.

**BICALUTAMIDE**

**Indications** locally advanced prostate cancer at high risk of disease progression, either alone or as adjuvant treatment to prostatectomy or radiotherapy; locally advanced, non-metastatic prostate cancer when surgical castration or other medical intervention inappropriate; advanced prostate cancer in combination with gonadorelin analogue or surgical castration

**Cautions** consider periodic liver function tests; **interactions:** Appendix 1 (bicalutamide)

**Hepatic impairment** increased accumulation possible in moderate to severe impairment

**Side-effects** nausea, diarrhoea, cholestasis, jaundice; asthenia, weight gain; gynaecomastia, breast tenderness, hot flushes, impotence, decreased libido; anaemia; alopecia, dry skin, hirsutism, pruritus; *less common* vomiting, abdominal pain, dyspepsia, interstitial lung disease, pulmonary fibrosis, depression, haematuria, thrombocytopenia, hypersensitivity reactions including angioneurotic oedema and urticaria; *rarely* cardiovascular disorders (including angina, heart failure, and arrhythmias), and hepatic failure

**Dose**

- Locally advanced prostate cancer at high risk of disease progression, 150 mg once daily
- Locally advanced, non-metastatic prostate cancer when surgical castration or other medical intervention inappropriate, 150 mg once daily
- Advanced prostate cancer, in combination with gonadorelin analogue or surgical castration, 50 mg once daily (started at the same time as surgical castration or at least 3 days before gonadorelin therapy, see also notes above)

**Bicalutamide** (Non-proprietary) (Pom)

**Tablets**, bicalutamide 50 mg, net price 28-tab pack = £6.22; 150 mg, 28-tab pack = £12.21

**Casodex®** (AstraZeneca) (Pom)

**Tablets**, f/c, bicalutamide 50 mg, net price 28-tab pack = £128.00; 150 mg, 28-tab pack = £240.00

**CYPROTERONE ACETATE**

**Indications** prostate cancer, see under Dose and also notes above; other indications, see section 6.4.2

**Cautions** in prostate cancer, blood counts initially and throughout treatment; monitor hepatic function (liver function tests should be performed before treatment, see also under Side-effects below); monitor adrenocortical function regularly; risk of recurrence of thromboembolic disease; diabetes mellitus, sickle-cell anaemia, severe depression (in other indications some of these are contra-indicated, see section 6.4.2)

**Driving** Fatigue and lassitude may impair performance of skilled tasks (e.g. driving)

**Contra-indications** patients with meningioma or history of meningioma; for contra-indications relating to other indications see section 6.4.2

**Hepatic impairment** dose-related toxicity; see also under cautions (above) and side-effects (below)

**Side-effects** see section 6.4.2

**Hepatotoxicity** Direct hepatic toxicity including jaundice, hepatitis and hepatic failure have been reported (usually after several months) in patients treated with cyproterone acetate 200–300 mg daily. Liver function tests should be performed before and regularly during treatment and whenever symptoms suggestive of hepatotoxicity occur—if confirmed cyproterone should normally be withdrawn unless the hepatotoxicity can be explained by another cause such as metastatic disease (in which case cyproterone should be continued only if the perceived benefit exceeds the risk)

**Dose**

- Prevention of flare with initial gonadorelin analogue therapy, 200 mg daily in 2–3 divided doses for 5–7 days before initiation of gonadorelin analogue, followed by 200 mg daily in 2–3 divided doses for 3–4 weeks after initiation of gonadorelin analogue; max. 300 mg daily
- Long-term palliative therapy where gonadorelin analogues or orchidectomy contra-indicated, not tolerated, or where oral therapy preferred, 200–300 mg daily in 2–3 divided doses
- Hot flushes with gonadorelin analogue therapy or after orchidectomy, initially 50 mg daily, adjusted according to response to 50–150 mg daily in 1–3 divided doses

**Cyproterone Acetate** (Non-proprietary) (Pom)

**Tablets**, cyproterone acetate 50 mg, net price 56-tab pack = £31.54; 100 mg, 84-tab pack = £85.72. Label: 21, counselling, driving

**Cyprostat®** (Bayer Schering) (Pom)

**Tablets**, scored, cyproterone acetate 50 mg, net price 168-tab pack = £73.23; 100 mg, 84-tab pack = £73.23. Label: 21, counselling, driving

**FLUTAMIDE**

**Indications** advanced prostate cancer, see also notes above

**Cautions** cardiac disease (oedema reported); also liver function tests, monthly for first 4 months, periodically thereafter and at the first sign or symptom of liver disorder (e.g. pruritus, dark urine, persistent anorexia, jaundice, abdominal pain, unexplained influenza-like symptoms); avoid excessive alcohol consumption; avoid in acute porphyria (section 9.8.2); **interactions:** Appendix 1 (flutamide)

**Hepatic impairment** use with caution (hepatotoxic)

**Side-effects** gynaecomastia (sometimes with galactorrhoea); nausea, vomiting, diarrhoea, increased appetite, insomnia, tiredness; other side-effects reported include decreased libido, reduced sperm count, gastric and chest pain, hypertension, headache, dizziness, oedema, blurred vision, thirst,

rash, pruritus, haemolytic anaemia, systemic lupus erythematosus-like syndrome, and lymphoedema; hepatic injury (with transaminase abnormalities, cholestatic jaundice, hepatic necrosis, hepatic encephalopathy and occasional fatality) reported

#### Dose

- 250 mg 3 times daily (see also notes above)

#### Flutamide (Non-proprietary) (POM)

**Tablets**, flutamide 250 mg. Net price 84-tab pack = £22.24

## Gonadotrophin-releasing hormone antagonists

**Degarelix** is a gonadotrophin-releasing hormone antagonist used to treat advanced hormone-dependent prostate cancer. It does not induce a testosterone surge or tumour 'flare', therefore anti-androgen therapy is not required.

### DEGARELIX

**Indications** see notes above

**Cautions** susceptibility to QT-interval prolongation (avoid concomitant use of drugs that prolong QT interval); monitor bone density; diabetes

**Hepatic impairment** manufacturer advises caution in severe impairment—no information available

**Renal impairment** manufacturer advises caution in severe impairment—no information available

**Side-effects** nausea; dizziness, headache, drowsiness, insomnia, asthenia; influenza-like symptoms; hot flushes, sweating (including night sweats), weight gain; injection-site reactions; *less commonly* diarrhoea, vomiting, abdominal discomfort, dry mouth, constipation, anorexia, atrio-ventricular block, QT-interval prolongation, fainting, hypertension, hypersensitivity reactions, depression, anxiety, oedema, gynaecomastia, micturition urgency, renal impairment, sexual dysfunction, pelvic pain, prostatitis, testicular pain, anaemia, musculoskeletal pain, tinnitus, urticaria, alopecia, and rash

#### Dose

- By **subcutaneous injection** into the abdominal region, **ADULT** over 18 years, initially 240 mg (administered as 2 injections of 120 mg), then 80 mg every 28 days

#### Firmagon® (Ferring) (POM)

**Injection**, powder for reconstitution, degarelix (as acetate), net price 80-mg vial (with diluent) = £129.37; 2 × 120-mg vials (with diluent) = £260.00

### 8.3.4.3 Somatostatin analogues

**Lanreotide** and **octreotide** are analogues of the hypothalamic release-inhibiting hormone somatostatin. They are indicated for the relief of symptoms associated with neuroendocrine (particularly carcinoid) tumours and acromegaly. Additionally, lanreotide is licensed for the treatment of thyroid tumours and octreotide is also licensed for the prevention of complications following pancreatic surgery; octreotide may also be valuable in reducing vomiting in palliative care (see p. 23) and in stopping variceal bleeding [unlicensed indication]—see also vasopressin and terlipressin (section 6.5.2).

**Cautions** Growth hormone-secreting pituitary tumours can expand causing serious complications; during treatment with somatostatin analogues patients should be monitored for signs of tumour expansion (e.g. visual field defects). Ultrasound examination of the gallbladder is recommended before treatment and at intervals of 6–12 months during treatment (avoid abrupt withdrawal of short-acting octreotide—see Side-effects below). In insulinoma an increase in the depth and duration of hypoglycaemia may occur (observe patients when initiating treatment and changing doses); in diabetes mellitus, insulin or oral antidiabetic requirements may be reduced.

**Side-effects** Gastro-intestinal disturbances including anorexia, nausea, vomiting, abdominal pain and bloating, flatulence, diarrhoea, and steatorrhoea may occur (administering non-depot injections of octreotide between meals and at bedtime may reduce gastro-intestinal side-effects). Postprandial glucose tolerance may be impaired and rarely persistent hyperglycaemia occurs with chronic administration; hypoglycaemia has also been reported. Gallstones have been reported after long-term treatment (abrupt withdrawal of subcutaneous octreotide is associated with biliary colic and pancreatitis). Pain and irritation may occur at the injection site and sites should be rotated. Rarely, pancreatitis has been reported shortly after administration.

### LANREOTIDE

**Indications** see notes above

**Cautions** see notes above; **interactions:** Appendix 1 (lanreotide)

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** manufacturer advises avoid unless potential benefit outweighs risk—no information available

**Side-effects** see notes above; also reported asthenia, fatigue, raised bilirubin; *less commonly* skin nodule, hot flushes, leg pain, malaise, headache, tenesmus, decreased libido, drowsiness, pruritus, increased sweating; *rarely* hypothyroidism (monitor as necessary)

#### Dose

- See under preparations

#### Somatuline® LA (Ipsen) (POM)

**Injection** (copolymer microparticles for aqueous suspension), lanreotide (as acetate) 30-mg vial (with vehicle) = £323.00

**Dose** by **intramuscular injection**, acromegaly and neuroendocrine (particularly carcinoid) tumours, initially 30 mg every 14 days, frequency increased to every 7–10 days according to response

Thyroid tumours, 30 mg every 14 days, frequency increased to every 10 days according to response

#### Somatuline Autogel® (Ipsen)

**Injection**, prefilled syringe, lanreotide (as acetate) 60 mg = £551.00; 90 mg = £736.00; 120 mg = £937.00

**Dose** by **deep subcutaneous injection** into the gluteal region, acromegaly (if somatostatin analogue not given previously), initially 60 mg every 28 days, adjusted according to response; for patients treated previously with somatostatin analogue, consult product literature for initial dose

Neuroendocrine (particularly carcinoid) tumours, initially 60–120 mg every 28 days, adjusted according to response

## OCTREOTIDE

**Indications** see under Dose

**Cautions** see notes above; monitor thyroid function on long-term therapy; **interactions:** Appendix 1 (octreotide)

**Hepatic impairment** adjustment of maintenance dose of non-depot preparations may be necessary in patients with liver cirrhosis

**Pregnancy** possible effect on fetal growth; manufacturer advises use only if potential benefit outweighs risk and effective contraception required during treatment

**Breast-feeding** manufacturer advises avoid unless essential—present in milk in *animal* studies

**Side-effects** see notes above; also bradycardia, dyspnoea, headache, dizziness, alopecia, rash; hepatitis also reported

### Dose

- Symptoms associated with carcinoid tumours with features of carcinoid syndrome, VIPomas, glucagonomas, by **subcutaneous injection**, initially 50 micrograms once or twice daily, gradually increased according to response to 200 micrograms 3 times daily (higher doses required exceptionally); maintenance doses variable; in carcinoid tumours discontinue after 1 week if no effect; if rapid response required, initial dose by **intravenous injection** (with ECG monitoring and after dilution to a concentration of 10–50% with sodium chloride 0.9% injection)
- Acromegaly, short-term treatment before pituitary surgery *or* long-term treatment in those inadequately controlled by other treatment *or* until radiotherapy becomes fully effective by **subcutaneous injection**, 100–200 micrograms 3 times daily; discontinue if no improvement within 3 months
- Prevention of complications following pancreatic surgery, consult product literature

**Octreotide** (Non-proprietary) (PoM)

**Injection**, octreotide (as acetate) 50 micrograms/mL, net price 1-mL amp = £3.72; 100 micrograms/mL, 1-mL amp = £6.53; 200 micrograms/mL, 5-mL vial = £69.66; 500 micrograms/mL, 1-mL amp = £33.87

**Sandostatin**<sup>®</sup> (Novartis) (PoM)

**Injection**, octreotide (as acetate) 50 micrograms/mL, net price 1-mL amp = £2.98; 100 micrograms/mL, 1-mL amp = £5.60; 200 micrograms/mL 5-mL vial = £69.66; 500 micrograms/mL, 1-mL amp = £27.10

### Depot preparation

**Sandostatin Lar**<sup>®</sup> (Novartis) (PoM)

**Injection** (microsphere powder for aqueous suspension), octreotide (as acetate) 10-mg vial = £637.50; 20-mg vial = £850.00; 30-mg vial = £1062.50 (all supplied with 2.5-mL diluent-filled syringe)

**Dose** acromegaly (test dose by **subcutaneous injection** 50–100 micrograms if subcutaneous octreotide not previously given), neuroendocrine (particularly carcinoid) tumour adequately controlled by subcutaneous octreotide, by **deep intramuscular injection** into gluteal muscle, initially 20 mg every 4 weeks for 3 months then adjusted according to response; max. 30 mg every 4 weeks

For acromegaly, start depot octreotide 1 day after the last dose of subcutaneous octreotide (for pituitary surgery give last dose of depot octreotide at least 3 weeks before surgery); for neuroendocrine tumours, continue subcutaneous octreotide for 2 weeks after first dose of depot octreotide

## 9.1 Anaemias and some other blood disorders

- 9.1.1 Iron-deficiency anaemias**
- 9.1.2 Drugs used in megaloblastic anaemias**
- 9.1.3 Drugs used in hypoplastic, haemolytic, and renal anaemias**
- 9.1.4 Drugs used in platelet disorders**
- 9.1.5 G6PD deficiency**
- 9.1.6 Drugs used in neutropenia**
- 9.1.7 Drugs used to mobilise stem cells**

Before initiating treatment for anaemia it is essential to determine which type is present. Iron salts may be harmful and result in iron overload if given alone to patients with anaemias other than those due to iron deficiency.

### 9.1.1 Iron-deficiency anaemias

- 9.1.1.1 Oral iron**
- 9.1.1.2 Parenteral iron**

*Treatment* with an iron preparation is justified only in the presence of a demonstrable iron-deficiency state. Before starting treatment, it is important to exclude any serious underlying cause of the anaemia (e.g. gastric erosion, gastro-intestinal cancer).

*Prophylaxis* with an iron preparation may be appropriate in malabsorption, menorrhagia, pregnancy, after subtotal or total gastrectomy, in haemodialysis patients, and in the management of low birth-weight infants such as preterm neonates.

#### 9.1.1.1 Oral iron

Iron salts should be given by mouth unless there are good reasons for using another route.

Ferrous salts show only marginal differences between one another in efficiency of absorption of iron. Haemoglobin regeneration rate is little affected by the type of salt used provided sufficient iron is given, and in most patients the speed of response is not critical. Choice of

preparation is thus usually decided by the incidence of side-effects and cost.

The oral dose of **elemental iron** for iron-deficiency anaemia should be 100 to 200 mg daily. It is customary to give this as **dried ferrous sulphate**, 200 mg (= 65 mg elemental iron) three times daily; for prophylaxis of iron-deficiency anaemia, a dose of ferrous sulphate 200 mg once or twice daily may be effective. For treatment of iron-deficiency anaemia in children and for prophylaxis of iron-deficiency anaemia in babies of low birth weight, see *BNF for Children*.

#### Iron content of different iron salts

Iron salt	Amount	Content of ferrous iron
Ferrous fumarate	200 mg	65 mg
Ferrous gluconate	300 mg	35 mg
Ferrous sulphate	300 mg	60 mg
Ferrous sulphate, dried	200 mg	65 mg

**Therapeutic response** The haemoglobin concentration should rise by about 100–200 mg/100 mL (1–2 g/litre) per day or 2 g/100 mL (20 g/litre) over 3–4 weeks. When the haemoglobin is in the reference range, treatment should be continued for a further 3 months to replenish the iron stores. Epithelial tissue changes such as atrophic glossitis and koilonychia are usually improved, but the response is often slow.

**Side-effects** Gastro-intestinal irritation can occur with iron salts. Nausea and epigastric pain are dose-related, but the relationship between dose and altered bowel habit (constipation or diarrhoea) is less clear. Oral iron, particularly modified-release preparations, can exacerbate diarrhoea in patients with inflammatory bowel disease; care is also needed in patients with intestinal strictures and diverticular disease.

Iron preparations taken orally can be constipating, particularly in older patients and occasionally lead to faecal impaction.

If side-effects occur, the dose may be reduced; alternatively, another iron salt may be used, but an improvement in tolerance may simply be a result of a lower content of elemental iron. The incidence of side-effects due to ferrous sulphate is no greater than with other iron salts when compared on the basis of equivalent amounts of elemental iron.

Iron preparations are a common cause of accidental overdose in children. For the treatment of **iron overdose**, see Emergency Treatment of Poisoning, p. 38.

**Counselling** Although iron preparations are best absorbed on an empty stomach they can be taken after food to reduce gastro-intestinal side-effects; they may discolour stools.

**Compound preparations** Preparations containing iron and **folic acid** are used during pregnancy in women who are at high risk of developing iron and folic acid deficiency; they should be distinguished from those used for the prevention of neural tube defects in women planning a pregnancy (see p. 580).

It is important to note that the small doses of folic acid contained in these preparations are inadequate for the treatment of megaloblastic anaemias.

Some oral preparations contain **ascorbic acid** to aid absorption of the iron but the therapeutic advantage of such preparations is minimal and cost may be increased.

There is no justification for the inclusion of other ingredients, such as the **B group of vitamins** (except folic acid for pregnant women, see notes above and on p. 580).

**Modified-release preparations** Modified-release preparations of iron are licensed for once-daily dosage, but have no therapeutic advantage and should not be used. These preparations are formulated to release iron gradually; the low incidence of side-effects may reflect the small amounts of iron available for absorption as the iron is carried past the first part of the duodenum into an area of the gut where absorption may be poor.

## FERROUS SULPHATE

**Indications** iron-deficiency anaemia

**Cautions interactions:** Appendix 1 (iron)

**Side-effects** see notes above

**Dose**

- See under preparations below and notes above

**Ferrous Sulphate** (Non-proprietary)

**Tablets**, coated, dried ferrous sulphate 200 mg (65 mg iron), net price 28-tab pack = £1.15

**Dose** prophylactic, 1 tablet daily; therapeutic, 1 tablet 2–3 times daily; **CHILD**, see *BNF for Children*

**Ironorm® Drops** (Wallace Mfg)

**Oral drops**, ferrous sulphate 125 mg (25 mg iron)/mL, net price 15-mL = £4.95

**Dose** **ADULT** and **CHILD** over 6 years, prophylactic, 0.6 mL daily; **CHILD** under 6 years, see *BNF for Children*

▀ **Modified-release preparations**

**Feospan®** (Intrapham)  

**Spansule®** (= capsules m/r), clear/red, enclosing green and brown pellets, dried ferrous sulphate 150 mg (47 mg iron), net price 30-cap pack = £2.11. Label: 25

**Dose** 1–2 capsules daily; **CHILD** over 1 year, 1 capsule daily; can be opened and sprinkled on food

**Ferrogad®** (Teofarma) 

**Tablets**, f/c, m/r, red, dried ferrous sulphate 325 mg (105 mg iron), net price 30-tab pack = £1.84. Label: 25

**Dose** **ADULT** and **CHILD** over 12 years, prophylactic and therapeutic, 1 tablet daily before food

▀ **With folic acid**

For prescribing information on folic acid, see section 9.1.2

**Fefol®** (Intrapham)  

**Spansule®** (= capsules m/r), clear/green, enclosing brown, yellow, and white pellets, dried ferrous sulphate 150 mg (47 mg iron), folic acid 500 micrograms, net price 30-cap pack = £1.69. Label: 25

**Dose** 1 capsule daily

**Ferrograd Folic®** (Teofarma) 

Tablets, f/c, red/yellow, dried ferrous sulphate 325 mg (105 mg iron) for sustained release, folic acid 350 micrograms, net price 30-tab pack = £1.89.

Label: 25

**Dose** ADULT and CHILD over 12 years, 1 tablet daily before food

**With ascorbic acid**

For prescribing information on ascorbic acid, see section 9.6.3

**Ferrograd C®** (Teofarma) 

Tablets, f/c, red, dried ferrous sulphate 325 mg (105 mg iron) for sustained release, ascorbic acid 500 mg (as sodium salt), net price 30-tab pack = £1.85.

Label: 25

**Dose** ADULT and CHILD over 12 years, 1 tablet daily before food

**FERROUS FUMARATE**

**Indications** iron-deficiency anaemia

**Cautions interactions:** Appendix 1 (iron)

**Side-effects** see notes above

**Dose**

- See under preparations below and notes above

**Fersaday®** (Goldshield)

Tablets, brown, f/c, ferrous fumarate 322 mg (100 mg iron), net price 28-tab pack = 79p

**Dose** prophylactic, 1 tablet daily; therapeutic, 1 tablet twice daily

**Fersamal®** (Goldshield)

Tablets, brown, ferrous fumarate 210 mg (68 mg iron), net price 100 = £1.44

**Dose** prophylactic, 1 tablet 1–2 times daily; therapeutic, 1 tablet 2–3 times daily

**Syrup**, brown, ferrous fumarate approx. 140 mg (45 mg iron)/5 mL, net price 200 mL = £3.11

**Dose** prophylactic, 5 mL twice daily; therapeutic, 10 mL twice daily; CHILD see *BNF for Children*

**Galfer®** (Thornton & Ross)

Capsules, red/green, ferrous fumarate 305 mg (100 mg iron), net price 100 = £2.00

**Dose** ADULT and CHILD over 12 years, prophylactic, 1 capsule daily; therapeutic, 1 capsule twice daily

**Syrup**, brown, sugar-free ferrous fumarate 140 mg (45 mg iron)/5 mL, net price 300 mL = £5.33

**Dose** ADULT and CHILD over 12 years, prophylactic, 10 mL once daily; therapeutic, 10 mL 1–2 times daily; PRETERM NEONATE and NEONATE, see *BNF for Children*; CHILD 1 month–12 years, prophylactic and therapeutic, 0.5 mL/kg daily in 2–3 divided doses; max. 20 mL daily

**With folic acid**

For prescribing information on folic acid, see section 9.1.2

**Galfer FA®** (Thornton & Ross)

Capsules, red/yellow, ferrous fumarate 305 mg (100 mg iron), folic acid 350 micrograms, net price 100 = £2.17

**Dose** 1 capsule daily before food

**Pregaday®** (UCB Pharma)

Tablets, brown, f/c, ferrous fumarate equivalent to 100 mg iron, folic acid 350 micrograms, net price 28-tab pack = £1.20

**Dose** 1 tablet daily

**FERROUS GLUCONATE**

**Indications** iron-deficiency anaemia

**Cautions interactions:** Appendix 1 (iron)

**Side-effects** see notes above

**Dose**

- See under preparation below and notes above

**Ferrous Gluconate** (Non-proprietary)

Tablets, red, coated, ferrous gluconate 300 mg (35 mg iron), net price 28 = £2.95

**Dose** prophylactic, 2 tablets daily before food; therapeutic, 4–6 tablets daily in divided doses before food; CHILD 6–12 years, prophylactic and therapeutic, 1–3 tablets daily

**POLYSACCHARIDE-IRON COMPLEX**

**Indications** iron-deficiency anaemia

**Cautions interactions:** Appendix 1 (iron)

**Side-effects** see notes above

**Dose**

- See under preparation below and notes above

**Niferex®** (Tillomed)

Elixir, brown, sugar-free, polysaccharide-iron complex equivalent to 100 mg of iron/5 mL, net price 240-mL pack = £6.06;  30-mL dropper bottle for paediatric use = £2.16. Counselling, use of dropper

**Dose** prophylactic, 2.5 mL daily; therapeutic, 5 mL 1–2 times daily (once daily if required during second and third trimester of pregnancy); PRETERM NEONATE, NEONATE, and INFANT (from dropper bottle) 1 drop (approx. 500 micrograms iron) per 450 g body-weight 3 times daily; CHILD 2–6 years 2.5 mL daily, 6–12 years 5 mL daily

1. except 30 mL paediatric dropper bottle for prophylaxis and treatment of iron deficiency in infants born prematurely; endorse prescription 'SLS'

**SODIUM FEREDETATE**

(Sodium ironedetate)

**Indications** iron-deficiency anaemia

**Cautions interactions:** Appendix 1 (iron)

**Side-effects** see notes above

**Dose**

- See under preparation below and notes above

**Sytron®** (Archimedes)

Elixir, sugar-free, sodium feredetate 190 mg equivalent to 27.5 mg of iron/5 mL, net price 100 mL = £1.07

**Dose** therapeutic, 5 mL increasing gradually to 10 mL 3 times daily; CHILD under 1 year, see *BNF for Children*; CHILD 1–5 years, therapeutic, 2.5 mL 3 times daily, 6–12 years, therapeutic, 5 mL 3 times daily

**9.1.1.2 Parenteral iron**

Iron can be administered parenterally as **iron dextran**, **iron sucrose**, **ferric carboxymaltose** or **iron isomaltoside 1000**. Parenteral iron is generally reserved for use when oral therapy is unsuccessful because the patient cannot tolerate oral iron, or does not take it reliably, or if there is continuing blood loss, or in malabsorption. Parenteral iron may also have a role in the management of chemotherapy-induced anaemia, when given with erythropoietins, in specific patient groups (see NICE guidance, p. 583).

Many patients with chronic renal failure who are receiving haemodialysis (and some who are receiving peritoneal dialysis) also require iron by the intravenous route on a regular basis (see also Erythropoietins, section 9.1.3).

With the exception of patients with severe renal failure receiving haemodialysis, parenteral iron does not produce a faster haemoglobin response than oral iron provided that the oral iron preparation is taken reliably and is absorbed adequately.

Anaphylactic reactions can occur with parenteral administration of iron complexes. Depending on the preparation, patients may be required to have a small test dose initially, see preparations for details; facilities for cardiopulmonary resuscitation must be available.

### FERRIC CARBOXYMALTOSE

A ferric carboxymaltose complex containing 5% (50 mg/mL) of iron

**Indications** iron-deficiency anaemia, see notes above

**Cautions** hypersensitivity can occur with parenteral iron and facilities for cardiopulmonary resuscitation must be available; oral iron should not be given concomitantly; allergic disorders including asthma and eczema; infection (discontinue if ongoing bacteraemia); **interactions:** Appendix 1 (iron)

**Hepatic impairment** use with caution; avoid in conditions where iron overload increases risk of impairment

**Pregnancy** avoid in first trimester; crosses the placenta in *animal* studies; may influence skeletal development

**Side-effects** gastro-intestinal disturbances; headache, dizziness; rash, injection-site reactions; *less commonly* hypotension, flushing, chest pain, peripheral oedema, hypersensitivity reactions (including anaphylaxis), fatigue, paraesthesia, malaise, pyrexia, rigors, myalgia, arthralgia, back pain, pruritus, and urticaria; *rarely* dyspnoea

#### Dose

- By **slow intravenous injection** or **by intravenous infusion**, **ADULT** and **CHILD** over 14 years, calculated according to body-weight and iron deficit, consult product literature

**Ferinject**<sup>®</sup> (Syner-Med) ▼ (PmI)

**Injection**, iron (as ferric carboxymaltose) 50 mg/mL, net price 2-mL vial = £21.75, 10-mL vial = £108.75  
**Electrolytes** Na<sup>+</sup> 0.24 mmol/mL

### IRON DEXTRAN

A complex of ferric hydroxide with dextran containing 5% (50 mg/mL) of iron

**Indications** iron-deficiency anaemia, see notes above

**Cautions** oral iron not to be given until 5 days after last injection; **interactions:** Appendix 1 (iron)

**Anaphylaxis** Anaphylactic reactions can occur with parenteral iron and a test dose is recommended before *each* dose; the patient should be carefully observed for 60 minutes after the first test dose and for 15 minutes after subsequent test doses (subsequent test doses not necessary for intramuscular administration). Facilities for cardiopulmonary resuscitation must be available; risk of allergic reactions increased in immune or inflammatory conditions

**Contra-indications** history of allergic disorders including asthma, and eczema; infection; active rheumatoid arthritis

**Hepatic impairment** avoid in severe impairment

**Renal impairment** avoid in acute renal failure

**Pregnancy** avoid in first trimester

**Side-effects** *less commonly* nausea, vomiting, abdominal pain, flushing, dyspnoea, anaphylactic reactions (see Anaphylaxis above), numbness, cramps, blurred vision, pruritus, and rash; *rarely* diarrhoea, chest pain, hypotension, angioedema, arrhythmias, tachycardia, dizziness, restlessness, fatigue, seizures, tremor, impaired consciousness, myalgia, arthralgia, sweating, and injection-site reactions; *very rarely* hypertension, palpitation, headache, paraesthesia, haemolysis, and transient deafness

#### Dose

- By **deep intramuscular injection** into the gluteal muscle or **by slow intravenous injection** or **by intravenous infusion**, calculated according to body-weight and iron deficit, consult product literature  
**CHILD** under 14 years, not recommended

**CosmoFer**<sup>®</sup> (Vitaline) (PmI)

**Injection**, iron (as iron dextran) 50 mg/mL, net price 2-mL amp = £7.97, 10-mL amp = £39.85

### IRON ISOMALTOSE 1000

A complex of ferric iron and isomaltosides containing 10% (100 mg/mL) of iron

**Indications** iron deficiency anaemia, see notes above

**Cautions** hypersensitivity can occur with parenteral iron and facilities for cardiopulmonary resuscitation must be available—risk of allergic reactions increased in immune or inflammatory conditions; oral iron therapy should not be given until 5 days after last injection; infection (discontinue if ongoing bacteraemia)

**Contra-indications** history of allergic disorders including asthma, and eczema; active rheumatoid arthritis

**Hepatic impairment** avoid in decompensated liver disease and hepatitis

**Pregnancy** avoid in first trimester

**Side-effects** *less commonly* nausea, vomiting, constipation, abdominal pain, dyspnoea, dysphonia, flushing, numbness, fever, cramps, blurred vision, pruritus, rash, hypersensitivity reactions (including anaphylaxis), injection-site reactions; *rarely* diarrhoea, angioedema, tachycardia, arrhythmias, hypotension, chest pain, malaise, seizures, tremor, dizziness, restlessness, loss of consciousness, altered mental status, myalgia, arthralgia, sweating; *very rarely* hypertension, foetal bradycardia, palpitation, headache, paraesthesia, haemolysis, transient deafness

#### Dose

- By **slow intravenous injection** or **by intravenous infusion**, **ADULT** over 18 years, calculated according to body-weight and iron deficit, consult product literature

**Monofer**<sup>®</sup> (Vitaline) ▼ (PmI)

**Injection**, iron (as iron isomaltoside 1000) 100 mg/mL, net price 1-mL vial = £16.95, 5-mL vial = £84.75, 10-mL vial = £169.50

## IRON SUCROSE

A complex of ferric hydroxide with sucrose containing 2% (20 mg/mL) of iron

**Indications** iron-deficiency anaemia, see notes above

**Cautions** oral iron therapy should not be given until 5 days after last injection; infection (discontinue if ongoing bacteraemia); **interactions:** Appendix 1 (iron)

**Anaphylaxis** Anaphylactic reactions can occur with parental iron and a test dose is recommended before the first dose; the patient should be carefully observed for 15 minutes. Facilities for cardiopulmonary resuscitation must be available

**Contra-indications** history of allergic disorders including asthma, eczema, and anaphylaxis

**Hepatic impairment** use with caution; avoid in conditions where iron overload increases risk of impairment

**Pregnancy** avoid in first trimester

**Side-effects** taste disturbances; *less commonly* nausea, vomiting, abdominal pain, diarrhoea, hypotension, tachycardia, flushing, palpitation, chest pain, bronchospasm, dyspnoea, headache, dizziness, fever, myalgia, pruritus, rash, and injection-site reactions; rarely peripheral oedema, anaphylactic reactions (see Anaphylaxis above), fatigue, asthenia, and paraesthesia; confusion, arthralgia, and increased sweating also reported

### Dose

- By slow intravenous injection or by intravenous infusion, calculated according to body-weight and iron deficit, consult product literature; **CHILD** not recommended

**Venofer®** (Syner-Med) (POM)

**Injection**, iron (as iron sucrose) 20 mg/mL, net price 5-mL vial = £9.35

*gastroctomy* if a vitamin B<sub>12</sub> absorption test shows vitamin B<sub>12</sub> malabsorption).

Apart from dietary deficiency, all other causes of vitamin B<sub>12</sub> deficiency are attributable to malabsorption. There is little place for the use of low-dose vitamin B<sub>12</sub> orally and none for vitamin B<sub>12</sub> intrinsic factor complexes given by mouth. Vitamin B<sub>12</sub> in larger oral doses of 1–2 mg daily [unlicensed] may be effective.

**Hydroxocobalamin** has completely replaced cyanocobalamin as the form of vitamin B<sub>12</sub> of choice for therapy; it is retained in the body longer than cyanocobalamin and thus for maintenance therapy can be given at intervals of up to 3 months. Treatment is generally initiated with frequent administration of intramuscular injections to replenish the depleted body stores. Thereafter, maintenance treatment, which is usually for life, can be instituted. There is no evidence that doses larger than those recommended provide any additional benefit in vitamin B<sub>12</sub> neuropathy.

**Folic acid** has few indications for long-term therapy since most causes of folate deficiency are self-limiting or will yield to a short course of treatment. It should not be used in undiagnosed megaloblastic anaemia unless vitamin B<sub>12</sub> is administered concurrently otherwise neuropathy may be precipitated (see above).

In *folate-deficient megaloblastic anaemia* (e.g. because of poor nutrition, pregnancy, or antiepileptic drugs), daily folic acid supplementation for 4 months brings about haematological remission and replenishes body stores.

For prophylaxis in *chronic haemolytic states, malabsorption, or in renal dialysis*, folic acid is given daily or sometimes weekly, depending on the diet and the rate of haemolysis.

For *prophylaxis in pregnancy*, see Prevention of Neural Tube Defects below.

Folic acid is also used for the prevention of methotrexate-induced side-effects in severe Crohn's disease (see section 1.5.3, p. 65), rheumatic disease (see section 10.1.3, p. 645), and severe psoriasis (see section 13.5.3, p. 721).

**Folinic acid** is also effective in the treatment of folate-deficient megaloblastic anaemia but it is generally used in association with cytotoxic drugs (see section 8.1); it is given as calcium folinate.

**Prevention of neural tube defects** Folic acid supplements taken before and during pregnancy can reduce the occurrence of neural tube defects. The risk of a neural tube defect occurring in a child should be assessed and folic acid given as follows:

Women at a low risk of conceiving a child with a neural tube defect should be advised to take folic acid as a medicinal or food supplement at a dose of 400 micrograms daily before conception and until week 12 of pregnancy. Women who have not been taking folic acid and who suspect they are pregnant should start at once and continue until week 12 of pregnancy.

Couples are at a high risk of conceiving a child with a neural tube defect if either partner has a neural tube defect (or either partner has a family history of neural tube defects), if they have had a previous pregnancy affected by a neural tube defect, or if the

## 9.1.2 Drugs used in megaloblastic anaemias

Most megaloblastic anaemias result from a lack of either vitamin B<sub>12</sub> or folate, and it is essential to establish in every case which deficiency is present and the underlying cause. In emergencies, when delay might be dangerous, it is sometimes necessary to administer both substances after the bone marrow test while plasma assay results are awaited. Normally, however, appropriate treatment should not be instituted until the results of tests are available.

One cause of megaloblastic anaemia in the UK is *pernicious anaemia* in which lack of gastric intrinsic factor resulting from an autoimmune gastritis causes malabsorption of vitamin B<sub>12</sub>.

Vitamin B<sub>12</sub> is also needed in the treatment of megaloblastosis caused by *prolonged nitrous oxide anaesthesia*, which inactivates the vitamin, and in the rare syndrome of *congenital transcobalamin II deficiency*.

Vitamin B<sub>12</sub> should be given prophylactically after *total gastrectomy* or *total ileal resection* (or after *partial*

woman has coeliac disease (or other malabsorption state), diabetes mellitus, sickle-cell anaemia, or is taking antiepileptic medicines (see also section 4.8.1).

Women in the high-risk group who wish to become pregnant (or who are at risk of becoming pregnant) should be advised to take folic acid 5 mg daily and continue until week 12 of pregnancy (women with sickle-cell disease should continue taking their normal dose of folic acid 5 mg daily (or to increase the dose to 5 mg daily) and continue this throughout pregnancy).

There is **no** justification for prescribing multiple-ingredient vitamin preparations containing vitamin B<sub>12</sub> or folic acid.

## HYDROXOCOBALAMIN

**Indications** see under dose below; cyanide poisoning (see Emergency Treatment of Poisoning, p. 39)

**Cautions** should not be given before diagnosis fully established but see also notes above; **interactions:** Appendix 1 (hydroxocobalamin)

**Breast-feeding** present in milk but not known to be harmful

**Side-effects** nausea, headache, dizziness; fever, hypersensitivity reactions (including rash and pruritus); injection-site reactions; hypokalaemia and thrombocytosis during initial treatment; chromaturia

### Dose

- **By intramuscular injection**, pernicious anaemia and other macrocytic anaemias without neurological involvement, initially 1 mg 3 times a week for 2 weeks then 1 mg every 3 months

Pernicious anaemia and other macrocytic anaemias with neurological involvement, initially 1 mg on alternate days until no further improvement, then 1 mg every 2 months

Prophylaxis of macrocytic anaemias associated with vitamin B<sub>12</sub> deficiency, 1 mg every 2–3 months

Tobacco amblyopia and Leber's optic atrophy, initially 1 mg daily for 2 weeks, then 1 mg twice weekly until no further improvement, thereafter 1 mg every 1–3 months

CHILD see *BNF for Children*

**Hydroxocobalamin** (Non-proprietary) (POM)

**Injection**, hydroxocobalamin 1 mg/mL. Net price 1-mL amp = 74p

**Note** The BP directs that when vitamin B<sub>12</sub> injection is prescribed or demanded hydroxocobalamin injection shall be dispensed or supplied

Brands include *Cobalin-H*<sup>®</sup>, *Neo-Cytamen*<sup>®</sup>

## CYANOCOBALAMIN

**Indications** see notes above

### Dose

- **By mouth**, vitamin B<sub>12</sub> deficiency of dietary origin, 50–150 micrograms daily taken between meals; CHILD 50–105 micrograms daily in 1–3 divided doses

- **By intramuscular injection**, initially 1 mg repeated 10 times at intervals of 2–3 days, maintenance 1 mg every month, but see notes above

**Cyanocobalamin** (Non-proprietary) (POM)

**Tablets**, cyanocobalamin 50 micrograms. Net price 50-tab pack = £6.24

Brands include *Cytacon*<sup>®</sup>

**Liquid**, cyanocobalamin 35 micrograms/5 mL.

Net price 200 mL = £2.77

Brands include *Cytacon*<sup>®</sup>

**Injection** (POM), cyanocobalamin 1 mg/mL. Net price 1-mL amp = £1.67

Brands include *Cytamen*<sup>®</sup>

**Note** The BP directs that when vitamin B<sub>12</sub> injection is prescribed or demanded hydroxocobalamin injection shall be dispensed or supplied

1. except to treat or prevent vitamin B<sub>12</sub> deficiency in a patient who is a vegan or who has a proven vitamin B<sub>12</sub> deficiency of dietary origin; endorse prescription 'SLS'; currently available brands may not be suitable for vegans—cyanocobalamin injection may be a suitable alternative

## FOLIC ACID

**Indications** see notes above and under dose

**Cautions** should never be given alone for pernicious anaemia and other vitamin B<sub>12</sub> deficiency states (may precipitate subacute combined degeneration of the spinal cord); **interactions:** Appendix 1 (folates)

**Side-effects** rarely gastro-intestinal disturbances

### Dose

- Folate-deficient megaloblastic anaemia, **by mouth**, **ADULT** and **CHILD** over 1 year, 5 mg daily for 4 months (until term in pregnant women); up to 15 mg daily may be required in malabsorption states; **CHILD** under 1 year, 500 micrograms/kg daily (max. 5 mg) for up to 4 months; up to 10 mg daily may be required in malabsorption states

- Prevention of neural tube defects, **by mouth**, see notes above

- Prevention of methotrexate-induced side-effects in severe Crohn's disease [unlicensed], **by mouth**, see section 1.5.3

- Prevention of methotrexate-induced side-effects in rheumatic disease [unlicensed], **by mouth**, **ADULT** over 18 years 5 mg once weekly; **CHILD** 2–18 years see *BNF for Children*

- Prevention of methotrexate-induced side-effects in severe psoriasis [unlicensed], **by mouth**, see section 13.5.3

- Prophylaxis in chronic haemolytic states, **by mouth**, **ADULT** 5 mg every 1–7 days depending on underlying disease

- Prophylaxis of folate deficiency in dialysis, **by mouth**, **ADULT** 5 mg every 1–7 days; **CHILD** 1–12 years 250 micrograms/kg (max. 10 mg) once daily, **CHILD** 12–18 years 5–10 mg once daily

**Folic Acid** (Non-proprietary) (POM)

**Tablets**, folic acid 400 micrograms, net price 90-tab pack = £2.37; 5 mg, 28-tab pack = £1.00

**Syrup**, folic acid 2.5 mg/5 mL, net price 150 mL = £9.16; 400 micrograms/5 mL, 150 mL = £1.40

Brands include *Folicare*<sup>®</sup>, *Lexpec*<sup>®</sup> (sugar-free)

**Injection**, folic acid 15 mg, net price 1-mL amp = £1.34

Available from 'special-order' manufacturers or specialist importing companies, see p. 988

1. Can be sold to the public provided daily doses do not exceed 500 micrograms

### 9.1.3 Drugs used in hypoplastic, haemolytic, and renal anaemias

Anabolic steroids (section 6.4.3), pyridoxine, antilymphocyte immunoglobulin, and various corticosteroids are used in hypoplastic and haemolytic anaemias.

**Antilymphocyte immunoglobulin** given intravenously through a central line over 12–18 hours each day for 5 days produces a response in about 50% of cases of acquired *aplastic anaemia*; the response rate may be increased when ciclosporin is given as well. Severe reactions are common in the first 2 days and profound immunosuppression can occur; antilymphocyte immunoglobulin should be given under specialist supervision with appropriate resuscitation facilities. Alternatively, oxymetholone tablets (available from 'special-order' manufacturers or specialist importing companies, see p. 988) can be used in aplastic anaemia at a dose of 1–5 mg/kg daily for 3 to 6 months.

It is unlikely that dietary deprivation of **pyridoxine** (section 9.6.2) produces clinically relevant haematological effects. However, certain forms of *sideroblastic anaemia* respond to pharmacological doses, possibly reflecting its role as a co-enzyme during haemoglobin synthesis. Pyridoxine is indicated in both *idiopathic acquired* and *hereditary sideroblastic anaemias*. Although complete cures have not been reported, some increase in haemoglobin can occur; the dose required is usually high, up to 400 mg daily. *Reversible sideroblastic anaemias* respond to treatment of the underlying cause but in pregnancy, haemolytic anaemias, and alcohol dependence, or during isoniazid treatment, pyridoxine is also indicated.

**Corticosteroids** (see section 6.3) have an important place in the management of a wide variety of haematological disorders. They include conditions with an immune basis such as *autoimmune haemolytic anaemia*, *immune thrombocytopenias* and *neutropenias*, and *major transfusion reactions*. They are also used in chemotherapy schedules for many types of *lymphoma*, *lymphoid leukaemias*, and *paraproteinaemias*, including *multiple myeloma*.

## Erythropoietins

**Epoetins** (recombinant human erythropoietins) are used to treat symptomatic anaemia associated with erythropoietin deficiency in chronic renal failure, to increase the yield of autologous blood in normal individuals and to shorten the period of symptomatic anaemia in patients receiving cytotoxic chemotherapy. Epoetin beta is also used for the prevention of anaemia in preterm neonates of low birth-weight; only unpreserved formulations should be used in neonates because other preparations may contain benzyl alcohol (see Excipients, p. 2).

**Darbepoetin** is a hyperglycosylated derivative of epoetin; it has a longer half-life and can be administered less frequently than epoetin.

**Methoxy polyethylene glycol-epoetin beta** is a continuous erythropoietin receptor activator that is licensed for the treatment of symptomatic anaemia associated with chronic kidney disease. It has a longer duration of action than epoetin.

Other factors, such as iron or folate deficiency, that contribute to the anaemia of chronic renal failure should be corrected before treatment and monitored during therapy. Supplemental iron may improve the response in resistant patients. Aluminium toxicity, concurrent infection, or other inflammatory disease can impair the response to erythropoietin.

### MHRA/CHM advice (December 2007) Erythropoietins—haemoglobin concentration

Overcorrection of haemoglobin concentration in patients with chronic kidney disease may increase the risk of death and serious cardiovascular events, and in patients with cancer may increase the risk of thrombosis and related complications:

- patients should not be treated with erythropoietins for the licensed indications in chronic kidney disease or cancer in patients receiving chemotherapy *unless* symptoms of anaemia are present;
- the haemoglobin concentration should be maintained within the range 10–12 g/100 mL;
- haemoglobin concentrations higher than 12 g/100 mL should be avoided;
- the aim of treatment is to relieve symptoms of anaemia, and in patients with chronic kidney disease to avoid the need for blood transfusion; the haemoglobin concentration should not be increased beyond that which provides adequate control of symptoms of anaemia (in some patients, this may be achieved at concentrations lower than the recommended range).

See also MHRA/CHM advice below.

### MHRA/CHM advice (December 2007 and July 2008) Erythropoietins—tumour progression and survival in patients with cancer

Clinical trial data show an unexplained excess mortality and increased risk of tumour progression in patients with anaemia associated with cancer who have been treated with erythropoietins. Many of these trials used erythropoietins *outside* of the licensed indications (i.e. overcorrected haemoglobin concentration or given to patients who have *not* received chemotherapy):

- erythropoietins licensed for the treatment of *symptomatic* anaemia associated with cancer, are licensed only for patients who are receiving chemotherapy;
- the decision to use erythropoietins should be based on an assessment of the benefits and risks for individual patients; blood transfusion may be the preferred treatment for anaemia associated with cancer chemotherapy, particularly in those with a good cancer prognosis.

See also MHRA/CHM advice above.

### Pure red cell aplasia

There have been very rare reports of pure red cell aplasia in patients treated with erythropoietins. In patients who develop a lack of efficacy with erythropoietin therapy and with a diagnosis of pure red cell aplasia, treatment with erythropoietins must be discontinued and testing for erythropoietin antibodies considered. Patients who develop pure red cell aplasia should **not** be switched to another form of erythropoietin.

**NICE guidance****Epoetin alfa, beta and darbepoetin alfa for cancer treatment-induced anaemia (May 2008)**

Erythropoietin analogues are **not** recommended for routine use in the management of cancer treatment-induced anaemia, but may be considered, in combination with intravenous iron, for:

- women receiving platinum-based chemotherapy for ovarian cancer who have symptomatic anaemia with a haemoglobin concentration of 8 g/100 mL or lower (the use of erythropoietin analogues does not preclude the use of existing approaches to the management of anaemia, including blood transfusion when necessary);
- patients who cannot be given blood transfusions and who have profound cancer treatment-related anaemia that is likely to have an impact on survival.

Patients currently treated with erythropoietin analogues for the management of cancer treatment-related anaemia who do not fulfil the criteria outlined above can continue therapy until they and their specialists consider it appropriate to stop.

**DARBEPOETIN ALFA**

**Indications** see under Dose below

**Cautions** see Epoetin

**Contra-indications** see Epoetin

**Hepatic impairment** manufacturer advises caution

**Pregnancy** no evidence of harm in *animal* studies—manufacturer advises caution

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** see Epoetin; also, oedema, injection-site pain; isolated reports of pure red cell aplasia, particularly following subcutaneous administration in patients with chronic renal failure (discontinue therapy)—see also notes above

**Dose**

- Symptomatic anaemia associated with chronic renal failure in patients on dialysis (see also MHRA/CHM advice, p. 582), **ADULT** and **CHILD** over 11 years, by **subcutaneous** or **intravenous injection**, initially 450 nanograms/kg once weekly, adjusted according to response by approx. 25% at intervals of at least 4 weeks; maintenance dose, given once weekly or once every 2 weeks
- Symptomatic anaemia associated with chronic renal failure in patients not on dialysis (see also MHRA/CHM advice, p. 582), **ADULT** and **CHILD** over 11 years, by **subcutaneous** or **intravenous injection**, initially 450 nanograms/kg once weekly or by **subcutaneous injection**, initially 750 nanograms/kg once every 2 weeks; adjusted according to response by approx. 25% at intervals of at least 4 weeks; maintenance dose, given **subcutaneously** or **intravenously** once weekly or **subcutaneously** once every 2 weeks or **subcutaneously** once every month

**Note** Subcutaneous route preferred in patients not on haemodialysis. Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemo-

globin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose. When changing route give same dose then adjust according to weekly or fortnightly haemoglobin measurements. Adjust doses not more frequently than every 2 weeks during maintenance treatment

- Symptomatic anaemia in adults with non-myeloid malignancies receiving chemotherapy (see also MHRA/CHM advice, p. 582), by **subcutaneous injection**, initially 6.75 micrograms/kg once every 3 weeks or 2.25 micrograms/kg once weekly (if response inadequate after 9 weeks further treatment may not be effective); if adequate response obtained, reduce dose by 25–50%

**Note** Reduce dose by approximately 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and restart at a dose approximately 25% lower than the previous dose. Discontinue approximately 4 weeks after ending chemotherapy

**Aranesp®** (Amgen) (POM)

**Injection**, prefilled syringe, darbepoetin alfa, 25 micrograms/mL, net price 0.4 mL (10 micrograms) = £14.68; 40 micrograms/mL, 0.375 mL (15 micrograms) = £22.03, 0.5 mL (20 micrograms) = £29.37; 100 micrograms/mL, 0.3 mL (30 micrograms) = £44.05, 0.4 mL (40 micrograms) = £58.73, 0.5 mL (50 micrograms) = £73.41; 200 micrograms/mL, 0.3 mL (60 micrograms) = £88.09, 0.4 mL (80 micrograms) = £117.45, 0.5 mL (100 micrograms) = £146.81, 0.65 mL (130 micrograms) = £190.86; 500 micrograms/mL, 0.3 mL (150 micrograms) = £220.22, 0.6 mL (300 micrograms) = £440.43, 1 mL (500 micrograms) = £734.05

**Injection** (*Aranesp® SureClick*), prefilled disposable injection device, darbepoetin alfa, 40 micrograms/mL, net price 0.5 mL (20 micrograms) = £29.36; 100 micrograms/mL, 0.4 mL (40 micrograms) = £58.72; 200 micrograms/mL, 0.3 mL (60 micrograms) = £88.09, 0.4 mL (80 micrograms) = £117.45, 0.5 mL (100 micrograms) = £146.81; 500 micrograms/mL, 0.3 mL (150 micrograms) = £220.22, 0.6 mL (300 micrograms) = £440.43, 1 mL (500 micrograms) = £734.05

**EPOETIN ALFA, BETA, THETA, and ZETA**

(Recombinant human erythropoietins)

**Note** The prescriber must specify which epoetin is required, see also Biosimilar medicines, p. 1

**Indications** see under preparations, below

**Cautions** see notes above; also inadequately treated or poorly controlled blood pressure (monitor closely blood pressure, reticulocyte counts, haemoglobin, and electrolytes), interrupt treatment if blood pressure uncontrolled; sudden stabbing migraine-like pain is warning of a hypertensive crisis; sickle-cell disease (lower target haemoglobin concentration may be appropriate); ischaemic vascular disease; thrombocytosis (monitor platelet count for first 8 weeks); epilepsy; malignant disease; increase in unfractionated or low molecular weight heparin dose may be needed during dialysis; risk of thrombosis may be increased when used for anaemia in adults receiving cancer chemotherapy; risk of thrombosis may be increased

when used for anaemia before orthopaedic surgery—avoid in cardiovascular disease including recent myocardial infarction or cerebrovascular accident

**Contra-indications** pure red cell aplasia following erythropoietin therapy (see also notes above); uncontrolled hypertension; patients unable to receive thromboprophylaxis; avoid injections containing benzyl alcohol in neonates (see under preparations, below)

**Hepatic impairment** manufacturers advise caution in chronic hepatic failure

**Pregnancy** no evidence of harm; benefits probably outweigh risk of anaemia and of transfusion in pregnancy

**Breast-feeding** unlikely to be present in milk; minimal effect on infant

**Side-effects** diarrhoea, nausea, vomiting; dose-dependent increase in blood pressure or aggravation of hypertension; in isolated patients with normal or low blood pressure, hypertensive crisis with encephalopathy-like symptoms and generalised tonic-clonic seizures requiring immediate medical attention; headache; dose-dependent increase in platelet count (but thrombocytosis rare) regressing during treatment; influenza-like symptoms (may be reduced if intravenous injection given over 5 minutes); cardiovascular events; shunt thrombosis especially if tendency to hypotension or arteriovenous shunt complications; *very rarely* sudden loss of efficacy because of pure red cell aplasia, particularly following subcutaneous administration in patients with chronic renal failure (discontinue erythropoietin therapy)—see also notes above, hyperkalaemia, hypersensitivity reactions (including anaphylaxis and angioedema), skin reactions, injection-site reactions, and peripheral oedema also reported

#### Dose

- See under preparations, below

#### ▲ Epoetin alfa

**Bिनocrit®** (Sandoz) ▼ [Pm]

**Injection**, prefilled syringe, epoetin alfa, net price  
1000 units = £5.09; 2000 units = £10.18; 3000 units = £15.27; 4000 units = £20.36; 5000 units = £25.46; 6000 units = £30.55; 8000 units = £40.73; 10 000 units = £50.91

**Note** Biosimilar medicine, p. 1

**Dose** symptomatic anaemia associated with chronic renal failure in patients on haemodialysis (see also MHRA/CHM advice, p. 582), **by intravenous injection** over 1–5 minutes, initially 50 units/kg 3 times weekly adjusted according to response in steps of 25 units/kg 3 times weekly at intervals of at least 4 weeks; maintenance dose, usually 25–100 units/kg 3 times weekly; **CHILD** **by intravenous injection** initially as for adults; maintenance dose, body-weight under 10 kg usually 75–150 units/kg 3 times weekly, body-weight 10–30 kg usually 60–150 units/kg 3 times weekly, body-weight over 30 kg usually 30–100 units/kg 3 times weekly Symptomatic anaemia associated with chronic renal failure in adults on peritoneal dialysis (see also MHRA/CHM advice, p. 582), **by intravenous injection** over 1–5 minutes, initially 50 units/kg twice weekly; maintenance dose 25–50 units/kg twice weekly

Severe symptomatic anaemia of renal origin in adults with renal insufficiency not yet on dialysis (see also MHRA/CHM advice, p. 582), **by intravenous injection** over 1–5 minutes, initially 50 units/kg 3 times weekly increased according to response in steps of 25 units/kg 3 times weekly at intervals of at least 4 weeks; maintenance dose 17–33 units/kg 3 times weekly, max. 200 units/kg 3 times weekly

**Note** Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration

continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose.

Symptomatic anaemia in adults receiving cancer chemotherapy (see also MHRA/CHM advice, p. 582), **by subcutaneous injection** (max. 1 mL per injection site), initially 150 units/kg 3 times weekly (or 450 units/kg once weekly), increased if appropriate rise in haemoglobin (or reticulocyte count) not achieved after 4 weeks to 300 units/kg 3 times weekly; discontinue if inadequate response after 4 weeks at higher dose

**Note** Reduce dose by approximately 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose. Discontinue approximately 4 weeks after ending chemotherapy To increase yield of autologous blood (to avoid homologous blood) in predonation programme in moderate anaemia *either* when large volume of blood required *or* when sufficient blood cannot be saved for elective major surgery, **by intravenous injection** over 1–5 minutes, 600 units/kg twice weekly for 3 weeks before surgery; consult product literature for details and advice on ensuring high iron stores

Moderate anaemia (haemoglobin concentration 10–13 g/100 mL) before elective orthopaedic surgery in adults with expected moderate blood loss to reduce exposure to allogeneic blood transfusion or if autologous transfusion unavailable, **by subcutaneous injection** (max. 1 mL per injection site), 600 units/kg every week for 3 weeks before surgery and on day of surgery or 300 units/kg daily for 15 days starting 10 days before surgery; consult product literature for details

**Eporex®** (Janssen-Cilag) [Pm]

**Injection**, prefilled syringe, epoetin alfa, net price  
1000 units = £5.53; 2000 units = £11.07; 3000 units = £16.60; 4000 units = £22.13; 5000 units = £27.66; 6000 units = £33.19; 8000 units = £44.25; 10 000 units = £55.31; 20 000 units = £110.62; 30 000 units = £199.11; 40 000 units = £265.48. An auto-injector device is available for use with prefilled syringes

**Dose** symptomatic anaemia associated with chronic renal failure in patients on haemodialysis (see also MHRA/CHM advice, p. 582), **by intravenous injection** over 1–5 minutes *or* **by subcutaneous injection** (max. 1 mL per injection site), initially 50 units/kg 3 times weekly adjusted according to response in steps of 25 units/kg 3 times weekly at intervals of at least 4 weeks; maintenance dose, usually a total of 75–300 units/kg weekly (as a single dose or in divided doses); **CHILD** **by intravenous injection** initially as for adults; maintenance dose, body-weight under 10 kg usually 75–150 units/kg 3 times weekly, body-weight 10–30 kg usually 60–150 units/kg 3 times weekly, body-weight over 30 kg usually 30–100 units/kg 3 times weekly

Symptomatic anaemia associated with chronic renal failure in adults on peritoneal dialysis (see also MHRA/CHM advice, p. 582), **by intravenous injection** over 1–5 minutes *or* **by subcutaneous injection** (max. 1 mL per injection site), initially 50 units/kg twice weekly; maintenance dose 25–50 units/kg twice weekly Severe symptomatic anaemia of renal origin in adults with renal insufficiency not yet on dialysis (see also MHRA/CHM advice, p. 582), **by intravenous injection** over 1–5 minutes *or* **by subcutaneous injection** (max. 1 mL per injection site), initially 50 units/kg 3 times weekly increased according to response in steps of 25 units/kg 3 times weekly at intervals of at least 4 weeks; maintenance dose 17–33 units/kg 3 times weekly; max. 200 units/kg 3 times weekly

**Note** Intravenous route preferred; reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose.

Symptomatic anaemia in adults receiving cancer chemotherapy (see also MHRA/CHM advice, p. 582), **by subcutaneous injection** (max. 1 mL per injection site), initially 150 units/kg 3 times weekly (or 450 units/kg once weekly), increased if appropriate rise in haemoglobin (or reticulocyte count) not achieved after 4 weeks to 300 units/kg 3 times weekly; discontinue if inadequate response after 4 weeks at higher dose

**Note** Reduce dose by approximately 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin

globin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose. Discontinue approximately 4 weeks after ending chemotherapy. To increase yield of autologous blood (to avoid homologous blood) in predonation programme in moderate anaemia either when large volume of blood required or when sufficient blood cannot be saved for elective major surgery, by **intravenous injection** over 1–5 minutes, 600 units/kg twice weekly for 3 weeks before surgery; consult product literature for details and advice on ensuring high iron stores.

Moderate anaemia (haemoglobin concentration 10–13 g/100 mL) before elective orthopaedic surgery in adults with expected moderate blood loss to reduce exposure to allogeneic blood transfusion or if autologous transfusion unavailable, by **subcutaneous injection** (max. 1 mL per injection site), 600 units/kg every week for 3 weeks before surgery and on day of surgery or 300 units/kg daily for 15 days starting 10 days before surgery; consult product literature for details.

## ▲ Epoetin beta

### NeoRecormon® (Roche) (POM)

**Injection**, prefilled syringe, epoetin beta, net price 500 units = £3.75; 2000 units = £14.98; 3000 units = £22.47; 4000 units = £29.96; 5000 units = £37.47; 6000 units = £44.94; 10 000 units = £70.14; 20 000 units = £140.28; 30 000 units = £224.69

**Excipients** include phenylalanine up to 300 micrograms/syringe (section 9.4.1)

**Dose** symptomatic anaemia associated with chronic renal failure (see also MHRA/CHM advice, p. 582), by **subcutaneous injection**, **ADULT** and **CHILD**, initially 20 units/kg 3 times weekly for 4 weeks, increased according to response at intervals of 4 weeks in steps of 20 units/kg 3 times weekly; total weekly dose may be divided into daily doses; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks; total weekly maintenance dose may be given as a single dose or in 3 or 7 divided doses; max. 720 units/kg weekly. By **intravenous injection** over 2 minutes, **ADULT** and **CHILD**, initially 40 units/kg 3 times weekly for 4 weeks, increased according to response to 80 units/kg 3 times weekly after 4 weeks, with further increases if needed at intervals of 4 weeks in steps of 20 units/kg 3 times weekly; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks; max. 720 units/kg weekly.

**Note** Subcutaneous route preferred in patients not on haemodialysis. Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration approaches or exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose.

Prevention of anaemia of prematurity in neonates with birth-weight of 0.75–1.5 kg and gestational age of less than 34 weeks, by **subcutaneous injection**, 250 units/kg 3 times weekly preferably starting within 3 days of birth and continued for 6 weeks.

Symptomatic anaemia in adults with non-myeloid malignancies receiving chemotherapy (see also MHRA/CHM advice, p. 582), by **subcutaneous injection**, initially 450 units/kg weekly (as a single dose or in 3–7 divided doses), increased if necessary after 4 weeks (if a rise in haemoglobin of at least 1 g/100 mL not achieved) to 900 units/kg weekly (as a single dose or in 3–7 divided doses); if adequate response obtained reduce dose by 25–50%; max. 60 000 units weekly.

**Note** Discontinue treatment if haemoglobin concentration does not increase by at least 1 g/100 mL after 8 weeks of therapy (response unlikely). Reduce dose by approximately 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose. Discontinue approximately 4 weeks after ending chemotherapy.

To increase yield of autologous blood (to avoid homologous blood) in predonation programme in moderate anaemia when blood-conserving procedures are insufficient or unavailable, consult product literature.

**Multidose injection**, powder for reconstitution, epoetin beta, net price 50 000-unit vial = £374.48 (with solvent)

**Excipients** include phenylalanine up to 5 mg/vial (section 9.4.1), benzyl alcohol (avoid in neonates, see Excipients p. 2)

**Note** Avoid contact of reconstituted injection with glass; use only plastic materials.

**Dose** symptomatic anaemia associated with chronic renal failure (see also MHRA/CHM advice, p. 582), by **subcutaneous injection**, **ADULT** and **CHILD** over 3 years, initially 20 units/kg 3 times weekly for 4 weeks, increased according to response at intervals of 4 weeks in steps of 20 units/kg 3 times weekly; total weekly dose may be divided into daily doses; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks; total weekly maintenance dose may be given as a single dose or in 3 or 7 divided doses; max. 720 units/kg weekly. By **intravenous injection** over 2 minutes, **ADULT** and **CHILD** over 3 years, initially 40 units/kg 3 times weekly for 4 weeks, increased according to response to 80 units/kg 3 times weekly after 4 weeks, with further increases if needed at intervals of 4 weeks in steps of 20 units/kg 3 times weekly; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks; max. 720 units/kg weekly.

**Note** Subcutaneous route preferred in patients not on haemodialysis. Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration approaches or exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose.

Symptomatic anaemia in adults with non-myeloid malignancies receiving chemotherapy (see also MHRA/CHM advice, p. 582), by **subcutaneous injection**, initially 450 units/kg weekly (as a single dose or in 3–7 divided doses), increased if necessary after 4 weeks (if a rise in haemoglobin of at least 1 g/100 mL not achieved) to 900 units/kg weekly (as a single dose or in 3–7 divided doses); if adequate response obtained reduce dose by 25–50%; max. 60 000 units weekly.

**Note** Discontinue treatment if haemoglobin concentration does not increase by at least 1 g/100 mL after 8 weeks of therapy (response unlikely). Reduce dose by approximately 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose. Discontinue approximately 4 weeks after ending chemotherapy.

To increase yield of autologous blood (to avoid homologous blood) in predonation programme in moderate anaemia when blood-conserving procedures are insufficient or unavailable, consult product literature.

## ▲ Epoetin theta

### Eporatio® (Ratiopharm UK) (POM)

**Injection**, prefilled syringe, epoetin theta, net price 1000 units = £5.99; 2000 units = £11.98; 3000 units = £17.98; 4000 units = £23.97; 5000 units = £29.96; 10 000 units = £59.92; 20 000 units = £119.84; 30 000 units = £179.75

**Note** If epoetin theta is substituted for another epoetin the same route of administration should be used.

**Dose** symptomatic anaemia associated with chronic renal failure (see also MHRA/CHM advice, p. 582), by **subcutaneous injection**, **ADULT** over 18 years, initially 20 units/kg 3 times weekly, increased after 4 weeks according to response to 40 units/kg 3 times weekly, with further increases if needed at 4-weekly intervals in steps of 25% of the previous dose; maintenance dose, adjusted if necessary in steps of 25%; weekly maintenance dose may be given as a single dose or in 3 divided doses; max. 700 units/kg weekly.

By **intravenous injection**, **ADULT** over 18 years, initially 40 units/kg 3 times weekly, increased according to response to 80 units/kg 3 times weekly after 4 weeks, with further increases if needed at intervals of 4 weeks in steps of 25% of the previous dose; maintenance dose, adjusted if necessary in steps of 25%; weekly maintenance dose may be given in 2 divided doses in stable patients; max. 700 units/kg weekly.

**Note** Subcutaneous route preferred in patients not on haemodialysis. Reduce dose by 25–50% if rise in haemoglobin concentration

exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration approaches or exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

Symptomatic anaemia in adults with non-myeloid malignancies receiving cancer chemotherapy (see also MHRA/CHM advice, p. 582), by **subcutaneous injection**, initially 20 000 units once weekly, increased if necessary after 4 weeks (if a rise in haemoglobin of at least 1 g/100 mL not achieved) to 40 000 units once weekly, with further increase if needed after 4 weeks to max. 60 000 units once weekly

**Note** Discontinue treatment if haemoglobin concentration does not increase by at least 1 g/100 mL after 12 weeks of therapy (response unlikely). Reduce dose by 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose. Discontinue approximately 4 weeks after ending chemotherapy

### ■ Epoetin zeta

**Retacrit®** (Hospira) ▼ [Pm]

**Injection**, prefilled syringe, epoetin zeta, net price 1000 units = £5.66; 2000 units = £11.31; 3000 units = £16.97; 4000 units = £22.63; 5000 units = £28.28; 6000 units = £33.94; 8000 units = £45.25; 10 000 units = £56.57; 20 000 units = £203.64; 30 000 units = £305.46; 40 000 units = £407.27

**Excipients** include phenylalanine up to 500 micrograms/syringe (section 9.4.1)

**Note** Biosimilar medicine, p. 1

**Dose** symptomatic anaemia associated with chronic renal failure in patients on haemodialysis (see also MHRA/CHM advice, p. 582), by **intravenous injection** over 1–5 minutes or by **subcutaneous injection** (max. 1 mL per injection site), initially 50 units/kg 3 times weekly adjusted according to response in steps of 25 units/kg 3 times weekly at intervals of at least 4 weeks; maintenance dose, usually 25–100 units/kg 3 times weekly; **CHILD** by **intravenous injection** initially as for adults; maintenance dose, body-weight under 10 kg usually 75–150 units/kg 3 times weekly, body-weight 10–30 kg usually 60–150 units/kg 3 times weekly, body-weight over 30 kg usually 30–100 units/kg 3 times weekly Symptomatic anaemia associated with chronic renal failure in adults on peritoneal dialysis (see also MHRA/CHM advice, p. 582), by **intravenous injection** over 1–5 minutes or by **subcutaneous injection** (max. 1 mL per injection site), initially 50 units/kg twice weekly, maintenance dose 25–50 units/kg twice weekly Severe symptomatic anaemia of renal origin in adults with renal insufficiency not yet on dialysis (see also MHRA/CHM advice, p. 582), by **intravenous injection** over 1–5 minutes or by **subcutaneous injection** (max. 1 mL per injection site), initially 50 units/kg 3 times weekly increased according to response in steps of 25 units/kg 3 times weekly at intervals of at least 4 weeks; maintenance dose 17–33 units/kg 3 times weekly, max. 200 units/kg 3 times weekly

**Note** Avoid increasing haemoglobin concentration at a rate exceeding 2 g/100 mL over 4 weeks

Symptomatic anaemia in adults receiving cancer chemotherapy (see also MHRA/CHM advice, p. 582), by **subcutaneous injection** (max. 1 mL per injection site), initially 150 units/kg 3 times weekly (or 450 units/kg once weekly), increased if appropriate rise in haemoglobin (or reticulocyte count) not achieved after 4 weeks to 300 units/kg 3 times weekly; discontinue if inadequate response after 4 weeks at higher dose

**Note** Reduce dose by approximately 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose. Discontinue approximately 4 weeks after ending chemotherapy

To increase yield of autologous blood (to avoid homologous blood) in predonation programme in moderate anaemia either when large volume of blood required or when sufficient blood cannot be saved for elective major surgery, by **intravenous injection** over 1–5 minutes, 600 units/kg twice weekly for 3 weeks before surgery; consult product literature for details and advice on ensuring high iron stores

## METHOXY POLYETHYLENE GLYCOL-EPOETIN BETA

**Indications** see under Dose below

**Cautions** see Epoetin

**Contra-indications** see Epoetin

**Pregnancy** no evidence of harm in *animal studies*—manufacturer advises caution

**Breast-feeding** manufacturer advises use only if potential benefit outweighs risk—present in milk in *animal studies*

**Side-effects** see Epoetin; also hot flushes reported

### Dose

- Symptomatic anaemia associated with chronic kidney disease in patients on dialysis and *not* currently treated with erythropoietins (see also MHRA/CHM advice, p. 582), **ADULT** over 18 years, by **subcutaneous** or **intravenous injection**, initially 600 nanograms/kg once every 2 weeks, adjusted according to response at intervals of at least 4 weeks; maintenance dose of double the previous fortnightly dose may be given every 4 weeks
- Symptomatic anaemia associated with chronic kidney disease in patients *not* on dialysis and *not* currently treated with erythropoietins (see also MHRA/CHM advice, p. 582), **ADULT** over 18 years, by **subcutaneous injection**, initially 1.2 micrograms/kg once every 4 weeks, **alternatively by subcutaneous or intravenous injection**, initially 600 nanograms/kg once every 2 weeks; dose adjusted according to response at intervals of at least 4 weeks; patients treated once every 2 weeks may be given a maintenance dose of double the previous fortnightly dose every 4 weeks
- Symptomatic anaemia associated with chronic kidney disease in patients currently treated with erythropoietins (see also MHRA/CHM advice, p. 582), **ADULT** over 18 years, by **subcutaneous** or **intravenous injection**, consult product literature

**Note** Subcutaneous route preferred in patients not on haemodialysis. Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks, or if haemoglobin concentration approaches or exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

**Mircera®** (Roche) ▼ [Pm]

**Injection**, prefilled syringe, methoxy polyethylene glycol-epoetin beta, net price 30 micrograms/0.3 mL = £44.05; 50 micrograms/0.3 mL = £73.41; 75 micrograms/0.3 mL = £110.11; 100 micrograms/0.3 mL = £146.81; 120 micrograms/0.3 mL = £176.18; 150 micrograms/0.3 mL = £220.22; 200 micrograms/0.3 mL = £293.62; 250 micrograms/0.3 mL = £367.03; 360 micrograms/0.6 mL = £528.56

## Sickle-cell disease

Sickle-cell disease is caused by a structural abnormality of haemoglobin resulting in deformed, less flexible red blood cells. Acute complications in the more severe forms include *sickle-cell crisis*, where infarction of the microvasculature and blood supply to organs results in severe pain. Sickle-cell crisis requires hospitalisation,

intravenous fluids, analgesia (section 4.7), and treatment of any concurrent infection. Chronic complications include skin ulceration, renal failure, and increased susceptibility to infection. Pneumococcal vaccine (section 14.4), haemophilus influenzae type b vaccine (section 14.4), an annual influenza vaccine (section 14.4) and prophylactic penicillin (Table 2, section 5.1) reduce the risk of infection. Hepatitis B vaccine (section 14.4) should be considered if the patient is not immune.

In most forms of sickle-cell disease, varying degrees of haemolytic anaemia are present accompanied by increased erythropoiesis; this may increase folate requirements and folate supplementation may be necessary (section 9.1.2).

**Hydroxycarbamide** can reduce the frequency of crises and the need for blood transfusions in sickle-cell disease; it should be considered in consultation with a specialist centre. The beneficial effects of hydroxycarbamide may not become evident for several months. Myelosuppression and skin reactions are the most common side-effects.

## HYDROXYCARBAMIDE

(Hydroxyurea)

**Indications** sickle-cell disease (see notes above); chronic myeloid leukaemia, cancer of the cervix (section 8.1.5)

**Cautions** see section 8.1 and notes above; also monitor renal and hepatic function before and during treatment; monitor full blood count before treatment, then every 2 weeks for the first 2 months and then every 2 months thereafter (or every 2 weeks if on max. dose); leg ulcers (review treatment if cutaneous vasculitic ulcerations develop); **interactions:** Appendix 1 (hydroxycarbamide)

**Hepatic impairment** manufacturer advises caution in mild to moderate impairment; avoid in severe impairment

**Renal impairment** reduce initial dose by 50% if eGFR less than 60 mL/minute/1.73 m<sup>2</sup>; avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** section 8.1.5

**Breast-feeding** section 8.1.5

**Side-effects** see section 8.1 and notes above; also headache; *less commonly* dizziness and rash; *rarely* reduced sperm count and activity; fever, amenorrhoea, skin cancers (in elderly patients), bleeding and hypomagnesaemia also reported

### Dose

- **By mouth**, initially 15 mg/kg daily, increased every 12 weeks in steps of 5 mg/kg daily according to response; usual dose 15–30 mg/kg daily (max. 35 mg/kg daily); **CHILD** under 18 years, see *BNF for Children*

**Siklos**<sup>®</sup> (Nordic) ▼ (P<sub>M</sub>)

Tablets, scored, f/c, hydroxycarbamide 1 g, net price 30-tab pack = £500.00

## Iron overload

Severe tissue iron overload can occur in aplastic and other refractory anaemias, mainly as the result of repeated blood transfusions. It is a particular problem

in refractory anaemias with hyperplastic bone marrow, especially *thalassaemia major*, where excessive iron absorption from the gut and inappropriate iron therapy can add to the tissue siderosis.

Iron overload associated with haemochromatosis can be treated with repeated venesection. Venesection may also be used for patients who have received multiple transfusions and whose bone marrow has recovered. Where venesection is contra-indicated, the long-term administration of the iron chelating compound **desferrioxamine mesilate** is useful. Subcutaneous infusions of desferrioxamine are given over 8–12 hours, 3–7 times a week. The dose should reflect the degree of iron overload. For children starting therapy (and who have low iron overload) the dose should not exceed 30 mg/kg. For established overload the dose is usually between 20 and 50 mg/kg daily. Desferrioxamine (up to 2 g per unit of blood) may also be given at the time of blood transfusion, provided that the desferrioxamine is **not** added to the blood and is **not** given through the same line as the blood (but the two may be given through the same cannula).

Iron excretion induced by desferrioxamine is enhanced by administration of ascorbic acid (vitamin C, section 9.6.3) 200 mg daily by mouth (100 mg in infants); it should be given separately from food since it also enhances iron absorption. Ascorbic acid should not be given to patients with cardiac dysfunction; in patients with normal cardiac function ascorbic acid should be introduced 1 month after starting desferrioxamine.

Desferrioxamine infusion can be used to treat **aluminium overload** in dialysis patients; theoretically 100 mg of desferrioxamine binds with 4.1 mg of aluminium.

**Deferasirox**, an oral iron chelator, is licensed for the treatment of chronic iron overload in adults and children over 6 years with *thalassaemia major* who receive frequent blood transfusions (more than 7 mL/kg/month of packed red blood cells). It is also licensed for chronic iron overload when desferrioxamine is contra-indicated or inadequate in patients with *thalassaemia major* who receive infrequent blood transfusions (less than 7 mL/kg/month of packed red blood cells), in patients with other anaemias, and in children aged 2 to 5 years.

The *Scottish Medicines Consortium* (p. 4) has advised (January 2007) that deferasirox is accepted for restricted use within NHS Scotland for the treatment of chronic iron overload associated with the treatment of rare acquired or inherited anaemias requiring recurrent blood transfusions. It is not recommended for patients with myelodysplastic syndromes.

**Deferiprone**, an oral iron chelator, is licensed for the treatment of iron overload in patients with *thalassaemia major* in whom desferrioxamine is contra-indicated or is inadequate. Blood dyscrasias, particularly agranulocytosis, have been reported with deferiprone.

## DEFERASIROX

**Indications** see notes above

**Cautions** eye and ear examinations required before treatment and annually during treatment; monitor body-weight, height, and sexual development in children annually; monitor serum-ferritin concentration monthly; elderly (increased risk of side-effects); risk of gastro-intestinal ulceration and haemorrhage; platelet count less than  $50 \times 10^9$ /litre; consider treatment

interruption if unexplained cytopenia occurs; not recommended in conditions which may reduce life expectancy (e.g. high-risk myelodysplastic syndromes); history of liver cirrhosis; test liver function before treatment, then every 2 weeks during the first month, and then monthly; measure baseline serum creatinine and monitor renal function weekly during the first month of treatment and monthly thereafter; test for proteinuria monthly; **interactions:** Appendix 1 (deferasirox)

**Hepatic impairment** manufacturer advises caution—no information available; avoid in severe impairment

**Renal impairment** reduce dose by 10 mg/kg if eGFR 60–90 mL/minute/1.73 m<sup>2</sup> and if serum creatinine increased by more than 33% of baseline measurement on 2 consecutive occasions—interrupt treatment if deterioration in renal function persists after dose reduction; avoid if eGFR less than 60 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** manufacturer advises avoid unless essential—toxicity in *animal* studies

**Breast-feeding** manufacturer advises avoid—present in milk in *animal* studies

**Side-effects** gastro-intestinal disturbances (including ulceration and fatal haemorrhage); headache; proteinuria; pruritus, rash; *less commonly* hepatitis, cholelithiasis, oedema, fatigue, anxiety, sleep disorder, dizziness, pyrexia, pharyngitis, glucosuria, renal tubulopathy, disturbances of hearing and vision (including lens opacity and maculopathy), and skin pigmentation; hepatic failure, acute renal failure, blood disorders (including agranulocytosis, neutropenia, pancytopenia, and thrombocytopenia), hypersensitivity reactions (including anaphylaxis and angioedema), alopecia also reported

#### Dose

- **ADULT** and **CHILD** over 2 years initially 10–30 mg/kg once daily according to serum-ferritin concentration and amount of transfused blood (consult product literature); maintenance, adjust dose every 3–6 months in steps of 5–10 mg/kg according to serum-ferritin concentration; usual max. 30 mg/kg daily, but may be increased to max. 40 mg/kg daily and reduced in steps of 5–10 mg/kg once control achieved

**Exjade**® (Novartis) ▼ (POM)

**Dispersible tablets**, deferasirox 125 mg, net price 28-tab pack = £117.60; 250 mg, 28-tab pack = £235.20; 500 mg, 28-tab pack = £470.40. Label: 13, 22, counselling, administration

**Counselling** Tablets should be dispersed in water, orange juice, or apple juice; if necessary resuspend residue

## DEFERIPRONE

**Indications** see notes above

**Cautions** monitor neutrophil count weekly and discontinue treatment if neutropenia develops; monitor plasma-zinc concentration

**Blood disorders** Patients or their carers should be told how to recognise signs of neutropenia and advised to seek immediate medical attention if symptoms such as fever or sore throat develop

**Contra-indications** history of agranulocytosis or recurrent neutropenia

**Hepatic impairment** manufacturer advises monitor liver function—interrupt treatment if persistent elevation in serum alanine aminotransferase

**Renal impairment** manufacturer advises caution—no information available

**Pregnancy** manufacturer advises avoid before intended conception and during pregnancy—teratogenic and embryotoxic in *animal* studies; contraception advised in women of child-bearing potential

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** gastro-intestinal disturbances (reducing dose and increasing gradually may improve tolerance), increased appetite; headache; red-brown urine discoloration; neutropenia, agranulocytosis; zinc deficiency; arthropathy

#### Dose

- **ADULT** and **CHILD** over 6 years 25 mg/kg 3 times daily (max. 100 mg/kg daily)

**Ferriprox**® (Swedish Orphan) (POM)

**Tablets**, f/c, scored, deferiprone 500 mg, net price 100-tab pack = £152.39. Label: 14, counselling, blood disorders

**Oral solution**, red, deferiprone 100 mg/mL, net price 500 mL = £152.39. Label: 14, counselling, blood disorders

## DESFERIOXAMINE MESILATE

(Deferoxamine Mesilate)

**Indications** see notes above; iron poisoning, see Emergency Treatment of Poisoning, p. 38

**Cautions** eye and ear examinations before treatment and at 3-month intervals during treatment; monitor body-weight and height in children at 3-month intervals—risk of growth retardation with excessive doses; aluminium-related encephalopathy (may exacerbate neurological dysfunction); **interactions:** Appendix 1 (desferrioxamine)

**Renal impairment** use with caution

**Pregnancy** teratogenic in *animal* studies; manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** manufacturer advises use only if potential benefit outweighs risk—no information available

**Side-effects** nausea, vomiting, abdominal pain; headache; pyrexia; growth retardation and bone disorders (see Cautions); arthralgia, myalgia; hearing disturbances; injection-site reactions; *rarely* diarrhoea, hepatic impairment, hypotension (especially when given too rapidly by intravenous injection), anaphylaxis, Yersinia and mucormycosis infections, blood dyscrasias (including thrombocytopenia and leucopenia), leg cramps, bone pain, visual disturbances (including lens opacity and retinopathy), rash; *very rarely* acute respiratory distress, neurological disturbances (including dizziness, neuropathy, convulsions, and paraesthesia), renal impairment; muscle spasms also reported

#### Dose

- See notes above; iron poisoning, see Emergency Treatment of Poisoning, p. 38
- Note** For full details and warnings relating to administration, consult product literature

**Desferrioxamine mesilate** (Non-proprietary) (POM)

**Injection**, powder for reconstitution, desferrioxamine mesilate, net price 500-mg vial = £4.26; 2-g vial = £17.05

**Desferal®** (Novartis) (PAM)

**Injection**, powder for reconstitution, desferrioxamine mesilate, net price 500-mg vial = £4.67, 2-g vial = £18.66

**Paroxysmal nocturnal haemoglobinuria**

**Eculizumab**, a recombinant monoclonal antibody, inhibits terminal complement activation at the C5 protein and thereby reduces haemolysis. It is used to reduce haemolysis in paroxysmal nocturnal haemoglobinuria, a severe and disabling form of haemolytic anaemia.

**ECULIZUMAB**

**Indications** paroxysmal nocturnal haemoglobinuria, in those with a history of blood transfusions (specialist use only)

**Cautions** active systemic infection; monitor for intravascular haemolysis (including serum-lactate dehydrogenase concentration) for at least 8 weeks after discontinuation

**Meningococcal infection** Vaccinate against *Neisseria meningitidis* at least 2 weeks before treatment (tetravalent vaccine against serotypes A, C, W135 and Y recommended); revaccinate according to current medical guidelines. Advise patient to report promptly any signs of meningococcal infection. Other immunisations should also be up to date (section 14.1)

**Contra-indications** unresolved *Neisseria meningitidis* infection; patients unvaccinated against *Neisseria meningitidis* (see Cautions above); known or suspected hereditary complement deficiencies

**Pregnancy** no information available—use only if potential benefit outweighs risk; human IgG antibodies known to cross placenta; manufacturer advises effective contraception during and for 5 months after treatment

**Breast-feeding** no information available—manufacturer advises avoid breast-feeding during and for 5 months after treatment

**Side-effects** gastro-intestinal disturbances; oedema; cough, nasopharyngitis; headache, dizziness, fatigue, dysgeusia, paraesthesia; infection (including meningococcal infection); spontaneous erection, dysuria; arthralgia, myalgia; blood disorders (including thrombocytopenia); alopecia, pruritus, rash; influenza-like symptoms; infusion-related reactions; less commonly anorexia, gingival pain, jaundice, palpitation, haematoma, hypotension, chest pain, syncope, hot flushing, epistaxis, anxiety, depression, mood changes, sleep disturbances, Graves' disease, menstrual disorders, renal impairment, malignant melanoma, muscle spasms, myelodysplastic syndrome, visual disturbances, tinnitus, hyperhidrosis, petechiae, and skin depigmentation

**Dose**

- **By intravenous infusion**, **ADULT** over 18 years, initially 600 mg once a week for 4 weeks, then 900 mg on week 5; maintenance, 900 mg once every 12–16 days

**Soliris®** (Alexion) (PAM)

**Concentrate for intravenous infusion**, eculizumab 10 mg/mL, net price 30-mL vial = £3150.00. Counselling, meningococcal infection, patient information card  
**Electrolytes** Na<sup>+</sup> 5 mmol/vial

**9.1.4 Drugs used in platelet disorders****Idiopathic thrombocytopenic purpura**

Acute idiopathic thrombocytopenic purpura is usually self-limiting in children. In adults, idiopathic thrombocytopenic purpura can be treated with a **corticosteroid**, e.g. prednisolone 1 mg/kg daily, gradually reducing the dose over several weeks. Splenectomy is considered if a satisfactory platelet count is not achieved or if there is a relapse on reducing the dose of corticosteroid or withdrawing it.

**Immunoglobulin** preparations (section 14.5.1), are also used in idiopathic thrombocytopenic purpura or where a temporary rapid rise in platelets is needed, as in pregnancy or pre-operatively; they are also used for children often in preference to a corticosteroid. **Anti-D (Rh<sub>0</sub>) immunoglobulin** (section 14.5.3) is effective in raising the platelet count in about 80% of unsplenectomised rhesus-positive individuals; its effects may last longer than normal immunoglobulin for intravenous use, but further doses are usually required.

Other therapy that has been tried in refractory idiopathic thrombocytopenic purpura includes azathioprine (section 8.2.1), cyclophosphamide (section 8.1.1), vincristine (section 8.1.4), ciclosporin (section 8.2.2), and danazol (section 6.7.2). Rituximab (section 8.2.3) may also be effective and in some cases induces prolonged remission. For patients with chronic severe thrombocytopenia refractory to other therapy, tranexamic acid (section 2.11) may be given to reduce the severity of haemorrhage.

**Eltrombopag** and **romiplostim** are thrombopoietin receptor agonists licensed for the treatment of chronic idiopathic thrombocytopenic purpura in splenectomised patients refractory to other treatments, such as corticosteroids or immunoglobulins, or as a second-line treatment in non-splenectomised patients when surgery is contra-indicated (see also NICE guidance below). **Eltrombopag** is an oral preparation and **romiplostim** is an injection which is made biosynthetically by recombinant DNA technology; they should both be used under the supervision of a specialist.

The *Scottish Medicines Consortium* (p. 4) has advised (July 2010) that **eltrombopag** (*Revolade®*) is accepted for restricted use within NHS Scotland for the treatment of both splenectomised and non-splenectomised patients with severe symptomatic immune (idiopathic) thrombocytopenic purpura or a high risk of bleeding.

**NICE guidance****Eltrombopag for the treatment of chronic immune (idiopathic) thrombocytopenic purpura (October 2010)**

Eltrombopag is **not** recommended for the treatment of chronic immune (idiopathic) thrombocytopenic purpura in splenectomised adults refractory to other treatments, such as corticosteroids or immunoglobulins, or as a second-line treatment in non-splenectomised adults when surgery is contra-indicated.

The *Scottish Medicines Consortium* (p. 4) has advised (September 2009) that **romiplostim** (*Nplate®*) is

accepted for restricted use within NHS Scotland for patients with severe symptomatic idiopathic thrombocytopenic purpura or those at high risk of bleeding.

## ELTROMBOPAG

**Indications** see notes above

**Cautions** patients of East Asian origin (see under Dose); risk factors for thromboembolism; monitor full blood count including platelet count and peripheral blood smears every week during treatment until a stable platelet count is reached ( $50 \times 10^9$ /litre or more for at least 4 weeks), then monthly thereafter; monitor liver function before treatment, every two weeks when adjusting the dose, and monthly thereafter; regular ophthalmological examinations for cataract formation recommended; **interactions:** Appendix 1 (eltrombopag)

**Hepatic impairment** use with caution; avoid in moderate to severe impairment unless potential benefit outweighs risk—reduce initial dose to 25 mg once daily

**Renal impairment** use with caution

**Pregnancy** avoid—toxicity in *animal* studies; ensure effective contraception during treatment

**Breast-feeding** manufacturer advises avoid

**Side-effects** gastro-intestinal disturbances including nausea, diarrhoea, abdominal pain, and constipation; peripheral oedema; headache, insomnia, paraesthesia, fatigue; arthralgia, bone pain, myalgia; cataract, dry eye; pruritus, rash, alopecia; *less commonly* dry mouth, gingival bleeding, haemorrhoids, taste disturbances, cholestasis, hepatitis, anorexia, changes in appetite, weight gain, flushing, palpitation, QT-interval prolongation, hypertension, tachycardia, thromboembolic events (including deep vein thrombosis, pulmonary embolism, and acute myocardial infarction), cough, sleep disorders, mood changes, depression, anxiety, dizziness, migraine, hemiparesis, tremor, peripheral neuropathy, respiratory and urinary tract infections, renal failure, nocturia, rectosigmoid cancer, blood disorders (including anaemia, and thrombocytopenia), gout, eye disorders, vertigo, epistaxis, skin reactions including ecchymosis, and sweating

### Dose

- **ADULT** over 18 years, initially 50 mg once daily (patients of **EAST ASIAN** origin such as Chinese, Japanese, Taiwanese, or Korean, initially 25 mg once daily), adjusted to achieve a platelet count of  $50 \times 10^9$ /litre or more (consult product literature for dose adjustments); max. 75 mg once daily; discontinue if inadequate response after 4 weeks at maximum dose
- Counselling** Each dose should be taken at least 4 hours before or after any dairy products (or foods containing calcium), indigestion remedies, or medicines containing aluminium, calcium, iron, magnesium, zinc, or selenium to reduce possible interference with absorption

**Revolade**® (GSK) ▼ (POM)

Tablets, f/c, eltrombopag (as olamine) 25 mg (white), net price 28-tab pack = £770.00; 50 mg (brown), 28-tab pack = £1540.00. Counselling, see above

## ROMIPILOSTIM

**Indications** see notes above

**Cautions** monitor full blood count and peripheral blood smears for morphological abnormalities before

and during treatment; monitor platelet count weekly until  $50 \times 10^9$ /litre or more for at least 4 weeks without dose adjustment, then monthly thereafter

**Driving** Dizziness may affect performance of skilled tasks (e.g. driving)

**Hepatic impairment** manufacturer advises caution—no information available

**Renal impairment** manufacturer advises caution—no information available

**Pregnancy** manufacturer advises use only if essential—toxicity in *animal* studies

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** gastro-intestinal disturbances; flushing, oedema; dizziness, migraine, insomnia, fatigue, asthenia, paraesthesia; influenza-like symptoms; arthralgia, myalgia, bone pain, muscle spasm; increased bone marrow reticulini; ecchymosis, rash; injection-site reactions

### Dose

- **By subcutaneous injection, ADULT** over 18 years, initially 1 microgram/kg once weekly, adjusted in steps of 1 microgram/kg at weekly intervals until a stable platelet count of  $50 \times 10^9$ /litre or more is reached (consult product literature for dose adjustments); max. 10 micrograms/kg once weekly; discontinue if inadequate response after 4 weeks at maximum dose

**Nplate**® (Amgen) ▼ (POM)

**Injection**, powder for reconstitution, romiplostim, net price 250-microgram vial (available with or without solvent) = £482.00

## Essential thrombocythaemia

**Anagrelide** inhibits platelet formation. It is licensed for essential thrombocythaemia in patients at risk of thrombo-haemorrhagic events who have not responded adequately to other drugs or who cannot tolerate other drugs. Anagrelide should be initiated under specialist supervision.

## ANAGRELIDE

**Indications** see notes above

**Cautions** cardiovascular disease—assess cardiac function before and during treatment; concomitant aspirin in patients at risk of haemorrhage; monitor full blood count (monitor platelet count every 2 days for 1 week, then weekly until maintenance dose established), liver function, serum creatinine and urea; **interactions:** Appendix 1 (anagrelide)

**Driving** Dizziness may affect performance of skilled tasks (e.g. driving)

**Hepatic impairment** manufacturer advises caution in mild impairment; avoid in moderate to severe impairment

**Renal impairment** manufacturer advises avoid if eGFR less than 50 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** manufacturer advises avoid (toxicity in *animal* studies)

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** gastro-intestinal disturbances; palpitation, tachycardia, fluid retention; headache, dizziness, fatigue; anaemia; rash; *less commonly* pancreatitis, gastro-intestinal haemorrhage, congestive heart failure, hypertension, arrhythmias, syncope, chest pain, dyspnoea, sleep disturbances, paraesthesia, hypoaesthesia, depression, nervousness, confusion, amnesia, fever, weight changes, impotence, blood disorders, myalgia, arthralgia, epistaxis, dry mouth, alopecia, skin discoloration, and pruritus; *rarely* gastritis, colitis, postural hypotension, angina, myocardial infarction, vasodilatation, pulmonary hypotension, pulmonary infiltrates, migraine, drowsiness, impaired coordination, dysarthria, asthenia, tinnitus, renal failure, nocturia, visual disturbances, and gingival bleeding; allergic alveolitis and hepatitis also reported

#### Dose

- Initially 500 micrograms twice daily adjusted according to response in steps of 500 micrograms daily at weekly intervals to max. 10 mg daily (max. single dose 2.5 mg); usual dose range 1–3 mg daily in divided doses

**Xagrid®** (Shire) ▼ (POM)

**Capsules**, anagrelide (as hydrochloride), 500 micrograms, net price 100-cap pack = £337.14. Counseling, driving, see above

## 9.1.5 G6PD deficiency

Glucose 6-phosphate dehydrogenase (G6PD) deficiency is highly prevalent in individuals originating from most parts of Africa, from most parts of Asia, from Oceania, and from Southern Europe; it can also occur, rarely, in any other individuals. G6PD deficiency is more common in males than it is in females.

Individuals with G6PD deficiency are susceptible to developing acute haemolytic anaemia when they take a number of common drugs. They are also susceptible to developing acute haemolytic anaemia when they eat fava beans (broad beans, *Vicia faba*); this is termed *favism* and can be more severe in children or when the fresh fava beans are eaten raw.

When prescribing drugs for patients with G6PD deficiency, the following three points should be kept in mind:

- G6PD deficiency is genetically heterogeneous; susceptibility to the haemolytic risk from drugs varies; thus, a drug found to be safe in some G6PD-deficient individuals may not be equally safe in others;
- manufacturers do not routinely test drugs for their effects in G6PD-deficient individuals;
- the risk and severity of haemolysis is almost always dose-related.

The lists below should be read with these points in mind. Ideally, information about G6PD deficiency should be available before prescribing a drug listed below. However, in the absence of this information, the possibility of haemolysis should be considered, especially if the patient belongs to a group in which G6PD deficiency is common.

A very few G6PD-deficient individuals with chronic non-spherocytic haemolytic anaemia have haemolysis even

in the absence of an exogenous trigger. These patients must be regarded as being at high risk of severe exacerbation of haemolysis following administration of any of the drugs listed below.

#### Drugs with definite risk of haemolysis in most G6PD-deficient individuals

Dapsone and other sulfones (higher doses for dermatitis herpetiformis more likely to cause problems)  
Methylthioninium chloride  
Niridazole [not on UK market]  
Nitrofurantoin  
Pamaquin [not on UK market]  
Primaquine (30 mg weekly for 8 weeks has been found to be without undue harmful effects in African and Asian people, see section 5.4.1)  
Quinolones (including ciprofloxacin, moxifloxacin, nalidixic acid, norfloxacin, and ofloxacin)  
Rasburicase  
Sulfonamides (including co-trimoxazole; some sulfonamides, e.g. sulfadiazine, have been tested and found not to be haemolytic in many G6PD-deficient individuals)

#### Drugs with possible risk of haemolysis in some G6PD-deficient individuals

Aspirin (acceptable up to a dose of at least 1 g daily in most G6PD-deficient individuals)  
Chloroquine (acceptable in acute malaria and malaria chemoprophylaxis)  
Menadione, water-soluble derivatives (e.g. menadiol sodium phosphate)  
Probenecid [not on UK market]  
Quinidine (acceptable in acute malaria) [not on UK market]  
Quinine (acceptable in acute malaria)

**Note** Naphthalene in mothballs also causes haemolysis in individuals with G6PD deficiency

## 9.1.6 Drugs used in neutropenia

Recombinant human granulocyte-colony stimulating factor (rhG-CSF) stimulates the production of neutrophils and may reduce the duration of chemotherapy-induced neutropenia and thereby reduce the incidence of associated sepsis; there is as yet no evidence that it improves overall survival. **Filgrastim** (unglycosylated rhG-CSF) and **lenograstim** (glycosylated rhG-CSF) have similar effects; both have been used in a variety of clinical settings, but they do not have any clear-cut routine indications. In congenital neutropenia filgrastim usually increases the neutrophil count with an appropriate clinical response. Prolonged use may be associated with an increased risk of myeloid malignancy. **Pegfilgrastim** is a polyethylene glycol-conjugated ('pegylated') derivative of filgrastim; pegylation increases the duration of filgrastim activity.

Granulocyte-colony stimulating factors should only be prescribed by those experienced in their use.

**Cautions** Granulocyte-colony stimulating factors should be used with caution in patients with pre-malignant or malignant myeloid conditions. Full blood counts including differential white cell and platelet counts should be monitored. Treatment should be withdrawn in patients who develop signs of pulmonary infiltration. There have been reports of pulmonary infiltrates leading to acute respiratory distress syndrome—patients with a history of pulmonary infiltrates or pneumonia may be at higher risk. Granulocyte-colony stimulating factors should be used with caution in patients with sickle-cell disease. Spleen size should be monitored during treatment because there is a risk of splenomegaly and rupture.

**Pregnancy** There have been reports of toxicity in animal studies and manufacturers advise not to use granulocyte-colony stimulating factors during pregnancy unless the potential benefit outweighs the risk.

**Breast-feeding** There is no evidence for the use of granulocyte-colony stimulating factors during breast-feeding and manufacturers advise avoiding their use.

**Side-effects** Side-effects of granulocyte-colony stimulating factors include gastro-intestinal disturbances, anorexia, headache, asthenia, fever, musculoskeletal pain, bone pain, rash, alopecia, injection-site reactions, thrombocytopenia, and leucocytosis. *Less commonly* chest pain can occur. Pulmonary side-effects, particularly interstitial pneumonia (see Cautions above), cutaneous vasculitis and acute febrile neutrophilic dermatitis have *rarely* been reported.

## FILGRASTIM

(Recombinant human granulocyte-colony stimulating factor, G-CSF)

**Indications** (specialist use only) reduction in duration of neutropenia and incidence of febrile neutropenia in cytotoxic chemotherapy for malignancy (except chronic myeloid leukaemia and myelodysplastic syndromes); reduction in duration of neutropenia (and associated sequelae) in myeloablative therapy followed by bone-marrow transplantation; mobilisation of peripheral blood progenitor cells for harvesting and subsequent autologous or allogeneic infusion; severe congenital neutropenia, cyclic neutropenia, or idiopathic neutropenia and history of severe or recurrent infections (distinguish carefully from other haematological disorders, consult product literature); persistent neutropenia in advanced HIV infection

**Cautions** see notes above; also regular morphological and cytogenetic bone-marrow examinations recommended in severe congenital neutropenia (possible risk of myelodysplastic syndromes or leukaemia); secondary acute myeloid leukaemia; osteoporotic bone disease (monitor bone density if given for more than 6 months); **interactions:** Appendix 1 (filgrastim)

**Contra-indications** severe congenital neutropenia (Kostmann's syndrome) with abnormal cytogenetics

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; also mucositis, splenic enlargement, hepatomegaly, transient hypotension, epistaxis, urinary abnormalities (including dysuria, proteinuria, and haematuria), osteoporosis, exacerbation of rheumatoid arthritis, anaemia, transient decrease in blood glucose, pseudogout, and raised uric acid; *very rarely* splenic rupture

### Dose

- Cytotoxic-induced neutropenia, preferably by **subcutaneous injection** or by **intravenous infusion** (over 30 minutes), **ADULT** and **CHILD**, 500 000 units/kg daily started at least 24 hours after cytotoxic chemotherapy, continued until neutrophil count in normal range, usually for up to 14 days (up to 38 days in acute myeloid leukaemia)
- Myeloablative therapy followed by bone-marrow transplantation, by **intravenous infusion** over 30 minutes or over 24 hours or by **subcutaneous infusion** over 24 hours, 1 million units/kg daily, started at least 24 hours following cytotoxic chemotherapy (and within 24 hours of bone-marrow infusion), then adjusted according to neutrophil count (consult product literature)
- Mobilisation of peripheral blood progenitor cells for autologous infusion, used alone, by **subcutaneous injection** or by **subcutaneous infusion** over 24 hours, 1 million units/kg daily for 5–7 days; used following adjunctive myelosuppressive chemotherapy (to improve yield), by **subcutaneous injection**, 500 000 units/kg daily, started the day after completing chemotherapy and continued until neutrophil count in normal range; for timing of leucopheresis consult product literature
- Mobilisation of peripheral blood progenitor cells in normal donors for allogeneic infusion, by **subcutaneous injection**, **ADULT** under 60 years and **CHILD** over 16 years, 1 million units/kg daily for 4–5 days; for timing of leucopheresis consult product literature
- Severe chronic neutropenia, by **subcutaneous injection**, **ADULT** and **CHILD**, in severe congenital neutropenia, initially 1.2 million units/kg daily in single or divided doses (initially 500 000 units/kg daily in idiopathic or cyclic neutropenia), adjusted according to response (consult product literature)
- Persistent neutropenia in HIV infection, by **subcutaneous injection**, initially 100 000 units/kg daily, increased as necessary until neutrophil count in normal range (usual max. 400 000 units/kg daily), then adjusted to maintain neutrophil count in normal range (consult product literature)

**Neupogen®** (Amgen) (POM)

**Injection**, filgrastim 30 million-units (300 micrograms)/mL, net price 1-mL vial = £58.56

**Injection (Singleject®)**, filgrastim 60 million-units (600 micrograms)/mL, net price 0.5-mL prefilled syringe = £58.56; 96 million-units (960 micrograms)/mL, 0.5-mL prefilled syringe = £93.40

**Nivestim®** (Hospira) ▼ (POM)

**Injection**, prefilled syringe, filgrastim, net price 12 million-units (120 micrograms)/0.2 mL = £36.00; 30 million-units (300 micrograms)/0.5 mL = £58.00; 48 million-units (480 micrograms)/0.5 mL = £93.00

**Note** Biosimilar medicine, p. 1

**Ratiograstim**<sup>®</sup> (Ratiopharm UK) ▼ (PoM)

**Injection**, prefilled syringe, filgrastim, net price  
30 million-units (300 micrograms)/0.5 mL = £62.26;  
48 million-units (480 micrograms)/0.8 mL = £99.29

**Note** Biosimilar medicine, p 1

**Tevagrastim**<sup>®</sup> (TEVA UK) ▼ (PoM)

**Injection**, prefilled syringe, filgrastim, net price  
30 million-units (300 micrograms)/0.5 mL = £62.25;  
48 million-units (480 micrograms)/0.8 mL = £99.29

**Note** Biosimilar medicine, p 1

**Zarzio**<sup>®</sup> (Sandoz) ▼ (PoM)

**Injection**, prefilled syringe, filgrastim, net price  
30 million-units (300 micrograms)/0.5 mL = £59.00;  
48 million-units (480 micrograms)/0.5 mL = £94.00

**Note** Biosimilar medicine, p 1

**LENOGRASTIM**

(Recombinant human granulocyte-colony stimulating factor, rHuG-CSF)

**Indications** (specialist use only) reduction in the duration of neutropenia and associated complications following peripheral stem cells or bone-marrow transplantation for non-myeloid malignancy, or following treatment with cytotoxic chemotherapy associated with a significant incidence of febrile neutropenia; mobilisation of peripheral blood progenitor cells for harvesting and subsequent infusion

**Cautions** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; also mucositis, splenic rupture, and toxic epidermal necrolysis

**Dose**

- Following bone-marrow transplantation, by **intravenous infusion** or **subcutaneous injection**, **ADULT** and **CHILD** over 2 years 19.2 million units/m<sup>2</sup> daily started the day after transplantation, continued until neutrophil count stable in acceptable range (max. 28 days)
- Following peripheral stem cells transplantation, by **intravenous infusion** or **subcutaneous injection**, **ADULT** 19.2 million units/m<sup>2</sup> daily started the day after transplantation, continued until neutrophil count stable in acceptable range (max. 28 days); **CHILD** see *BNF for Children*
- Cytotoxic-induced neutropenia, by **subcutaneous injection**, **ADULT** 19.2 million units/m<sup>2</sup> daily started the day after completion of chemotherapy, continued until neutrophil count stable in acceptable range (max. 28 days); **CHILD** see *BNF for Children*
- Mobilisation of peripheral blood progenitor cells, used alone, by **subcutaneous injection**, **ADULT** 1.28 million units/kg daily for 4–6 days (5–6 days in healthy donors); used following adjunctive myelosuppressive chemotherapy (to improve yield), by **subcutaneous injection**, 19.2 million units/m<sup>2</sup> daily, started 1–5 days after completion of chemotherapy and continued until neutrophil count in acceptable range; for timing of leucopheresis consult product literature; **CHILD** see *BNF for Children*

**Granocyte**<sup>®</sup> (Chugai) (PoM)

**Injection**, powder for reconstitution, lenograstim, net price 13.4 million-unit (105-microgram) vial = £40.11; 33.6 million-unit (263-microgram) vial = £62.54 (both with 1-mL prefilled syringe water for injections)  
**Excipients** include phenylalanine (section 9.4.1)

**PEGFILGRASTIM**

(Pegylated recombinant methionyl human granulocyte-colony stimulating factor)

**Indications** (specialist use only) reduction in duration of neutropenia and incidence of febrile neutropenia in cytotoxic chemotherapy for malignancy (except chronic myeloid leukaemia and myelodysplastic syndromes)

**Cautions** see notes above; also acute leukaemia and myelosuppressive chemotherapy; **interactions:** Appendix 1 (filgrastim)

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; also *very rarely* splenic rupture

**Dose**

**Note** Dose expressed as filgrastim

- By **subcutaneous injection**, **ADULT** over 18 years, 6 mg (0.6 mL) for each chemotherapy cycle, starting 24 hours after chemotherapy

**Neulasta**<sup>®</sup> (Amgen) (PoM)

**Injection**, pegfilgrastim (expressed as filgrastim) 10 mg/mL, net price 0.6-mL (6-mg) prefilled syringe = £686.38

**9.1.7 Drugs used to mobilise stem cells**

**Plerixafor** is a chemokine receptor antagonist licensed to mobilise haematopoietic stem cells to peripheral blood for collection and subsequent autologous transplantation in patients with lymphoma or multiple myeloma. Plerixafor should be given under specialist supervision following 4 days treatment with a granulocyte-colony stimulating factor (section 9.1.6)

**PLERIXAFOR**

**Indications** see notes above

**Cautions** monitor platelet and white blood cell count

**Renal impairment** reduce dose to 160 micrograms/kg daily if creatinine clearance 20–50 mL/minute; no information available if creatinine clearance less than 20 mL/minute

**Pregnancy** manufacturer advises avoid unless essential and use effective contraception during treatment—teratogenic in *animal* studies

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** gastro-intestinal disturbances, dry mouth, oral hypoaesthesia; dizziness, headache, insomnia, fatigue; arthralgia, musculoskeletal pain; erythema, sweating; injection-site reactions; *less commonly* hypersensitivity reactions including dyspnoea and periorbital swelling

**Dose**

- By **subcutaneous injection**, **ADULT** over 18 years, 240 micrograms/kg daily 6–11 hours before initiation of apheresis; usual duration 2–4 days (max. 7 days)

**Mozobil**<sup>®</sup> (Genzyme) ▼ (PoM)

**Injection**, plerixafor 20 mg/mL, net price 1.2 mL-vial = £4882.77  
**Electrolytes** Na<sup>+</sup> <0.5 mmol/mL

## 9.2 Fluids and electrolytes

### 9.2.1 Oral preparations for fluid and electrolyte imbalance

### 9.2.2 Parenteral preparations for fluid and electrolyte imbalance

The following tables give a selection of useful electrolyte values:

#### Electrolyte concentrations—intravenous fluids

	Millimoles per litre				
Intravenous infusion	Na <sup>+</sup>	K <sup>+</sup>	HCO <sub>3</sub> <sup>-</sup>	Cl <sup>-</sup>	Ca <sup>2+</sup>
<i>Normal plasma values</i>	142	4.5	26	103	2.5
Sodium Chloride 0.9%	150	—	—	150	—
Compound Sodium Lactate (Hartmann's)	131	5	29	111	2
Sodium Chloride 0.18% and Glucose 4%	30	—	—	30	—
Potassium Chloride 0.3% and Glucose 5%	—	40	—	40	—
Potassium Chloride 0.3% and Sodium Chloride 0.9%	150	40	—	190	—
<i>To correct metabolic acidosis</i>					
Sodium Bicarbonate 1.26%	150	—	150	—	—
Sodium Bicarbonate 8.4% for cardiac arrest	1000	—	1000	—	—
Sodium Lactate (m/6)	167	—	167	—	—

#### Electrolyte content—gastro-intestinal secretions

Type of fluid	Millimoles per litre				
	H <sup>+</sup>	Na <sup>+</sup>	K <sup>+</sup>	HCO <sub>3</sub> <sup>-</sup>	Cl <sup>-</sup>
Gastric	40–60	20–80	5–20	—	100–150
Biliary	—	120–140	5–15	30–50	80–120
Pancreatic	—	120–140	5–15	70–110	40–80
Small bowel	—	120–140	5–15	20–40	90–130

Faeces, vomit, or aspiration should be saved and analysed where possible if abnormal losses are suspected; where this is impracticable the approximations above may be helpful in planning replacement therapy.

### 9.2.1 Oral preparations for fluid and electrolyte imbalance

#### 9.2.1.1 Oral potassium

#### 9.2.1.2 Oral sodium and water

#### 9.2.1.3 Oral bicarbonate

Sodium and potassium salts, which may be given by mouth to prevent deficiencies or to treat established deficiencies of mild or moderate degree, are discussed

in this section. Oral preparations for removing excess potassium and preparations for oral rehydration therapy are also included here. Oral bicarbonate, for metabolic acidosis, is also discussed in this section.

For reference to calcium, magnesium, and phosphate, see section 9.5.

#### 9.2.1.1 Oral potassium

Compensation for potassium loss is especially necessary:

- in those taking digoxin or anti-arrhythmic drugs, where potassium depletion may induce arrhythmias;
- in patients in whom secondary hyperaldosteronism occurs, e.g. renal artery stenosis, cirrhosis of the liver, the nephrotic syndrome, and severe heart failure;
- in patients with excessive losses of potassium in the faeces, e.g. chronic diarrhoea associated with intestinal malabsorption or laxative abuse.

Measures to compensate for potassium loss may also be required in the elderly since they frequently take inadequate amounts of potassium in the diet (but see below for **warning on renal insufficiency**). Measures may also be required during long-term administration of drugs known to induce potassium loss (e.g. corticosteroids). Potassium supplements are **seldom required** with the small doses of diuretics given to treat hypertension; **potassium-sparing diuretics** (rather than potassium supplements) are recommended for prevention of hypokalaemia due to diuretics such as furosemide or the thiazides when these are given to eliminate oedema.

**Dosage** If potassium salts are used for the *prevention of hypokalaemia*, then doses of potassium chloride 2 to 4 g (approx. 25 to 50 mmol) daily (in divided doses) by mouth are suitable in patients taking a normal diet. *Smaller doses* must be used if there is *renal insufficiency (common in the elderly)* to reduce the risk of **hyperkalaemia**. Potassium salts cause nausea and vomiting and poor compliance is a major limitation to their effectiveness; when appropriate, potassium-sparing diuretics are preferable (see also above). Regular monitoring of plasma-potassium concentration is essential in those taking potassium supplements. When there is *established potassium depletion* larger doses may be necessary, the quantity depending on the severity of any continuing potassium loss (monitoring of plasma-potassium concentration and specialist advice would be required). Potassium depletion is frequently associated with chloride depletion and with metabolic alkalosis, and these disorders require correction.

**Administration** Potassium salts are preferably given as a liquid (or effervescent) preparation, rather than modified-release tablets; they should be given as the chloride (the use of effervescent potassium tablets BPC 1968 should be restricted to *hyperchloraemic states*, section 9.2.1.3).

**Salt substitutes** A number of salt substitutes which contain significant amounts of potassium chloride are readily available as health food products (e.g. *LoSalt*® and *Ruthmol*®). These should not be used by patients with renal failure as potassium intoxication may result.

## POTASSIUM CHLORIDE

**Indications** potassium depletion (see notes above)

**Cautions** see notes above; cardiac disease; elderly; with *modified-release preparations*, intestinal stricture, history of peptic ulcer, hiatus hernia; **interactions:** Appendix 1 (potassium salts)

**Contra-indications** plasma-potassium concentration above 5 mmol/litre

**Renal impairment** close monitoring required—risk of hyperkalaemia; avoid in severe impairment

**Side-effects** nausea, vomiting, abdominal pain, diarrhoea, flatulence; with *modified-release preparations*, gastro-intestinal obstruction, ulceration and bleeding also reported

### Dose

• See notes above

**Note** Do not confuse Effervescent Potassium Tablets BPC 1968 (section 9.2.1.3) with effervescent potassium chloride tablets. Effervescent Potassium Tablets BPC 1968 do not contain chloride ions and their use should be restricted to hyperchloraemic states (section 9.2.1.3).

**Kay-Cee-L®** (Geistlich)

**Syrup**, sugar-free, red, potassium chloride 7.5% (1 mmol/mL each of K<sup>+</sup> and Cl<sup>-</sup>), net price 500 mL = £4.07. Label: 21

**Sando-K®** (HK Pharma)

**Tablets**, effervescent, potassium bicarbonate and chloride equivalent to potassium 470 mg (12 mmol of K<sup>+</sup>) and chloride 285 mg (8 mmol of Cl<sup>-</sup>). Net price 20 = £1.53. Label: 13, 21

### Modified-release preparations

Avoid unless effervescent tablets or liquid preparations inappropriate

**Slow-K®** (Alliance) 

**Tablets**, m/r, orange, s/c, potassium chloride 600 mg (8 mmol each of K<sup>+</sup> and Cl<sup>-</sup>), net price 100 = £2.14. Label: 25, 27, counselling, swallow whole with fluid during meals while sitting or standing

## Management of hyperkalaemia

*Acute severe hyperkalaemia* (plasma-potassium concentration above 6.5 mmol/L or in the presence of ECG changes) calls for urgent treatment with 10–20 mL of calcium gluconate 10% by slow intravenous injection, titrated and adjusted to ECG improvement, to temporarily protect against myocardial excitability. An intravenous injection of soluble insulin (5–10 units) with 50 mL glucose 50% given over 5–15 minutes, reduces serum-potassium concentration; this is repeated if necessary or a continuous infusion instituted. Salbutamol (unlicensed indication), by nebulisation or slow intravenous injection may also reduce plasma-potassium concentration; it should be used with caution in patients with cardiovascular disease. The correction of causal or compounding acidosis with sodium bicarbonate infusion (section 9.2.2) should be considered (**important:** preparations of sodium bicarbonate and calcium salts should not be administered in the same line—risk of precipitation). Drugs exacerbating hyperkalaemia should be reviewed and stopped as appropriate; occasionally haemodialysis is needed.

Ion-exchange resins may be used to remove excess potassium in *mild hyperkalaemia* or in *moderate hyperkalaemia* when there are no ECG changes.

## POLYSTYRENE SULPHONATE RESINS

**Indications** hyperkalaemia associated with anuria or severe oliguria, and in dialysis patients

**Cautions** children (impaction of resin with excessive dosage or inadequate dilution); monitor for electrolyte disturbances (stop if plasma-potassium concentration below 5 mmol/litre); *sodium-containing resin* in congestive heart failure, hypertension, and oedema; **interactions:** Appendix 1 (polystyrene sulphonate resins)

**Contra-indications** obstructive bowel disease; neonates with reduced gut motility; *calcium-containing resin* in hyperparathyroidism, multiple myeloma, sarcoidosis, or metastatic carcinoma

**Renal impairment** use *sodium-containing resin* with caution

**Pregnancy** manufacturers advise use only if potential benefit outweighs risk—no information available

**Breast-feeding** manufacturers advise use only if potential benefit outweighs risk—no information available

**Side-effects** faecal impaction following rectal administration, gastro-intestinal concretions following oral administration, intestinal necrosis reported with concomitant use of sorbitol, gastric irritation, anorexia, nausea, vomiting, constipation (discontinue treatment—avoid magnesium-containing laxatives), diarrhoea, hypomagnesaemia; gastro-intestinal obstruction, ulceration, necrosis, and ischaemic colitis also reported; with *calcium-containing resin*, hypercalcaemia (including in dialysed patients and occasionally in those with renal impairment); with *sodium-containing resin*, sodium retention, hypocalcaemia

### Dose

- **By mouth**, 15 g 3–4 times daily in water (not fruit squash which has a high potassium content) or as a paste; **CHILD** 0.5–1 g/kg daily in divided doses
- **By rectum**, as an enema, 30 g in methylcellulose solution, retained for 9 hours followed by irrigation to remove resin from colon; **NEONATE** and **CHILD**, 0.5–1 g/kg daily

**Calcium Resonium®** (Sanofi-Aventis)

**Powder**, buff, calcium polystyrene sulphonate. Net price 300 g = £68.47. Label: 13

**Resonium A®** (Sanofi-Aventis)

**Powder**, buff, sodium polystyrene sulphonate. Net price 454 g = £67.50. Label: 13

### 9.2.1.2 Oral sodium and water

Sodium chloride is indicated in states of sodium depletion and usually needs to be given intravenously (section 9.2.2). In chronic conditions associated with mild or moderate degrees of sodium depletion, e.g. in salt-losing bowel or renal disease, oral supplements of sodium chloride or sodium bicarbonate (section 9.2.1.3), according to the acid-base status of the patient, may be sufficient.

## SODIUM CHLORIDE

**Indications** sodium depletion—see also 9.2.2.1; nebuliser diluent (section 3.1.5); eye (section 11.8.1); oral hygiene (section 12.3.4); wound irrigation (section 13.11.1)

**Slow Sodium**® (HK Pharma)

**Tablets**, m/r, sodium chloride 600 mg (approx. 10 mmol each of  $\text{Na}^+$  and  $\text{Cl}^-$ ). Net price 100-tablet pack = £6.05. Label: 25

**Dose** prophylaxis of sodium chloride deficiency 4–8 tablets daily with water (in severe depletion up to max. 20 tablets daily)  
Chronic renal salt wasting, up to 20 tablets daily with appropriate fluid intake

**CHILD** see *BNF for Children*

## Oral rehydration therapy (ORT)

As a worldwide problem *diarrhoea* is by far the most important indication for fluid and electrolyte replacement. Intestinal absorption of sodium and water is enhanced by glucose (and other carbohydrates). Replacement of fluid and electrolytes lost through *diarrhoea* can therefore be achieved by giving solutions containing sodium, potassium, and glucose or another carbohydrate such as rice starch.

Oral rehydration solutions should:

- enhance the absorption of water and electrolytes;
- replace the electrolyte deficit adequately and safely;
- contain an alkalinising agent to counter acidosis;
- be slightly hypo-osmolar (about 250 mmol/litre) to prevent the possible induction of osmotic *diarrhoea*;
- be simple to use in hospital and at home;
- be palatable and acceptable, especially to children;
- be readily available.

It is the policy of the World Health Organization (WHO) to promote a single oral rehydration solution but to use it flexibly (e.g. by giving extra water between drinks of oral rehydration solution to moderately dehydrated infants).

Oral rehydration solutions used in the UK are lower in sodium (50–60 mmol/litre) than the WHO formulation since, in general, patients suffer less severe sodium loss.

Rehydration should be rapid over 3 to 4 hours (except in hypernatraemic dehydration in which case rehydration should occur more slowly over 12 hours). The patient should be reassessed after initial rehydration and if still dehydrated rapid fluid replacement should continue.

Once rehydration is complete further dehydration is prevented by encouraging the patient to drink normal volumes of an appropriate fluid and by replacing continuing losses with an oral rehydration solution; in infants, breast-feeding or formula feeds should be offered between oral rehydration drinks.

For intravenous rehydration see section 9.2.2.

## ORAL REHYDRATION SALTS (ORS)

**Indications** fluid and electrolyte loss in *diarrhoea*, see notes above

**Dose**

- According to fluid loss, usually 200–400 mL solution after every loose motion; **INFANT** 1–1½ times usual feed volume; **CHILD** 200 mL after every loose motion

### UK formulations

**Note** After reconstitution any unused solution should be discarded no later than 1 hour after preparation unless stored in a refrigerator when it may be kept for up to 24 hours

**Dioralyte**® (Sanofi-Aventis)

**Oral powder**, sodium chloride 470 mg, potassium chloride 300 mg, disodium hydrogen citrate 530 mg, glucose 3.56 g/sachet, net price 6-sachet pack = £2.25, 20-sachet pack (black currant- or citrus-flavoured or natural) = £6.72

**Note** Reconstitute 1 sachet with 200 mL of water (freshly boiled and cooled for infants); 5 sachets reconstituted with 1 litre of water provide  $\text{Na}^+$  60 mmol,  $\text{K}^+$  20 mmol,  $\text{Cl}^-$  60 mmol, citrate 10 mmol, and glucose 90 mmol

**Dioralyte**® Relief (Sanofi-Aventis)

**Oral powder**, sodium chloride 350 mg, potassium chloride 300 mg, sodium citrate 580 mg, cooked rice powder 6 g/sachet, net price 6-sachet pack (apricot-, black currant- or raspberry-flavoured) = £2.50, 20-sachet pack (apricot-flavoured) = £7.13

**Note** Reconstitute 1 sachet with 200 mL of water (freshly boiled and cooled for infants); 5 sachets when reconstituted with 1 litre of water provide  $\text{Na}^+$  60 mmol,  $\text{K}^+$  20 mmol,  $\text{Cl}^-$  50 mmol and citrate 10 mmol; contains aspartame (section 9.4.1)

**Electrolade**® (Actavis)

**Oral powder**, sodium chloride 236 mg, potassium chloride 300 mg, sodium bicarbonate 500 mg, anhydrous glucose 4 g/sachet (banana-, black currant-, lemon and lime-, or orange-flavoured). Net price 6-sachet (plain or multiflavoured) pack = £1.33, 20-sachet (single- or multiflavoured) pack = £4.99

**Note** Reconstitute 1 sachet with 200 mL of water (freshly boiled and cooled for infants); 5 sachets when reconstituted with 1 litre of water provide  $\text{Na}^+$  50 mmol,  $\text{K}^+$  20 mmol,  $\text{Cl}^-$  40 mmol,  $\text{HCO}_3^-$  30 mmol, and glucose 111 mmol

### WHO formulation

**Oral Rehydration Salts** (Non-proprietary)

**Oral powder**, sodium chloride 2.6 g, potassium chloride 1.5 g, sodium citrate 2.9 g, anhydrous glucose 13.5 g. To be dissolved in sufficient water to produce 1 litre (providing  $\text{Na}^+$  75 mmol,  $\text{K}^+$  20 mmol,  $\text{Cl}^-$  65 mmol, citrate 10 mmol, glucose 75 mmol/litre)

**Note** Recommended by the WHO and the United Nations Children's Fund but not commonly used in the UK.

### 9.2.1.3 Oral bicarbonate

**Sodium bicarbonate** is given by mouth for *chronic acidotic states* such as uraemic acidosis or renal tubular acidosis. The dose for correction of metabolic acidosis is not predictable and the response must be assessed; sodium bicarbonate 4.8 g daily (57 mmol each of  $\text{Na}^+$  and  $\text{HCO}_3^-$ ) or more may be required. For severe *metabolic acidosis*, sodium bicarbonate can be given intravenously (section 9.2.2).

Sodium bicarbonate may also be used to increase the pH of the urine (see section 7.4.3); for use in dyspepsia see section 1.1.1.

Sodium supplements may increase blood pressure or cause fluid retention and pulmonary oedema in those at risk; hypokalaemia may be exacerbated.

Where *hyperchloraemic acidosis* is associated with potassium deficiency, as in some renal tubular and gastro-intestinal disorders it may be appropriate to give oral **potassium bicarbonate**, although acute or severe deficiency should be managed by intravenous therapy.

## SODIUM BICARBONATE

**Indications** see notes above

**Cautions** see notes above; avoid in respiratory acidosis; **interactions:** Appendix 1 (antacids)

**Hepatic impairment** section 1.1.1

### Dose

- See notes above

**Sodium Bicarbonate** (Non-proprietary)

**Capsules**, sodium bicarbonate 500 mg (approx. 6 mmol each of  $\text{Na}^+$  and  $\text{HCO}_3^-$ ), net price 56-cap pack = £5.16

**Tablets**, sodium bicarbonate 600 mg, net price 100 = £2.48

**Important** Oral solutions of sodium bicarbonate are required occasionally; these are available from 'special-order' manufacturers or specialist importing companies, see p. 988; the strength of sodium bicarbonate should be stated on the prescription

## POTASSIUM BICARBONATE

**Indications** see notes above

**Cautions** elderly; cardiac disease; **interactions:** Appendix 1 (potassium salts)

**Contra-indications** hypochloaemia; plasma-potassium concentration above 5 mmol/litre

**Renal impairment** close monitoring required—high risk of hyperkalaemia; avoid in severe impairment

**Side-effects** nausea, vomiting, abdominal pain, diarrhoea, and flatulence

### Dose

- See notes above

**Potassium Tablets, Effervescent** (Non-proprietary)

**Effervescent tablets**, potassium bicarbonate 500 mg, potassium acid tartrate 300 mg, each tablet providing 6.5 mmol of  $\text{K}^+$ . To be dissolved in water before administration. Net price 56 = £33.38. Label: 13, 21

**Note** These tablets do not contain chloride; for effervescent tablets containing potassium and chloride, see under Potassium Chloride, section 9.2.1.1

## 9.2.2 Parenteral preparations for fluid and electrolyte imbalance

### 9.2.2.1 Electrolytes and water

#### 9.2.2.2 Plasma and plasma substitutes

### 9.2.2.1 Electrolytes and water

Solutions of electrolytes are given intravenously, to meet normal fluid and electrolyte requirements or to replenish substantial deficits or continuing losses, when the patient is nauseated or vomiting and is unable to take adequate amounts by mouth. When intravenous administration is not possible, fluid (as sodium chloride 0.9% or glucose 5%) can also be given by subcutaneous infusion (hypodermoclysis).

The nature and severity of the electrolyte imbalance must be assessed from the history and clinical and biochemical investigations. Sodium, potassium, chloride, magnesium, phosphate, and water depletion can occur singly and in combination with or without dis-

turbances of acid-base balance; for reference to the use of magnesium and phosphates, see section 9.5.

Isotonic solutions may be infused safely into a peripheral vein. Solutions more concentrated than plasma, e.g. 20% glucose, are best given through an indwelling catheter positioned in a large vein.

## Intravenous sodium

**Sodium chloride** in isotonic solution provides the most important extracellular ions in near physiological concentrations and is indicated in *sodium depletion*, which can arise from such conditions as gastro-enteritis, diabetic ketoacidosis, ileus, and ascites. In a severe deficit of 4 to 8 litres, 2 to 3 litres of isotonic sodium chloride may be given over 2 to 3 hours; thereafter the infusion can usually be at a slower rate. Excessive administration should be avoided; the jugular venous pressure should be assessed, the bases of the lungs should be examined for crepitations, and in elderly or seriously ill patients it is often helpful to monitor the right atrial (central) venous pressure.

Chronic hyponatraemia arising from inappropriate secretion of antidiuretic hormone should ideally be corrected by fluid restriction. However, if sodium chloride is required for acute or chronic hyponatraemia, regardless of the cause, the deficit should be corrected slowly to avoid the risk of osmotic demyelination syndrome and the rise in plasma-sodium concentration should not exceed 10 mmol/litre in 24 hours. In severe hyponatraemia, sodium chloride 1.8% may be used cautiously.

**Compound sodium lactate** (Hartmann's solution) can be used instead of isotonic sodium chloride solution during or after surgery, or in the initial management of the injured or wounded; it may reduce the risk of hyperchloraemic acidosis.

**Sodium chloride and glucose** solutions are indicated when there is combined *water and sodium depletion*. A 1:1 mixture of isotonic sodium chloride and 5% glucose allows some of the water (free of sodium) to enter body cells which suffer most from dehydration while the sodium salt with a volume of water determined by the normal plasma  $\text{Na}^+$  remains extracellular. Maintenance fluid should accurately reflect daily requirements and close monitoring is required to avoid fluid and electrolyte imbalance. Illness or injury increase the secretion of anti-diuretic hormone and therefore the ability to excrete excess water may be impaired. Injudicious use of hypotonic solutions such as sodium chloride 0.18% and glucose 4% may also cause dilutional hyponatraemia especially in children and the elderly; if necessary, guidance should be sought from a clinician experienced in the management of fluid and electrolytes.

Combined sodium, potassium, chloride, and water depletion may occur, for example, with severe diarrhoea or persistent vomiting; replacement is carried out with sodium chloride intravenous infusion 0.9% and glucose intravenous infusion 5% with potassium as appropriate.

## SODIUM CHLORIDE

**Indications** electrolyte imbalance—see also section 9.2.1.2; nebuliser diluent (section 3.1.5); eye (section 11.8.1); oral hygiene (section 12.3.4); wound irrigation (section 13.11.1)

**Cautions** restrict intake in impaired renal function, cardiac failure, hypertension, peripheral and pulmonary oedema, toxæmia of pregnancy

**Side-effects** administration of large doses may give rise to sodium accumulation, oedema, and hyperchloraemic acidosis

#### Dose

- See notes above

**Sodium Chloride Intravenous Infusion** (Non-proprietary) (PoM)

**Intravenous infusion**, usual strength sodium chloride 0.9% (9 g, 150 mmol each of Na<sup>+</sup> and Cl<sup>-</sup>/litre), this strength being supplied when normal saline for injection is requested. Net price 2-mL amp = 32p; 5-mL amp = 38p; 10-mL amp = 52p; 20-mL amp = £1.04; 50-mL amp = £3.63

In hospitals, 500- and 1000-mL packs, and sometimes other sizes, are available

**Note** The term 'normal saline' should not be used to describe sodium chloride intravenous infusion 0.9%, the term 'physiological saline' is acceptable but it is preferable to give the composition (i.e. sodium chloride intravenous infusion 0.9%).

#### With other ingredients

**Sodium Chloride and Glucose Intravenous Infusion** (Non-proprietary) (PoM)

**Intravenous infusion**, sodium chloride 0.18% (Na<sup>+</sup> and Cl<sup>-</sup> each 30 mmol/litre), glucose 4%

In hospitals, usually 500-mL packs and sometimes other sizes are available

**Intravenous infusion**, sodium chloride 0.45% (Na<sup>+</sup> and Cl<sup>-</sup> each 75 mmol/litre), glucose 2.5%

In hospitals, usually 500-mL packs and sometimes other sizes are available

**Intravenous infusion**, sodium chloride 0.45% (Na<sup>+</sup> and Cl<sup>-</sup> each 75 mmol/litre), glucose 5%

In hospitals, usually 500-mL packs and sometimes other sizes are available

**Intravenous infusion**, sodium chloride 0.9% (Na<sup>+</sup> and Cl<sup>-</sup> each 150 mmol/litre), glucose 5%

In hospitals, usually 500-mL packs and sometimes other sizes are available

**Note** See above for warning on hyponatraemia especially in children and elderly

**Ringer's Solution for Injection** (PoM)

Calcium chloride (dihydrate) 322 micrograms, potassium chloride 300 micrograms, sodium chloride 8.6 mg/mL, providing the following ions (in mmol/litre), Ca<sup>2+</sup> 2.2, K<sup>+</sup> 4, Na<sup>+</sup> 147, Cl<sup>-</sup> 156

In hospitals, 500- and 1000-mL packs, and sometimes other sizes, are available

**Sodium Lactate Intravenous Infusion, Compound**

(Non-proprietary) (PoM)

**(Hartmann's Solution for Injection; Ringer-Lactate Solution for Injection)**

**Intravenous infusion**, sodium chloride 0.6%, sodium lactate 0.32%, potassium chloride 0.04%, calcium chloride 0.027% (containing Na<sup>+</sup> 131 mmol, K<sup>+</sup> 5 mmol, Ca<sup>2+</sup> 2 mmol, HCO<sub>3</sub><sup>-</sup> (as lactate) 29 mmol, Cl<sup>-</sup> 111 mmol/litre)

In hospitals, 500- and 1000-mL packs, and sometimes other sizes, are available

## Intravenous glucose

Glucose solutions (5%) are used mainly to replace water deficit and should not be given alone except when there is no significant loss of electrolytes; prolonged admin-

istration of glucose solutions without electrolytes can lead to hyponatraemia and other electrolyte disturbances. Average water requirements in a healthy adult are 1.5 to 2.5 litres daily and this is needed to balance unavoidable losses of water through the skin and lungs and to provide sufficient for urinary excretion. Water depletion (dehydration) tends to occur when these losses are not matched by a comparable intake, as may occur in coma or dysphagia or in the elderly or apathetic who may not drink enough water on their own initiative.

Excessive loss of water without loss of electrolytes is uncommon, occurring in fevers, hyperthyroidism, and in uncommon water-losing renal states such as diabetes insipidus or hypercalcaemia. The volume of glucose solution needed to replace deficits varies with the severity of the disorder, but usually lies within the range of 2 to 6 litres.

Glucose solutions are also used to correct and prevent hypoglycaemia and to provide a source of energy in those too ill to be fed adequately by mouth; glucose solutions are a key component of parenteral nutrition (section 9.3).

Glucose solutions are given in regimens with calcium and insulin for the emergency management of *hyperkalaemia* (see p. 595). They are also given, after correction of hyperglycaemia, during treatment of diabetic ketoacidosis, when they must be accompanied by continuing insulin infusion.

## GLUCOSE

### (Dextrose Monohydrate)

**Note** Glucose BP is the monohydrate but Glucose Intravenous Infusion BP is a sterile solution of anhydrous glucose or glucose monohydrate, potency being expressed in terms of anhydrous glucose

**Indications** fluid replacement (see notes above), provision of energy (section 9.3); hypoglycaemia (section 6.1.4)

**Side-effects** glucose injections especially if hypertonic may have a low pH and may cause venous irritation and thrombophlebitis

#### Dose

- Water replacement, see notes above; energy source, 1–3 litres daily of 20–50% solution

**Glucose Intravenous Infusion** (Non-proprietary) (PoM)

**Intravenous infusion**, glucose or anhydrous glucose (potency expressed in terms of anhydrous glucose), usual strength 5% (50 mg/mL), 10% (100 mg/mL), and 20% (200 mg/mL); 20% solution, net price 20-mL amp = £2.04; 50% solution,<sup>1</sup> 20-mL amp = 95p, 50-mL vial = £2.13

In hospitals, 500- and 1000-mL packs, and sometimes other sizes and strengths, are available; also available as *Minijet® Glucose*, 50% in 50-mL disposable syringe<sup>1</sup>

- (PoM) restriction does not apply where administration is for saving life in emergency

## Intravenous potassium

Potassium chloride and sodium chloride intravenous infusion is the initial treatment for the correction of severe *hypokalaemia* and when sufficient potassium cannot be taken by mouth. Ready-mixed infusion solutions should be used when possible; alternatively, potassium chloride concentrate, as ampoules containing 1.5 g

( $K^+$  20 mmol) in 10 mL, is **thoroughly mixed** with 500 mL of sodium chloride 0.9% intravenous infusion and given slowly over 2 to 3 hours, with specialist advice and ECG monitoring in difficult cases. Higher concentrations of potassium chloride may be given in very severe depletion, but require specialist advice.

Repeated measurement of plasma-potassium concentration is necessary to determine whether further infusions are required and to avoid the development of hyperkalaemia, which is especially likely in renal impairment.

Initial potassium replacement therapy should **not** involve glucose infusions, because glucose may cause a further decrease in the plasma-potassium concentration.

## POTASSIUM CHLORIDE

**Indications** electrolyte imbalance; see also oral potassium supplements, section 9.2.1.1

**Cautions** for intravenous infusion the concentration of solution should not usually exceed 3 g (40 mmol)/litre; specialist advice and ECG monitoring (see notes above); **interactions:** Appendix 1 (potassium salts)

**Contra-indications** plasma-potassium concentration above 5 mmol/litre

**Renal impairment** close monitoring required—high risk of hyperkalaemia; avoid in severe impairment

**Side-effects** rapid infusion toxic to heart

### Dose

- **By slow intravenous infusion**, depending on the deficit or the daily maintenance requirements, see also notes above

### Potassium Chloride and Glucose Intravenous

**Infusion** (Non-proprietary) (PoM)

**Intravenous infusion**, usual strength potassium chloride 0.3% (3 g, 40 mmol each of  $K^+$  and  $Cl^-$ /litre) or 0.15% (1.5 g, 20 mmol each of  $K^+$  and  $Cl^-$ /litre) with 5% of anhydrous glucose

In hospitals, 500- and 1000-mL packs, and sometimes other sizes, are available

### Potassium Chloride and Sodium Chloride Intravenous Infusion

(Non-proprietary) (PoM)

**Intravenous infusion**, usual strength potassium chloride 0.15% (1.5 g/litre) with sodium chloride 0.9% (9 g/litre), containing  $K^+$  20 mmol,  $Na^+$  150 mmol, and  $Cl^-$  170 mmol/litre or potassium chloride 0.3% (3 g/litre) with sodium chloride 0.9% (9 g/litre), containing  $K^+$  40 mmol,  $Na^+$  150 mmol, and  $Cl^-$  190 mmol/litre

In hospitals, 500- and 1000-mL packs, and sometimes other sizes, are available

### Potassium Chloride, Sodium Chloride, and Glucose Intravenous Infusion

(Non-proprietary) (PoM)

**Intravenous infusion**, sodium chloride 0.45% (4.5 g,  $Na^+$  75 mmol/litre) with 5% of anhydrous glucose and usually sufficient potassium chloride to provide  $K^+$  10–40 mmol/litre (to be specified by the prescriber)

In hospitals, 500- and 1000-mL packs, and sometimes other sizes, are available

**Intravenous infusion**, sodium chloride 0.18% (1.8 g,  $Na^+$  30 mmol/litre) with 4% of anhydrous glucose and usually sufficient potassium chloride to provide  $K^+$  10–40 mmol/litre (to be specified by the prescriber)

In hospitals, 500- and 1000-mL packs, and sometimes other sizes, are available

### Potassium Chloride Concentrate, Sterile

(Non-proprietary) (PoM)

**Sterile concentrate**, potassium chloride 15%

(150 mg, approximately 2 mmol each of  $K^+$  and  $Cl^-$ /mL). Net price 10-mL amp = 48p

**Important** Must be diluted with **not less** than 50 times its volume of sodium chloride intravenous infusion 0.9% or other suitable diluent and **mixed well**

Solutions containing 10 and 20% of potassium chloride are also available in both 5- and 10-mL ampoules

## Bicarbonate and lactate

**Sodium bicarbonate** is used to control severe *metabolic acidosis* ( $pH < 7.1$ ) particularly that caused by loss of bicarbonate (as in renal tubular acidosis or from excessive gastro-intestinal losses). Mild metabolic acidosis associated with volume depletion should first be managed by appropriate fluid replacement because acidosis usually resolves as tissue and renal perfusion are restored. In more severe metabolic acidosis or when the acidosis remains unresponsive to correction of anaemia or hypovolaemia, sodium bicarbonate (1.26%) can be infused over 3–4 hours with plasma-pH and electrolyte monitoring. In severe shock (section 2.7.1), for example in cardiac arrest, metabolic acidosis can develop without sodium or volume depletion; in these circumstances sodium bicarbonate is best given as a small volume of hypertonic solution, such as 50 mL of 8.4% solution intravenously; plasma-pH and electrolytes should be monitored.

**Sodium lactate** intravenous infusion is no longer used in metabolic acidosis because of the risk of producing lactic acidosis, particularly in seriously ill patients with poor tissue perfusion or impaired hepatic function.

For *chronic acidotic states*, sodium bicarbonate can be given by mouth (section 9.2.1.3).

## SODIUM BICARBONATE

**Indications** metabolic acidosis, see also notes above  
**Hepatic impairment** section 1.1.1

### Dose

- **By slow intravenous injection**, a strong solution (up to 8.4%), or **by continuous intravenous infusion**, a weaker solution (usually 1.26%), an amount appropriate to the body base deficit (see notes above)

### Sodium Bicarbonate Intravenous Infusion

(PoM) Usual strength sodium bicarbonate 1.26% (12.6 g, 150 mmol each of  $Na^+$  and  $HCO_3^-$ /litre); various other strengths available

In hospitals, 500- and 1000-mL packs, and sometimes other sizes, are available

### Minijet® Sodium Bicarbonate

(UCB Pharma) (PoM)

**Intravenous injection**, sodium bicarbonate in disposable syringe, net price 4.2%, 10 mL = £11.03; 8.4%, 10 mL = £11.10, 50 mL = £12.15

## SODIUM LACTATE

**Indications** see notes above

### Sodium Lactate

(Non-proprietary) (PoM)

**Intravenous infusion**, sodium lactate M/6, contains the following ions (in mmol/litre),  $Na^+$  167,  $HCO_3^-$  (as lactate) 167

## Water

### Water for Injections (PoM)

Net price 1-mL amp = 18p; 2-mL amp = 20p; 5-mL amp = 36p; 10-mL amp = 37p, 10-mL vial = £1.40; 20-mL amp = 92p; 50-mL amp = £1.91; 100-mL vial = £2.01

### 9.2.2.2 Plasma and plasma substitutes

Plasma and plasma substitutes ('colloids') contain large molecules that do not readily leave the intravascular space where they exert osmotic pressure to maintain circulatory volume. Compared to fluids containing electrolytes such as sodium chloride and glucose ('crystalloids'), a smaller volume of colloid is required to produce the same expansion of blood volume, thereby shifting salt and water from the extravascular space. If resuscitation requires a volume of fluid that exceeds the maximum dose of the colloid then crystalloids can be given; packed red cells may also be required.

**Albumin solutions**, prepared from whole blood, contain soluble proteins and electrolytes but no clotting factors, blood group antibodies, or plasma cholinesterases; they may be given without regard to the recipient's blood group.

Albumin is usually used after the acute phase of illness, to correct a plasma-volume deficit; hypoalbuminaemia itself is not an appropriate indication. The use of albumin solutions in acute plasma or blood loss may be wasteful; plasma substitutes are more appropriate. Concentrated albumin solutions (20%) can be used under specialist supervision in patients with an intravascular fluid deficit and oedema because of interstitial fluid overload, to restore intravascular plasma volume with less exacerbation of the salt and water overload than isotonic solutions. Concentrated albumin solutions may also be used to obtain a diuresis in hypoalbuminaemic patients (e.g. in hepatic cirrhosis).

Recent evidence does not support the previous view that the use of albumin increases mortality.

Plasma and plasma substitutes are often used in very ill patients whose condition is unstable. Therefore, close monitoring is required and fluid and electrolyte therapy should be adjusted according to the patient's condition at all times.

## ALBUMIN SOLUTION

(Human Albumin Solution)

A solution containing protein derived from plasma, serum, or normal placentas; at least 95% of the protein is albumin. The solution may be isotonic (containing 3.5–5% protein) or concentrated (containing 15–25% protein).

**Indications** see under preparations, and also notes above

**Cautions** history of cardiac or circulatory disease (administer slowly to avoid rapid rise in blood pressure and cardiac failure, and monitor cardiovascular and respiratory function); increased capillary permeability; correct dehydration when administering concentrated solution

**Contra-indications** cardiac failure; severe anaemia

**Side-effects** hypersensitivity reactions (including anaphylaxis) with nausea, vomiting, increased saliva-

tion, fever, tachycardia, hypotension and chills reported

### ■ Isotonic solutions

**Indications:** acute or sub-acute loss of plasma volume e.g. in burns, pancreatitis, trauma, and complications of surgery; plasma exchange

Available as: *Human Albumin Solution 4.5%* (50-, 100-, 250- and 400-mL bottles—Baxter); *Human Albumin Solution 5%* (250- and 500-mL bottles—Baxter); *Albunorm® 5%* (100-, 250-, and 500-mL bottles—Octapharm); *Octalbin® 5%* (100- and 250-mL bottles—Octapharm); *Zenalb® 4.5%* (50-, 100-, 250-, and 500-mL bottles—BPL)

### ■ Concentrated solutions (20%)

**Indications:** severe hypoalbuminaemia associated with low plasma volume and generalised oedema where salt and water restriction with plasma volume expansion are required; adjunct in the treatment of hyperbilirubinaemia by exchange transfusion in the newborn; paracentesis of large volume ascites associated with portal hypertension

Available as: *Human Albumin Solution 20%* (50- and 100-mL vials—Baxter); *Albunorm® 20%* (50- and 100-mL bottles—Octapharm); *Flexbumin® 20%* (50- and 100-mL bags—Baxter); *Octalbin® 20%* (50- and 100-mL bottles—Octapharm); *Zenalb® 20%* (50- and 100-mL bottles—BPL)

## Plasma substitutes

**Dextran, gelatin**, and the **etherified starches** (heta-starch, pentastarch, and tetrastarch) are macromolecular substances which are metabolised slowly; they may be used at the outset to expand and maintain blood volume in shock arising from conditions such as burns or septicaemia. Plasma substitutes may be used as an immediate short-term measure to treat haemorrhage until blood is available. They are rarely needed when shock is due to sodium and water depletion because, in these circumstances, the shock responds to water and electrolyte repletion; see also section 2.7.1 for the management of shock.

Plasma substitutes should **not** be used to maintain plasma volume in conditions such as burns or peritonitis where there is loss of plasma protein, water, and electrolytes over periods of several days or weeks. In these situations, plasma or plasma protein fractions containing large amounts of albumin should be given.

Large volumes of *some* plasma substitutes can increase the risk of bleeding through depletion of coagulation factors.

Dextran 70 by intravenous infusion is used for volume expansion. Dextran may interfere with blood group cross-matching or biochemical measurements, and these should be carried out before infusion is begun.

Plasma and plasma substitutes are often used in very ill patients whose condition is unstable. Therefore, close monitoring is required and fluid and electrolyte therapy should be adjusted according to the patient's condition at all times.

**Cautions** Plasma substitutes should be used with caution in patients with cardiac disease, liver disease, or renal impairment; urine output should be monitored. Care should be taken to avoid haematocrit concentra-

tion from falling below 25–30% and the patient should be monitored for hypersensitivity reactions.

**Side-effects** Hypersensitivity reactions may occur including, rarely, severe anaphylactic reactions. Transient increase in bleeding time may occur.

## DEXTRAN 70

Dextrans of weight average molecular weight about '70 000'

**Indications** short-term blood volume expansion

**Cautions** see notes above; can interfere with some laboratory tests (see also above); where possible, monitor central venous pressure

**Pregnancy** avoid—reports of anaphylaxis in mother causing fetal anoxia, neurological damage and death

**Side-effects** see notes above

### Dose

- See under preparation below

## Hypertonic solution

**RescueFlow**<sup>®</sup> (Vitaline) (POM)

**Intravenous infusion**, dextran 70 intravenous infusion 6% in sodium chloride intravenous infusion 7.5%. Net price 250-mL bag = £28.50

**Cautions** see notes above; severe hyperglycaemia and hyperosmolality

**Dose** initial treatment of hypovolaemia with hypotension induced by traumatic injury, by **intravenous infusion** over 2–5 minutes, 250 mL, followed immediately by administration of isotonic fluids

## GELATIN

**Note** The gelatin is partially degraded

**Indications** low blood volume (but see notes above)

**Cautions** see notes above

**Pregnancy** manufacturer of *Geloplasma*<sup>®</sup> advises avoid at the end of pregnancy

**Side-effects** see notes above

### Dose

- By **intravenous infusion**, initially 500–1000 mL of a 3.5–4% solution (see notes above)

**Gelofusine**<sup>®</sup> (Braun) (POM)

**Intravenous infusion**, succinylated gelatin (modified fluid gelatin, average molecular weight 30 000) 40 g (4%), Na<sup>+</sup> 154 mmol, Cl<sup>-</sup> 120 mmol/litre, net price 500-mL *Ecobag*<sup>®</sup> = £5.15, 1-litre *Ecobag*<sup>®</sup> = £9.67

**Geloplasma**<sup>®</sup> (Fresenius Kabi) (POM)

**Intravenous infusion**, partially hydrolysed and succinylated gelatin (modified liquid gelatin) (as anhydrous gelatin) 30 g (3%), Na<sup>+</sup> 150 mmol, K<sup>+</sup> 5 mmol, Mg<sup>2+</sup> 1.5 mmol, Cl<sup>-</sup> 100 mmol, lactate 30 mmol/litre, net price 500-mL bag = £5.05

**Isoplex**<sup>®</sup> (Beacon) (POM)

**Intravenous infusion**, succinylated gelatin (modified fluid gelatin, average molecular weight 30 000) 40 g (4%), Na<sup>+</sup> 145 mmol, K<sup>+</sup> 4 mmol, Mg<sup>2+</sup> 0.9 mmol, Cl<sup>-</sup> 105 mmol, lactate 25 mmol/litre, net price 500-mL bag = £7.53, 1-litre bag = £14.54

**Volplex**<sup>®</sup> (Beacon) (POM)

**Intravenous infusion**, succinylated gelatin (modified fluid gelatin, average molecular weight 30 000) 40 g (4%), Na<sup>+</sup> 154 mmol, Cl<sup>-</sup> 125 mmol/litre, net price 500-mL bag = £4.70, 1-litre bag = £9.09

## ETHERIFIED STARCH

A starch composed of more than 90% of amylopectin that has been etherified with hydroxyethyl groups; the terms tetra starch, penta starch, and hexa starch reflect the degree of etherification

**Indications** low blood volume

**Cautions** see notes above; children

**Renal impairment** use with caution in mild to moderate impairment; avoid in severe impairment

**Side-effects** see notes above; also pruritus, raised serum amylase

### Dose

- See under preparations below

## Hetastarch

**Hetastarch** (Non-proprietary) (POM)

**Intravenous infusion**, hetastarch (weight average molecular weight 450 000) 6% in sodium chloride intravenous infusion 0.9%, net price 500-mL bag = £8.00

**Dose** by **intravenous infusion**, 500–1000 mL; usual daily max. 1500 mL (see notes above)

## Pentastarch

**Pentastarch** (Non-proprietary) (POM)

**Intravenous infusion**, pentastarch (weight average molecular weight 200 000), net price (in sodium chloride intravenous infusion 0.9%) 10%, 500-mL bag = £9.24

**Dose** by **intravenous infusion**, pentastarch 10%, 500–1000 mL; max. 1500 mL daily (see notes above)

**HAES-steril**<sup>®</sup> (Fresenius Kabi) (POM)

**Intravenous infusion**, pentastarch (weight average molecular weight 200 000) 10% in sodium chloride intravenous infusion 0.9%, net price 500 mL = £16.50

**Dose** by **intravenous infusion**, up to 1500 mL daily (see notes above)

**Hemohes**<sup>®</sup> (Braun) (POM)

**Intravenous infusion**, pentastarch (weight average molecular weight 200 000), net price (both in sodium chloride intravenous infusion 0.9%) 6%, 500 mL = £12.50; 10%, 500 mL = £16.50

**Cautions** see notes above

**Dose** by **intravenous infusion**, pentastarch 6%, up to 2500 mL daily; pentastarch 10%, up to 1500 mL daily (see notes above)

## Tetrastarch

**Tetraspan**<sup>®</sup> (Braun) (POM)

**Intravenous infusion**, hydroxyethyl starch (weight average molecular weight 130 000) 6% in sodium chloride 0.625%, containing Na<sup>+</sup> 140 mmol, K<sup>+</sup> 4 mmol, Mg<sup>2+</sup> 1 mmol, Cl<sup>-</sup> 118 mmol, Ca<sup>2+</sup> 2.5 mmol, acetate 24 mmol, malate 5 mmol/litre, net price 500-mL bag = £13.50

**Dose** by **intravenous infusion**, up to 50 mL/kg daily (see notes above)

**Intravenous infusion**, hydroxyethyl starch (weight average molecular weight 130 000) 10% in sodium chloride 0.625%, containing Na<sup>+</sup> 140 mmol, K<sup>+</sup> 4 mmol, Mg<sup>2+</sup> 1 mmol, Cl<sup>-</sup> 118 mmol, Ca<sup>2+</sup> 2.5 mmol, acetate 24 mmol, malate 5 mmol/litre, net price 500-mL bag = £17.50

**Dose** by **intravenous infusion**, up to 30 mL/kg daily (see notes above)

**Venofundin**<sup>®</sup> (Braun) (POM)

**Intravenous infusion**, hydroxyethyl starch (weight average molecular weight 130 000) 6% in sodium

chloride intravenous infusion 0.9%, net price 500-mL bag = £12.90

**Dose** by intravenous infusion, up to 50 mL/kg daily (see notes above)

**Volulyte®** (Fresenius Kabi) (Pom)

**Intravenous infusion**, hydroxyethyl starch (weight average molecular weight 130 000) 6% in sodium chloride intravenous infusion 0.6%, containing Na<sup>+</sup> 137 mmol, K<sup>+</sup> 4 mmol, Mg<sup>2+</sup> 1.5 mmol, Cl<sup>-</sup> 110 mmol, acetate 34 mmol/litre, net price 500-mL bag = £13.50

**Dose** by intravenous infusion, up to 50 mL/kg daily (see notes above)

**Voluven®** (Fresenius Kabi) (Pom)

**Intravenous infusion**, hydroxyethyl starch (weight average molecular weight 130 000) 6% in sodium chloride intravenous infusion 0.9%, net price 500-mL bag = £12.50

**Dose** by intravenous infusion, up to 50 mL/kg daily (see notes above)

▲ **Hypertonic solution**

**HyperHAES®** (Fresenius Kabi) (Pom)

**Intravenous infusion**, hydroxyethyl starch (weight average molecular weight 200 000) 6% in sodium chloride intravenous infusion 7.2%, net price 250-mL bag = £28.00

**Cautions** see notes above; also diabetes

**Dose** by intravenous injection over 2–5 minutes, 4 mL/kg as a single dose, followed immediately by administration of appropriate replacement fluids

## 9.3 Intravenous nutrition

When adequate feeding through the alimentary tract is not possible, nutrients may be given by intravenous infusion. This may be in addition to ordinary oral or tube feeding—**supplemental parenteral nutrition**, or may be the sole source of nutrition—**total parenteral nutrition (TPN)**. Indications for this method include preparation of undernourished patients for surgery, chemotherapy, or radiation therapy; severe or prolonged disorders of the gastro-intestinal tract; major surgery, trauma, or burns; prolonged coma or refusal to eat; and some patients with renal or hepatic failure. The composition of proprietary preparations available is given in the table Proprietary Infusion Fluids for Parenteral Feeding, p. 603.

Parenteral nutrition requires the use of a solution containing amino acids, glucose, fat, electrolytes, trace elements, and vitamins. This is now commonly provided by the pharmacy in the form of a 3-litre bag. A single dose of vitamin B<sub>12</sub>, as hydroxocobalamin, is given by intramuscular injection; regular vitamin B<sub>12</sub> injections are not usually required unless total parenteral nutrition continues for many months. Folic acid is given in a dose of 15 mg once or twice each week, usually in the nutrition solution. Other vitamins are usually given daily; they are generally introduced in the parenteral nutrition solution. Alternatively, if the patient is able to take small amounts by mouth, vitamins may be given orally.

The nutrition solution is infused through a central venous catheter inserted under full surgical precautions. Alternatively, infusion through a peripheral vein may be used for supplementary as well as total parenteral nutrition for periods of up to a month, depending on the availability of peripheral veins; factors prolonging cannula life and preventing thrombophlebitis include

the use of soft polyurethane paediatric cannulas and use of feeds of low osmolality and neutral pH. Only nutritional fluids should be given by the dedicated intravenous line.

Before starting, the patient should be well oxygenated with a near normal circulating blood volume and attention should be given to renal function and acid-base status. Appropriate biochemical tests should have been carried out beforehand and serious deficits corrected. Nutritional and electrolyte status must be monitored throughout treatment.

Complications of long-term parenteral nutrition include gall bladder sludging, gall stones, cholestasis and abnormal liver function tests. For details of the prevention and management of parenteral nutrition complications, specialist literature should be consulted.

**Protein** is given as mixtures of essential and non-essential synthetic L-amino acids. Ideally, all essential amino acids should be included with a wide variety of non-essential ones to provide sufficient nitrogen together with electrolytes (see also section 9.2.2). Solutions vary in their composition of amino acids; they often contain an energy source (usually glucose) and electrolytes.

**Energy** is provided in a ratio of 0.6 to 1.1 megajoules (150–250 kcal) per gram of protein nitrogen. Energy requirements must be met if amino acids are to be utilised for tissue maintenance. A mixture of carbohydrate and fat energy sources (usually 30–50% as fat) gives better utilisation of amino acids than glucose alone.

**Glucose** is the preferred source of carbohydrate, but if more than 180 g is given per day frequent monitoring of blood glucose is required, and insulin may be necessary. Glucose in various strengths from 10 to 50% must be infused through a central venous catheter to avoid thrombosis.

In parenteral nutrition regimens, it is necessary to provide adequate **phosphate** in order to allow phosphorylation of glucose and to prevent hypophosphataemia; between 20 and 30 mmol of phosphate is required daily.

Fructose and sorbitol have been used in an attempt to avoid the problem of hyperosmolar hyperglycaemic non-ketotic acidosis but other metabolic problems may occur, as with xylitol and ethanol which are now rarely used.

**Fat emulsions** have the advantages of a high energy to fluid volume ratio, neutral pH, and iso-osmolality with plasma, and provide essential fatty acids. Several days of adaptation may be required to attain maximal utilisation. Reactions include occasional febrile episodes (usually only with 20% emulsions) and rare anaphylactic responses. Interference with biochemical measurements such as those for blood gases and calcium may occur if samples are taken before fat has been cleared. Daily checks are necessary to ensure complete clearance from the plasma in conditions where fat metabolism may be disturbed. **Additives should not be mixed with fat emulsions unless compatibility is known.**

### Administration

Because of the complex requirements relating to parenteral nutrition full details relating to administration have been omitted. In all cases *product literature and other specialist literature should be consulted.*

## Proprietary Infusion Fluids for Parenteral Feeding

Preparation	Nitrogen g/litre	<sup>1,2</sup> Energy kJ/litre	Electrolytes mmol/litre				Other components/litre	
			K <sup>+</sup>	Mg <sup>2+</sup>	Na <sup>+</sup>	Acet <sup>-</sup> Cl <sup>-</sup>

## Supplementary preparations

Compatibility with the infusion solution must be ascertained before adding supplementary preparations.

### Addiphos® (Fresenius Kabi) (PmI)

**Solution**, sterile, phosphate 40 mmol, K<sup>+</sup> 30 mmol, Na<sup>+</sup> 30 mmol/20 mL. For addition to *Vamin*® solutions and glucose intravenous infusions. Net price 20-mL vial = £1.53

### Additrac® (Fresenius Kabi) (PmI)

**Solution**, trace elements for addition to *Vamin*® solutions and glucose intravenous infusions, traces of Fe<sup>3+</sup>, Zn<sup>2+</sup>, Mn<sup>2+</sup>, Cu<sup>2+</sup>, Cr<sup>3+</sup>, Se<sup>4+</sup>, Mo<sup>6+</sup>, F<sup>-</sup>, I<sup>-</sup>. For adults and children over 40 kg. Net price 10-mL amp = £2.31

### Cernevit® (Baxter) (PmI)

**Solution**, *d,l*-alpha tocopherol 11.2 units, ascorbic acid 125 mg, biotin 69 micrograms, coalfeciferol 220 units, cyanocobalamin 6 micrograms, folic acid 414 micrograms, glycine 250 mg, nicotinamide 46 mg, pantothenic acid (as dexpanthenol) 17.25 mg, pyridoxine hydrochloride 5.5 mg, retinol (as palmitate) 3500 units, riboflavin (as dihydrated sodium phosphate) 4.14 mg, thiamine (as cocarboxylase tetrahydrate) 3.51 mg. Dissolve in 5 mL water for injections. Net price per vial = £4.64

### Decan® (Baxter) (PmI)

**Solution**, trace elements for addition to infusion solutions, Fe<sup>2+</sup>, Zn<sup>2+</sup>, Cu<sup>2+</sup>, Mn<sup>2+</sup>, F<sup>-</sup>, Co<sup>2+</sup>, I<sup>-</sup>, Se<sup>4+</sup>, Mo<sup>6+</sup>, Cr<sup>3+</sup>. For adults over 40 kg. Net price 40-mL vial = £2.00

### Dipeptiven® (Fresenius Kabi) (PmI)

**Solution**, *N*(2)-L-alanyl-L-glutamine 200 mg/mL (providing L-alanine 82 mg, L-glutamine 134.6 mg). For addition to infusion solutions containing amino acids. Net price 50 mL = £16.40, 100 mL = £30.50  
**Dose** amino acid supplement for hypercatabolic or hypermetabolic states, 300–400 mg/kg daily; max. 400 mg/kg daily, dose not to exceed 20% of total amino acid intake

### Glycophos® Sterile Concentrate (Fresenius Kabi) (PmI)

**Solution**, sterile, phosphate 20 mmol, Na<sup>+</sup> 40 mmol/20 mL. For addition to *Vamin*® and *Vaminolact*® solutions, and glucose intravenous infusions. Net price 20-mL vial = £4.60

### Peditrac® (Fresenius Kabi) (PmI)

**Solution**, trace elements for addition to *Vaminolact*®, *Vamin*® 14 *Electrolyte-Free* solutions and glucose intravenous infusions, traces of Zn<sup>2+</sup>, Cu<sup>2+</sup>, Mn<sup>2+</sup>, Se<sup>4+</sup>, F<sup>-</sup>, I<sup>-</sup>. For use in neonates (when kidney function established, usually second day of life), infants, and children. Net price 10-mL vial = £4.18

**Cautions** reduced biliary excretion especially in cholestatic liver disease or in markedly reduced urinary excretion (careful biochemical monitoring required); total parenteral nutrition exceeding 1 month (measure serum manganese concentration and check liver function before commencing treatment and regularly during treatment)—discontinue if manganese concentration raised or if cholestasis develops

### Solvitro N® (Fresenius Kabi) (PmI)

**Solution**, powder for reconstitution, biotin 60 micrograms, cyanocobalamin 5 micrograms, folic acid 400 micrograms, glycine 300 mg, nicotinamide 40 mg, pyridoxine hydrochloride 4.9 mg, riboflavin sodium phosphate 4.9 mg, sodium ascorbate 113 mg, sodium

pantothenate 16.5 mg, thiamine mononitrate 3.1 mg. Dissolve in water for injections or glucose intravenous infusion for adding to glucose intravenous infusion or *Intralipid*®; dissolve in *Vitlipid N*® or *Intralipid*® for adding to *Intralipid*® only. Net price per vial = £2.32

### Tracutil® (Braun) (PmI)

**Solution**, trace elements for addition to infusion solutions, Fe<sup>2+</sup>, Zn<sup>2+</sup>, Mn<sup>2+</sup>, Cu<sup>2+</sup>, Cr<sup>3+</sup>, Se<sup>4+</sup>, Mo<sup>6+</sup>, I<sup>-</sup>, F<sup>-</sup>. For adults. Net price 10-mL amp = £1.90

### Vitlipid N® (Fresenius Kabi) (PmI)

**Emulsion, adult**, vitamin A 330 units, ergocalciferol 20 units, *d,l*-alpha tocopherol 1 unit, phytomenadione 15 micrograms/mL. For addition to *Intralipid*®. For adults and children over 11 years. Net price 10-mL amp = £2.32

**Emulsion, infant**, vitamin A 230 units, ergocalciferol 40 units, *d,l*-alpha tocopherol 0.7 unit, phytomenadione 20 micrograms/mL. For addition to *Intralipid*®. Net price 10-mL amp = £2.32

## 9.4 Oral nutrition

### 9.4.1 Foods for special diets

#### 9.4.2 Enteral nutrition

### 9.4.1 Foods for special diets

These are preparations that have been modified to eliminate a particular constituent from a food or that are nutrient mixtures formulated as food substitutes for patients who either cannot tolerate or cannot metabolise certain common constituents of food. In certain clinical conditions, some food preparations are regarded as drugs and can be prescribed within the NHS if they have been approved by the Advisory Committee on Borderline Substances (ACBS)—see Appendix 7.

**Phenylketonuria** Phenylketonuria (hyperphenylalaninaemia, PKU), which results from the inability to metabolise phenylalanine, is managed by restricting dietary intake of phenylalanine to a small amount sufficient for tissue building and repair.

**Sapropterin**, a synthetic form of tetrahydrobiopterin, is licensed as an adjunct to dietary restriction of phenylalanine in the management of patients with phenylketonuria and tetrahydrobiopterin deficiency.

**Aspartame** (used as a sweetener in some foods and medicines) contributes to the phenylalanine intake and may affect control of phenylketonuria. Where the presence of aspartame is specified in the product literature this is indicated in the BNF against the preparation; the patient should be informed of this.

**Coeliac disease** Intolerance to gluten in coeliac disease is managed by completely eliminating gluten from the diet. A range of gluten-free products is available for prescription—see Appendix 7, p. 925.

## SAPROPTERIN DIHYDROCHLORIDE

Note Sapropterin is a synthetic form of tetrahydrobiopterin

**Indications** see under Dose below

**Cautions** monitor blood-phenylalanine concentration before and after first week of treatment—if

unsatisfactory response increase dose at weekly intervals to max. dose and monitor blood-phenylalanine concentration weekly; discontinue treatment if unsatisfactory response after 1 month; monitor blood-phenylalanine and tyrosine concentrations 1–2 weeks after dose adjustment and during treatment; history of convulsions

**Hepatic impairment** manufacturer advises caution—no information available

**Renal impairment** manufacturer advises caution—no information available

**Pregnancy** manufacturer advises caution—consider only if strict dietary management inadequate

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** diarrhoea, vomiting, abdominal pain; nasal congestion, cough, pharyngolaryngeal pain; headache

#### Dose

- Phenylketonuria (specialist use only), by mouth, ADULT and CHILD over 4 years, initially 10 mg/kg once daily, preferably in the morning, adjusted according to response; usual dose 5–20 mg/kg daily
- Tetrahydrobiopterin deficiency (specialist use only), by mouth, ADULT and CHILD initially 2–5 mg/kg once daily, preferably in the morning, adjusted according to response; max. 20 mg/kg daily; total daily dose may alternatively be given in 2–3 divided doses

**Kuvan®** (Merck Serono) ▼ PsM

**Dispersible tablets**, sapropterin dihydrochloride 100 mg, net price 30-tab pack = £597.22, 120-tab pack = £2388.88. Label: 13, 21

**Counselling** Tablets should be dissolved in water and taken within 20 minutes

## 9.4.2 Enteral nutrition

The body's reserves of protein rapidly become exhausted in severely ill patients, especially during chronic illness or in those with severe burns, extensive trauma, pancreatitis, or intestinal fistula. Much can be achieved by frequent meals and by persuading the patient to take supplementary snacks of ordinary food between the meals.

However, extra calories, protein, other nutrients, and vitamins are often best given by supplementing ordinary meals with enteral sip or tube feeds (preparations, see Appendix 7).

When patients cannot feed normally, for example, patients with severe facial injury, oesophageal obstruction, or coma, a nutritionally complete diet of enteral feeds must be given. The advice of a dietician should be sought to determine the protein and total energy requirement of the patient and the form and relative contribution of carbohydrate and fat to the energy requirements.

Most enteral feeds contain protein derived from cows' milk or soya. Elemental feeds containing protein hydrolysates or free amino acids can be used for patients who have diminished ability to break down protein, for example in inflammatory bowel disease or pancreatic insufficiency.

Even when nutritionally complete feeds are given, water and electrolyte balance should be monitored. Haematological and biochemical parameters should also be

monitored, particularly in clinically unstable patients. Extra minerals (e.g. magnesium and zinc) may be needed in patients where gastro-intestinal secretions are being lost. Additional vitamins may also be needed. Feeds containing vitamin K may affect the INR in patients receiving warfarin—see **interactions**: Appendix 1 (vitamins).

**Children** Children have special requirements and in most situations liquid feeds prepared for adults are totally unsuitable—the advice of a paediatric dietician should be sought; see also *BNF for Children*, section 9.4.2

#### Preparations

See Borderline Substances, Appendix 7.

## 9.5 Minerals

**9.5.1 Calcium and magnesium**

**9.5.2 Phosphorus**

**9.5.3 Fluoride**

**9.5.4 Zinc**

**9.5.5 Selenium**

See section 9.1.1 for iron salts.

### 9.5.1 Calcium and magnesium

**9.5.1.1 Calcium supplements**

**9.5.1.2 Hypercalcaemia and hypercalciuria**

**9.5.1.3 Magnesium**

#### 9.5.1.1 Calcium supplements

Calcium supplements are usually only required where dietary calcium intake is deficient. This dietary requirement varies with age and is relatively greater in childhood, pregnancy, and lactation, due to an increased demand, and in old age, due to impaired absorption. In osteoporosis, a calcium intake which is double the recommended amount reduces the rate of bone loss. If the actual dietary intake is less than the recommended amount, a supplement of as much as 40 mmol is appropriate, see also Osteoporosis, p. 469 and Vitamin D, p. 617.

In severe acute hypocalcaemia or hypocalcaemic tetany, an initial slow intravenous injection of 10–20 mL of calcium gluconate injection 10% (providing approximately 2.25–4.5 mmol of calcium) should be given, with plasma-calcium and ECG monitoring (risk of arrhythmias if given too rapidly), and either repeated as required or, if only temporary improvement, followed by a continuous intravenous infusion to prevent recurrence. For infusion, dilute 100 mL of calcium gluconate 10% in 1 litre of glucose 5% or sodium chloride 0.9% and give at an initial rate of 50 mL/hour adjusted according to response. Calcium chloride injection is also available, but is more irritant; care should be taken to prevent extravasation. Oral supplements of calcium and vitamin D may also be required in persistent hypocalcaemia (see also section 9.6.4). Concurrent

hypomagnesaemia should be corrected with **magnesium sulphate** (section 9.5.1.3).

For the role of calcium gluconate in temporarily reducing the toxic effects of hyperkalaemia, see p. 595.

## CALCIUM SALTS

**Indications** see notes above; calcium deficiency

**Cautions** sarcoidosis; history of nephrolithiasis; avoid calcium chloride in respiratory acidosis or respiratory failure; **interactions:** Appendix 1 (antacids, calcium salts)

**Contra-indications** conditions associated with hypercalcaemia and hypercalciuria (e.g. some forms of malignant disease)

**Renal impairment** use with caution (but see also Calcium Gluconate injection, below)

**Side-effects** gastro-intestinal disturbances; bradycardia, arrhythmias; *with injection*, peripheral vaso-dilatation, fall in blood pressure, injection-site reactions, severe tissue damage with extravasation

### Dose

- **By mouth**, daily in divided doses, see notes above
- **By slow intravenous injection**, acute hypocalcaemia, calcium gluconate 1–2 g ( $\text{Ca}^{2+}$  2.25–4.5 mmol); **CHILD** see *BNF for Children*
- **By continuous intravenous infusion**, acute hypocalcaemia, see notes above

### Oral preparations

**Calcium Gluconate** (Non-proprietary)

**Effervescent tablets**, calcium gluconate 1 g (calcium 89 mg or  $\text{Ca}^{2+}$  2.23 mmol), net price 28-tab pack = £14.83. Label: 13

**Note** Each tablet usually contains 4.46 mmol  $\text{Na}^+$

**Calcium Lactate** (Non-proprietary)

**Tablets**, calcium lactate 300 mg (calcium 39 mg or  $\text{Ca}^{2+}$  1 mmol), net price 84 = £2.92

**Adcal**<sup>®</sup> (ProStrakan)

**Chewable tablets**, fruit flavour, calcium carbonate 1.5 g (calcium 600 mg or  $\text{Ca}^{2+}$  15 mmol), net price 100-tab pack = £7.25. Label: 24

**Cacit**<sup>®</sup> (Warner Chilcott)

**Tablets**, effervescent, pink, calcium carbonate 1.25 g, providing calcium citrate when dispersed in water (calcium 500 mg or  $\text{Ca}^{2+}$  12.5 mmol), net price 76-tab pack = £11.81. Label: 13

**Calcichew**<sup>®</sup> (Shire)

**Tablets** (chewable), orange flavour, calcium carbonate 1.25 g (calcium 500 mg or  $\text{Ca}^{2+}$  12.5 mmol), net price 100-tab pack = £9.33. Label: 24

**Forté tablets** (chewable), orange flavour, scored, calcium carbonate 2.5 g (calcium 1 g or  $\text{Ca}^{2+}$  25 mmol), net price 60-tab pack = £13.16. Label: 24  
**Excipients** include aspartame (section 9.4.1)

**Calcium-500** (Martindale)

**Tablets**, pink, f/c, calcium carbonate 1.25 g (calcium 500 mg or  $\text{Ca}^{2+}$  12.5 mmol), net price 100-tab pack = £9.46. Label: 25

**Calcium-Sandoz**<sup>®</sup> (Alliance)

**Syrup**, orange flavour, calcium gluconate 1.09 g, calcium lactobionate 727 mg (calcium 108.3 mg or  $\text{Ca}^{2+}$  2.7 mmol)/5 mL, net price 300 mL = £4.07

**Sandocal**<sup>®</sup> (Novartis Consumer Health)

**Sandocal 400 tablets**, effervescent, orange flavour, calcium lactate gluconate 930 mg, calcium carbonate 700 mg, providing calcium 400 mg ( $\text{Ca}^{2+}$  10 mmol), net price 5 × 20-tab pack = £6.87. Label: 13

**Excipients** include aspartame (section 9.4.1)

**Sandocal 1000 tablets**, effervescent, orange flavour, calcium lactate gluconate 2.263 g, calcium carbonate 1.75 g, providing 1 g calcium ( $\text{Ca}^{2+}$  25 mmol), net price 3 × 10-tab pack = £6.17. Label: 13

**Excipients** include aspartame (section 9.4.1)

### Parenteral preparations

**Calcium Gluconate** (Non-proprietary) **(PnM)**

**Injection**, calcium gluconate 10% (calcium 8.4 mg or  $\text{Ca}^{2+}$  226 micromol/mL), net price 10-mL amp = 60p

**Note** The MHRA has advised that repeated or prolonged administration of calcium gluconate injection packaged in 10 mL glass containers is contra-indicated in children under 18 years and in patients with renal impairment owing to the risk of aluminium accumulation; in these patients the use of calcium gluconate injection packaged in plastic containers is recommended

**Calcium Chloride** (Non-proprietary) **(PnM)**

**Injection**, calcium chloride dihydrate 10% (calcium 27.3 mg or  $\text{Ca}^{2+}$  680 micromol/mL), net price 10-mL disposable syringe = £5.10

**Brands include** *Minijet*<sup>®</sup> Calcium Chloride 10%

**Injection**, calcium chloride dihydrate 13.4% (calcium 36 mg or  $\text{Ca}^{2+}$  910 micromol/mL), net price 10-mL amp = £14.94

### With vitamin D

Section 9.6.4

### With disodium etidronate

Section 6.6.2

### With risedronate sodium and colecalciferol

Section 6.6.2

## 9.5.1.2 Hypercalcaemia and hypercalciuria

**Severe hypercalcaemia** Severe hypercalcaemia calls for urgent treatment before detailed investigation of the cause. Dehydration should be corrected first with intravenous infusion of **sodium chloride 0.9%**. Drugs (such as thiazides and vitamin D compounds) which promote hypercalcaemia, should be discontinued and dietary calcium should be restricted.

If *severe hypercalcaemia persists* drugs which inhibit mobilisation of calcium from the skeleton may be required. The **bisphosphonates** are useful and disodium pamidronate (section 6.6.2) is probably the most effective.

**Corticosteroids** (section 6.3) are widely given, but may only be useful where hypercalcaemia is due to sarcoidosis or vitamin D intoxication; they often take several days to achieve the desired effect.

**Calcitonin** (section 6.6.1) is relatively non-toxic but its effect can wear off after a few days despite continued use; it is rarely effective where bisphosphonates have failed to reduce serum calcium adequately.

After treatment of severe hypercalcaemia the underlying cause must be established. *Further treatment is*

governed by the same principles as for initial therapy. Salt and water depletion and drugs promoting hypercalcaemia should be avoided; oral administration of a bisphosphonate may be useful.

**Hyperparathyroidism** **Cinacalcet** is licensed for the treatment of secondary hyperparathyroidism in dialysis patients with end-stage renal disease (but see NICE guidance below), for primary hyperparathyroidism in patients where parathyroidectomy is inappropriate, and for the treatment of hypercalcaemia in parathyroid carcinoma. Cinacalcet reduces parathyroid hormone which leads to a decrease in serum calcium concentrations.

**Paricalcitol** (section 9.6.4) is also licensed for the prevention and treatment of secondary hyperparathyroidism associated with chronic renal failure.

Parathyroidectomy may be indicated for hyperparathyroidism.

#### NICE guidance

##### Cinacalcet for the treatment of secondary hyperparathyroidism in patients with end-stage renal disease on maintenance dialysis therapy (January 2007)

Cinacalcet is not recommended for the routine treatment of secondary hyperparathyroidism in patients with end-stage renal disease on maintenance dialysis therapy.

Cinacalcet is recommended for the treatment of refractory secondary hyperparathyroidism in patients with end-stage renal disease (including those with calciphylaxis) **only** in those:

- who have 'very uncontrolled' plasma concentration of intact parathyroid hormone (defined as greater than 85 picomol/litre) refractory to standard therapy, and a normal or high adjusted serum calcium concentration, **and**
- in whom surgical parathyroidectomy is contraindicated, in that the risks of surgery outweigh the benefits.

Response to treatment should be monitored regularly and treatment should be continued only if a reduction in the plasma concentration of intact parathyroid hormone of 30% or greater is seen within 4 months of treatment.

**Hypercalcaemia** Hypercalcaemia should be investigated for an underlying cause, which should be treated. Where a cause is not identified (idiopathic hypercalcaemia), the condition is managed by increasing fluid intake and giving bendroflumethiazide in a dose of 2.5 mg daily (a higher dose is not usually necessary). Reducing dietary calcium intake may be beneficial but severe restriction of calcium intake has not proved beneficial and may even be harmful.

## CINACALCET

**Indications** see under Dose and notes above

**Cautions** measure serum-calcium concentration before initiation of treatment and within 1 week after starting treatment or adjusting dose, then monthly for secondary hyperparathyroidism and every 2–3 months for primary hyperparathyroidism and para-

thyroid carcinoma; treatment should not be initiated in patients with hypocalcaemia; in secondary hyperparathyroidism measure parathyroid hormone concentration 1–4 weeks after starting treatment or adjusting dose, then every 1–3 months; dose adjustment may be necessary if smoking started or stopped during treatment; **interactions:** Appendix 1 (cinacalcet)

**Hepatic impairment** manufacturer advises caution in moderate to severe impairment—monitor closely especially when increasing dose

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk—no information available

**Breast-feeding** manufacturer advises avoid—present in milk in *animal* studies

**Side-effects** nausea, vomiting, anorexia; dizziness, paraesthesia, asthenia; reduced testosterone concentrations; myalgia; rash; *less commonly* dyspepsia, diarrhoea, and seizures; hypotension, heart failure, and allergic reactions (including angioedema) also reported

#### Dose

- Secondary hyperparathyroidism in patients with end-stage renal disease on dialysis (but see notes above), **ADULT** over 18 years, initially 30 mg once daily, adjusted every 2–4 weeks to max. 180 mg daily
- Hypercalcaemia of primary hyperparathyroidism or parathyroid carcinoma, **ADULT** over 18 years, initially 30 mg twice daily, adjusted every 2–4 weeks according to response up to max. 90 mg 4 times daily

**Mimpara®** (Amgen) POM

Tablets, green, f/c, cinacalcet (as hydrochloride) 30 mg, net price 28-tab pack = £121.36; 60 mg, 28-tab pack = £223.87; 90 mg, 28-tab pack = £335.81. Label: 21

## 9.5.1.3 Magnesium

Magnesium is an essential constituent of many enzyme systems, particularly those involved in energy generation; the largest stores are in the skeleton.

Magnesium salts are not well absorbed from the gastrointestinal tract, which explains the use of magnesium sulphate (section 1.6.4) as an osmotic laxative.

Magnesium is excreted mainly by the kidneys and is therefore retained in renal failure, but significant *hypomagnesaemia* (causing muscle weakness and arrhythmias) is rare.

**Hypomagnesaemia** Since magnesium is secreted in large amounts in the gastro-intestinal fluid, excessive losses in diarrhoea, stoma or fistula are the most common causes of *hypomagnesaemia*; deficiency may also occur in alcoholism or as a result of treatment with certain drugs. Hypomagnesaemia often causes secondary hypocalcaemia, and also hypokalaemia and hyponatraemia.

Symptomatic *hypomagnesaemia* is associated with a deficit of 0.5–1 mmol/kg; up to 160 mmol Mg<sup>2+</sup> over up to 5 days may be required to replace the deficit (allowing for urinary losses). Magnesium is given initially by intravenous infusion or by intramuscular injection of **magnesium sulphate**; the intramuscular injection is painful. Plasma magnesium concentration should be measured to determine the rate and duration of infusion

and the dose should be reduced in renal impairment. To prevent *recurrence of the deficit*, magnesium may be given by mouth in a dose of 24 mmol  $Mg^{2+}$  daily in divided doses; suitable preparations are magnesium glycerophosphate tablets or liquid [unlicensed], available from 'special-order' manufacturers or specialist importing companies, see p.988. For maintenance (e.g. in intravenous nutrition), parenteral doses of magnesium are of the order of 10–20 mmol  $Mg^{2+}$  daily (often about 12 mmol  $Mg^{2+}$  daily).

**Arrhythmias** Magnesium sulphate has also been recommended for the emergency treatment of *serious arrhythmias*, especially in the presence of hypokalaemia (when hypomagnesaemia may also be present) and when salvos of rapid ventricular tachycardia show the characteristic twisting wave front known as *torsade de pointes* (see also section 2.3.1). The usual dose of magnesium sulphate by intravenous injection is 2 g (8 mmol  $Mg^{2+}$ ) over 10–15 minutes (repeated once if necessary).

**Myocardial infarction** Limited evidence that magnesium sulphate prevents arrhythmias and reperfusion injury in patients with suspected myocardial infarction has not been confirmed by large studies. Routine use of magnesium sulphate for this purpose is not recommended. For the management of myocardial infarction, see section 2.10.1.

**Eclampsia and pre-eclampsia** Magnesium sulphate is the drug of choice for the treatment of seizures and the prevention of recurrent seizures in women with *eclampsia*. Regimens may vary between hospitals. Calcium gluconate injection is used for the management of magnesium toxicity.

Magnesium sulphate is also of benefit in women with *pre-eclampsia* in whom there is concern about developing eclampsia. The patient should be monitored carefully (see under Magnesium Sulphate).

## MAGNESIUM SULPHATE

**Indications** see notes above; constipation (section 1.6.4); severe acute asthma (section 3.1); paste for boils (section 13.10.5)

**Cautions** see notes above; in severe hypomagnesaemia administer initially via controlled infusion device (preferably syringe pump); monitor blood pressure, respiratory rate, urinary output and for signs of overdosage (loss of patellar reflexes, weakness, nausea, sensation of warmth, flushing, drowsiness, double vision, and slurred speech); **interactions:** Appendix 1 (magnesium, parenteral)

**Hepatic impairment** avoid in hepatic coma if risk of renal failure

**Renal impairment** avoid or reduce dose; increased risk of toxicity

**Pregnancy** not known to be harmful for short-term intravenous administration in eclampsia, but excessive doses in third trimester cause neonatal respiratory depression

**Side-effects** generally associated with hypermagnesaemia, nausea, vomiting, thirst, flushing of skin, hypotension, arrhythmias, coma, respiratory depression, drowsiness, confusion, loss of tendon reflexes, muscle weakness; colic and diarrhoea following oral administration

### Dose

- Hypomagnesaemia, see notes above
- Arrhythmias, see notes above
- Prevention of seizures in pre-eclampsia [unlicensed indication], initially by **intravenous injection** over 5–15 minutes, 4 g followed by **intravenous infusion**, 1 g/hour for 24 hours; if seizure occurs, additional dose by **intravenous injection**, 2 g
- Treatment of seizures and prevention of seizure recurrence in eclampsia, initially by **intravenous injection** over 5–15 minutes, 4 g, followed by **intravenous infusion**, 1 g/hour for 24 hours after seizure or delivery, whichever is later; if seizure recurs, increase the infusion rate to 1.5–2 g/hour or give an additional dose by **intravenous injection**, 2 g

**Intravenous administration** For intravenous injection concentration of magnesium sulphate should not exceed 20% (dilute 1 part of magnesium sulphate injection 50% with at least 1.5 parts of water for injections)

**Note** Magnesium sulphate (as heptahydrate) 1 g equivalent to  $Mg^{2+}$  approx. 4 mmol

### Magnesium Sulphate (Non-proprietary) (POM)

**Injection**, magnesium sulphate (as heptahydrate) 20% ( $Mg^{2+}$  approx. 0.8 mmol/mL), net price 20-mL (4-g) amp = £2.75; 50% ( $Mg^{2+}$  approx. 2 mmol/mL), 2-mL (1-g) amp = £2.39, 4-mL (2-g) prefilled syringe = £7.39, 5-mL (2.5-g) amp = £3.00, 10-mL (5-g) amp = 69p; 10-mL (5-g) prefilled syringe = £4.95

**Brands include** *Minijet® Magnesium Sulphate 50%*

## 9.5.2 Phosphorus

### 9.5.2.1 Phosphate supplements

#### 9.5.2.2 Phosphate-binding agents

### 9.5.2.1 Phosphate supplements

Oral phosphate supplements may be required in addition to vitamin D in a small minority of patients with hypophosphataemic vitamin D-resistant rickets. Diarrhoea is a common side-effect and should prompt a reduction in dosage.

Phosphate infusion is occasionally needed in alcohol dependence or in phosphate deficiency arising from use of parenteral nutrition deficient in phosphate supplements; phosphate depletion also occurs in severe diabetic ketoacidosis. For *established hypophosphataemia*, monobasic potassium phosphate may be infused at a rate of 9 mmol every 12 hours. In critically ill patients, the dose of phosphate can be increased up to 500 micromol/kg (approx. 30 mmol in adults, max. 50 mmol), infused over 6–12 hours, according to severity. Excessive doses of phosphates may cause hypocalcaemia and metastatic calcification; it is **essential** to monitor closely plasma concentrations of calcium, phosphate, potassium, and other electrolytes.

For phosphate requirements in *total parenteral nutrition* regimens, see section 9.3.

### Phosphates (Fresenius Kabi) (POM)

**Intravenous infusion**, phosphates (providing  $PO_4^{3-}$  100 mmol,  $K^+$  19 mmol, and  $Na^+$  162 mmol/litre), net price 500 mL (*Polyfusor®*) = £3.75.

For the treatment of moderate to severe hypophosphatemia

**Phosphate-Sandoz®** (HK Pharma)

**Tablets**, effervescent, anhydrous sodium acid phosphate 1.936 g, sodium bicarbonate 350 mg, potassium bicarbonate 315 mg, equivalent to phosphorus 500 mg (phosphate 16.1 mmol), sodium 468.8 mg ( $\text{Na}^+$  20.4 mmol), potassium 123 mg ( $\text{K}^+$  3.1 mmol). Net price 20 = £3.29. Label: 13

**Dose** vitamin D-resistant hypophosphataemic osteomalacia, 4–6 tablets daily; **CHILD** under 5 years 2–3 tablets daily

**9.5.2.2 Phosphate-binding agents**

Calcium-containing preparations are used as phosphate-binding agents in the management of hyperphosphataemia complicating renal failure. Aluminium-containing preparations are rarely used as phosphate-binding agents and can cause aluminium accumulation.

**Sevelamer hydrochloride** and **sevelamer carbonate** are both licensed for the treatment of hyperphosphataemia in patients on haemodialysis or peritoneal dialysis. Sevelamer carbonate is also licensed for the treatment of patients with chronic kidney disease not on dialysis who have a serum-phosphate concentration of 1.78 mmol/L or more.

**Lanthanum** is licensed for the control of hyperphosphataemia in patients with chronic renal failure on haemodialysis or continuous ambulatory peritoneal dialysis (CAPD), and in patients with chronic kidney disease not on dialysis who have a serum-phosphate concentration of 1.78 mmol/L or more that cannot be controlled by a low-phosphate diet.

The *Scottish Medicines Consortium* (p. 4) has advised (March 2007) that lanthanum (*Fosrenol®*) is accepted for restricted use within NHS Scotland for the control of hyperphosphataemia in patients with chronic renal failure on haemodialysis or continuous ambulatory peritoneal dialysis, as a second-line agent, where a non-aluminium, non-calcium phosphate binder is required.

**ALUMINIUM HYDROXIDE**

**Indications** hyperphosphataemia; dyspepsia (section 1.1)

**Cautions** see notes above; **interactions:** Appendix 1 (antacids)

**Side-effects** constipation; hyperalbuminaemia

**Alu-Cap®** (Meda)

**Capsules**, green/red, dried aluminium hydroxide 475 mg (low  $\text{Na}^+$ ), net price 120-cap pack = £3.75

**Dose** phosphate-binding agent in renal failure, 4–20 capsules daily in divided doses with meals

**CALCIUM SALTS**

**Indications** hyperphosphataemia

**Cautions** **interactions:** Appendix 1 (antacids, calcium salts)

**Contra-indications** hypercalcaemia, hypercalcaemia

**Side-effects** hypercalcaemia

**Adcal®** section 9.5.1.1

**Calcichew®** section 9.5.1.1

**Calcium-500** section 9.5.1.1

**Phosex®** (Vitaline) **(POM)**

**Tablets**, yellow, scored, calcium acetate 1 g (calcium 250 mg or  $\text{Ca}^{2+}$  6.2 mmol), net price 180-tab pack = £19.79. Counselling, do not chew, with meals

**Dose** initially 1 tablet 3 times daily with meals, adjusted according to serum-phosphate concentration (usual dose 4–6 tablets daily (1 or 2 tablets with each meal)); max. 12 tablets daily

**PhosLo®** (Fresenius Medical Care) **(POM)**

**Capsules**, calcium acetate (anhydrous) 667 mg (calcium 169 mg or  $\text{Ca}^{2+}$  4.2 mmol), net price 200-cap pack = £14.40. Counselling, with meals

**Excipients** include propylene glycol (see Excipients, p. 2)

**Dose** initially 2 capsules with each meal, adjusted according to serum-phosphate concentration (usual dose 3 or 4 capsules with each meal)

**With magnesium carbonate**

**Osvaren®** (Fresenius Medical Care) **(POM)**

**Tablets**, f/c, scored, calcium acetate 435 mg (calcium 110 mg or  $\text{Ca}^{2+}$  2.7 mmol), heavy magnesium carbonate 235 mg (magnesium 60 mg), net price 180-tab pack = £24.00. Counselling, do not crush or chew, with meals, avoid other drugs at same time (see below)

**Contra-indications** hypercalcaemia, hypermagnesaemia; third-degree AV block; myasthenia gravis

**Dose** **ADULT** over 18 years, initially 1 tablet 3 times daily with meals, adjusted according to serum-phosphate concentration (usual dose 3–10 tablets daily); max. 12 tablets daily

**Counselling** Manufacturers advise that other drugs should be taken at least 2 hours before or 3 hours after *Osvaren®* to reduce possible interference with absorption of other drugs

**LANTHANUM**

**Indications** see notes above

**Cautions** acute peptic ulcer; ulcerative colitis; Crohn's disease; bowel obstruction; monitor liver function; **interactions:** Appendix 1 (lanthanum)

**Hepatic impairment** use with caution

**Pregnancy** manufacturer advises avoid—toxicity in animal studies

**Breast-feeding** manufacturer advises caution—no information available

**Side-effects** gastro-intestinal disturbances; hypocalcaemia; less commonly anorexia, increased appetite, taste disturbances, dry mouth, thirst, stomatitis, chest pain, peripheral oedema, headache, dizziness, vertigo, asthenia, fatigue, malaise, hyperglycaemia, hyperparathyroidism, hypercalcaemia, hypophosphataemia, eosinophilia, arthralgia, myalgia, osteoporosis, sweating, alopecia, pruritus, and erythematous rash; accumulation of lanthanum in bone, and transient changes in QT interval also reported

**Dose**

• **ADULT** over 18 years, initially 750 mg daily in divided doses chewed with or immediately after meals, adjusted according to serum-phosphate concentration every 2–3 weeks (usual dose range 1.5–3 g daily in divided doses)

**Fosrenol®** (Shire) **(POM)**

**Tablets** (chewable), lanthanum (as carbonate hydrate) 500 mg, net price 90-tab pack = £114.13; 750 mg, 90-tab pack = £152.17; 1 g, 90-tab pack = £161.33.

Label: 21, counselling, to be chewed

## SEVELAMER HYDROCHLORIDE

**Indications** hyperphosphataemia in patients on haemodialysis or peritoneal dialysis

**Cautions** gastro-intestinal disorders; **interactions:** Appendix 1 (sevelamer)

**Contra-indications** bowel obstruction

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** manufacturer advises use only if potential benefit outweighs risk

**Side-effects** nausea, vomiting, abdominal pain, constipation, diarrhoea, dyspepsia, flatulence; *very rarely* intestinal obstruction; *also reported* intestinal perforation, ileus, diverticulitis, pruritus, rash

### Dose

- **ADULT** over 18 years, initially 2.4–4.8 g daily in 3 divided doses with meals, adjusted according to serum-phosphate concentration (usual dose range 2.4–12 g daily in 3 divided doses)

**Renagel**® (Genzyme) (POM)

Tablets, f/c, sevelamer hydrochloride 800 mg, net price 180-tab pack = £117.97. Label: 25, counselling with meals

**Excipients** include propylene glycol (see Excipients, p. 2)

## SEVELAMER CARBONATE

**Indications** hyperphosphataemia in patients on haemodialysis or peritoneal dialysis, and patients with chronic kidney disease not on dialysis who have a serum-phosphate concentration of 1.78 mmol/L or more

**Cautions** gastro-intestinal disorders; **interactions:** Appendix 1 (sevelamer)

**Contra-indications** bowel obstruction

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** unlikely to be present in milk (however, manufacturer advises avoid)

**Side-effects** nausea, vomiting, abdominal pain, constipation, diarrhoea, dyspepsia, flatulence; *also reported* intestinal obstruction and perforation, ileus, pruritus, rash

### Dose

- **ADULT** over 18 years, initially 2.4–4.8 g daily in 3 divided doses with meals, adjusted according to serum-phosphate concentration every 2–4 weeks (usual dose approx. 6 g daily in 3 divided doses)

**Renvela**® (Genzyme) (POM)

Tablets, f/c, sevelamer carbonate 800 mg, net price 180-tab pack = £117.97. Label: 25, counselling, with meals

**Excipients** include include propylene glycol (see Excipients, p. 2)

**Powder for oral suspension**, pale yellow, sevelamer carbonate 2.4 g, net price 60-sachet pack (citrus-flavoured) = £117.97. Label: 13, counselling, with meals

**Note** Each sachet to be dispersed in 60 mL water

## 9.5.3 Fluoride

Availability of adequate fluoride confers significant resistance to dental caries. It is now considered that the topical action of fluoride on enamel and plaque is more important than the systemic effect.

When the fluoride content of drinking water is less than 700 micrograms per litre (0.7 parts per million), daily administration of fluoride tablets or drops provides suitable supplementation. Systemic fluoride supplements should not be prescribed without reference to the fluoride content of the local water supply. Infants need not receive fluoride supplements until the age of 6 months.

Dentifrices which incorporate sodium fluoride or monofluorophosphate are also a convenient source of fluoride.

Individuals who are either particularly caries prone or medically compromised may be given additional protection by use of fluoride rinses or by application of fluoride gels. Rinses may be used daily or weekly; daily use of a less concentrated rinse is more effective than weekly use of a more concentrated one. High-strength gels must be applied regularly under professional supervision; extreme caution is necessary to prevent children from swallowing any excess. Less concentrated gels are available for home use. Varnishes are also available and are particularly valuable for young or disabled children since they adhere to the teeth and set in the presence of moisture.

Fluoride mouthwash, oral drops, tablets and toothpaste are prescribable on form FP10D (GP14 in Scotland, WP10D in Wales; for details see preparations, p. 614).

There are also arrangements for health authorities to supply fluoride tablets in the course of pre-school dental schemes, and they may also be supplied in school dental schemes.

Fluoride gels are not prescribable on form FP10D (GP14 in Scotland, WP10D in Wales).

## FLUORIDES

**Note** Sodium fluoride 2.2 mg provides approx. 1 mg fluoride ion

**Indications** prophylaxis of dental caries—see notes above

**Contra-indications** not for areas where drinking water is fluoridated

**Side-effects** occasional white flecks on teeth with recommended doses; *rarely* yellowish-brown discoloration if recommended doses are exceeded

### Dose

**Note** Dose expressed as fluoride ion (F<sup>-</sup>)

- Water content less than F<sup>-</sup> 300 micrograms/litre (0.3 parts per million), **CHILD** up to 6 months none; 6 months–3 years F<sup>-</sup> 250 micrograms daily, 3–6 years F<sup>-</sup> 500 micrograms daily, over 6 years F<sup>-</sup> 1 mg daily
- Water content between F<sup>-</sup> 300 and 700 micrograms/litre (0.3–0.7 parts per million), **CHILD** up to 3 years none, 3–6 years F<sup>-</sup> 250 micrograms daily, over 6 years F<sup>-</sup> 500 micrograms daily
- Water content above F<sup>-</sup> 700 micrograms/litre (0.7 parts per million), supplements not advised

**Note** These doses reflect the recommendations of the British Dental Association, the British Society of Paediatric Dentistry and the British Association for the Study of Community Dentistry (*Br Dent J* 1997; 182: 6–7)

### ▲ Tablets

**Counselling** Tablets should be sucked or dissolved in the mouth and taken preferably in the evening

#### En-De-Kay® (Manx)

**Flootabs 3–6 years**, orange-flavoured, scored, sodium fluoride 1.1 mg (F<sup>-</sup> 500 micrograms), net price 200-tab pack = £2.38

**Dental prescribing on NHS** May be prescribed as Sodium Fluoride Tablets

**Flootabs 6+ years**, orange-flavoured, scored, sodium fluoride 2.2 mg (F<sup>-</sup> 1 mg), net price 200-tab pack = £2.38

**Dental prescribing on NHS** May be prescribed as Sodium Fluoride Tablets

#### Fluor-a-day® (Dental Health)

**Tablets**, buff, sodium fluoride 1.1 mg (F<sup>-</sup> 500 micrograms), net price 200-tab pack = £2.54; 2.2 mg (F<sup>-</sup> 1 mg), 200-tab pack = £2.54

**Dental prescribing on NHS** May be prescribed as Sodium Fluoride Tablets

#### FluoriGard® (Colgate-Palmolive)

**Tablets 0.5**, purple, grape-flavoured, scored, sodium fluoride 1.1 mg (F<sup>-</sup> 500 micrograms), net price 200-tab pack = £1.91

**Dental prescribing on NHS** May be prescribed as Sodium Fluoride Tablets

**Tablets 1.0**, orange, orange-flavoured, scored, sodium fluoride 2.2 mg (F<sup>-</sup> 1 mg), net price 200-tab pack = £1.91

**Dental prescribing on NHS** May be prescribed as Sodium Fluoride Tablets

### ▲ Oral drops

**Note** Fluoride supplements not considered necessary below 6 months of age (see notes above)

#### En-De-Kay® (Manx)

**Floordrops®** (= paediatric drops), sugar-free, sodium fluoride 550 micrograms (F<sup>-</sup> 250 micrograms)/0.15 mL. Net price 60 mL = £2.38

**Dental prescribing on NHS** Corresponds to Sodium Fluoride Oral Drops DPF 0.37% equivalent to sodium fluoride 80 micrograms (F<sup>-</sup> 36 micrograms)/drop

### ▲ Mouthwashes

Rinse mouth for 1 minute and spit out

**Counselling** Avoid eating, drinking, or rinsing mouth for 15 minutes after use

#### Duraphat® (Colgate-Palmolive)

**Weekly dental rinse** (= mouthwash), blue, sodium fluoride 0.2%. Net price 150 mL = £2.13. Counselling, see above

**Dose** CHILD 6 years and over, for *weekly* use, rinse with 10 mL

**Dental prescribing on NHS** May be prescribed as Sodium Fluoride Mouthwash 0.2%

#### En-De-Kay® (Manx)

**Daily fluoride mouthrinse** (= mouthwash), blue, sodium fluoride 0.05%. Net price 250 mL = £1.51

**Dose** CHILD 6 years and over, for *daily* use, rinse with 10 mL

**Dental prescribing on NHS** May be prescribed as Sodium Fluoride Mouthwash 0.05%

**Fluorinse** (= mouthwash), red, sodium fluoride 2%. Net price 100 mL = £4.97. Counselling, see above

**Dose** CHILD 8 years and over, for *daily* use, dilute 5 drops to 10 mL of water; for *weekly* use, dilute 20 drops to 10 mL

**Dental prescribing on NHS** May be prescribed as Sodium Fluoride Mouthwash 2%

#### FluoriGard® (Colgate-Palmolive)

**Daily dental rinse** (= mouthwash), blue, sodium fluoride 0.05%. Net price 500 mL = £2.61. Counselling, see above

**Dose** CHILD 6 years and over, for *daily* use, rinse with 10 mL

**Dental prescribing on NHS** May be prescribed as Sodium Fluoride Mouthwash 0.05%

### ▲ Gels

#### FluoriGard® (Colgate-Palmolive)

**Gel-Kam** (= gel), stannous fluoride 0.4% in glycerol basis. Net price 100 mL = £2.63. Counselling, see below

**Dose** ADULT and CHILD 3 years and over, for *daily* use, using a toothbrush, apply onto all tooth surfaces

**Counselling** Swish between teeth for 1 minute before spitting out. Avoid eating, drinking, or rinsing mouth for at least 30 minutes after use

### ▲ Toothpastes

#### Duraphat® (Colgate-Palmolive) <sup>(POM)</sup>

**Duraphat® '2800 ppm' toothpaste**, sodium fluoride 0.619%. Net price 75 mL = £3.26, dual pack (2 × 75 mL) = £5.54. Counselling, see below

**Dose** ADULT and CHILD over 10 years, apply 1 cm twice daily using a toothbrush

**Counselling** Brush teeth for 1 minute before spitting out. Avoid drinking or rinsing mouth for 30 minutes after use

**Dental prescribing on NHS** May be prescribed as Sodium Fluoride Toothpaste 0.619%

**Duraphat® '5000 ppm' toothpaste**, sodium fluoride 1.1%. Net price 51 g = £6.50. Counselling, see below

**Dose** ADULT and ADOLESCENT over 16 years, apply 2 cm 3 times daily after meals using a toothbrush

**Counselling** Brush teeth for 3 minutes before spitting out

**Dental prescribing on NHS** May be prescribed as Sodium Fluoride Toothpaste 1.1%

## 9.5.4 Zinc

Zinc supplements should not be given unless there is good evidence of deficiency (hypoproteinaemia spuriously lowers plasma-zinc concentration) or in zinc-losing conditions. Zinc deficiency can occur as a result of inadequate diet or malabsorption; excessive loss of zinc can occur in trauma, burns, and protein-losing conditions. A zinc supplement is given until clinical improvement occurs, but it may need to be continued in severe malabsorption, metabolic disease (section 9.8.1), or in zinc-losing states.

Parenteral nutrition regimens usually include trace amounts of zinc (section 9.3). If necessary, further zinc can be added to intravenous feeding regimens. A suggested dose for intravenous nutrition is elemental zinc 6.5 mg (Zn<sup>2+</sup> 100 micromol) daily.

### ZINC SULPHATE

**Indications** zinc deficiency or supplementation in zinc-losing conditions

**Cautions interactions:** Appendix 1 (zinc)

**Renal impairment** accumulation may occur in acute renal failure

**Pregnancy** crosses placenta; risk theoretically minimal, but no information available

**Breast-feeding** present in milk; risk theoretically minimal, but no information available

**Side-effects** abdominal pain, dyspepsia, nausea, vomiting, diarrhoea, gastric irritation; irritability, headache, lethargy

#### Dose

- See preparation below and notes above

#### Zinc Sulphate (Non-proprietary) <sup>[PwM]</sup>

**Injection**, zinc sulphate 14.6 mg/mL (zinc 50 micromol/mL), net price 10 mL vial = £2.50

#### Solvazinc® (Galen)

**Effervescent tablets**, zinc sulphate monohydrate 125 mg (45 mg zinc), net price 30 = £4.32. Label: 13, 21

**Dose** **ADULT** and **CHILD** over 30 kg, 1 tablet in water 1–3 times daily after food; **CHILD** under 10 kg, ½ tablet daily; 10–30 kg, ½ tablet 1–3 times daily

## 9.5.5 Selenium

Selenium deficiency can occur as a result of inadequate diet or prolonged parenteral nutrition. A selenium supplement should not be given unless there is good evidence of deficiency.

### SELENIUM

**Indications** selenium deficiency

**Cautions** interactions: Appendix 1 (selenium)

#### Dose

- **By mouth or by intramuscular injection or by intravenous injection**, 100–500 micrograms daily

#### Selenase® (Oxford Nutrition) <sup>[PwM]</sup>

**Oral solution**, selenium (as sodium selenite pentahydrate) 50 micrograms/mL, net price 2-mL amp = £1.03, 10-mL bottle = £4.05

**Injection**, selenium (as sodium selenite pentahydrate) 50 micrograms/mL, net price 2-mL amp = £1.50, 10-mL vial = £4.25

## 9.6 Vitamins

- 9.6.1 Vitamin A
- 9.6.2 Vitamin B group
- 9.6.3 Vitamin C
- 9.6.4 Vitamin D
- 9.6.5 Vitamin E
- 9.6.6 Vitamin K
- 9.6.7 Multivitamin preparations

Vitamins are used for the prevention and treatment of specific deficiency states or where the diet is known to be inadequate; they may be prescribed in the NHS to prevent or treat deficiency but not as dietary supplements.

Their use as general 'pick-me-ups' is of unproven value and, in the case of preparations containing vitamin A or D, may actually be harmful if patients take more than the prescribed dose. The 'fad' for mega-vitamin therapy with water-soluble vitamins, such as ascorbic acid and pyridoxine, is unscientific and can be harmful.

Dietary reference values for vitamins are available in the Department of Health publication:

Dietary Reference Values for Food Energy and Nutrients for the United Kingdom: Report of the Panel on Dietary Reference Values of the Committee on Medical Aspects of Food Policy. *Report on Health and Social Subjects 41*. London: HMSO, 1991

**Dental patients** It is unjustifiable to treat stomatitis or glossitis with mixtures of vitamin preparations; this delays diagnosis and correct treatment.

Most patients who develop a nutritional deficiency despite an adequate intake of vitamins have malabsorption and if this is suspected the patient should be referred to a medical practitioner.

## 9.6.1 Vitamin A

Deficiency of vitamin A (retinol) is associated with ocular defects (particularly xerophthalmia) and an increased susceptibility to infections, but deficiency is rare in the UK (even in disorders of fat absorption).

Massive overdose can cause rough skin, dry hair, an enlarged liver, and a raised erythrocyte sedimentation rate and raised serum calcium and serum alkaline phosphatase concentrations.

**Pregnancy** In view of evidence suggesting that high levels of vitamin A may cause birth defects, women who are (or may become) pregnant are advised not to take vitamin A supplements (including tablets and fish-liver oil drops), except on the advice of a doctor or an antenatal clinic; nor should they eat liver or products such as liver pâté or liver sausage.

### VITAMIN A (Retinol)

**Indications** see notes above

**Cautions** see notes above; **interactions**: Appendix 1 (vitamins)

**Pregnancy** excessive doses may be teratogenic; see also notes above

**Breast-feeding** theoretical risk of toxicity in infants of mothers taking large doses

**Side-effects** see notes above

#### Dose

- See notes above and under preparations

#### ▲ Vitamins A and D

**Halibut-liver Oil** (Non-proprietary)

**Capsules**, vitamin A 4000 units [also contains vitamin D], net price 100-cap pack = £1.05

**Vitamins A and D** (Non-proprietary)

**Capsules**, vitamin A 4000 units, vitamin D 400 units, net price 84-cap pack = £3.44

**Note** May be difficult to obtain

#### ▲ Vitamins A, C and D

**Healthy Start Children's Vitamin Drops** (Non-proprietary)

**Oral drops**, vitamin A 5000 units, vitamin D 2000 units, ascorbic acid 150 mg/mL

Available free of charge to children under 4 years in families on the Healthy Start Scheme, or alternatively may be available direct to

the public—further information for healthcare professionals can be accessed at <http://tinyurl.com/3yckebe>. Beneficiaries can contact their midwife or health visitor for further information on where to obtain supplies.

**Dose** prevention of vitamin deficiency. CHILD 1 month–5 years, 5 drops daily (5 drops contain vitamin A approx. 700 units, vitamin D approx. 300 units, ascorbic acid approx. 20 mg)

**Note** *Healthy Start Vitamins for women* (containing ascorbic acid, vitamin D, and folic acid) are also available free of charge to women on the Healthy Start Scheme during pregnancy and until their baby is one year old, or alternatively may be available direct to the public—further information for healthcare professionals can be accessed at <http://tinyurl.com/3yckebe>. Beneficiaries can contact their midwife or health visitor for further information on where to obtain supplies.

## 9.6.2 Vitamin B group

Deficiency of the B vitamins, other than vitamin B<sub>12</sub> (section 9.1.2), is rare in the UK and is usually treated by preparations containing thiamine (B<sub>1</sub>), riboflavin (B<sub>2</sub>), and nicotinamide, which is used in preference to nicotinic acid, as it does not cause vasodilatation. Other members (or substances traditionally classified as members) of the vitamin B complex such as aminobenzoic acid, biotin, choline, inositol, and pantothenic acid or pantholn may be included in vitamin B preparations but there is no evidence of their value.

The severe deficiency states Wernicke's encephalopathy and Korsakoff's psychosis, especially as seen in chronic alcoholism (section 4.10.1), are best treated initially by the parenteral administration of B vitamins (*Pabrinex*®), followed by oral administration of thiamine in the longer term. Anaphylaxis has been reported with parenteral B vitamins (see MHRA/CHM advice, below).

As with other vitamins of the B group, pyridoxine (B<sub>6</sub>) deficiency is rare, but it may occur during isoniazid therapy (section 5.1.9) or penicillamine treatment in Wilson's disease (section 9.8.1) and is characterised by peripheral neuritis. High doses of pyridoxine are given in some metabolic disorders, such as hyperoxaluria, and it is also used in sideroblastic anaemia (section 9.1.3). There is evidence to suggest that pyridoxine in a dose not exceeding 100 mg daily may provide some benefit in premenstrual syndrome. It has been tried for a wide variety of other disorders, but there is little sound evidence to support the claims of efficacy, and over-dosage induces toxic effects.

Nicotinic acid inhibits the synthesis of cholesterol and triglyceride (see section 2.12). Folic acid and vitamin B<sub>12</sub> are used in the treatment of megaloblastic anaemia (section 9.1.2). Folic acid (available as calcium folinate) is used in association with cytotoxic therapy (section 8.1).

### RIBOFLAVIN

(Riboflavine, vitamin B<sub>2</sub>)

**Indications** see notes above

#### Preparations

Injections of vitamins B and C, see under Thiamine

#### Oral vitamin B complex preparations

See p. 617

### THIAMINE

(Vitamin B<sub>1</sub>)

**Indications** see notes above

**Cautions** anaphylaxis may occasionally follow injection (see MHRA/CHM advice below)

#### MHRA/CHM advice (September 2007)

Although potentially serious allergic adverse reactions may rarely occur during, or shortly after, parenteral administration, the CHM has recommended that:

1. This should not preclude the use of parenteral thiamine in patients where this route of administration is required, particularly in patients at risk of Wernicke-Korsakoff syndrome where treatment with thiamine is essential;
2. Intravenous administration should be by infusion over 30 minutes;
3. Facilities for treating anaphylaxis (including resuscitation facilities) should be available when parenteral thiamine is administered.

**Breast-feeding** severely thiamine-deficient mothers should avoid breast-feeding as toxic methyl-glyoxal present in milk

#### Dose

- Mild deficiency, **by mouth**, 25–100 mg daily; severe deficiency, 200–300 mg daily in divided doses

**Thiamine** (Non-proprietary)

**Tablets**, thiamine hydrochloride 50 mg, net price 100 = £5.19; 100 mg, 100 = £8.04

Brands include *Benerva*® JMS

**Pabrinex**® (Archimedes) [PvM]

**I/M High Potency injection**, for intramuscular use only, ascorbic acid 500 mg, nicotinamide 160 mg, pyridoxine hydrochloride 50 mg, riboflavin 4 mg, thiamine hydrochloride 250 mg/7 mL. Net price 7 mL (in 2 amps) = £1.96

**Excipients** include benzyl alcohol (avoid in neonates, see Excipients, p. 2)

**I/V High Potency injection**, for intravenous use only, ascorbic acid 500 mg, anhydrous glucose 1 g, nicotinamide 160 mg, pyridoxine hydrochloride 50 mg, riboflavin 4 mg, thiamine hydrochloride 250 mg/10 mL. Net price 10 mL (in 2 × 5 mL amps) = £1.96  
Parenteral vitamins B and C for rapid correction of severe depletion or malabsorption (e.g. in alcoholism, after acute infections, postoperatively, or in psychiatric states), maintenance of vitamins B and C in chronic intermittent haemodialysis

**Dose** see MHRA/CHM advice above

Treatment of Wernicke's encephalopathy, **by intravenous infusion of I/V High Potency** or **by deep intramuscular injection** into the gluteal muscle of **I/M High Potency**, 2 pairs 3 times daily for 2 days; if no response, discontinue; if symptoms resolve after 2 days, give 1 pair once daily for 5 days or for as long as improvement continues

Prophylaxis of Wernicke's encephalopathy in alcohol dependence, **by intravenous infusion of I/V High Potency** or **by deep intramuscular injection** into the gluteal muscle of **I/M High Potency**, 1 pair once daily for 3–5 days

Psychosis following narcosis or electroconvulsive therapy, toxicity from acute infections, **by intravenous infusion of I/V High Potency** or **by deep intramuscular injection** into the gluteal muscle of **I/M High Potency**, 1 pair twice daily for up to 7 days  
Haemodialysis, **by intravenous infusion of I/V High Potency** (in sodium chloride intravenous infusion 0.9%), 1 pair every 2 weeks

**Note** *Pabrinex*® doses in BNF may differ from those in product literature

#### Oral vitamin B complex preparations

See p. 617

**PYRIDOXINE HYDROCHLORIDE**(Vitamin B<sub>6</sub>)**Indications** see under Dose**Cautions** interactions: Appendix 1 (vitamins)**Side-effects** sensory neuropathy reported with high doses given for extended periods**Dose**

- Deficiency states, 20–50 mg up to 3 times daily
- Isoniazid-induced neuropathy, prophylaxis 10 mg daily [or 20 mg daily if suitable product not available]; treatment, 50 mg three times daily; **CHILD** under 18 years see *BNF for Children*
- Idiopathic sideroblastic anaemia, 100–400 mg daily in divided doses
- Penicillamine-induced neuropathy, prophylaxis in Wilson's disease [unlicensed use] (see also notes above), 20 mg daily; **CHILD** under 18 years see *BNF for Children*
- Premenstrual syndrome [unlicensed use], 50–100 mg daily (see notes above)

Prolonged use of pyridoxine in a dose of 10 mg daily is considered safe but the long-term use of pyridoxine in a dose of 200 mg or more daily has been associated with neuropathy. The safety of long-term pyridoxine supplementation with doses above 10 mg daily has not been established.

**Pyridoxine** (Non-proprietary)

**Tablets**, pyridoxine hydrochloride 10 mg, net price 500 = £8.53; 20 mg, 500 = £8.53; 50 mg, 28 = £1.52

**■ Injections of vitamins B and C**

See under Thiamine

**NICOTINAMIDE****Indications** see notes above; acne vulgaris, see section 13.6.1**■ Injections of vitamins B and C**

See under Thiamine

**Oral vitamin B complex preparations****Note** Other multivitamin preparations are in section 9.6.7.**Vitamin B Tablets, Compound** 

**Tablets**, nicotinamide 15 mg, riboflavin 1 mg, thiamine hydrochloride 1 mg, net price 28 = £1.00

**Dose** prophylactic, 1–2 tablets daily**Vitamin B Tablets, Compound, Strong** 

**Tablets**, brown, f/c or s/c, nicotinamide 20 mg, pyridoxine hydrochloride 2 mg, riboflavin 2 mg, thiamine hydrochloride 5 mg. Net price 28-tab pack = £2.30

**Dose** treatment of vitamin-B deficiency, 1–2 tablets 3 times daily**Vigranon B<sup>®</sup>** (Wallace Mfg) 

**Syrup**, thiamine hydrochloride 5 mg, riboflavin 2 mg, nicotinamide 20 mg, pyridoxine hydrochloride 2 mg, panthenol 3 mg/5 mL. Net price 150 mL = £2.41

**Other compounds**

**Potassium aminobenzoate** has been used in the treatment of various disorders associated with excessive fibrosis such as scleroderma but its therapeutic value is **doubtful**.

**Potaba<sup>®</sup>** (Glenwood) 

**Capsules**, potassium aminobenzoate 500 mg, net price 240 = £35.80. Label: 21

**Envules<sup>®</sup>** (= powder in sachets), potassium aminobenzoate 3 g, net price 40 sachets = £27.45. Label: 13, 21

**Dose** Peyronie's disease, scleroderma, 12 g daily in divided doses after food**9.6.3 Vitamin C**  
(Ascorbic acid)

Vitamin C therapy is essential in scurvy, but less florid manifestations of vitamin C deficiency are commonly found, especially in the elderly. It is rarely necessary to prescribe more than 100 mg daily except early in the treatment of scurvy.

Severe scurvy causes gingival swelling and bleeding margins as well as petechiae on the skin. This is, however, exceedingly rare and a patient with these signs is more likely to have leukaemia. Investigation should not be delayed by a trial period of vitamin treatment.

Claims that vitamin C ameliorates colds or promotes wound healing have not been proved.

**ASCORBIC ACID****Indications** prevention and treatment of scurvy**Cautions** interactions: Appendix 1 (vitamins)**Dose**

- Prophylactic, 25–75 mg daily; therapeutic, not less than 250 mg daily in divided doses

**Ascorbic Acid** (Non-proprietary)

**Tablets**, ascorbic acid 50 mg, net price 28 = £1.79; 100 mg, 28 = £1.42; 200 mg, 28 = £1.42; 500 mg (label: 24), 28 = £2.34

Brands include *Redoxon<sup>®</sup>* 

**Injection**, ascorbic acid 100 mg/mL. Net price 5-mL amp = £4.39

Available from UCB Pharma

**9.6.4 Vitamin D**

**Note** The term Vitamin D is used for a range of compounds which possess the property of preventing or curing rickets. They include ergocalciferol (calciferol, vitamin D<sub>2</sub>), colecalciferol (vitamin D<sub>3</sub>), dihydrotachysterol, alfalcaldiol (1 $\alpha$ -hydroxycholecalciferol), and calcitriol (1,25-dihydroxycholecalciferol).

Simple vitamin D deficiency can be prevented by taking an oral supplement of only 10 micrograms (400 units) of **ergocalciferol** (calciferol, vitamin D<sub>2</sub>) or **colecalciferol** (vitamin D<sub>3</sub>) daily. Vitamin D deficiency can occur in people whose exposure to sunlight is limited and in those whose diet is deficient in vitamin D. In these

individuals, ergocalciferol or colecalciferol in a dose of 20 micrograms (800 units) daily by mouth may be given to treat vitamin D deficiency; higher doses may be necessary for *severe* deficiency. Patients who do not respond should be referred to a specialist.

Preparations containing **calcium with colecalciferol** are available for the management of combined calcium and vitamin D deficiency, or for those at high risk of deficiency (see also Osteoporosis, p. 469 and Calcium Supplements, p. 608).

Vitamin D deficiency caused by *intestinal malabsorption* or *chronic liver disease* usually requires vitamin D in pharmacological doses, such as ergocalciferol tablets up to 1 mg (40 000 units) daily; the hypocalcaemia of *hypoparathyroidism* often requires doses of up to 2.5 mg (100 000 units) daily in order to achieve normocalcaemia.

Vitamin D requires hydroxylation by the kidney to its active form, therefore the hydroxylated derivatives **alfacalcidol** or **calcitriol** should be prescribed if patients with *severe renal impairment* require vitamin D therapy. Calcitriol is also licensed for the management of postmenopausal osteoporosis.

**Paricalcitol**, a synthetic vitamin D analogue, is licensed for the prevention and treatment of secondary hyperparathyroidism associated with chronic renal failure (section 9.5.1.2).

**Important.** All patients receiving pharmacological doses of vitamin D should have their plasma-calcium concentration checked at intervals (initially once or twice weekly) and whenever nausea or vomiting occur.

## ERGOCALCIFEROL

(Calciferol, Vitamin D<sub>2</sub>)

**Indications** see notes above

**Cautions** take care to ensure correct dose in infants; monitor plasma-calcium concentration in patients receiving high doses and in renal impairment (see notes above); **interactions:** Appendix 1 (vitamins)

**Contra-indications** hypercalcaemia; metastatic calcification

**Pregnancy** high systemic doses teratogenic in *animals* but therapeutic doses unlikely to be harmful

**Breast-feeding** caution with high systemic doses; may cause hypercalcaemia in infant—monitor serum-calcium concentration

**Side-effects** symptoms of overdosage include anorexia, lassitude, nausea and vomiting, diarrhoea, constipation, weight loss, polyuria, sweating, headache, thirst, vertigo, and raised concentrations of calcium and phosphate in plasma and urine

### Dose

- See notes above

### ▲ Daily supplements

**Note** There is no plain vitamin D tablet available for treating simple deficiency (see notes above). Alternatives include vitamins capsules (section 9.6.7), preparations of vitamins A and D (section 9.6.1), and calcium and ergocalciferol tablets (see below).

For prescribing information on calcium, see section 9.5.1.1

**Calcium and Ergocalciferol** (Non-proprietary)  
(Calcium and Vitamin D)

**Tablets**, calcium lactate 300 mg, calcium phosphate 150 mg (calcium 97 mg or Ca<sup>2+</sup> 2.4 mmol), ergocalciferol 10 micrograms (400 units). Net price 28-tab pack

= £7.10. Counselling, crush before administration or may be chewed

### ▲ Pharmacological strengths

**Note** The BP directs that when calciferol is prescribed or demanded, colecalciferol or ergocalciferol should be dispensed or supplied

**Ergocalciferol** (Non-proprietary)

**Tablets**, ergocalciferol 250 micrograms (10 000 units), net price 100 = £21.99; 1.25 mg (50 000 units), 100 = £30.34

**Note** May be difficult to obtain

**Important** When the strength of the tablets ordered or prescribed is not clear, the intention of the prescriber with respect to the strength (expressed in micrograms or milligrams per tablet) should be ascertained.

**Injection**, for intramuscular use only, ergocalciferol, 7.5 mg (300 000 units)/mL in oil, net price 1-mL amp = £8.50, 2-mL amp = £9.85

## ALFACALCIDOL

(1 $\alpha$ -Hydroxycholecalciferol)

**Indications** see notes above

**Cautions** see under Ergocalciferol; also nephrolithiasis

**Contra-indications** see under Ergocalciferol

**Pregnancy** see under Ergocalciferol

**Breast-feeding** see under Ergocalciferol

**Side-effects** see under Ergocalciferol; also *rarely* nephrocalcinosis, pruritus, rash, and urticaria

### Dose

- **By mouth or by intravenous injection** over 30 seconds, **ADULT** and **CHILD** over 20 kg, initially 1 microgram daily (elderly 500 nanograms), adjusted to avoid hypercalcaemia; maintenance, usually 0.25–1 microgram daily; **NEONATE** and **PRETERM NEONATE** initially 50–100 nanograms/kg daily, **CHILD** under 20 kg initially 50 nanograms/kg daily

**Alfacalcidol** (Non-proprietary) (POM)

**Capsules**, alfacalcidol 250 nanograms, net price 30-cap pack = £5.94; 500 nanograms 30-cap pack = £11.64; 1 microgram 30-cap pack = £15.91

**One-Alpha<sup>®</sup>** (LEO) (POM)

**Capsules**, alfacalcidol 250 nanograms (white), net price 30-cap pack = £3.37; 500 nanograms (red), 30-cap pack = £6.27; 1 microgram (brown), 30-cap pack = £8.75

**Excipients** include sesame oil

**Oral drops**, sugar-free, alfacalcidol 2 micrograms/mL (1 drop contains approx. 100 nanograms), net price 10 mL = £22.49

**Excipients** include alcohol

**Note** The concentration of alfacalcidol in *One-Alpha<sup>®</sup> drops* is 10 times greater than that of the former preparation *One-Alpha<sup>®</sup> solution*.

**Injection**, alfacalcidol 2 micrograms/mL, net price 0.5-mL amp = £2.16, 1-mL amp = £4.11

**Excipients** include alcohol, propylene glycol (caution in neonates, see Excipients, p. 2)

**Note** Shake ampoule for at least 5 seconds before use

## CALCITRIOL

(1,25-Dihydroxycholecalciferol)

**Indications** see notes above

**Cautions** see under Ergocalciferol; monitor plasma calcium, phosphate, and creatinine during dosage titration

**Contra-indications** see under Ergocalciferol

**Pregnancy** see under Ergocalciferol

**Breast-feeding** see under Ergocalciferol

**Side-effects** see under Ergocalciferol

#### Dose

- **By mouth**, renal osteodystrophy, initially 250 nanograms daily, or on alternate days (in patients with normal or only slightly reduced plasma-calcium concentration), increased if necessary in steps of 250 nanograms at intervals of 2–4 weeks; usual dose 0.5–1 microgram daily; **CHILD** not established  
Established postmenopausal osteoporosis, 250 nanograms twice daily (monitor plasma-calcium concentration and creatinine, consult product literature)
- **By intravenous injection** (or injection through catheter after haemodialysis), hypocalcaemia in dialysis patients with chronic renal failure, initially 500 nanograms (approx. 10 nanograms/kg) 3 times a week, increased if necessary in steps of 250–500 nanograms at intervals of 2–4 weeks; usual dose 0.5–3 micrograms 3 times a week; **CHILD** see *BNF for Children*  
Moderate to severe secondary hyperparathyroidism in dialysis patients, initially 0.5–4 micrograms 3 times a week, increased if necessary in steps of 250–500 nanograms at intervals of 2–4 weeks; max. 8 micrograms 3 times a week

**Calcitriol** (Non-proprietary) (POM)

**Capsules**, calcitriol 250 nanograms, net price 30-cap pack = £18.04, 100-cap pack = £19.15; 500 nanograms, 30-cap pack = £32.25, 100-cap pack = £25.76

**Rocaltrol**<sup>®</sup> (Roche) (POM)

**Capsules**, calcitriol 250 nanograms (red/white), net price 100 = £18.04; 500 nanograms (red), 100 = £32.25

**Calcijex**<sup>®</sup> (Abbott) (POM)

**Injection**, calcitriol 1 microgram/mL, net price 1-mL amp = £5.14; 2 micrograms/mL, 1-mL amp = £10.28

## COLECALCIFEROL

(Cholecalciferol, vitamin D<sub>3</sub>)

**Indications** see notes above

**Cautions** see under Ergocalciferol

**Contra-indications** see under Ergocalciferol

**Pregnancy** see under Ergocalciferol

**Breast-feeding** see under Ergocalciferol

**Side-effects** see under Ergocalciferol

#### Dose

- See notes above

**Colecalciferol** (Non-proprietary)

**Capsules**, colecalciferol 20 000 units

Available from 'special-order' manufacturers or specialist importing companies, see p. 988

#### With calcium

For prescribing information on calcium, see section 9.5.1.1

**Adcal-D<sub>3</sub>**<sup>®</sup> (ProStrakan)

**Tablets** (chewable) (lemon or tutti-frutti flavour), calcium carbonate 1.5 g (calcium 600 mg or Ca<sup>2+</sup> 15 mmol), colecalciferol 10 micrograms (400 units), net price 56-tab pack = £3.89, 112-tab pack = £7.78. Label: 24

**Dissolve** (effervescent tablets), lemon flavour, calcium carbonate 1.5 g (calcium 600 mg or Ca<sup>2+</sup>

15 mmol), colecalciferol 10 micrograms (400 units), net price 56-tab pack = £4.99. Label: 13

**Cacit**<sup>®</sup> D3 (Warner Chilcott)

**Granules**, effervescent, lemon flavour, calcium carbonate 1.25 g (calcium 500 mg or Ca<sup>2+</sup> 12.5 mmol), colecalciferol 11 micrograms (440 units)/sachet, net price 30-sachet pack = £4.06. Label: 13

**Calceos**<sup>®</sup> (Galen)

**Tablets** (chewable), lemon flavour, calcium carbonate 1.25 g (calcium 500 mg or Ca<sup>2+</sup> 12.5 mmol), colecalciferol 10 micrograms (400 units), net price 60-tab pack = £3.62. Label: 24

**Calcichew-D<sub>3</sub>**<sup>®</sup> (Shire)

**Calcichew-D<sub>3</sub>**<sup>®</sup> **Tablets** (chewable), orange flavour, calcium carbonate 1.25 g (calcium 500 mg or Ca<sup>2+</sup> 12.5 mmol), colecalciferol 5 micrograms (200 units), net price 100-tab pack = £7.68. Label: 24  
**Excipients** include aspartame (section 9.4.1)

**Calcichew-D<sub>3</sub>**<sup>®</sup> **Forte Tablets** (chewable), lemon flavour, calcium carbonate 1.25 g (calcium 500 mg or Ca<sup>2+</sup> 12.5 mmol), colecalciferol 10 micrograms (400 units), net price 60-tab pack = £4.32, 100-tab pack = £7.21. Label: 24  
**Excipients** include aspartame (section 9.4.1)

**Calcichew-D<sub>3</sub>**<sup>®</sup> **500 mg/400 unit caplets, f/c**, lemon flavour, calcium carbonate providing calcium 500 mg, colecalciferol 10 micrograms (400 units), net price 100-tab pack = £7.57  
**Excipients** include propylene glycol, see Excipients, p. 2

**Calfovite D3**<sup>®</sup> (Menarini)

**Powder**, lemon flavour, calcium phosphate 3.1 g (calcium 1.2 g or Ca<sup>2+</sup> 30 mmol), colecalciferol 20 micrograms (800 units), net price 30-sachet pack = £4.32. Label: 13, 21

**Natecal D3**<sup>®</sup> (Chiesi)

**Tablets** (chewable), (aniseed, peppermint, and molasses flavour), calcium carbonate 1.5 g (calcium 600 mg or Ca<sup>2+</sup> 15 mmol), colecalciferol 10 micrograms (400 units), net price 60-tab pack = £3.63. Label: 24  
**Excipients** include aspartame (section 9.4.1)

**Sandocal**<sup>®</sup>+D (Novartis Consumer Health)

**Sandocal**<sup>®</sup> +D **600 tablets**, effervescent, orange flavour, calcium lactate gluconate 1.36 g, calcium carbonate 1.05 g, providing calcium 600 mg (Ca<sup>2+</sup> 15 mmol), colecalciferol concentrate 4 mg, providing colecalciferol 10 micrograms (400 units), net price 60-tab pack = £5.35, 100-tab pack = £8.75. Label: 13  
**Excipients** include aspartame (section 9.4.1)

**Sandocal**<sup>®</sup> +D **1200 tablets**, effervescent, orange flavour, calcium lactate gluconate 2.72 g, calcium carbonate 2.1 g, providing calcium 1200 mg (Ca<sup>2+</sup> 30 mmol), colecalciferol concentrate 8 mg, providing colecalciferol 20 micrograms (800 units), net price 30-tab pack = £4.32. Label: 13  
**Excipients** include aspartame (section 9.4.1)

#### With alendronic acid

Section 6.6.2

#### With risedronate sodium and calcium

Section 6.6.2

**DIHYDROTACHYSTEROL**

- Indications** see notes above  
**Cautions** see under Ergocalciferol  
**Contra-indications** see under Ergocalciferol  
**Pregnancy** see under Ergocalciferol  
**Breast-feeding** see under Ergocalciferol  
**Side-effects** see under Ergocalciferol

**AT 10<sup>®</sup>** (Intrapharm)

**Oral solution**, dihydrotachysterol 250 micrograms/mL. Net price 15-mL dropper bottle = £22.87

**Excipients** include arachis (peanut) oil

**Dose** acute, chronic, and latent forms of hypocalcaemic tetany due to hypoparathyroidism, consult product literature

**PARICALCITOL**

- Indications** see under preparations below  
**Cautions** monitor plasma calcium and phosphate during dose titration and at least monthly when stabilised; monitor parathyroid hormone concentration; **interactions:** Appendix 1 (vitamins)

**Contra-indications** see under Ergocalciferol

**Pregnancy** toxicity in *animal* studies—manufacturer advises avoid unless potential benefit outweighs risk; see also under Ergocalciferol

**Breast-feeding** manufacturer advises caution—no information available; see also under Ergocalciferol

**Side-effects** see under Ergocalciferol; also dyspepsia, taste disturbance, breast tenderness, acne, pruritus, and rash

**Dose**

- Consult product literature

**Zemplar<sup>®</sup>** (Abbott) (POM)

**Capsules**, paricalcitol 1 microgram (grey), net price 28-cap pack = £69.44; 2 micrograms (orange-brown), 28-cap pack = £138.88; 4 micrograms (gold), 28-cap pack = £277.76

For prevention and treatment of secondary hyperparathyroidism associated with chronic renal failure

**Injection**, paricalcitol 5 micrograms/mL, net price 1-mL amp = £12.40, 2-mL amp = £24.80. For injection via haemodialysis access

**Excipients** include propylene glycol, see Excipients, p. 2

For prevention and treatment of secondary hyperparathyroidism associated with chronic renal failure in patients on haemodialysis

## 9.6.5 Vitamin E (Tocopherols)

The daily requirement of vitamin E has not been well defined but is probably about 3 to 15 mg daily. There is little evidence that oral supplements of vitamin E are essential in adults, even where there is fat malabsorption secondary to cholestasis. In young children with congenital cholestasis, abnormally low vitamin E concentrations may be found in association with neuromuscular abnormalities, which usually respond only to the parenteral administration of vitamin E.

Vitamin E has been tried for various other conditions but there is little scientific evidence of its value.

**ALPHA TOCOPHERYL ACETATE**

- Indications** see notes above  
**Cautions** predisposition to thrombosis; increased risk of necrotising enterocolitis in neonate weighing less than 1.5 kg; **interactions:** Appendix 1 (vitamins)  
**Pregnancy** no evidence of safety of high doses  
**Breast-feeding** excreted in milk; minimal risk, although caution with large doses  
**Side-effects** diarrhoea and abdominal pain with doses more than 1 g daily

**Vitamin E Suspension** (Non-proprietary)

**Suspension**, alpha tocopheryl acetate 500 mg/5 mL. Net price 100 mL = £30.35

**Dose** malabsorption in cystic fibrosis, 100–200 mg daily; **CHILD** 1 month–1 year 50 mg daily; 1–12 years, 100 mg daily

Malabsorption in abetalipoproteinaemia, **ADULT** and **CHILD** 50–100 mg/kg daily

Malabsorption in chronic cholestasis and severe liver disease, **CHILD** see *BNF for Children*

**Note** Tablets containing tocopheryl acetate are available from 'special-order' manufacturers or specialist importing companies, see p. 988

**ALPHA TOCOPHEROL**

**Indications** vitamin E deficiency because of malabsorption in congenital or hereditary chronic cholestasis

**Cautions** predisposition to thrombosis; **interactions:** Appendix 1 (Vitamin E)

**Contra-indications** preterm neonates

**Hepatic impairment** manufacturer advises caution and monitor closely—no information available

**Renal impairment** manufacturer advises caution and monitor closely; risk of renal toxicity due to polyethylene glycol content

**Pregnancy** manufacturer advises caution, no evidence of harm in *animal* studies

**Breast-feeding** manufacturer advises use only if potential benefit outweighs risk—no information available

**Side-effects** diarrhoea; *less commonly* asthenia, headache, disturbances in serum-potassium and serum-sodium concentrations, alopecia, pruritus, and rash

**Vedrop<sup>®</sup>** (Orphan Europe) ▼ (POM)

**Oral solution**, yellow, D-alpha tocopherol (as tocopherolsol) 50 mg/mL, net price 20 mL = £54.55, 60 mL = £163.65 (all with oral syringe)

**Note** Tocopherolsol is a water-soluble form of D-alpha tocopherol

**Dose** **CHILD** under 18 years, 17 mg/kg daily, adjusted as necessary

## 9.6.6 Vitamin K

Vitamin K is necessary for the production of blood clotting factors and proteins necessary for the normal calcification of bone.

Because vitamin K is fat soluble, patients with fat malabsorption, especially in biliary obstruction or hepatic disease, may become deficient. **Menadiol sodium phosphate** is a water-soluble synthetic vitamin K derivative that can be given orally to prevent vitamin K deficiency in malabsorption syndromes.

Oral coumarin anticoagulants act by interfering with vitamin K metabolism in the hepatic cells and their effects can be antagonised by giving vitamin K; for advice on the use of vitamin K in haemorrhage, see section 2.8.2.

**Vitamin K deficiency bleeding** Neonates are relatively deficient in vitamin K and those who do not receive supplements of vitamin K are at risk of serious bleeding including intracranial bleeding. The Chief Medical Officer and the Chief Nursing Officer have recommended that all newborn babies should receive vitamin K to prevent vitamin K deficiency bleeding (previously termed haemorrhagic disease of the newborn). An appropriate regimen should be selected after discussion with parents in the antenatal period.

Vitamin K (as **phytomenadione**) 1 mg may be given by a single intramuscular injection at birth; this prevents vitamin K deficiency bleeding in virtually all babies. For preterm neonates, see *BNF for Children*.

Alternatively, in healthy babies who are not at particular risk of bleeding disorders, vitamin K may be given by mouth, and arrangements must be in place to ensure the appropriate regimen is followed. Two doses of a colloidal (mixed micelle) preparation of phytomenadione 2 mg should be given by mouth in the first week, the first dose being given at birth and the second dose at 4–7 days. For exclusively breast-fed babies, a third dose of colloidal phytomenadione 2 mg is given by mouth at 1 month of age; the third dose is omitted in formula-fed babies because formula feeds contain adequate vitamin K. An alternative regimen is to give one dose of phytomenadione 1 mg by mouth at birth (using the contents of a phytomenadione capsule, see preparation below) to protect from the risk of vitamin K deficiency bleeding in the first week; for exclusively breast-fed babies, further doses of phytomenadione 1 mg are given by mouth (using the contents of a phytomenadione capsule) at weekly intervals for 12 weeks.

## MENADIOL SODIUM PHOSPHATE

**Indications** see notes above

**Cautions** G6PD deficiency (section 9.1.5) and vitamin E deficiency (risk of haemolysis); **interactions:** Appendix 1 (vitamins)

**Contra-indications** neonates and infants

**Pregnancy** avoid in late pregnancy and labour unless benefit outweighs risk of neonatal haemolytic anaemia, hyperbilirubinaemia, and kernicterus in neonate

### Dose

- 10–40 mg daily, adjusted as necessary; **CHILD** 1–12 years, 5–10 mg daily, adjusted as necessary, 12–18 years, 10–20 mg daily, adjusted as necessary

**Menadiol Phosphate** (Non-proprietary)

**Tablets**, menadiol sodium phosphate equivalent to 10 mg of menadiol phosphate, net price 100-tab pack = £58.39

## PHYTOMENADIONE

(Vitamin K<sub>1</sub>)

**Indications** see notes above

**Cautions** intravenous injections should be given very slowly (see also below); **interactions:** Appendix 1 (vitamins)

**Pregnancy** use if potential benefit outweighs risk

**Breast-feeding** present in milk, but see notes above

### Dose

- See notes above and section 2.8.2

**Neokay**<sup>®</sup> (Neoceuticals) (POM)

**Capsules**, brown, phytomenadione 1 mg in an oily basis, net price 12-cap pack = £3.95; 100-cap pack = £34.00

**Note** The contents of one capsule should be administered by cutting the narrow tubular tip off and squeezing the liquid contents into the mouth; if the baby spits out the dose or is sick within three hours of administration a replacement dose should be given

### Colloidal formulation

**Konakion**<sup>®</sup> **MM** (Roche) (POM)

**Injection**, phytomenadione 10 mg/mL in a mixed micelles vehicle, net price 1-mL amp = 38p

**Excipients** include glycocholic acid 54.6 mg/amp, lecithin

**Cautions** reduce dose in elderly; liver impairment (glycocholic acid may displace bilirubin); reports of anaphylactoid reactions

**Note** **Konakion**<sup>®</sup> **MM** may be administered by slow intravenous injection or by intravenous infusion in glucose 5% (see Appendix 6); **not** for intramuscular injection

**Konakion**<sup>®</sup> **MM Paediatric** (Roche) (POM)

**Injection**, phytomenadione 10 mg/mL in a mixed micelles vehicle, net price 0.2-mL amp = 95p

**Excipients** include glycocholic acid 10.9 mg/amp, lecithin

**Cautions** parental administration in neonate of less than 2.5 kg (increased risk of kernicterus)

**Note** **Konakion**<sup>®</sup> **MM Paediatric** may be administered by mouth or by intramuscular injection or by intravenous injection

## 9.6.7 Multivitamin preparations

### Vitamins

**Capsules**, ascorbic acid 15 mg, nicotinamide 7.5 mg, riboflavin 500 micrograms, thiamine hydrochloride 1 mg, vitamin A 2500 units, vitamin D 300 units, net price 28-cap pack = £1.50

**Abidec**<sup>®</sup> (Chefaro UK)

**Drops**, vitamins A, B group, C, and D, net price 25 mL (with dropper) = £2.20

**Excipients** include arachis (peanut) oil

**Note** Contains 1333 units of vitamin A (as palmitate) per 0.6-mL dose

**Dalivit**<sup>®</sup> (LPC)

**Oral drops**, vitamins A, B group, C, and D, net price 25 mL = £2.98, 50 mL = £4.85

**Note** Contains 5000 units of vitamin A (as palmitate) per 0.6-mL dose

## Vitamin and mineral supplements and adjuncts to synthetic diets

**Forceval**<sup>®</sup> (Alliance)

**Capsules**, brown/red, vitamins (ascorbic acid 60 mg, biotin 100 micrograms, cyanocobalamin 3 micrograms, folic acid 400 micrograms, nicotinamide 18 mg, pantothenic acid 4 mg, pyridoxine 2 mg, riboflavin 1.6 mg, thiamine 1.2 mg, vitamin A 2500 units, vitamin D<sub>2</sub> 400 units, vitamin E 10 mg, minerals and trace elements (calcium 100 mg, chromium 200 micrograms, copper 2 mg, iodine 140 micrograms, iron 12 mg, magnesium 30 mg, manganese

3 mg, molybdenum 250 micrograms, phosphorus 77 mg, potassium 4 mg, selenium 50 micrograms, zinc 15 mg), net price 15-cap pack = £2.83, 30-cap pack = £5.19, 90-cap pack = £12.53. Label: 25

**Dose** vitamin and mineral deficiency and as adjunct in synthetic diets, **ADULT** 1 capsule daily one hour after a meal

**Junior capsules**, brown, vitamins (ascorbic acid 25 mg, biotin 50 micrograms, cyanocobalamin 2 micrograms, folic acid 100 micrograms, nicotinamide 7.5 mg, pantothenic acid 2 mg, pyridoxine 1 mg, riboflavin 1 mg, thiamine 1.5 mg, vitamin A 1250 units, vitamin D<sub>2</sub> 200 units, vitamin E 5 mg, vitamin K<sub>1</sub> 25 micrograms), minerals and trace elements (chromium 50 micrograms, copper 1 mg, iodine 75 micrograms, iron 5 mg, magnesium 1 mg, manganese 1.25 mg, molybdenum 50 micrograms, selenium 25 micrograms, zinc 5 mg), net price 30-cap pack = £3.52, 60-cap pack = £6.69

**Dose** vitamin and mineral deficiency and as adjunct in synthetic diets, **CHILD** over 5 years, 2 junior capsules daily

### Ketovite® (Paines & Byrne)

**Tablets** <sup>(POM)</sup>, yellow, ascorbic acid 16.6 mg, riboflavin 1 mg, thiamine hydrochloride 1 mg, pyridoxine hydrochloride 330 micrograms, nicotinamide 3.3 mg, calcium pantothenate 1.16 mg, alpha tocopheryl acetate 5 mg, inositol 50 mg, biotin 170 micrograms, folic acid 250 micrograms, acetomenaphthone 500 micrograms, net price 100-tab pack = £4.17

**Dose** prevention of vitamin deficiency in disorders of carbohydrate or amino-acid metabolism and adjunct in restricted, specialised, or synthetic diets, 1 tablet 3 times daily; use with *Ketovite® Liquid* for complete vitamin supplementation

**Liquid**, pink, sugar-free, vitamin A 2500 units, ergocalciferol 400 units, choline chloride 150 mg, cyanocobalamin 12.5 micrograms/5 mL, net price 150-mL pack = £2.70

**Dose** prevention of vitamin deficiency in disorders of carbohydrate or amino-acid metabolism and adjunct in restricted, specialised, or synthetic diets, 5 mL daily; use with *Ketovite® Tablets* for complete vitamin supplementation

## 9.7 Bitters and tonics

Mixtures containing simple and aromatic bitters are traditional remedies for loss of appetite; there is no evidence to support their use.

## 9.8 Metabolic disorders

### 9.8.1 Drugs used in metabolic disorders

#### 9.8.2 Acute porphyrias

This section covers drugs used in metabolic disorders and not readily classified elsewhere.

### 9.8.1 Drugs used in metabolic disorders

## Wilson's disease

**Penicillamine** (see also section 10.1.3) is used in Wilson's disease (hepatolenticular degeneration) to aid

the elimination of copper ions. See below for other indications.

**Trientine** is used for the treatment of Wilson's disease only in patients intolerant of penicillamine; it is **not** an alternative to penicillamine for rheumatoid arthritis or cystinuria. Penicillamine-induced systemic lupus erythematosus may not resolve on transfer to trientine.

**Zinc** prevents the absorption of copper in Wilson's disease. Symptomatic patients should be treated initially with a chelating agent because zinc has a slow onset of action. When transferring from chelating treatment to zinc maintenance therapy, chelating treatment should be co-administered for 2–3 weeks until zinc produces its maximal effect.

## PENICILLAMINE

**Indications** see under Dose below

**Cautions** section 10.1.3; also neurological involvement in Wilson's disease

**Contra-indications** section 10.1.3

**Renal impairment** section 10.1.3

**Pregnancy** section 10.1.3

**Breast-feeding** section 10.1.3

**Side-effects** section 10.1.3; also neuropathy (especially if previous neurological involvement in Wilson's disease—prophylactic pyridoxine recommended, see section 9.6.2)

### Dose

- Wilson's disease, 1.5–2 g daily in divided doses before food; max. 2 g daily for 1 year; maintenance 0.75–1 g daily; **ELDERLY** 20 mg/kg daily in divided doses, adjusted according to response; **CHILD** under 12 years see *BNF for Children*
- Autoimmune hepatitis (used rarely; after disease controlled with corticosteroids), initially 500 mg daily in divided doses increased slowly over 3 months; usual maintenance dose 1.25 g daily; **ELDERLY** not recommended
- Cystinuria, therapeutic, 1–3 g daily in divided doses before food, adjusted to maintain urinary cystine below 200 mg/litre; prophylactic (maintain urinary cystine below 300 mg/litre) 0.5–1 g at bedtime; maintain adequate fluid intake (at least 3 litres daily); **CHILD** and **ELDERLY** minimum dose to maintain urinary cystine below 200 mg/litre
- Severe active rheumatoid arthritis, section 10.1.3

### Preparations

Section 10.1.3

## TRIENTINE DIHYDROCHLORIDE

**Indications** Wilson's disease in patients intolerant of penicillamine

**Cautions** see notes above; **interactions:** Appendix 1 (trientine)

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk; monitor maternal and neonatal serum-copper concentration; teratogenic in *animal* studies

**Side-effects** nausea, rash; *very rarely* anaemia; duodenitis and colitis also reported

**Dose**

- **ADULT** and **CHILD** over 12 years, 1.2–2.4 g daily in 2–4 divided doses before food; **CHILD** 2–12 years, initially 0.6–1.5 g daily in 2–4 divided doses before food, adjusted according to response

**Trientine Dihydrochloride** (Univar) (POM)

Capsules, trientine dihydrochloride 300 mg. Label: 6, 22

**ZINC ACETATE**

**Indications** Wilson's disease (initiated under specialist supervision)

**Cautions** portal hypertension (risk of hepatic decompensation when switching from chelating agent); monitor full blood count and serum cholesterol;

**interactions:** Appendix 1 (zinc)

**Pregnancy** reduce dose to 25 mg 3 times daily adjusted according to plasma-copper concentration and urinary copper excretion

**Breast-feeding** manufacturer advises avoid; present in milk—may cause zinc-induced copper deficiency in infant

**Side-effects** gastric irritation (usually transient; may be reduced if first dose taken mid-morning or with a little protein); *less commonly* sideroblastic anaemia and leucopenia

**Dose**

**Note** Dose expressed as elemental zinc

- Wilson's disease, 50 mg 3 times daily (max. 50 mg 5 times daily), adjusted according to response; **CHILD** 1–6 years, 25 mg twice daily; 6–16 years, body-weight under 57 kg, 25 mg 3 times daily, body-weight over 57 kg, 50 mg 3 times daily; **ADOLESCENT** 16–18 years, 50 mg 3 times daily

**Wilzin**® (Orphan Europe) (POM)

Capsules, zinc (as acetate) 25 mg (blue), net price 250-cap pack = £132.00; 50 mg (orange), 250-cap pack = £242.00. Label: 23

**Carnitine deficiency**

**Carnitine** is available for the management of primary carnitine deficiency due to inborn errors of metabolism or of secondary deficiency in haemodialysis patients.

**CARNITINE**

**Indications** primary and secondary carnitine deficiency

**Cautions** diabetes mellitus; monitoring of free and acyl carnitine in blood and urine recommended

**Renal impairment** accumulation of metabolites may occur with chronic oral administration in severe impairment

**Pregnancy** appropriate to use; no evidence of teratogenicity in *animal* studies

**Side-effects** nausea, vomiting, abdominal pain, diarrhoea, body odour; side-effects may be dose-related—monitor tolerance during first week and after any dose increase

**Dose**

- Primary deficiency, **by mouth**, up to 200 mg/kg daily in 2–4 divided doses; higher doses of up to 400 mg/kg daily occasionally required; usual max. 3 g daily; **by**

**intravenous injection** over 2–3 minutes, up to 100 mg/kg daily in 3–4 divided doses

- Secondary deficiency, **by intravenous injection** over 2–3 minutes, 20 mg/kg after each dialysis session (dosage adjusted according to plasma-carnitine concentration); maintenance (if benefit gained from first intravenous course), **by mouth**, 1 g daily

**Carnitor**® (Sigma-Tau) (POM)

Tablets, L-carnitine 330 mg, net price 90-tab pack = £103.95

**Chewable tablets**, L-carnitine 1 g, net price 10-tab pack = £35.00

**Oral liquid**, L-carnitine 100 mg/mL (10%), net price 10 × 10-mL (1-g) single-dose bottle = £35.00

**Paediatric oral solution**, L-carnitine 300 mg/mL (30%), net price 20 mL = £21.00

**Injection**, L-carnitine 200 mg/mL, net price 5-mL amp = £11.90

**Fabry's disease**

**Agalsidase alfa** and **agalsidase beta**, enzymes produced by recombinant DNA technology, are licensed for long-term enzyme replacement therapy in Fabry's disease (a lysosomal storage disorder caused by deficiency of alpha-galactosidase A).

**AGALSIDASE ALFA and BETA**

**Indications** Fabry's disease (specialist use only)

**Cautions** **interactions:** Appendix 1 (agalsidase alfa and beta)

**Infusion-related reactions** Infusion-related reactions very common; manage by slowing the infusion rate or interrupting the infusion, or minimise by pre-treatment with an antihistamine, antipyretic, or corticosteroid—consult product literature

**Pregnancy** use with caution

**Breast-feeding** use with caution—no information available

**Side-effects** gastro-intestinal disturbances, taste disturbances; tachycardia, bradycardia, palpitation, hypertension, hypotension, chest pain, oedema, flushing; dyspnoea, cough, rhinorrhoea; headache, fatigue, dizziness, asthenia, paraesthesia, syncope, neuropathic pain, tremor, sleep disturbances; influenza-like symptoms, nasopharyngitis; muscle spasms, myalgia, arthralgia; eye irritation; tinnitus; hypersensitivity reactions, angioedema, pruritus, urticaria, rash, acne; *less commonly* cold extremities, parosmia, ear pain and swelling, skin discoloration, and injection-site reactions

**Fabrazyme**® (Genzyme) (POM)

**Intravenous infusion**, powder for reconstitution, agalsidase beta, net price 5-mg vial = £315.08; 35-mg vial = £2196.59

**Dose** **By intravenous infusion**, **ADULT** and **CHILD** over 8 years 1 mg/kg every 2 weeks

**Replagal**® (Shire HGT) (POM)

**Concentrate for intravenous infusion**, agalsidase alfa 1 mg/mL, net price 1-mL vial = £356.85; 3.5-mL vial = £1068.64

**Dose** **By intravenous infusion**, **ADULT** and **CHILD** over 7 years 200 micrograms/kg every 2 weeks

## Gaucher's disease

**Imiglucerase**, an enzyme produced by recombinant DNA technology, is administered as enzyme replacement therapy for non-neurological manifestations of type I or type III Gaucher's disease, a familial disorder affecting principally the liver, spleen, bone marrow, and lymph nodes.

**Velaglucerase alfa**, an enzyme produced by recombinant DNA technology, is administered as enzyme replacement therapy for the treatment of type I Gaucher's disease.

**Miglustat**, an inhibitor of glucosylceramide synthase, is licensed for the treatment of mild to moderate type I Gaucher's disease in patients for whom enzyme replacement therapy is unsuitable; it is given by mouth; see p. 627.

### IMIGLUCERASE

**Indications** (specialist use only) non-neurological manifestations of type I or type III Gaucher's disease

**Cautions** monitor for imiglucerase antibodies; when stabilised, monitor all parameters and response to treatment at intervals of 6–12 months

**Pregnancy** manufacturer advises use with caution—limited information available

**Breast-feeding** no information available

**Side-effects** hypersensitivity reactions (including urticaria, angioedema, cyanosis, hypotension, flushing, tachycardia, paraesthesia, backache); *less commonly* nausea, vomiting, diarrhoea, abdominal cramps, headache, dizziness, fatigue, fever, arthralgia, and injection-site reactions

#### Dose

- By intravenous infusion, initially 60 units/kg once every 2 weeks (doses as low as 15 units/kg once every 2 weeks may improve haematological parameters and organomegaly, but not bone parameters); maintenance, adjust dose according to response

**Cerezyme**® (Genzyme) (PmL)

Intravenous infusion, powder for reconstitution, imiglucerase, net price 200-unit vial = £535.65; 400-unit vial = £1071.29

Electrolytes Na<sup>+</sup> 0.62 mmol/200-unit vial, 1.24 mmol/400-unit vial

### VELAGLUCERASE ALFA

**Indications** (specialist use only) type I Gaucher's disease

**Cautions** monitor immunoglobulin G (IgG) antibody concentration in severe infusion-related reactions or if there is a lack or loss of effect with velaglucerase alfa

**Infusion-related reactions** Infusion-related reactions very common; manage by slowing the infusion rate, or interrupting the infusion, or minimise by pre-treatment with an antihistamine, antipyretic, or corticosteroid—consult product literature

**Pregnancy** manufacturer advises use with caution—limited information available

**Breast-feeding** manufacturer advises use with caution—no information available

**Side-effects** nausea, abdominal pain, tachycardia, hypertension, hypotension, flushing, headache, dizziness, malaise, pyrexia, arthralgia, bone pain, back pain, hypersensitivity reactions, rash, urticaria

#### Dose

- By intravenous infusion, ADULT and CHILD over 4 years, 60 units/kg once every 2 weeks; adjusted according to response to 15–60 units/kg once every 2 weeks

**VPRIV**® (Shire HGT) (PmL)

Intravenous infusion, powder for reconstitution, velaglucerase alfa, net price 400-unit vial = £1410.20

Electrolytes Na<sup>+</sup> 0.53 mmol/400-unit vial

## Mucopolysaccharidosis

**Laronidase**, an enzyme produced by recombinant DNA technology, is licensed for long-term replacement therapy in the treatment of non-neurological manifestations of mucopolysaccharidosis I, a lysosomal storage disorder caused by deficiency of alpha-L-iduronidase.

**Idursulfase**, an enzyme produced by recombinant DNA technology, is licensed for long-term replacement therapy in mucopolysaccharidosis II (Hunter syndrome), a lysosomal storage disorder caused by deficiency of iduronate-2-sulfatase.

**Galsulfase**, a recombinant form of human N-acetylgalactosamine-4-sulfatase, is licensed for long-term replacement therapy in mucopolysaccharidosis VI (Maroteaux-Lamy syndrome).

**Infusion-related reactions** Infusion-related reactions often occur with administration of laronidase, idursulfase, and galsulfase; they can be managed by slowing the infusion rate or interrupting the infusion, and can be minimised by pre-treatment with an antihistamine and an antipyretic. Recurrent infusion-related reactions may require pre-treatment with a corticosteroid—consult product literature for details.

### GALSULFASE

**Indications** (specialist use only) mucopolysaccharidosis VI

**Cautions** respiratory disease; acute febrile or respiratory illness (consider delaying treatment)

**Infusion-related reactions** See notes above

**Pregnancy** manufacturer advises avoid unless essential

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** abdominal pain, umbilical hernia, gastroenteritis; chest pain, hypertension; dyspnoea, apnoea, nasal congestion; rigors, malaise, areflexia; pharyngitis; conjunctivitis, corneal opacity; ear pain; facial oedema

#### Dose

- By intravenous infusion, ADULT and CHILD over 5 years, 1 mg/kg once weekly

**Naglazyme**® (BioMarin) (PmL)

Concentrate for intravenous infusion, galsulfase 1 mg/mL, net price 5-mL vial = £982.00

### IDURSULFASE

**Indications** (specialist use only) mucopolysaccharidosis II

**Cautions** severe respiratory disease; acute febrile respiratory illness (consider delaying treatment)

**Infusion-related reactions** See notes above

**Contra-indications** women of child-bearing potential

**Pregnancy** manufacturer advises avoid

**Breast-feeding** manufacturer advises avoid—present in milk in *animal* studies

**Side-effects** gastro-intestinal disturbances, swollen tongue; arrhythmia, tachycardia, chest pain, cyanosis, peripheral oedema, hypertension, hypotension, flushing; bronchospasm, hypoxia, cough, wheezing, tachypnoea, dyspnoea; headache, dizziness, tremor; pyrexia; arthralgia; facial oedema, urticaria, pruritus, rash, infusion-site swelling, erythema; pulmonary embolism and anaphylaxis also reported

#### Dose

- By **intravenous infusion**, **ADULT** and **CHILD** over 5 years, 500 micrograms/kg once weekly

**Elaprase**<sup>®</sup> (Shire HGT) ▼ (POM)

Concentrate for intravenous infusion, idursulfase 2 mg/mL, net price 3-mL vial = £1985.00

## LARONIDASE

**Indications** (specialist use only) non-neurological manifestations of mucopolysaccharidosis I

**Cautions** monitor immunoglobulin G (IgG) antibody concentration; **interactions:** Appendix 1 (laronidase)

**Infusion-related reactions** See notes above

**Pregnancy** manufacturer advises avoid unless essential—no information available

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** nausea, vomiting, diarrhoea, abdominal pain; cold extremities, pallor, flushing, tachycardia, blood pressure changes; dyspnoea, cough, angioedema, anaphylaxis; headache, paraesthesia, dizziness, fatigue, restlessness; influenza-like symptoms; musculoskeletal pain, pain in extremities; rash, pruritus, urticaria, alopecia, infusion-site reactions; bronchospasm and respiratory arrest also reported

#### Dose

- By **intravenous infusion**, 100 units/kg once weekly; **CHILD** see *BNF for Children*

**Aldurazyme**<sup>®</sup> (Genzyme) ▼ (POM)

Concentrate for intravenous infusion, laronidase 100 units/mL, net price 5-mL vial = £444.70  
Electrolytes Na<sup>+</sup> 1.29 mmol/5-mL vial

## Nephropathic cystinosis

**Mercaptamine** is available for the treatment of nephropathic cystinosis.

## MERCAPTAMINE

(Cysteamine)

**Indications** (specialist use only) nephropathic cystinosis

**Cautions** leucocyte-cystine concentration and haematological monitoring required—consult product literature; dose of phosphate supplement may need to be adjusted

**Contra-indications** hypersensitivity to mercaptamine or penicillamine

**Pregnancy** avoid—teratogenic and toxic in *animal* studies

**Breast-feeding** avoid

**Side-effects** breath and body odour, nausea, vomiting, diarrhoea, anorexia, lethargy, fever, rash; also reported dehydration, hypertension, abdominal discomfort, gastroenteritis, drowsiness, encephalopathy, headache, nervousness, depression; anaemia, leucopenia; *rarely* gastro-intestinal ulceration and bleeding, seizures, hallucinations, urticaria, interstitial nephritis

#### Dose

- Initial doses should be one-sixth to one-quarter of the expected maintenance dose, increased gradually over 4–6 weeks
- Maintenance, **ADULT** and **CHILD** over 50 kg body-weight, 2 g daily in 4 divided doses  
**CHILD** up to 12 years, 1.3 g/m<sup>2</sup> (approx. 50 mg/kg) daily in 4 divided doses

**Cystagon**<sup>®</sup> (Orphan Europe) (POM)

**Capsules**, mercaptamine (as bitartrate) 50 mg, net price 100-cap pack = £70.00; 150 mg, 100-cap pack = £190.00

**Note** **CHILD** under 6 years at risk of aspiration, capsules can be opened and contents sprinkled on food (at a temperature suitable for eating); avoid adding to acidic drinks (e.g. orange juice)

## Pompe disease

**Alglucosidase alfa**, an enzyme produced by recombinant DNA technology, is licensed for long-term replacement therapy in Pompe disease, a lysosomal storage disorder caused by deficiency of acid alpha-glucosidase.

## ALGLUCOSIDASE ALFA

**Indications** (specialist use only) Pompe disease

**Cautions** cardiac and respiratory dysfunction—monitor closely; monitor immunoglobulin G (IgG) antibody concentration

**Infusion-related reactions** Infusion-related reactions very common, calling for use of antihistamine, antipyretic, or corticosteroid; consult product literature for details

**Pregnancy** toxicity in *animal* studies, but treatment should not be withheld

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** nausea, vomiting, diarrhoea; flushing, tachycardia, blood pressure changes, cold extremities, cyanosis, facial oedema, chest discomfort; cough, tachypnoea, bronchospasm; headache, agitation, tremor, irritability, restlessness, paraesthesia, dizziness, fatigue; pyrexia; antibody formation; myalgia, muscle spasm; sweating, rash, pruritus, urticaria, injection-site reactions; hypersensitivity reactions (including anaphylaxis); severe skin reactions (including ulcerative and necrotising skin lesions) also reported

#### Dose

- By **intravenous infusion**, **ADULT** and **CHILD** 20 mg/kg every 2 weeks

**Myozyme**<sup>®</sup> (Genzyme) ▼ (POM)

**Intravenous infusion**, powder for reconstitution, alglucosidase alfa, net price 50-mg vial = £356.06

## Tyrosinaemia type I

Nitisinone is licensed for the treatment of hereditary tyrosinaemia type I in combination with dietary restriction of tyrosine and phenylalanine.

### NITISINONE

(NTBC)

**Indications** hereditary tyrosinaemia type I (specialist use only)

**Cautions** slit-lamp examination of eyes recommended before treatment; monitor liver function regularly; monitor platelet and white blood cell count every 6 months

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies

**Breast-feeding** manufacturer advises avoid—adverse effects in *animal* studies

**Side-effects** thrombocytopenia, leucopenia, granulocytopenia; conjunctivitis, photophobia, corneal opacity, keratitis, eye pain; *less commonly* leucocytosis, blepharitis, pruritus, exfoliative dermatitis, and erythematous rash

#### Dose

- **ADULT** and **CHILD** initially 500 micrograms/kg twice daily, adjusted according to response; max. 2 mg/kg daily

**Note** Capsules can be opened and the contents suspended in a small amount of water or formula diet and taken immediately

**Orfadin**<sup>®</sup> (Swedish Orphan) (POM)

**Capsules**, nitisinone 2 mg, net price 60-cap pack = £564.00; 5 mg, 60-cap pack = £1127.00; 10 mg, 60-cap pack = £2062.00

## Urea cycle disorders

**Sodium phenylbutyrate** is used in the management of urea cycle disorders. It is indicated as adjunctive therapy in all patients with neonatal-onset disease and in those with late-onset disease who have a history of hyperammonaemic encephalopathy.

**Carglumic acid** is licensed for the treatment of hyperammonaemia due to *N*-acetylglutamate synthase deficiency.

### CARGLUMIC ACID

**Indications** hyperammonaemia due to *N*-acetylglutamate synthase deficiency (initiated under specialist supervision)

**Pregnancy** manufacturer advises avoid unless essential—no information available

**Breast-feeding** manufacturer advises avoid—present in milk in *animal* studies

**Side-effects** sweating

#### Dose

- **ADULT** and **CHILD** initially 100–250 mg/kg daily in 2–4 divided doses immediately before food, adjusted according to plasma-ammonia concentration; maintenance 10–100 mg/kg daily in 2–4 divided doses

**Carbaglu**<sup>®</sup> (Orphan Europe) (POM)

**Dispersible tablets**, carglumic acid 200 mg, net price 5-tab pack = £299.00, 60-tab pack = £3499.00. Label: 13

## SODIUM PHENYLBUTYRATE

**Indications** adjunct in long-term treatment of urea cycle disorders (under specialist supervision)

**Cautions** congestive heart failure; **interactions:** Appendix 1 (sodium phenylbutyrate)

**Hepatic impairment** manufacturer advises caution

**Renal impairment** manufacturer advises caution

**Pregnancy** avoid—toxicity in *animal* studies; manufacturer advises adequate contraception during administration

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** gastro-intestinal disturbances, weight gain, taste disturbance, decreased appetite; syncope, oedema; headache, depression, irritability; renal tubular acidosis, menstrual disorders; blood disorders, metabolic acidosis, alkalosis; rash, blood odour; *less commonly* rectal bleeding, peptic ulcer, pancreatitis, and arrhythmias

#### Dose

- **ADULT** and **CHILD** body-weight over 20 kg, 9.9–13 g/m<sup>2</sup> daily in divided doses with meals (max. 20 g daily); **CHILD** body-weight less than 20 kg, 450–600 mg/kg daily in divided doses with meals

**Ammonaps**<sup>®</sup> (Swedish Orphan) (POM)

**Tablets**, sodium phenylbutyrate 500 mg. Contains Na<sup>+</sup> 2.7 mmol/tablet. Net price 250-tab pack = £493.00

**Granules**, sodium phenylbutyrate 940 mg/g. Contains Na<sup>+</sup> 5.4 mmol/g. Net price 266-g pack = £860.00

**Note** Granules should be mixed with food before taking

## Homocystinuria

**Betaine** is licensed for the adjunctive treatment of homocystinuria involving deficiencies or defects in cystathionine beta-synthase, 5,10-methylene-tetrahydrofolate reductase, or cobalamin cofactor metabolism. Betaine should be used in conjunction with dietary restrictions and may be given with supplements of Vitamin B<sub>12</sub>, pyridoxine, and folate under specialist advice.

The *Scottish Medicines Consortium* (p. 4) has advised (July 2010) that betaine anhydrous (*Cystadane*<sup>®</sup>) is accepted for restricted use within NHS Scotland for the adjunctive treatment of homocystinuria involving deficiencies or defects in cystathionine beta-synthase, 5,10-methylene-tetrahydrofolate reductase, or cobalamin cofactor metabolism in patients who are not responsive to pyridoxine treatment.

## BETAINE

**Indications** (specialist use only) adjunctive treatment of homocystinuria

**Cautions** monitor plasma-methionine concentration before and during treatment—interrupt treatment if symptoms of cerebral oedema occur

**Pregnancy** manufacturer advises avoid unless essential—limited information available

**Breast-feeding** manufacturer advises caution—no information available

**Side-effects** *less commonly* gastro-intestinal disorders, anorexia, reversible cerebral oedema (see Cau-

tions), agitation, depression, personality disorder, sleep disturbances, urinary incontinence, alopecia, and urticaria

### Dose

- **ADULT** and **CHILD** over 10 years, 3 g twice daily, adjusted according to response; max. 20 g/day; **CHILD** under 10 years 50 mg/kg twice daily, dose and frequency adjusted according to response; max. 75 mg/kg twice daily

### Cystadane® (Orphan Europe) (FoM)

Powder, betaine (anhydrous), net price 180 g = £347.00

**Note** Powder should be mixed with water, juice, milk, formula, or food until completely dissolved and taken immediately; measuring spoons are provided to measure 1 g, 150 mg, and 100 mg of powder

## Other metabolic disorders

**Miglustat** is available for the treatment of progressive neurological manifestations of Niemann-Pick type C disease, a neurodegenerative disorder characterised by impaired intracellular lipid trafficking; it is also licensed for the treatment of mild to moderate type 1 Gaucher's disease for whom imiglucerase is unsuitable, see also p. 624.

## MIGLUSTAT

**Indications** mild to moderate type I Gaucher's disease (specialist supervision only); Niemann-Pick type C disease (specialist supervision only)

**Cautions** monitor cognitive and neurological function; monitor growth and platelet count in Niemann-Pick type C disease

**Hepatic impairment** no information available—manufacturer advises caution

**Renal impairment** for Gaucher's disease initially 100 mg twice daily if eGFR 50–70 mL/minute/1.73 m<sup>2</sup>; initially 100 mg once daily if eGFR 30–50 mL/minute/1.73 m<sup>2</sup>; for Niemann-Pick type C disease, initially 200 mg twice daily if eGFR 50–70 mL/minute/1.73 m<sup>2</sup>; initially 100 mg twice daily if eGFR 30–50 mL/minute/1.73 m<sup>2</sup>; child under 12 years—consult product literature; avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** manufacturer advises avoid (toxicity in animal studies)—effective contraception must be used during treatment; also men should avoid fathering a child during and for 3 months after treatment

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** diarrhoea, flatulence, abdominal pain, dyspepsia, constipation, nausea, vomiting, anorexia, weight changes; tremor, dizziness, headache, peripheral neuropathy, ataxia, hypoaesthesia, paraesthesia, insomnia, fatigue, asthenia; decreased libido; thrombocytopenia; muscle spasm

### Dose

- Gaucher's disease, **ADULT** over 18 years, 100 mg 3 times daily; reduced if not tolerated to 100 mg 1–2 times daily
- Niemann-Pick type C disease, **ADULT** and **CHILD** over 12 years, 200 mg 3 times daily; **CHILD** 4–12 years, body surface area less than 0.47 m<sup>2</sup>, 100 mg once daily; body surface area 0.47–0.73 m<sup>2</sup>, 100 mg twice daily;

body surface area 0.73–0.88 m<sup>2</sup>, 100 mg three times daily; body surface area 0.88–1.25 m<sup>2</sup>, 200 mg twice daily; body surface area greater than 1.25 m<sup>2</sup>, adult dose

### Zavesca® (Actelion) (FoM)

**Capsules**, miglustat 100 mg, net price 84-cap pack = £3934.17 (hospital only)

## 9.8.2 Acute porphyrias

The acute porphyrias (acute intermittent porphyria, variegata porphyria, hereditary coproporphyria, and 5-aminolaevulinic acid dehydratase deficiency porphyria) are hereditary disorders of haem biosynthesis; they have a prevalence of about 1 in 10 000 of the population.

Great care must be taken when prescribing for patients with acute porphyria, since certain drugs can induce acute porphyric crises. Since acute porphyrias are hereditary, relatives of affected individuals should be screened and advised about the potential danger of certain drugs.

Treatment of serious or life-threatening conditions should not be withheld from patients with acute porphyria. When there is no safe alternative, treatment should be started and urinary porphobilinogen excretion should be measured regularly; if it increases or symptoms occur, the drug can be withdrawn and the acute attack treated. If an acute attack of porphyria occurs during pregnancy, contact an expert porphyria service for further advice.

**Haem arginate** is administered by short intravenous infusion as haem replacement in moderate, severe, or unremitting acute porphyria crises.

Supplies of haem arginate may be obtained in an emergency outside office hours from the on-call pharmacist at:

St Thomas' Hospital  
London  
Tel: (020) 7188 7188

## HAEM ARGINATE

(Human hemin)

**Indications** acute porphyrias (acute intermittent porphyria, porphyria variegata, hereditary coproporphyria)

**Pregnancy** manufacturer advises avoid unless essential

**Breast-feeding** manufacturer advises avoid unless essential—no information available

**Side-effects** rarely hypersensitivity reactions and fever; pain and thrombophlebitis at injection site

### Dose

- By intravenous infusion, **ADULT** and **CHILD** 3 mg/kg once daily (max. 250 mg daily) for 4 days; if response inadequate, repeat 4-day course with close biochemical monitoring

### Normosang® (Orphan Europe) (FoM)

**Concentrate for intravenous infusion**, haem arginate 25 mg/mL, net price 10-mL amp = £434.25

## Drugs unsafe for use in acute porphyrias

The following list contains drugs on the UK market that have been classified as 'unsafe' in porphyria because they have been shown to be porphyrinogenic in animals or *in vitro*, or have been associated with acute attacks in patients. Absence of a drug from the following lists does not necessarily imply that the drug is safe. For many drugs no information about porphyria is available.

An up-to-date list of drugs considered **safe** in acute porphyrias is available at [www.wmic.wales.nhs.uk/porphyria\\_info.php](http://www.wmic.wales.nhs.uk/porphyria_info.php)

Further information may be obtained from:  
[www.porphyrria-europe.org](http://www.porphyrria-europe.org)

and also from:

Welsh Medicines Information Centre  
University Hospital of Wales  
Cardiff, CF14 4XW  
Tel: (029) 2074 2979/3877

**Note** Quite modest changes in chemical structure can lead to changes in porphyrinogenicity but where possible general statements have been made about groups of drugs; these should be checked first.

## Unsafe Drug Groups (check first)

Alkylating drugs <sup>1</sup>	Calcium channel blockers <sup>5</sup>	Non-nucleoside reverse transcriptase inhibitors <sup>1</sup>	Sulfonylureas <sup>11</sup>
Amfetamines	Contraceptives, hormonal <sup>6</sup>	Protease inhibitors <sup>1</sup>	Taxanes <sup>1</sup>
Anabolic steroids	Ergot derivatives <sup>7</sup>	Progesterogens <sup>5</sup>	Tetracyclines
Antidepressants <sup>2</sup>	Hormone replacement therapy <sup>6</sup>	Statins <sup>9</sup>	Thiazolidinediones <sup>1</sup>
Antihistamines <sup>3</sup>	Imidazole antifungals <sup>8</sup>	Sulfonamides <sup>10</sup>	Triazole antifungals <sup>8</sup>
Barbiturates <sup>4</sup>			

## Unsafe Drugs (check groups above first)

Aceclofenac	Disopyramide	Meprobamate	Probenecid
Alcohol	Disulfiram	Methyldopa	Pyrazinamide
Aminophylline	Erythromycin	Metoclopramide <sup>16</sup>	Rifabutin <sup>18</sup>
Amiodarone	Etamsylate	Metolazone	Rifampicin <sup>18</sup>
Bexarotene	Ethosuximide	Metronidazole <sup>16</sup>	Risperidone
Bosentan	Etomidate	Metyrapone	Selegiline
Bromocriptine	Fenfluramine	Mifepristone	Spiroglactone
Buspirone	Flupentixol	Minoxidil <sup>16</sup>	Sulfinpyrazone
Cabergoline	Flutamide	Nalidixic acid	Tamoxifen
Carbamazepine	Fosphenytoin	Nitrazepam	Telithromycin
Chloral hydrate <sup>12</sup>	Gold	Nitrofurantoin	Temoporfin
Chloramphenicol	Griseofulvin	Orphenadrine	Theophylline
Chloroform <sup>13</sup>	Halothane	Oxcarbazepine	Tiagabine
Clindamycin	Hydralazine	Oxybutynin	Tinidazole
Cocaine	Indapamide	Oxycodone <sup>17</sup>	Topiramate
Colistin	Isometheptene mucate	Pentazocine <sup>17</sup>	Toremifene
Cycloserine	Isoniazid	Pentoxifylline	Trimethoprim
Danazol	Ketamine	Phenoxybenzamine	Valproate <sup>14</sup>
Dapsone	Ketorolac	Phenytoin	Xipamide
Dexfenfluramine	Lidocaine <sup>15</sup>	Pivmecillinam	Zidovudine <sup>1</sup>
Diazepam <sup>14</sup>	Mebeverine	Porfimer	Zuclophenthixol
Diclofenac	Mefenamic acid <sup>16</sup>		

1. Contact Welsh Medicines Information Centre for further advice.

2. Includes tricyclic (and related) antidepressants and MAOIs; fluoxetine, venlafaxine, and mianserin thought to be safe.

3. Alimemazine, chlorphenamine, desloratadine, fexofenadine, ketotifen, loratadine, and promethazine thought to be safe.

4. Includes primidone and thiopental.

5. Amlodipine, felodipine, and nifedipine may be used with caution.

6. Progesterogens are more porphyrinogenic than oestrogens; oestrogens may be safe at least in replacement doses. Progesterogens should be avoided whenever possible by all women susceptible to acute porphyria; however, when non-hormonal contraception is inappropriate, progesterogens may be used with extreme caution if the potential benefit outweighs risk. The risk of an acute attack is greatest in women who have had a previous attack or are aged under 30 years. Long-acting progesterone preparations should **never** be used in those at risk of acute porphyria.

7. Includes ergometrine (oxytocin probably safe) and pergolide.

8. Applies to oral and intravenous use; topical antifungals are thought to be safe due to low systemic exposure.

9. Rosuvastatin is thought to be safe.

10. Includes co-trimoxazole and sulfasalazine.

11. Glipizide is thought to be safe.

12. Although evidence of hazard is uncertain, manufacturer advises avoid.

13. Small amounts in medicines probably safe.

14. Status epilepticus has been treated successfully with intravenous diazepam.

15. When used for local anaesthesia, articaine, bupivacaine, lidocaine, prilocaine, and tetracaine are thought to be safe.

16. May be used with caution if safer alternative not available.

17. Buprenorphine, codeine, diamorphine, dihydrocodeine, fentanyl, methadone, morphine, pethidine, and tramadol are thought to be safe.

18. Rifamycins have been used in a few patients without evidence of harm—use with caution if safer alternative not available.

# 10 Musculoskeletal and joint diseases

<b>10.1</b>	<b>Drugs used in rheumatic diseases and gout</b>	<b>629</b>
<b>10.1.1</b>	Non-steroidal anti-inflammatory drugs	630
<b>10.1.2</b>	Corticosteroids	640
<b>10.1.2.1</b>	Systemic corticosteroids	640
<b>10.1.2.2</b>	Local corticosteroid injections	641
<b>10.1.3</b>	Drugs that suppress the rheumatic disease process	642
<b>10.1.4</b>	Gout and cytotoxic-induced hyperuricaemia	654
<b>10.1.5</b>	Other drugs for rheumatic diseases	657
<b>10.2</b>	<b>Drugs used in neuromuscular disorders</b>	<b>657</b>
<b>10.2.1</b>	Drugs that enhance neuromuscular transmission	657
<b>10.2.2</b>	Skeletal muscle relaxants	659
<b>10.3</b>	<b>Drugs for the relief of soft-tissue inflammation and topical pain relief</b>	<b>663</b>
<b>10.3.1</b>	Enzymes	663
<b>10.3.2</b>	Rubefacients, topical NSAIDs, capsaicin, and poultices	664

This chapter also includes advice on the drug management of the following:

- dental and orofacial pain, p. 631
- extravasation, p. 663
- gout, p. 654
- myasthenia gravis, p. 657
- osteoarthritis and soft-tissue disorders, below
- rheumatoid arthritis and other inflammatory disorders, below

For treatment of septic arthritis see Table 1, section 5.1.

## 10.1 Drugs used in rheumatic diseases and gout

<b>10.1.1</b>	<b>Non-steroidal anti-inflammatory drugs</b>
<b>10.1.2</b>	<b>Corticosteroids</b>
<b>10.1.3</b>	<b>Drugs that suppress the rheumatic disease process</b>
<b>10.1.4</b>	<b>Gout and cytotoxic-induced hyperuricaemia</b>
<b>10.1.5</b>	<b>Other drugs for rheumatic diseases</b>

### Rheumatoid arthritis and other inflammatory disorders

A **non-steroidal anti-inflammatory drug** (NSAID) is indicated for pain and stiffness resulting from inflammatory rheumatic disease; analgesics such as **paracetamol** or **codeine** can also be used. For advice on the prophylaxis and treatment of NSAID-associated gastrointestinal ulcers, see p. 50.

Drugs are also used to influence the rheumatic disease process itself (section 10.1.3). For *rheumatoid arthritis* these **disease-modifying antirheumatic drugs** (DMARDs) include methotrexate, cytokine modulators, azathioprine, ciclosporin, cyclophosphamide, leflunomide, penicillamine, gold, antimalarials (chloroquine and hydroxychloroquine), and sulfasalazine. **Corticosteroids** also have a significant role in the management of rheumatoid arthritis (section 10.1.2.1).

Drugs which may affect the disease process in *psoriatic arthritis* include sulfasalazine, gold salts, azathioprine, methotrexate, and cytokine modulators (section 10.1.3).

For long-term control of *gout*, uricosuric drugs and allopurinol (section 10.1.4) can be used.

### Osteoarthritis and soft-tissue disorders

For pain relief in osteoarthritis and soft-tissue disorders, **paracetamol** (section 4.7.1) should be used first and may need to be taken regularly. A **topical NSAID** (section 10.3.2) or topical **capsaicin** 0.025% (section 10.3.2) should also be considered, particularly in knee or hand osteoarthritis. An **oral NSAID** (section 10.1.1) can be substituted for, or used in addition to, paracetamol. If further pain relief is required in osteoarthritis, then the addition of an **opioid analgesic** (section 4.7.2) may be considered, but with a substantial risk of adverse effects; however, an opioid analgesic should be considered

before a NSAID in patients taking low-dose aspirin. For advice on the prophylaxis and treatment of NSAID-associated gastro-intestinal ulcers, see p. 50.

Intra-articular **corticosteroid** injections (section 10.1.2.2) may produce temporary benefit in osteoarthritis, especially if associated with soft-tissue inflammation.

Non-drug measures, such as weight reduction and exercise, should also be encouraged.

**Glucosamine** (section 10.1.5) and **rubefaciants** (section 10.3.2) are not recommended for the treatment of osteoarthritis.

**Hyaluronic acid** and its derivatives are available for osteoarthritis of the knee, but are not recommended. Sodium hyaluronate (*Durolane*<sup>®</sup>, *Euflexxa*<sup>®</sup>, *Fermatron*<sup>®</sup>, *Hyalgan*<sup>®</sup> , *Orthovisc*<sup>®</sup>, *Ostenil*<sup>®</sup>, *Suplasyn*<sup>®</sup>, *Synocrom*<sup>®</sup>, *Synopsis*<sup>®</sup>) or hylan G-F 20 (*Synvisc*<sup>®</sup>) is injected intra-articularly to supplement natural hyaluronic acid in the synovial fluid. These injections may reduce pain over 1–6 months, but are associated with a short-term increase in knee inflammation.

### 10.1.1 Non-steroidal anti-inflammatory drugs

In *single doses* non-steroidal anti-inflammatory drugs (NSAIDs) have analgesic activity comparable to that of paracetamol (section 4.7.1), but paracetamol is preferred, particularly in the elderly (see also Prescribing for the Elderly, p. 25).

In regular *full dosage* NSAIDs have both a lasting analgesic and an anti-inflammatory effect which makes them particularly useful for the treatment of continuous or regular pain associated with inflammation. Therefore, although paracetamol often gives adequate pain control in osteoarthritis, NSAIDs are more appropriate than paracetamol or the opioid analgesics in the *inflammatory arthritides* (e.g. rheumatoid arthritis) and in some cases of *advanced osteoarthritis*. NSAIDs can also be of benefit in the less well defined conditions of *back pain* and *soft-tissue disorders*.

**Choice** Differences in anti-inflammatory activity between NSAIDs are small, but there is considerable variation in individual response and tolerance to these drugs. About 60% of patients will respond to any NSAID; of the others, those who do not respond to one may well respond to another. Pain relief starts soon after taking the first dose and a full analgesic effect should normally be obtained within a week, whereas an anti-inflammatory effect may not be achieved (or may not be clinically assessable) for up to 3 weeks. If appropriate responses are not obtained within these times, another NSAID should be tried.

NSAIDs reduce the production of prostaglandins by inhibiting the enzyme cyclo-oxygenase. They vary in

their selectivity for inhibiting different types of cyclo-oxygenase; selective inhibition of cyclo-oxygenase-2 is associated with less gastro-intestinal intolerance. Several other factors also influence susceptibility to gastro-intestinal effects, and a NSAID should be chosen on the basis of the incidence of gastro-intestinal and other side-effects.

**Ibuprofen** is a propionic acid derivative with anti-inflammatory, analgesic, and antipyretic properties. It has fewer side-effects than other non-selective NSAIDs but its anti-inflammatory properties are weaker. Doses of 1.6 to 2.4 g daily are needed for rheumatoid arthritis and it is unsuitable for conditions where inflammation is prominent, such as acute gout. **Dexibuprofen** is the active enantiomer of ibuprofen. It has similar properties to ibuprofen and is licensed for the relief of mild to moderate pain and inflammation.

Other propionic acid derivatives:

**Naproxen** is one of the first choices because it combines good efficacy with a low incidence of side-effects (but more than ibuprofen, see CSM comment below).

**Fenbufen** is claimed to be associated with less gastro-intestinal bleeding, but there is a high risk of rash (see p. 635).

**Fenoprofen** is as effective as naproxen, and **flurbiprofen** may be slightly more effective. Both are associated with slightly more gastro-intestinal side-effects than ibuprofen.

**Ketoprofen** has anti-inflammatory properties similar to ibuprofen and has more side-effects (see also CSM advice below). **Dexketoprofen**, an isomer of ketoprofen, has been introduced for the short-term relief of mild to moderate pain.

**Tiaprofenic acid** is as effective as naproxen; it has more side-effects than ibuprofen (**important:** reports of severe cystitis, see CSM advice on p. 640).

Drugs with properties similar to those of propionic acid derivatives:

**Diclofenac** and **aceclofenac** have actions and side-effects similar to those of naproxen.

**Etodolac** is comparable in efficacy to naproxen; it is licensed for symptomatic relief of osteoarthritis and rheumatoid arthritis.

**Indometacin** has an action equal to or superior to that of naproxen, but with a high incidence of side-effects including headache, dizziness, and gastro-intestinal disturbances (see also CSM advice below).

**Mefenamic acid** has minor anti-inflammatory properties. It has occasionally been associated with diarrhoea and haemolytic anaemia which require discontinuation of treatment.

**Meloxicam** is licensed for the short-term relief of pain in osteoarthritis and for long-term treatment of rheumatoid arthritis and ankylosing spondylitis.

**Nabumetone** is comparable in effect to naproxen.

**Phenylbutazone** is licensed for ankylosing spondylitis, but is not recommended because it is associated with serious side-effects, in particular haematological reactions; it should be used only by a specialist in severe cases where other treatments have been found unsuitable.

**Piroxicam** is as effective as naproxen and has a long duration of action which permits once-daily administra-

tion. However, it has more gastro-intestinal side-effects than most other NSAIDs, and is associated with more frequent serious skin reactions (**important**: see CHMP advice, p. 639).

**Sulindac** is similar in tolerance to naproxen.

**Tenoxicam** is similar in activity and tolerance to naproxen. Its long duration of action allows once-daily administration.

**Tolfenamic acid** is licensed for the treatment of migraine (section 4.7.4.1).

**Ketorolac** and the selective inhibitor of cyclo-oxygenase-2, **parecoxib**, are licensed for the short-term management of postoperative pain (section 15.1.4.2).

The selective inhibitors of cyclo-oxygenase-2, **etoricoxib** and **celecoxib**, are as effective as non-selective NSAIDs such as diclofenac and naproxen. Short-term data indicate that the risk of serious upper gastro-intestinal events is lower with selective inhibitors compared to non-selective NSAIDs; this advantage may be lost in patients who require concomitant low-dose aspirin. There are concerns about the cardiovascular safety of cyclo-oxygenase-2 selective inhibitors (see below).

**Celecoxib** and **etoricoxib** are licensed for the relief of pain in osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis; **etoricoxib** is also licensed for the relief of pain from acute gout.

**Dental and orofacial pain** Most mild to moderate dental pain and inflammation is effectively relieved by NSAIDs. Those used for dental pain include **ibuprofen** and **diclofenac**.

In an appraisal of the relative safety of 7 non-selective NSAIDs, the CSM assessed ibuprofen to have the lowest risk of serious gastro-intestinal side-effects (see p. 632). For further information on the management of dental and orofacial pain, see p. 257.

**Cautions and contra-indications** NSAIDs should be used with caution in the elderly (risk of serious side-effects and fatalities, see also Prescribing for the Elderly p. 25), in allergic disorders (they are **contra-indicated** in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID), and in coagulation defects. Long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment. Caution is also required in patients with connective-tissue disorders, see Side-effects below.

In patients with cardiac impairment, caution is required since NSAIDs may impair renal function (see also Side-effects, below). All NSAIDs are **contra-indicated** in severe heart failure. The selective inhibitors of cyclo-oxygenase-2 (celecoxib, etoricoxib, and parecoxib) are **contra-indicated** in ischaemic heart disease, cerebrovascular disease, peripheral arterial disease, and moderate or severe heart failure. The selective inhibitors of cyclo-oxygenase-2 should be used with caution in patients with a history of cardiac failure, left ventricular dysfunction, hypertension, in patients with oedema for any other reason, and in patients with risk factors for heart disease.

### NSAIDs and cardiovascular events

Cyclo-oxygenase-2 selective inhibitors are associated with an increased risk of thrombotic events (e.g. myocardial infarction and stroke) and should not be used in preference to non-selective NSAIDs except when specifically indicated (i.e. for patients at a particularly high risk of developing gastroduodenal ulceration or bleeding) *and* after assessing their cardiovascular risk.

Non-selective NSAIDs are also associated with a small increased risk of thrombotic events even when used short-term in those with no cardiovascular risk factors. **Diclofenac** (150 mg daily) and **ibuprofen** (2.4 g daily) are associated with an increased risk of thrombotic events. The increased risk for diclofenac is similar to that of licensed doses of **etoricoxib**. **Naproxen** (1 g daily) is associated with a lower thrombotic risk, and low doses of ibuprofen (1.2 g daily or less) have not been associated with an increased risk of myocardial infarction.

The lowest effective dose of NSAID or cyclo-oxygenase-2 selective inhibitor should be prescribed for the shortest period to control symptoms and that the need for long-term treatment should be reviewed periodically.

The CSM has advised that non-selective NSAIDs are **contra-indicated** in patients with previous or active peptic ulceration and that selective inhibitors of cyclo-oxygenase-2 are **contra-indicated** in active peptic ulceration (see also CSM advice below). While it is preferable to avoid NSAIDs in patients with active or previous gastro-intestinal ulceration or bleeding, and to withdraw them if gastro-intestinal lesions develop, nevertheless patients with serious rheumatic diseases (e.g. rheumatoid arthritis) are usually dependent on NSAIDs for effective relief of pain and stiffness. Patients at risk of gastro-intestinal ulceration (including the elderly), who need NSAID treatment should receive gastroprotective treatment; for advice on the prophylaxis and treatment of NSAID-associated gastro-intestinal ulcers, see section 1.3.

For **interactions** of NSAIDs, see Appendix 1 (NSAIDs).

**Hepatic impairment** NSAIDs should be used with caution in patients with hepatic impairment; there is an increased risk of gastro-intestinal bleeding and fluid retention. NSAIDs should be avoided in severe liver disease; see also individual drugs.

**Renal impairment** NSAIDs should be avoided if possible or used with caution in patients with renal impairment; the **lowest effective dose** should be used for the **shortest possible duration**, and renal function should be **monitored**. Sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure; deterioration in renal function has also been reported after topical use; see also individual drugs.

**Pregnancy** Most manufacturers advise avoiding the use of NSAIDs during pregnancy or avoiding them unless the potential benefit outweighs the risk. NSAIDs should be avoided during the third trimester because use is associated with a risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn. In addition, the onset of

labour may be delayed and its duration may be increased.

**Breast-feeding** NSAIDs should be used with caution during breast-feeding; see also individual drugs.

**Side-effects** Gastro-intestinal disturbances including discomfort, nausea, diarrhoea, and occasionally bleeding and ulceration occur (see also CSM advice below and Cautions above). Systemic as well as local effects of NSAIDs contribute to gastro-intestinal damage; taking oral formulations with milk or food, or using enteric-coated formulations, or changing the route of administration may only partially reduce symptoms such as dyspepsia.

#### CSM advice (gastro-intestinal side-effects)

All NSAIDs are associated with serious gastro-intestinal toxicity; the risk is higher in the elderly. Evidence on the relative safety of 7 **non-selective** NSAIDs indicates differences in the risks of serious upper gastro-intestinal side-effects. **Azapropazone** is associated with the **highest risk** and **ibuprofen** with the **lowest**; **piroxicam**, **ketoprofen**, **indometacin**, **naproxen** and **diclofenac** are associated with **intermediate risks** (possibly higher in the case of piroxicam, see also CHMP advice, p. 639). **Selective inhibitors of cyclo-oxygenase-2** are associated with a **lower risk** of serious upper gastro-intestinal side-effects than non-selective NSAIDs.

Recommendations are that NSAIDs associated with a low risk e.g. **ibuprofen** are **generally preferred**, to start at the **lowest recommended dose**, not to use more than one oral NSAID at a time, and to remember that all NSAIDs (including selective inhibitors of cyclo-oxygenase-2) are **contra-indicated** in patients with active peptic ulceration. The CSM also **contra-indicates** non-selective NSAIDs in patients with a history of peptic ulceration.

The combination of a NSAID and low-dose aspirin can increase the risk of gastro-intestinal side-effects; this combination should be used only if absolutely necessary and the patient should be monitored closely.

Other side-effects include hypersensitivity reactions (particularly rashes, angioedema, and bronchospasm—see below), headache, dizziness, nervousness, depression, drowsiness, insomnia, vertigo, hearing disturbances such as tinnitus, photosensitivity, and haematuria. Blood disorders have also occurred. Fluid retention may occur (rarely precipitating congestive heart failure); blood pressure may be raised.

#### Asthma

Any degree of worsening of asthma may be related to the ingestion of NSAIDs, either prescribed or (in the case of ibuprofen and others) purchased over the counter.

Renal failure may be provoked by NSAIDs, especially in patients with pre-existing renal impairment (**important**, see Renal impairment, above). Rarely, papillary necrosis or interstitial fibrosis associated with NSAIDs can lead to renal failure.

Hepatic damage, alveolitis, pulmonary eosinophilia, pancreatitis, visual disturbances, Stevens-Johnson syndrome, and toxic epidermal necrolysis are other rare side-effects. Induction of or exacerbation of colitis or Crohn's disease has been reported. Aseptic meningitis has been reported rarely with NSAIDs—patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible.

**Overdosage:** see Emergency Treatment of Poisoning, p. 34.

## ACECLOFENAC

**Indications** pain and inflammation in rheumatoid arthritis, osteoarthritis and ankylosing spondylitis

**Cautions** see notes above; avoid in acute porphyria (section 9.8.2)

**Contra-indications** see notes above

**Hepatic impairment** initially 100 mg daily; see also notes above

**Renal impairment** avoid in moderate to severe impairment; see also notes above

**Pregnancy** see notes above

**Breast-feeding** manufacturer advises avoid; see also notes above

**Side-effects** see notes above

#### Dose

- 100 mg twice daily; **CHILD** not recommended

**Acceclofenac** (Non-proprietary) (POM)

Tablets, aceclofenac 100 mg, net price 60-tab pack = £10.48. Label: 21

**Preservex**<sup>®</sup> (Almiral) (POM)

Tablets, f/c, aceclofenac 100 mg, net price 60-tab pack = £9.45. Label: 21

## ACEMETACIN

(Glycolic acid ester of indometacin)

**Indications** pain and inflammation in rheumatic disease and other musculoskeletal disorders; postoperative analgesia

**Cautions** see under Indometacin and notes above

**Driving** Dizziness may affect performance of skilled tasks (e.g. driving)

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** manufacturer advises avoid; see also notes above

**Side-effects** see under Indometacin and notes above

#### Dose

- 120 mg daily in divided doses with food, increased if necessary to 180 mg daily; **CHILD** not recommended

**Emflex**<sup>®</sup> (Merck Serono) (POM)

Capsules, yellow/orange, acemetacin 60 mg, net price 90-cap pack = £28.20. Label: 21, counselling, driving

## CELECOXIB

**Indications** see under preparations

**Cautions** see notes above; monitor blood pressure before treatment and during treatment; anastomotic

ulcer (avoid concomitant administration of anticoagulants or aspirin)

**Contra-indications** see notes above; sulphonamide sensitivity; inflammatory bowel disease

**Hepatic impairment** in *pain and inflammation*, halve initial dose in moderate impairment; in *familial adenomatous polyposis*, halve dose in moderate impairment and avoid in severe impairment; see also notes above

**Renal impairment** avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>; see also notes above

**Pregnancy** avoid (teratogenic in *animal* studies); see also notes above

**Breast-feeding** avoid—present in milk in *animal* studies; see also notes above

**Side-effects** see notes above; dyspnoea, influenza-like symptoms; *less commonly* stomatitis, palpitation, dysphonia, cerebral infarction, fatigue, paraesthesia, lipoma, muscle cramps; *rarely* taste disturbance, alopecia; *very rarely* seizures; *also reported* chest pain

#### ▲ Pain and inflammation

**Celebrex®** (Pharmacia) (POM)

**Capsules**, celecoxib 100 mg (white/blue), net price 60-cap pack = £21.55; 200 mg (white/gold), 30-cap pack = £21.55

**Dose** osteoarthritis, 200 mg daily in 1–2 divided doses, increased if necessary to max. 200 mg twice daily; **CHILD** not recommended Rheumatoid arthritis, 100 mg twice daily, increased if necessary to 200 mg twice daily; **CHILD** not recommended

Ankylosing spondylitis, 200 mg daily in 1–2 divided doses, increased if necessary to max. 400 mg daily in 1–2 divided doses; **CHILD** not recommended

**Note** Discontinue if no improvement after 2 weeks on max. dose

#### ▲ Familial adenomatous polyposis

**Onsenal®** (Pharmacia) (POM)

**Capsules**, celecoxib 400 mg, net price 60-cap pack = £86.20. Label: 21

**Dose** familial adenomatous polyposis, **ADULT** over 18 years, 400 mg twice daily

## DEXIBUPROFEN

**Indications** pain and inflammation associated with osteoarthritis and other musculoskeletal disorders; mild to moderate pain and inflammation including dysmenorrhoea and dental pain

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** reduce initial dose; avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>; see also notes above

**Pregnancy** see notes above

**Breast-feeding** present in milk—but risk to infant minimal; see also notes above

**Side-effects** see notes above

#### Dose

● 600–900 mg daily in up to 3 divided doses; increased if necessary to max. 1.2 g daily (900 mg daily for dysmenorrhoea); max. single dose 400 mg (300 mg for dysmenorrhoea); **CHILD** not recommended

**Seractil®** (Genus) (POM)

**Tablets**, f/c, dexibuprofen 300 mg, net price 60–tab pack = £9.47; 400 mg (scored) 60–tab pack = £9.47. Label: 21

## DEXKETOPROFEN

**Indications** short-term treatment of mild to moderate pain including dysmenorrhoea

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** reduce initial dose to max.

50 mg daily in mild to moderate impairment; see also notes above

**Renal impairment** reduce initial dose to 50 mg daily; avoid in moderate to severe impairment; see also notes above

**Pregnancy** see notes above

**Breast-feeding** manufacturer advises avoid—no information available; see also notes above

**Side-effects** see notes above

#### Dose

● 12.5 mg every 4–6 hours or 25 mg every 8 hours; max. 75 mg daily; **ELDERLY** initially max. 50 mg daily; **CHILD** not recommended

**Keral®** (Menarini) (POM)

**Tablets**, f/c, scored, dexketoprofen (as trometamol) 25 mg, net price 20-tab pack = £3.67, 50-tab pack = £9.18. Label: 22

## DICLOFENAC POTASSIUM

**Indications** pain and inflammation in rheumatic disease and other musculoskeletal disorders; acute gout; postoperative pain; migraine

**Cautions** see notes above; avoid in acute porphyria (section 9.8.2)

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** avoid in severe impairment; see also notes above

**Pregnancy** see notes above

**Breast-feeding** amount in milk too small to be harmful; see also notes above

**Side-effects** see notes above

#### Dose

● Rheumatic disease, musculoskeletal disorders, acute gout, postoperative pain, 75–150 mg daily in 2–3 divided doses; **CHILD** over 14 years, 75–100 mg daily in 2–3 divided doses

● Migraine, 50 mg at onset, repeated after 2 hours if necessary then after 4–6 hours; max. 200 mg in 24 hours; **CHILD** not recommended

**Diclofenac Potassium** (Non-proprietary) (POM)

**Tablets**, diclofenac potassium 25 mg, net price 28-tab pack = 81p; 50 mg, 28-tab pack = £1.55. Label: 21

**<sup>1</sup> Voltarol® Rapid** (Novartis) (POM)

**Tablets**, s/c, diclofenac potassium 25 mg (red), net price 30-tab pack = £3.46; 50 mg (brown), 30-tab pack = £6.62. Label: 21

1. 12.5 mg tablets can be sold to the public for the treatment of headache, dental pain, period pain, rheumatic and muscular pain, backache and the symptoms of cold and flu (including fever), in patients aged over 14 years subject to max. single dose of 25 mg, max. daily dose of 75 mg for max. 3 days, and max. pack size of 18 × 12.5 mg

## DICLOFENAC SODIUM

**Indications** pain and inflammation in rheumatic disease (including juvenile idiopathic arthritis) and other musculoskeletal disorders; acute gout; postoperative pain

**Cautions** see notes above; avoid in acute porphyria (section 9.8.2)

**Contra-indications** see notes above; avoid injections containing benzyl alcohol in neonates (see preparations below)

**Intravenous use** Additional contra-indications include concomitant NSAID or anticoagulant use (including low-dose heparins), history of haemorrhagic diathesis, history of confirmed or suspected cerebrovascular bleeding, operations with high risk of haemorrhage, history of asthma, moderate or severe renal impairment (see also Renal impairment below), hypovolaemia, dehydration;

**Hepatic impairment** see notes above

**Renal impairment** avoid in severe impairment; avoid intravenous use if serum creatinine greater than 160 micromol/litre; see also notes above

**Pregnancy** see notes above

**Breast-feeding** amount in milk too small to be harmful; see also notes above

**Side-effects** see notes above; suppositories may cause rectal irritation; injection site reactions

### Dose

- **By mouth**, 75–150 mg daily in 2–3 divided doses
- **By rectum** in suppositories, 75–150 mg daily in divided doses
- Juvenile idiopathic arthritis, **CHILD** 6 months–18 years, **by mouth**, see *BNF for Children*
- Postoperative pain, **CHILD** 6–12 years, **by rectum**, 1–2 mg/kg (max. 150 mg) daily in divided doses (12.5 mg and 25 mg suppositories only) for max. 4 days

### Diclofenac Sodium (Non-proprietary) <sup>(PoM)</sup>

**Tablets**, e/c, diclofenac sodium 25 mg, net price 84-tab pack = £1.14; 50 mg, 84-tab pack = £1.31. Label: 5, 25

**Brands include** *Defenac<sup>®</sup>*, *Dicloflex<sup>®</sup>*, *Diclozip<sup>®</sup>*, *Fenactol<sup>®</sup>*, *Flamrase<sup>®</sup>*

**Dental prescribing on NHS** Diclofenac Sodium Tablets may be prescribed

**Suppositories**, diclofenac sodium 100 mg, net price 10 = £3.97

**Brands include** *Econac<sup>®</sup>*

### Dyloject<sup>®</sup> (Therabel) <sup>(PoM)</sup>

**Injection**, diclofenac sodium 37.5 mg/mL, net price 2-mL vial = £4.80

**Note** May be difficult to obtain

**Dose** by deep intramuscular injection into the gluteal muscle, acute exacerbations of pain and postoperative pain, 75 mg once daily (twice daily in severe cases) for max. 2 days

Ureteric colic, 75 mg then a further 75 mg after 30 minutes if necessary

By intravenous injection (in supervised settings), acute postoperative pain, 75 mg repeated after 4–6 hours if necessary; max. 150 mg in 24 hours for 2 days

Prevention of postoperative pain, 25–50 mg after surgery; further doses given after 4–6 hours if necessary; max. 150 mg in 24 hours for 2 days

**Note** The Scottish Medicines Consortium (p. 4) has advised (February 2008) that *Dyloject<sup>®</sup>* is accepted for restricted use within NHS Scotland for the treatment or prevention of postoperative pain by intravenous injection in supervised healthcare settings

### Voltarol<sup>®</sup> (Novartis) <sup>(PoM)</sup>

**Tablets**, e/c, diclofenac sodium 25 mg (yellow), net price 84-tab pack = £2.94; 50 mg (brown), 84-tab pack = £4.57. Label: 5, 25

**Dispersible tablets**, sugar-free, pink, diclofenac, equivalent to diclofenac sodium 50 mg, net price 21-tab pack = £6.19. Label: 13, 21

**Note** Voltarol Dispersible tablets are more suitable for short-term use in acute conditions for which treatment required for no more than 3 months (no information on use beyond 3 months)

**Injection**, diclofenac sodium 25 mg/mL, net price 3-mL amp = 83p

**Excipients** include benzyl alcohol (avoid in neonates unless there is no safer alternative, see Excipients, p. 2), propylene glycol

**Dose** by deep intramuscular injection into the gluteal muscle, acute exacerbations of pain and postoperative pain, 75 mg once daily (twice daily in severe cases) for max. 2 days; **CHILD** 2–18 years, see *BNF for Children*

Ureteric colic, 75 mg then a further 75 mg after 30 minutes if necessary

By intravenous infusion (in hospital setting), acute postoperative pain, 75 mg repeated if necessary after 4–6 hours; max. 150 mg in 24 hours for 2 days; **CHILD** 2–18 years, see *BNF for Children*  
Prevention of postoperative pain, initially after surgery 25–50 mg over 15–60 minutes then 5 mg/hour; max. 150 mg in 24 hours for 2 days

**Suppositories**, diclofenac sodium 12.5 mg, net price 10 = 58p; 25 mg, 10 = £1.03; 50 mg, 10 = £1.70; 100 mg, 10 = £3.03

### Modified release

#### Diclomax SR<sup>®</sup> (Galen) <sup>(PoM)</sup>

**Capsules**, m/r, yellow, diclofenac sodium 75 mg, net price 56-cap pack = £11.40. Label: 21, 25

**Dose** 1 capsule 1–2 times daily or 2 capsules once daily, preferably with food; **CHILD** not recommended

#### Diclomax Retard<sup>®</sup> (Galen) <sup>(PoM)</sup>

**Capsules**, m/r, diclofenac sodium 100 mg, net price 28-cap pack = £8.20. Label: 21, 25

**Dose** 1 capsule daily preferably with food; **CHILD** not recommended

#### Motifene<sup>®</sup> 75 mg (Daiichi Sankyo) <sup>(PoM)</sup>

**Capsules**, e/c, m/r, diclofenac sodium 75 mg (enclosing e/c pellets containing diclofenac sodium 25 mg and m/r pellets containing diclofenac sodium 50 mg), net price 56-cap pack = £8.00. Label: 25

**Dose** 1 capsule 1–2 times daily; **CHILD** not recommended

#### Voltarol<sup>®</sup> 75 mg SR (Novartis) <sup>(PoM)</sup>

**Tablets**, m/r, f/c, pink, diclofenac sodium 75 mg, net price 28-tab pack = £6.46; 56-tab pack = £12.92. Label: 21, 25

**Dose** 75 mg 1–2 times daily preferably with food; **CHILD** not recommended

**Note** Other brands of modified-release tablets containing diclofenac sodium 75 mg include *Defenac<sup>®</sup> SR*, *Dexomon<sup>®</sup> 75 SR*, *Dicloflex<sup>®</sup> 75 SR*, *Fenactol<sup>®</sup> 75 mg SR*, *Flamatak<sup>®</sup> 75 MR*, *Flamrase<sup>®</sup> SR*, *Flexotard<sup>®</sup> MR 75*, *Rheumatak<sup>®</sup> Retard 75*, *Rhumalgan<sup>®</sup> CR*, *Slofenac<sup>®</sup> SR*, *Volsaid<sup>®</sup> Retard 75*

#### Voltarol<sup>®</sup> Retard (Novartis) <sup>(PoM)</sup>

**Tablets**, m/r, f/c, red, diclofenac sodium 100 mg. Net price 28-tab pack = £9.47. Label: 21, 25

**Dose** 1 tablet daily preferably with food; **CHILD** not recommended

**Note** Other brands of modified-release tablets containing diclofenac sodium 100 mg include *Defenac<sup>®</sup> Retard*, *Dexomon<sup>®</sup> Retard 100*, *Dicloflex<sup>®</sup> Retard*, *Fenactol<sup>®</sup> Retard 100 mg*, *Flamatak<sup>®</sup> 100 MR*, *Flamrase<sup>®</sup> SR*, *Rhumalgan<sup>®</sup> CR*, *Slofenac<sup>®</sup> SR*, *Volsaid<sup>®</sup> Retard 100*

**With misoprostol**

For prescribing information on misoprostol, see section 1.3.4

**Arthrotec®** (Pharmacia) (Pom)

**Arthrotec® 50 tablets**, diclofenac sodium (in e/c core) 50 mg, misoprostol 200 micrograms, net price 60-tab pack = £11.98; Label: 21, 25

**Dose** prophylaxis against NSAID-induced gastroduodenal ulceration in patients requiring diclofenac for rheumatoid arthritis or osteoarthritis, 1 tablet 2–3 times daily with food; **CHILD** not recommended

**Arthrotec® 75 tablets**, diclofenac sodium (in e/c core) 75 mg, misoprostol 200 micrograms, net price 60-tab pack = £15.83; Label: 21, 25

**Dose** prophylaxis against NSAID-induced gastroduodenal ulceration in patients requiring diclofenac for rheumatoid arthritis or osteoarthritis, 1 tablet twice daily with food; **CHILD** not recommended

**Note** The BNF recommends a higher starting dose of misoprostol for prophylaxis against NSAID-induced gastroduodenal ulceration than that provided by *Arthrotec®* (see section 1.3.4)

**Topical preparations**

Section 10.3.2

**ETODOLAC**

**Indications** pain and inflammation in rheumatoid arthritis and osteoarthritis

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** avoid in severe impairment; see also notes above

**Pregnancy** see notes above

**Breast-feeding** manufacturer advises avoid; see also notes above

**Side-effects** see notes above; also stomatitis, vasculitis, palpitation, dyspnoea, confusion, fatigue, paraesthesia, tremor, urinary frequency, dysuria, pyrexia, and pruritus

**Dose**

- **ADULT** over 18 years, 600 mg daily in 1–2 divided doses

**Etodolac** (Non-proprietary) (Pom)

**Capsules**, etodolac 300 mg, net price 60-cap pack = £8.14

Brands include *Eccoxolac®*

**Modified release****Etopan XL®** (Taro) (Pom)

**Tablets**, m/r, f/c, grey, etodolac 600 mg, net price 30-tab pack = £14.60; Label: 25

**Dose** 1 tablet daily; **CHILD** not recommended

**Lodine SR®** (Almiral) (Pom)

**Tablets**, m/r, f/c, light-grey, etodolac 600 mg, net price 30-tab pack = £15.50; Label: 25

**Dose** 1 tablet daily; **CHILD** not recommended

**ETORICOXIB**

**Indications** pain and inflammation in osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis; acute gout

**Cautions** see notes above; also dehydration; monitor blood pressure before treatment, 2 weeks after initiation and periodically during treatment

**Contra-indications** see notes above; inflammatory bowel disease; uncontrolled hypertension (persistently above 140/90 mmHg)

**Hepatic impairment** max. 60 mg daily in mild impairment; max. 60 mg on alternate days or 30 mg once daily in moderate impairment; see also notes above

**Renal impairment** avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>; see also notes above

**Pregnancy** manufacturer advises avoid (teratogenic in animal studies); see also notes above

**Breast-feeding** manufacturer advises avoid—present in milk in animal studies; see also notes above

**Side-effects** see notes above; also palpitation, fatigue, influenza-like symptoms, ecchymosis; *less commonly* dry mouth, taste disturbance, mouth ulcer, appetite and weight change, atrial fibrillation, transient ischaemic attack, chest pain, flushing, cough, dyspnoea, epistaxis, anxiety, mental acuity impaired, paraesthesia, electrolyte disturbance, myalgia and arthralgia; *very rarely* confusion and hallucinations

**Dose**

- Osteoarthritis, **ADULT** and **CHILD** over 16 years, 30 mg once daily, increased if necessary to 60 mg once daily
- Rheumatoid arthritis and ankylosing spondylitis, **ADULT** and **CHILD** over 16 years, 90 mg once daily
- Acute gout, **ADULT** and **CHILD** over 16 years, 120 mg once daily for max. 8 days

**Arcoxia®** (MSD) (Pom)

**Tablets**, f/c, etoricoxib 30 mg (blue-green), net price 28-tab pack = £13.99; 60 mg (dark green), 28-tab pack = £20.11; 90 mg (white), 28-tab pack = £22.96; 120 mg (pale green), 7-tab pack = £6.03, 28-tab pack = £24.11

**FENBUFEN**

**Indications** pain and inflammation in rheumatic disease and other musculoskeletal disorders

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** small amount present in milk—manufacturer advises avoid; see also notes above

**Side-effects** see notes above, but also high risk of rashes especially in seronegative rheumatoid arthritis, psoriatic arthritis and in women (discontinue immediately); also allergic interstitial lung disorders (may follow rashes)

**Dose**

- 300 mg in the morning and 600 mg at bed-time or 450 mg twice daily; **CHILD** under 14 years not recommended

**Fenbufen** (Non-proprietary) (Pom)

**Capsules**, fenbufen 300 mg, net price 84-cap pack = £20.71; Label: 21

**Tablets**, fenbufen 300 mg, net price 84-tab pack = £6.00; 450 mg, 56-tab pack = £6.49; Label: 21

**FENOPROFEN**

**Indications** pain and inflammation in rheumatic disease and other musculoskeletal disorders; mild to moderate pain

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** amount too small to be harmful; see also notes above

**Side-effects** see notes above; upper respiratory-tract infection, nasopharyngitis, and cystitis also reported

#### Dose

- 300–600 mg 3–4 times daily with food; max. 3 g daily; **CHILD** not recommended

**Fenpropion® 300** (Typharm) (POM)

Tablets, orange, fenpropion (as calcium salt) 300 mg, net price 100-tab pack = £9.45 Label: 21

## FLURBIPROFEN

**Indications** pain and inflammation in rheumatic disease and other musculoskeletal disorders; mild to moderate pain including dysmenorrhoea; migraine; postoperative analgesia; sore throat (section 12.3.1)

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** avoid in severe impairment; see also notes above

**Pregnancy** see notes above

**Breast-feeding** small amount present in milk—manufacturer advises avoid; see also notes above

**Side-effects** see notes above; also stomatitis; less commonly paraesthesia, confusion, hallucinations, and fatigue

#### Dose

- **ADULT** and **CHILD** over 12 years, 150–200 mg daily in 2–4 divided doses, increased in acute conditions to 300 mg daily
- Dysmenorrhoea, **ADULT** and **CHILD** over 12 years, initially 100 mg, then 50–100 mg every 4–6 hours; max. 300 mg daily

**Flurbiprofen** (Non-proprietary) (POM)

Tablets, flurbiprofen 50 mg, net price 100 = £14.36; 100 mg, 100 = £29.00. Label: 21

**Froben®** (Abbott) (POM)

Tablets, yellow, s/c, flurbiprofen 50 mg, net price 100 = £9.24; 100 mg, 100 = £17.51. Label: 21

#### Modified release

**Froben SR®** (Abbott) (POM)

Capsules, m/r, yellow, flurbiprofen 200 mg, net price 30-cap pack = £7.53. Label: 21, 25

**Dose** **ADULT** and **CHILD** over 12 years, 1 capsule daily, preferably in the evening

## IBUPROFEN

**Indications** pain and inflammation in rheumatic disease (including juvenile idiopathic arthritis) and other musculoskeletal disorders; mild to moderate pain including dysmenorrhoea; postoperative analgesia; migraine; dental pain; fever with discomfort and pain in children; post-immunisation pyrexia (section 14.1)

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** avoid in severe impairment; see also notes above

**Pregnancy** see notes above

**Breast-feeding** amount too small to be harmful but some manufacturers advise avoid (including topical use); see also notes above

**Side-effects** see notes above

#### Dose

- **ADULT** and **CHILD** over 12 years, initially 300–400 mg 3–4 times daily; increased if necessary to max. 2.4 g daily; maintenance dose of 0.6–1.2 g daily may be adequate
- Pain and fever in children, **CHILD** 1–3 months, see *BNF for Children*; **CHILD** 3–6 months (body-weight over 5 kg), 50 mg 3 times daily (max. 30 mg/kg daily in 3–4 divided doses); **CHILD** 6 months–1 year, 50 mg 3–4 times daily (max. 30 mg/kg daily in 3–4 divided doses); **CHILD** 1–4 years, 100 mg 3 times daily (max. 30 mg/kg daily in 3–4 divided doses); **CHILD** 4–7 years, 150 mg 3 times daily (max. 30 mg/kg daily in 3–4 divided doses); **CHILD** 7–10 years, 200 mg 3 times daily (up to 30 mg/kg daily (max. 2.4 g) in 3–4 divided doses); **CHILD** 10–12 years, 300 mg 3 times daily (up to 30 mg/kg daily (max. 2.4 g) in 3–4 divided doses)
- Rheumatic disease in children (including juvenile idiopathic arthritis), **CHILD** 3 months–18 years (body-weight over 5 kg), 30–40 mg/kg (max. 2.4 g) daily in 3–4 divided doses; in systemic juvenile idiopathic arthritis up to 60 mg/kg (max. 2.4 g) daily [unlicensed] in 4–6 divided doses

**1 Ibuprofen** (Non-proprietary) (POM)

Tablets, coated, ibuprofen 200 mg, net price 84-tab pack = £1.62; 400 mg, 84-tab pack = £1.72; 600 mg, 84-tab pack = £4.06. Label: 21

**Brands include** *Arthrofen®, Ebufac®, Rimafen®*

**Dental prescribing on NHS** Ibuprofen Tablets may be prescribed

**Oral suspension**, ibuprofen 100 mg/5 mL, net price 100 mL = £1.48, 150 mL = £2.71, 500 mL = £8.88. Label: 21

**Note** Sugar-free versions are available and can be ordered by specifying 'sugar-free' on the prescription

**Brands include** *Calprofen®, Feverfen®, Nurofen® for Children, Orbifen® for Children*

**Dental prescribing on NHS** Ibuprofen Oral Suspension Sugar-free may be prescribed

1. Can be sold to the public in certain circumstances; for exemptions see *Medicines, Ethics and Practice*, No. 34, London, Pharmaceutical Press, 2010 (and subsequent editions as available)

**Brufen®** (Abbott) (POM)

Tablets, f/c, ibuprofen 200 mg, net price 100-tab pack = £3.92; 400 mg, 100-tab pack = £8.16; 600 mg, 100-tab pack = £12.24. Label: 21

**Syrup**, orange, ibuprofen 100 mg/5 mL, net price 500 mL (orange-flavoured) = £8.88. Label: 21

**Granules**, effervescent, ibuprofen 600 mg/sachet, net price 20-sachet pack = £6.53. Label: 13, 21

**Electrolytes Na<sup>+</sup>** approx. 9 mmol/sachet

#### Modified release

**Brufen Retard®** (Abbott) (POM)

Tablets, m/r, ibuprofen 800 mg, net price 56-tab pack = £6.48. Label: 25, 27

**Dose** **ADULT** and **CHILD** over 12 years, 2 tablets daily as a single dose, preferably in the early evening, increased in severe cases to 3 tablets daily in 2 divided doses

**Fenbid®** (Goldshield) (POM)

**Spansule®** (= capsule m/r), maroon/pink, enclosing off-white pellets, ibuprofen 300 mg, net price 120-cap pack = £9.64. Label: 25

**Dose** **ADULT** and **CHILD** over 12 years, initially 2 capsules twice daily, increased in severe cases to 3 capsules twice daily; then 1–2 capsules twice daily

### ▲ Topical preparations

Section 10.3.2

## INDOMETACIN

(Indomethacin)

**Indications** pain and moderate to severe inflammation in rheumatic disease and other acute musculoskeletal disorders; acute gout; dysmenorrhoea; premature labour (section 7.1.3)

**Cautions** see notes above; also epilepsy, parkinsonism, psychiatric disturbances; during prolonged therapy ophthalmic and blood examinations particularly advisable; avoid rectal administration in proctitis and haemorrhoids

**Driving** Dizziness may affect performance of skilled tasks (e.g. driving)

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** avoid in severe impairment; see also notes above

**Pregnancy** see notes above

**Breast-feeding** amount probably too small to be harmful—manufacturers advise avoid; see also notes above

**Side-effects** see notes above; *rarely* confusion, convulsions, psychiatric disturbances, syncope, blood disorders (particularly thrombocytopenia), hyperglycaemia, peripheral neuropathy, and intestinal strictures; suppositories may cause rectal irritation and occasional bleeding

### Dose

- **By mouth**, rheumatic disease, 50–200 mg daily in divided doses; **CHILD** see *BNF for Children*  
Acute gout, 150–200 mg daily in divided doses  
Dysmenorrhoea, up to 75 mg daily
- **By rectum** in suppositories, 100 mg at night and in the morning if required; **CHILD** not recommended  
Combined oral and rectal treatment, max. total daily dose 150–200 mg

**Indometacin** (Non-proprietary) (POM)

**Capsules**, indometacin 25 mg, net price 28-cap pack = £2.33; 50 mg, 28-cap pack = £2.29. Label: 21, counselling, driving, see above  
**Brands include** *Rimacid®*

**Suppositories**, indometacin 100 mg, net price 10 = £20.07. Counselling, driving, see above

### ▲ Modified release

**Indometacin m/r preparations** (POM)

**Capsules**, m/r, indometacin 75 mg. Label: 21, 25, counselling, driving, see above  
**Brands include** *Indolar SR®, Pardelprin®*

**Dose** 75 mg 1–2 times daily (once daily in dysmenorrhoea); **CHILD** not recommended

## KETOPROFEN

**Indications** pain and mild inflammation in rheumatic disease and other musculoskeletal disorders, and after orthopaedic surgery; acute gout; dysmenorrhoea

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** avoid in severe impairment; see also notes above

**Pregnancy** see notes above

**Breast-feeding** amount probably too small to be harmful but manufacturer advises avoid unless essential; see also notes above

**Side-effects** see notes above; pain may occur at injection site (occasionally tissue damage); suppositories may cause rectal irritation

### Dose

- **By mouth**, rheumatic disease, 100–200 mg daily in 2–4 divided doses; **CHILD** not recommended  
Pain and dysmenorrhoea, 50 mg up to 3 times daily; **CHILD** not recommended
- **By rectum** in suppositories, rheumatic disease, 100 mg at bedtime; **CHILD** not recommended  
Combined oral and rectal treatment, max. total daily dose 200 mg
- **By deep intramuscular injection** into the gluteal muscle, 50–100 mg every 4 hours (max. 200 mg in 24 hours) for up to 3 days; **CHILD** not recommended

**Ketoprofen** (Non-proprietary) (POM)

**Capsules**, ketoprofen 50 mg, net price 28-cap pack = £9.32; 100 mg, 56-cap pack = £6.66. Label: 21

**Orudis®** (Sanofi-Aventis) (POM)

**Capsules**, ketoprofen 50 mg (green/purple), net price 112-cap pack = £15.14; 100 mg (pink), 56-cap pack = £15.49. Label: 21

**Suppositories**, ketoprofen 100 mg. Net price 10 = £6.65

**Oruvail®** (Sanofi-Aventis) (POM)

**Injection**, ketoprofen 50 mg / mL. Net price 2-mL amp = £1.07

### ▲ Modified release

**Oruvail®** (Sanofi-Aventis) (POM)

**Capsules**, m/r, enclosing white pellets, ketoprofen 100 mg (pink/purple), net price 56-cap pack = £23.93; 150 mg (pink), 28-cap pack = £13.66; 200 mg (pink/white), 28-cap pack = £23.85. Label: 21, 25

**Dose** 100–200 mg once daily with food; **CHILD** not recommended

**Note** Other brands of modified-release capsules containing ketoprofen 100 mg and 200 mg include *Ketocid®* 200 mg, *Ketovail®*, *Tiloker® CR*

### ▲ With omeprazole

For prescribing information on omeprazole, see section 1.3.5

**Axorid®** (Meda) (POM)

**Capsules**, m/r, ketoprofen 100 mg, omeprazole 20 mg (yellow/white), net price 30-cap pack = £13.80; ketoprofen 200 mg, omeprazole 20 mg (white), 30-cap pack = £13.80. Label: 21, 25

**Excipients** include propylene glycol (see Excipients, p. 2)

**Note** Capsules enclose microgranules containing modified-release ketoprofen and gastro-resistant omeprazole

**Dose** (expressed as ketoprofen) patients requiring ketoprofen for osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis, who are at risk of NSAID-associated duodenal or gastric ulcer or gastroduodenal erosions, **ADULT** and **CHILD** over 15 years, 100 mg (with omeprazole 20 mg) once daily increased to 200 mg (with omeprazole 20 mg) once daily depending on severity of symptoms

### ▲ Topical preparations

Section 10.3.2

## MEFENAMIC ACID

**Indications** pain and inflammation in rheumatoid arthritis and osteoarthritis; postoperative pain; mild to moderate pain; dysmenorrhoea and menorrhagia

**Cautions** see notes above; epilepsy; acute porphyria (section 9.8.2)

**Contra-indications** see notes above; inflammatory bowel disease

**Hepatic impairment** see notes above

**Renal impairment** avoid in severe impairment; see also notes above

**Pregnancy** see notes above

**Breast-feeding** amount too small to be harmful but manufacturer advises avoid; see also notes above

**Side-effects** see notes above; also diarrhoea or rashes (withdraw treatment), stomatitis; *less commonly* paraesthesia and fatigue; *rarely* hypotension, palpitation, glucose intolerance, thrombocytopenia, haemolytic anaemia (positive Coombs' test), and aplastic anaemia

## Dose

- **ADULT** over 18 years, 500 mg 3 times daily
- **CHILD** 12–18 years, acute pain including dysmenorrhoea, menorrhagia, 500 mg 3 times daily

**Mefenamic Acid** (Non-proprietary) (POM)

**Capsules**, mefenamic acid 250 mg, net price 100-cap pack = £2.83. Label: 21

**Tablets**, mefenamic acid 500 mg, net price 28-tab pack = £2.20. Label: 21

**Suspension**, mefenamic acid 50 mg/5 mL, net price 125 mL = £79.98. Label: 21

**Excipients** include ethanol

**Ponstan**<sup>®</sup> (Chemidex) (POM)

**Capsules**, blue/ivory, mefenamic acid 250 mg, net price 100-cap pack = £8.17. Label: 21

**Forté tablets**, yellow, mefenamic acid 500 mg, net price 100-tab pack = £15.72. Label: 21

## MELOXICAM

**Indications** pain and inflammation in rheumatic disease; exacerbation of osteoarthritis (short-term); ankylosing spondylitis

**Cautions** see notes above; avoid rectal administration in proctitis or haemorrhoids

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** avoid if eGFR less than 25 mL/minute/1.73m<sup>2</sup>; see also notes above

**Pregnancy** see notes above

**Breast-feeding** present in milk in *animal* studies—manufacturer advises avoid; see also notes above

**Side-effects** see notes above

## Dose

- **By mouth**, osteoarthritis, **ADULT** and **CHILD** over 16 years, 7.5 mg once daily, increased if necessary to max. 15 mg once daily  
Rheumatoid arthritis, ankylosing spondylitis, **ADULT** and **CHILD** over 16 years, 15 mg once daily, may be reduced to 7.5 mg once daily; **ELDERLY** 7.5 mg daily
- **By rectum**, in suppositories, rheumatoid arthritis, ankylosing spondylitis, **ADULT** and **CHILD** over 16 years, 15 mg once daily, may be reduced to 7.5 mg once daily; **ELDERLY** 7.5 mg once daily [but *Mobic*<sup>®</sup> 7.5 mg suppositories discontinued]

- **CHILD** over 12 years, see *BNF for Children*

**Meloxicam** (Non-proprietary) (POM)

**Tablets**, meloxicam 7.5 mg, net price 30-tab pack = £1.36; 15 mg, 30-tab pack = £1.62. Label: 21

**Mobic**<sup>®</sup> (Boehringer Ingelheim) (POM)

**Tablets**, yellow, scored, meloxicam 7.5 mg, net price 30-tab pack = £9.30; 15 mg, 30-tab pack = £12.93. Label: 21

**Note** Tablets may be dispersed in water

**Suppositories**, meloxicam 15 mg, net price 12 = £5.58

## NABUMETONE

**Indications** pain and inflammation in osteoarthritis and rheumatoid arthritis

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** avoid in severe impairment; see also notes above

**Pregnancy** see notes above

**Breast-feeding** manufacturer advises avoid; see also notes above

**Side-effects** see notes above

## Dose

- 1 g at night; severe or persistent symptoms 0.5–1 g in morning and 1 g at night; **ELDERLY** 0.5–1 g daily; **CHILD** not recommended

**Nabumetone** (Non-proprietary) (POM)

**Tablets**, nabumetone 500 mg, net price 56-tab pack = £5.75. Label: 21

**Relifex**<sup>®</sup> (Meda) (POM)

**Tablets**, red, f/c, nabumetone 500 mg. Net price 56-tab pack = £6.18. Label: 21

**Suspension**, sugar-free, nabumetone 500 mg/5 mL. Net price 300-mL pack = £24.08. Label: 21

## NAPROXEN

**Indications** pain and inflammation in rheumatic disease (including juvenile idiopathic arthritis) and other musculoskeletal disorders; dysmenorrhoea; acute gout

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>; see also notes above

**Pregnancy** see notes above

**Breast-feeding** amount too small to be harmful but manufacturer advises avoid; see also notes above

**Side-effects** see notes above

## Dose

- Rheumatic disease, 0.5–1 g daily in 1–2 divided doses; **CHILD** 2–18 years, juvenile idiopathic arthritis, see *BNF for Children*
- Acute musculoskeletal disorders and dysmenorrhoea, 500 mg initially, then 250 mg every 6–8 hours as required; max. dose after first day 1.25 g daily; **CHILD** under 18 years, see *BNF for Children*
- Acute gout, 750 mg initially, then 250 mg every 8 hours until attack has passed; **CHILD** under 16 years not recommended

**<sup>1</sup>Naproxen** (Non-proprietary) 

**Tablets**, naproxen 250 mg, net price 28-tab pack = £1.35; 500 mg, 28-tab pack = £1.72. Label: 21  
Brands include *Arthrofen*<sup>®</sup>

**Tablets**, e/c, naproxen 250 mg, net price 56-tab pack = £3.18; 375 mg, 56-tab pack = £26.82; 500 mg, 56-tab pack = £4.83. Label: 5, 25

- Can be sold to the public for the treatment of primary dysmenorrhoea in women aged 15–50 years subject to max. single dose of 500 mg, max. daily dose of 750 mg for max. 3 days, and a max. pack size of 9 × 250 mg tablets

**Naprosyn**<sup>®</sup> (Roche) 

**Tablets**, yellow, scored, naproxen 250 mg, net price 56-tab pack = £4.29; 500 mg, 56-tab pack = £8.56. Label: 21

**Tablets**, e/c, (*Naprosyn EC*<sup>®</sup>), naproxen 250 mg, net price 56-tab pack = £4.29; 375 mg, 56-tab pack = £6.42; 500 mg, 56-tab pack = £8.56. Label: 5, 25

**Synflex**<sup>®</sup> (Roche) 

**Tablets**, blue, naproxen sodium 275 mg, net price 60-tab pack = £7.10. Label: 21

**Note** 275 mg naproxen sodium ≡ 250 mg naproxen

**Dose** musculoskeletal disorders, postoperative analgesia, 550 mg twice daily when necessary, preferably after food; max. 1.1 g daily; **CHILD** under 16 years not recommended  
Dysmenorrhoea and acute gout, initially 550 mg then 275 mg every 6–8 hours as required; max. of 1.375 g on first day and 1.1 g daily thereafter; **CHILD** under 16 years not recommended  
Migraine, 825 mg at onset, then 275–550 mg at least 30 minutes after initial dose; max. 1.375 g in 24 hours; **CHILD** under 16 years not recommended

**With esomeprazole**

For prescribing information on esomeprazole, see section 1.3.5

**Vimovo**<sup>®</sup> (AstraZeneca) 

**Tablets**, f/c, m/r, naproxen 500 mg, esomeprazole (as magnesium trihydrate) 20 mg, net price 60-tab pack = £14.95. Label: 22, 25

**Note** Naproxen component is gastro-resistant

**Dose** patients requiring naproxen for osteoarthritis, rheumatoid arthritis, or ankylosing spondylitis, who are at risk of NSAID-associated duodenal or gastric ulcer and when treatment with lower doses of naproxen or other NSAIDs is ineffective; **ADULT** over 18 years, 1 tablet twice daily

**With misoprostol**

For prescribing information on misoprostol, see section 1.3.4

**Napratec**<sup>®</sup> (Pharmacia) 

**Combination pack**, 56 yellow scored tablets, naproxen 500 mg; 56 white scored tablets, misoprostol 200 micrograms. Net price = £23.76. Label: 21

**Dose** patients requiring naproxen for rheumatoid arthritis, osteoarthritis, or ankylosing spondylitis, with prophylaxis against NSAID-induced gastroduodenal ulceration, 1 naproxen 500-mg tablet and 1 misoprostol 200-microgram tablet taken together twice daily with food; **CHILD** not recommended

**Note** The BNF recommends a higher starting dose of misoprostol for prophylaxis against NSAID-induced gastroduodenal ulceration than that provided by *Napratec*<sup>®</sup> (see section 1.3.4)

**PIROXICAM** 

**Indications** rheumatoid arthritis, osteoarthritis, and ankylosing spondylitis (see also CHMP advice below)

**Cautions** see notes above and CHMP advice below

**Contra-indications** inflammatory bowel disease; see also notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** amount too small to be harmful; see also notes above

**Side-effects** see notes above

**Dose**

- By mouth, max. 20 mg once daily (see also CHMP advice below); **CHILD** 6–18 years, juvenile idiopathic arthritis, see *BNF for Children*

**CHMP advice****Piroxicam (June 2007)**

The CHMP has recommended restrictions on the use of piroxicam because of the increased risk of gastrointestinal side effects and serious skin reactions. The CHMP has advised that:

- piroxicam should be initiated only by physicians experienced in treating inflammatory or degenerative rheumatic diseases
- piroxicam should not be used as first-line treatment
- in adults, use of piroxicam should be limited to the symptomatic relief of osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis
- piroxicam dose should not exceed 20 mg daily
- piroxicam should no longer be used for the treatment of acute painful and inflammatory conditions
- treatment should be reviewed 2 weeks after initiating piroxicam, and periodically thereafter
- concomitant administration of a gastro-protective agent (section 1.3) should be considered

**Note** Topical preparations containing piroxicam are not affected by these restrictions

**Piroxicam** (Non-proprietary) 

**Capsules**, piroxicam 10 mg, net price 56-cap pack = £16.62; 20 mg, 28-cap pack = £22.45. Label: 21

**Dispersible tablets**, piroxicam 10 mg, net price 56-tab pack = £9.96; 20 mg, 28-tab pack = £32.41. Label: 13, 21

**Brexidol**<sup>®</sup> (Chiesi) 

**Tablets**, yellow, scored, piroxicam (as betadex) 20 mg, net price 30-tab pack = £13.82. Label: 21

**Dose** osteoarthritis, rheumatic disease and acute musculoskeletal disorders, 1 tablet daily (may be halved in elderly); **CHILD** not recommended

**Feldene**<sup>®</sup> (Pfizer) 

**Capsules**, piroxicam 10 mg (red/blue), net price 30-cap pack = £38.86; 20 mg (white), 30-cap pack = £7.71. Label: 21

**Tablets**, (*Feldene Melt*<sup>®</sup>), piroxicam 20 mg, net price 28-tab pack = £9.83. Label: 10, patient information leaflet, 21

**Excipients** include aspartame equivalent to phenylalanine 140 micrograms/tablet (section 9.4.1)

**Note** *Feldene Melt*<sup>®</sup> tablets can be taken by placing on tongue up by swallowing

**Topical preparations**

Section 10.3.2

**SULINDAC**

**Indications** pain and inflammation in rheumatic disease and other musculoskeletal disorders; acute gout

**Cautions** see notes above; also history of renal stones and ensure adequate hydration

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** avoid in severe impairment; see also notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; jaundice with fever, cholestasis, hepatitis, hepatic failure; also urine discoloration occasionally reported

#### Dose

- 200 mg twice daily (may be reduced according to response); max. 400 mg daily; acute gout should respond within 7 days; limit treatment of peri-articular disorders to 7–10 days; **CHILD** not recommended

**Sulindac** (Non-proprietary) (POM)

Tablets, sulindac 100 mg, net price 56-tab pack = £18.20; 200 mg, 56-tab pack = £33.34. Label: 21

## TENOXCAM

**Indications** pain and inflammation in rheumatic disease and other musculoskeletal disorders

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** avoid in severe impairment; see also notes above

**Pregnancy** see notes above

**Breast-feeding** present in milk in *animal* studies; see also notes above

**Side-effects** see notes above

#### Dose

- By mouth, rheumatic disease, **ADULT** over 18 years, 20 mg daily  
Acute musculoskeletal disorders, **ADULT** over 18 years, 20 mg daily for 7 days; max. duration of treatment 14 days (including treatment by intravenous or intramuscular injection)
- By intravenous or intramuscular injection, **ADULT** over 18 years, initial treatment for 1–2 days if oral administration not possible, 20 mg once daily

**Tenoxicam** (Non-proprietary) (POM)

Tablets, f/c, tenoxicam 20 mg, net price 28-tab pack = £14.13. Label: 21

Injection, powder for reconstitution, tenoxicam, net price 20-mg vial = £3.98

**Mobiflex**<sup>®</sup> (Meda) (POM)

Tablets, yellow, f/c, tenoxicam 20 mg, net price 30-tab pack = £12.92. Label: 21

## TIAPROFENIC ACID

**Indications** pain and inflammation in rheumatic disease and other musculoskeletal disorders

**Cautions** see notes above

**Contra-indications** see notes above; also active bladder or prostate disease (or symptoms) and history of recurrent urinary-tract disorders—if urinary symptoms develop discontinue immediately and perform urine tests and culture; see also CSM advice below

#### CSM advice

Following reports of **severe cystitis** the CSM has recommended that tiaprofenic acid should not be given to patients with urinary-tract disorders and should be stopped if urinary symptoms develop. Patients should be advised to stop taking tiaprofenic acid and to report to their doctor promptly if they develop urinary-tract symptoms (such as increased frequency, nocturia, urgency, pain on urinating, or blood in urine)

**Hepatic impairment** reduce dose in mild or moderate impairment; see also notes above

**Renal impairment** reduce dose in mild or moderate impairment; avoid in severe impairment; see also notes above

**Pregnancy** see notes above

**Breast-feeding** amount too small to be harmful; see also notes above

**Side-effects** see notes above

#### Dose

- **ADULT** over 18 years, 300 mg twice daily

**Surgam**<sup>®</sup> (Sanofi-Aventis) (POM)

Tablets, tiaprofenic acid 300 mg, net price 56-tab pack = £14.95. Label: 21

## Aspirin

**Aspirin** (section 4.7.1) has been used in high doses to treat rheumatoid arthritis, but other NSAIDs are now preferred.

## 10.1.2 Corticosteroids

### 10.1.2.1 Systemic corticosteroids

The general actions, uses, and cautions of corticosteroids are described in section 6.3. Short-term treatment with corticosteroids can help to rapidly improve symptoms of rheumatoid arthritis. Long-term treatment in rheumatoid arthritis should be considered only after evaluating the risks and all other treatment options have been considered. Corticosteroids can induce osteoporosis, and prophylaxis should be considered on long-term treatment (section 6.6).

In severe, possibly life-threatening, situations a high initial dose of corticosteroid is given to induce remission and the dose is then reduced gradually and discontinued altogether. Relapse may occur as the dose of corticosteroid is reduced, particularly if the reduction is too rapid. The tendency is therefore to increase the maintenance dose and consequently the patient becomes dependent on corticosteroids. For this reason pulse doses of corticosteroids (e.g. methylprednisolone up to 1 g intravenously on 3 consecutive days) are used to suppress highly active inflammatory disease while longer-term treatment with a disease-modifying drug is commenced.

**Prednisolone** 7.5 mg daily may reduce the rate of joint destruction in moderate to severe *rheumatoid arthritis* of less than 2 years' duration. The reduction in joint destruction must be distinguished from mere symptomatic improvement (which lasts only 6 to 12 months at this dose) and care should be taken to avoid increasing the dose above 7.5 mg daily. Evidence supports maintenance of this anti-erosive dose for 2–4 years only after which treatment should be tapered off to reduce long-term adverse effects.

A modified-release preparation of **prednisone** (section 6.3.2) is also available for the treatment of moderate to severe rheumatoid arthritis.

*Polymyalgia rheumatica* and *giant cell (temporal) arteritis* are always treated with corticosteroids. The usual initial dose of prednisolone in polymyalgia rheumatica is 10–15 mg daily and in giant cell arteritis 40–60 mg daily (the higher dose being used if visual symp-

toms occur). Treatment should be continued until remission of disease activity and doses are then reduced gradually to about 7.5–10 mg daily for maintenance. Relapse is common if therapy is stopped prematurely. Many patients require treatment for at least 2 years and in some patients it may be necessary to continue long-term low-dose corticosteroid treatment.

*Polyarteritis nodosa* and *polymyositis* are usually treated with corticosteroids. An initial dose of 60 mg of prednisolone daily is often used and reduced to a maintenance dose of 10–15 mg daily.

*Systemic lupus erythematosus* is treated with corticosteroids when necessary using a similar dosage regimen to that for polyarteritis nodosa and polymyositis (above). Patients with pleuritis, pericarditis, or other systemic manifestations will respond to corticosteroids. It may then be possible to reduce the dosage; alternate-day treatment is sometimes adequate, and the drug may be gradually withdrawn. In some mild cases corticosteroid treatment may be stopped after a few months. Many mild cases of systemic lupus erythematosus do not require corticosteroid treatment. Alternative treatment with anti-inflammatory analgesics, and possibly chloroquine or hydroxychloroquine, should be considered.

*Ankylosing spondylitis* should not be treated with long-term corticosteroids; rarely, pulse doses may be needed and may be useful in extremely active disease that does not respond to conventional treatment.

### 10.1.2.2 Local corticosteroid injections

Corticosteroids are injected locally for an anti-inflammatory effect. In inflammatory conditions of the joints, particularly in rheumatoid arthritis, they are given by *intra-articular injection* to relieve pain, increase mobility, and reduce deformity in one or a few joints. Full aseptic precautions are essential; infected areas should be avoided. Occasionally an acute inflammatory reaction develops after an intra-articular or soft-tissue injection of a corticosteroid. This may be a reaction to the microcrystalline suspension of the corticosteroid used, but must be distinguished from sepsis introduced into the injection site.

Smaller amounts of corticosteroids may also be injected directly into soft tissues for the relief of inflammation in conditions such as *tennis or golfer's elbow* or *compression neuropathies*. In *tendinitis*, injections should be made into the tendon sheath and not directly into the tendon (due to the absence of a true tendon sheath and a high risk of rupture, the Achilles tendon should not be injected).

Hydrocortisone acetate or one of the synthetic analogues is generally used for local injection. Intra-articular corticosteroid injections can cause flushing and may affect the hyaline cartilage. Each joint should usually be treated **no more** than 3 times in one year.

Corticosteroid injections are also injected into soft tissues for the treatment of skin lesions (see section 13.4).

## LOCAL CORTICOSTEROID INJECTIONS

**Indications** local inflammation of joints and soft tissues (for details, consult product literature)

**Cautions** see notes above and consult product literature; see also section 6.3.2

**Contra-indications** see notes above and consult product literature; avoid injections containing benzyl alcohol in neonates (see preparations below)

**Side-effects** see notes above and consult product literature

### Dose

- See under preparations

#### ■ Betamethasone

**Betnesol®** (UCB Pharma) (POM)

**Injection**, betamethasone (as sodium phosphate) 4 mg/mL, net price 1-mL amp = £1.17.

#### ■ Dexamethasone

**Dexamethasone** (Non-proprietary) (POM)

**Injection**, dexamethasone (as sodium phosphate) 4 mg/mL, net price 1-mL amp = 83p, 2-mL vial = £1.27

**Dose** by *intra-articular injection* (for details consult product literature), 0.3–3 mg according to size; where appropriate may be repeated at intervals of 3–21 days according to response

**Injection**, dexamethasone (as sodium phosphate) 3.3 mg/mL, net price 1-mL amp = £1.00, 2-mL vial = £1.98

**Dose** by *intra-articular injection* (for details consult product literature), 0.33–3.3 mg according to size (by *soft-tissue infiltration* 1.7–5 mg); where appropriate may be repeated at intervals of 3–21 days

#### ■ Hydrocortisone acetate

**Hydrocortistab®** (Sovereign) (POM)

**Injection** (aqueous suspension), hydrocortisone acetate 25 mg/mL, net price 1-mL amp = £5.72

**Dose** by *intra-articular injection* (for details consult product literature), 5–50 mg according to size; where appropriate may be repeated at intervals of 21 days; not more than 3 joints should be treated on any one day; **CHILD** 5–30 mg (divided)

#### ■ Methylprednisolone acetate

**Depo-Medrone®** (Pharmacia) (POM)

**Injection** (aqueous suspension), methylprednisolone acetate 40 mg/mL, net price 1-mL vial = £2.87; 2-mL vial = £5.15; 3-mL vial = £7.47

**Dose** by *intra-articular injection* (for details consult product literature), 4–80 mg, according to size; where appropriate may be repeated at intervals of 7–35 days; also for *intralesional injection*

**Depo-Medrone® with Lidocaine** (Pharmacia) (POM)

**Injection** (aqueous suspension), methylprednisolone acetate 40 mg, lidocaine hydrochloride 10 mg/mL, net price 1-mL vial = £3.28; 2-mL vial = £5.88

**Dose** by *intra-articular injection* (for details consult product literature), 4–80 mg, according to size; where appropriate may be repeated at intervals of 7–35 days

#### ■ Prednisolone acetate

**Deltastab®** (Sovereign) (POM)

**Injection** (aqueous suspension), prednisolone acetate 25 mg/mL, net price 1-mL amp = £5.73

**Dose** by *intra-articular injection* (for details consult product literature), 5–25 mg according to size; not more than 3 joints should be treated on any one day; where appropriate may be repeated when relapse occurs

For *intramuscular injection*, see section 6.3.2

#### ■ Triamcinolone acetonide

**Adcortyl® Intra-articular/Intradermal** (Squibb) (POM)

**Injection** (aqueous suspension), triamcinolone acetonide 10 mg/mL, net price 1-mL amp = 90p; 5-mL vial = £3.63

**Excipients** include benzyl alcohol (avoid in neonates, see Excipients, p. 2)

**Dose** by *intra-articular injection* (for details consult product literature), 2.5–15 mg according to size (for larger doses use

*Kenalog*®); where appropriate may be repeated when relapse occurs; CHILD under 18 years see *BNF for Children*  
 By *intra-articular injection*, (for details consult product literature); 2–3 mg; max. 5 mg at any one site (total max. 30 mg); where appropriate may be repeated at intervals of 1–2 weeks; CHILD under 6 years not recommended

#### **Kenalog® Intra-articular/Intramuscular** (Squibb) (POM)

*Injection* (aqueous suspension), triamcinolone acetonide 40 mg/mL, net price 1-mL vial = £1.49

**Dose** by *intra-articular injection* (for details consult product literature), 5–40 mg according to size; total max. 80 mg (for doses below 5 mg use *Adcortyl® Intra-articular/Intradermal*); where appropriate may be repeated when relapse occurs; CHILD under 18 years see *BNF for Children*

For *intramuscular injection*, see section 6.3.2

## 10.1.3 Drugs that suppress the rheumatic disease process

Certain drugs such as those affecting the immune response can suppress the disease process in *rheumatoid arthritis* and *psoriatic arthritis*; gold, penicillamine, hydroxychloroquine, chloroquine, and sulfasalazine can also suppress the disease process in *rheumatoid arthritis* while sulfasalazine and possibly gold can suppress the disease process in *psoriatic arthritis*. Unlike NSAIDs, disease-modifying anti-rheumatic drugs (DMARDs) can affect the progression of disease but may require 2–6 months of treatment for a full therapeutic response. Since in the first few months of treatment, the course of rheumatoid arthritis is unpredictable and the diagnosis uncertain, it is usual to start treatment with an NSAID alone. However, disease-modifying anti-rheumatic drugs should be initiated by specialists as soon as diagnosis, progression, and severity of the disease have been confirmed. Response to a disease-modifying anti-rheumatic drug may allow the dose of the NSAID to be reduced.

Disease-modifying anti-rheumatic drugs can improve not only the symptoms of inflammatory joint disease but also extra-articular manifestations such as vasculitis. They reduce the erythrocyte sedimentation rate, C-reactive protein, and sometimes the titre of rheumatoid factor; some also retard erosive damage as judged radiologically.

**Choice** The choice of a disease-modifying anti-rheumatic drug should take into account co-morbidity and patient preference. Methotrexate, sulfasalazine, intramuscular gold, and penicillamine are similar in efficacy. However, methotrexate or sulfasalazine may be better tolerated.

A combination of DMARDs (including methotrexate and at least one other DMARD) and a short-term corticosteroid (section 10.1.2), should be given to patients with newly diagnosed active rheumatoid arthritis, ideally within 3 months of the onset of persistent symptoms. If the use of particular DMARDs is contraindicated and combination therapy is not possible, monotherapy with a suitable DMARD should be given and the dose rapidly increased until clinically effective. In patients with established and stable rheumatoid arthritis, cautiously reduce drug doses to the lowest that are clinically effective. Response to drug treatment often produces a reduction in requirements of both corticosteroids and other drugs.

Gold and penicillamine are effective in *palindromic rheumatism*. *Systemic and discoid lupus erythematosus* are sometimes treated with chloroquine or hydroxychloroquine.

If a disease-modifying anti-rheumatic drug does not lead to an objective benefit within 6 months, it should be replaced by a different one.

**Juvenile idiopathic arthritis** Many children with *juvenile idiopathic arthritis* (juvenile chronic arthritis) do not require disease-modifying antirheumatic drugs. Methotrexate is effective [unlicensed indication]; sulfasalazine is an alternative [unlicensed indication] but it should be avoided in *systemic-onset juvenile idiopathic arthritis*. Gold and penicillamine are no longer used. For the role of cytokine modulators in *polyarticular juvenile idiopathic arthritis*, see p. 647.

## Gold

Gold can be given as **sodium aurothiomalate** for active progressive rheumatoid arthritis; it must be given by deep intramuscular injection and the area gently massaged. A test dose of 10 mg must be given followed by doses of 50 mg at weekly intervals until there is definite evidence of remission. Benefit is not to be expected until about 300–500 mg has been given; it should be discontinued if there is no remission after 1 g has been given. In patients who do respond, the interval between injections is then gradually increased to 4 weeks and treatment is continued for up to 5 years after complete remission. If relapse occurs the dosage frequency may be immediately increased to 50 mg weekly and only once control has been obtained again should the dosage frequency be decreased; if no response is seen within 2 months, alternative treatment should be sought. It is important to avoid complete relapse since second courses of gold are not usually effective.

Sodium aurothiomalate should be discontinued in the presence of blood disorders, gastro-intestinal bleeding (associated with ulcerative enterocolitis), or unexplained proteinuria (associated with immune complex nephritis) which is repeatedly above 300 mg/litre. Urine tests and full blood counts (including total and differential white cell and platelet counts) must therefore be performed before starting treatment and before each intramuscular injection. Rashes with pruritus often occur after 2 to 6 months of treatment and may necessitate discontinuation.

## SODIUM AUROTHIOMALATE

**Indications** active progressive rheumatoid arthritis

**Cautions** see notes above; elderly, history of urticaria, eczema, colitis; monitor for pulmonary fibrosis with annual chest X-ray; **interactions:** Appendix 1 (sodium aurothiomalate)

**Counselling** Patients should be advised to seek prompt medical attention if diarrhoea, sore throat, fever, infection, non-specific illness, unexplained bleeding and bruising, purpura, mouth ulcers, metallic taste, rash, breathlessness, or cough develop

**Contra-indications** history of blood disorders or bone marrow aplasia, exfoliative dermatitis, systemic lupus erythematosus, necrotising enterocolitis, pulmonary fibrosis; acute porphyria (section 9.8.2)

**Hepatic impairment** caution in mild to moderate impairment, avoid in severe impairment

**Renal impairment** caution in mild to moderate impairment; avoid in severe impairment

**Pregnancy** manufacturer advises avoid but limited data suggests usually not necessary to withdraw if condition well controlled—consider reducing dose and frequency

**Breast-feeding** manufacturer advises avoid—present in milk; theoretical possibility of rashes and idiosyncratic reactions

**Side-effects** see notes above; also severe anaphylactic reactions; stomatitis, taste disturbances, colitis, hepatotoxicity with cholestatic jaundice, pulmonary fibrosis, peripheral neuropathy, mouth ulcers, proteinuria, blood disorders (sometimes sudden and fatal), nephrotic syndrome, gold deposits in eye, alopecia, and skin reactions (including, on prolonged parenteral treatment, irreversible pigmentation in sun-exposed areas)

#### Dose

- By deep intramuscular injection, administered on expert advice, see notes above

**Myocrisin**<sup>®</sup> (Sanofi-Aventis) [Pm]

**Injection**, sodium aurothiomalate 20 mg/mL, net price 0.5-mL (10-mg) amp = £3.80; 100 mg/mL, 0.5-mL (50-mg) amp = £11.23. Label: 11, counselling, blood disorder symptoms

## Penicillamine

**Penicillamine** has a similar action to gold. More patients are able to continue treatment than with gold but side-effects are common.

Patients should be warned not to expect improvement for at least 6 to 12 weeks after treatment is initiated. Penicillamine should be discontinued if there is no improvement within 1 year.

Blood counts, including platelets, and urine examinations should be carried out before starting treatment and then every 1 or 2 weeks for the first 2 months then every 4 weeks to detect blood disorders and proteinuria (they should also be carried out in the week after any dose increase). A reduction in platelet count calls for discontinuation with subsequent re-introduction at a lower dosage and then, if possible, gradual increase. Proteinuria, associated with immune complex nephritis, occurs in up to 30% of patients, but may resolve despite continuation of treatment; treatment may be continued provided that renal function tests remain normal, oedema is absent, and the 24-hour urinary excretion of protein does not exceed 2 g.

Nausea may occur but is not usually a problem provided that penicillamine is taken before food or on retiring and that low initial doses are used and only gradually increased. Loss of taste can occur about 6 weeks after treatment is started but usually returns 6 weeks later irrespective of whether treatment is discontinued; mineral supplements are not recommended. Rashes are a common side-effect. Those that occur in the first few months of treatment disappear when the drug is stopped and treatment may then be re-introduced at a lower dose level and gradually increased. Late rashes are more resistant and often necessitate discontinuation of treatment.

Patients who are hypersensitive to penicillin may react rarely to penicillamine.

## PENICILLAMINE

**Indications** see notes above and under Dose

**Cautions** see notes above; concomitant nephrotoxic drugs (increased risk of toxicity); gold treatment (avoid concomitant use if adverse reactions to gold); **interactions:** Appendix 1 (penicillamine)

**Blood counts and urine tests** See notes above. Longer intervals may be adequate in cystinuria and Wilson's disease. Consider withdrawal if platelet count falls below 120 000/mm<sup>3</sup> or white blood cells below 2500/mm<sup>3</sup> or if 3 successive falls within reference range (can restart at reduced dose when counts return to within reference range but permanent withdrawal necessary if recurrence of leucopenia or thrombocytopenia)

**Counselling** Warn patient to tell doctor promptly if sore throat, fever, infection, non-specific illness, unexplained bleeding and bruising, purpura, mouth ulcers, or rashes develop

**Contra-indications** lupus erythematosus

**Renal impairment** reduce dose and monitor renal function or avoid (consult product literature)

**Pregnancy** fetal abnormalities reported rarely; avoid if possible

**Breast-feeding** manufacturer advises avoid unless potential benefit outweighs risk—no information available

**Side-effects** (see also notes above) initially nausea, anorexia, fever, and skin reactions; taste loss (mineral supplements not recommended); blood disorders including thrombocytopenia, leucopenia, agranulocytosis and aplastic anaemia; proteinuria, rarely haematuria (withdraw immediately and seek specialist advice); haemolytic anaemia, pancreatitis, cholestatic jaundice, nephrotic syndrome, lupus erythematosus-like syndrome, myasthenia gravis-like syndrome, neuropathy, polymyositis (rarely with cardiac involvement), dermatomyositis, mouth ulcers, stomatitis, alopecia, bronchiolitis and pneumonitis, pemphigus, Goodpasture's syndrome, and Stevens-Johnson syndrome also reported; male and female breast enlargement reported; in non-rheumatoid conditions rheumatoid arthritis-like syndrome also reported; late rashes (consider withdrawing treatment)

#### Dose

- Severe active rheumatoid arthritis, administered on expert advice, **ADULT** over 18 years, initially 125–250 mg daily for 1 month increased by similar amounts at intervals of not less than 4 weeks to usual maintenance of 500–750 mg daily in divided doses; max. 1.5 g daily; if remission sustained for 6 months, reduction of daily dose by 125–250 mg every 12 weeks may be attempted; **ELDERLY** initially up to 125 mg daily for 1 month increased by similar amounts at intervals of not less than 4 weeks; max. 1 g daily
- Wilson's disease, autoimmune hepatitis, and cystinuria, section 9.8.1

**Penicillamine** (Non-proprietary) [Pm]

**Tablets**, penicillamine 125 mg, net price 56-tab pack = £16.66; 250 mg, 56-tab pack = £25.00. Label: 6, 22, counselling, blood disorder symptoms (see above)

**Distamine**<sup>®</sup> (Alliance) [Pm]

**Tablets**, f/c, penicillamine 125 mg, net price 100-tab pack = £10.34; 250 mg, 100-tab pack = £17.78. Label: 6, 22, counselling, blood disorder symptoms (see above)

## Antimalarials

The antimalarial **hydroxychloroquine** is used to treat rheumatoid arthritis of moderate inflammatory activity; **chloroquine** is also licensed for treating inflammatory disorders but is used much less frequently and is generally reserved for use if other drugs have failed. Chloroquine and hydroxychloroquine are effective for mild systemic lupus erythematosus, particularly involving the skin and joints. These drugs should not be used for psoriatic arthritis.

Chloroquine and hydroxychloroquine are better tolerated than gold or penicillamine. Retinopathy (see below) rarely occurs provided that the recommended doses are not exceeded; in the elderly it is difficult to distinguish drug-induced retinopathy from changes of ageing.

**Mepacrine** (section 5.4.4) is sometimes used in discoid lupus erythematosus [unlicensed].

**Cautions** Manufacturers recommend regular ophthalmological examination but the evidence of practical value is unsatisfactory (see advice of the Royal College of Ophthalmologists, below). Chloroquine and hydroxychloroquine should be used with caution in neurological disorders (especially in those with a history of epilepsy), in severe gastro-intestinal disorders, in G6PD deficiency (section 9.1.5), in acute porphyria, and in the elderly (see also above). Chloroquine and hydroxychloroquine may exacerbate psoriasis and aggravate myasthenia gravis. Concurrent use of hepatotoxic drugs should be avoided; other **interactions**: Appendix 1 (chloroquine and hydroxychloroquine).

**Screening for ocular toxicity** A review group convened by the Royal College of Ophthalmologists has updated guidelines for screening to prevent ocular toxicity on long-term treatment with chloroquine and hydroxychloroquine (*Hydroxychloroquine and Ocular Toxicity: Recommendations on Screening 2009*). Chloroquine should be considered (for treating chronic inflammatory conditions) **only** if other drugs have failed. All patients taking chloroquine should receive ocular examination according to a protocol arranged locally between the prescriber and the ophthalmologist. The following recommendations relate to hydroxychloroquine, which is only rarely associated with toxicity.

### Before treatment:

- Assess renal and liver function (adjust dose if impaired)
- Ask patient about visual impairment (not corrected by glasses). If impairment or eye disease present, assessment by an optometrist is advised and any abnormality should be referred to an ophthalmologist
- Record near visual acuity of each eye (with glasses where appropriate) using a standard reading chart
- Initiate hydroxychloroquine treatment if no abnormality detected (at a dose not exceeding hydroxychloroquine sulphate 6.5 mg/kg daily)

### During treatment:

- Ask patient about visual symptoms and monitor visual acuity annually using the standard reading chart

- Refer to ophthalmologist if visual acuity changes or if vision blurred and warn patient to seek prescribing doctor's advice about stopping treatment
- A child treated for juvenile idiopathic arthritis should receive slit-lamp examination routinely to check for uveitis
- If long-term treatment is required (more than 5 years), individual arrangement should be agreed with the local ophthalmologist

### Important

To avoid excessive dosage in obese patients, the doses of hydroxychloroquine and chloroquine should be calculated on the basis of ideal body-weight. Ocular toxicity is unlikely if the dose of chloroquine phosphate does not exceed 4 mg/kg daily (equivalent to chloroquine base approx. 2.5 mg/kg daily)

**Hepatic impairment** Chloroquine and hydroxychloroquine should be used with caution in moderate to severe hepatic impairment.

**Pregnancy** It is not necessary to withdraw an antimalarial drug during pregnancy if the rheumatic disease is well controlled; however, the manufacturer of hydroxychloroquine advises avoiding use.

**Breast-feeding** Chloroquine and hydroxychloroquine are present in breast milk and breast-feeding should be avoided when they are used to treat rheumatic disease.

**Side-effects** The side-effects of chloroquine and hydroxychloroquine include gastro-intestinal disturbances, headache and skin reactions (rashes, pruritus); those occurring less frequently include ECG changes, convulsions, visual changes, retinal damage (see above), keratopathy, ototoxicity, hair depigmentation, hair loss, and discoloration of skin, nails, and mucous membranes. Side-effects that occur rarely include blood disorders (including thrombocytopenia, agranulocytosis, and aplastic anaemia), mental changes (including emotional disturbances and psychosis), myopathy (including cardiomyopathy and neuromyopathy), acute generalised exanthematous pustulosis, exfoliative dermatitis, Stevens-Johnson syndrome, photosensitivity, and hepatic damage; angioedema has also been reported. **Important:** very toxic in overdose—immediate advice from poisons centres essential (see also p. 37).

## CHLOROQUINE

**Indications** active rheumatoid arthritis, systemic and discoid lupus erythematosus; malaria (section 5.4.1)

**Cautions** see notes above

**Hepatic impairment** see notes above

**Renal impairment** manufacturer advises caution; reduce dose

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above

**Dose**

- Administered on expert advice, **by mouth, ADULT** over 18 years, chloroquine (base) 150 mg daily; max. 2.5 mg/kg daily based on ideal body-weight, see also recommendations above

**Note** Chloroquine base 150 mg = chloroquine sulphate 200 mg = chloroquine phosphate 250 mg (approx.).

**Preparations**

Section 5.4.1

**HYDROXYCHLOROQUINE SULPHATE**

**Indications** active rheumatoid arthritis (including juvenile idiopathic arthritis), systemic and discoid lupus erythematosus; dermatological conditions caused or aggravated by sunlight

**Cautions** see notes above

**Hepatic impairment** see notes above

**Renal impairment** manufacturer advises caution and monitoring of plasma-hydroxychloroquine concentration in severe impairment

**Pregnancy** see notes above

**Breast-feeding** avoid—risk of toxicity in infant; see also notes above

**Side-effects** see notes above; also reported bronchospasm

**Dose**

- Administered on expert advice, 200–400 mg daily (but not exceeding 6.5 mg/kg daily based on ideal body-weight, see also recommendations above); **CHILD** 1 month–18 years see *BNF for Children*

**Hydroxychloroquine** (Non-proprietary) [PmL]

**Tablets**, hydroxychloroquine sulphate 200 mg, net price 60-tab pack = £5.25. Label: 5, 21

**Brands include** *Quinoric*®

**Plaquenil**® (Sanofi-Aventis) [PmL]

**Tablets**, f/c, hydroxychloroquine sulphate 200 mg, net price 60-tab pack = £5.25. Label: 5, 21

**Drugs affecting the immune response**

**Methotrexate** is a disease-modifying antirheumatic drug suitable for moderate to severe rheumatoid arthritis. **Azathioprine**, **cyclosporin**, **cyclophosphamide**, **leflunomide**, and the **cytokine modulators** are considered more toxic and they are used in cases that have not responded to other disease-modifying drugs.

**Methotrexate** is usually given in an initial dose of 7.5 mg by mouth once a week, adjusted according to response to a maximum of 15 mg once a week (occasionally 20 mg once a week). Regular full blood counts (including differential white cell count and platelet count), renal and liver function tests are required. In patients who experience mucosal or gastro-intestinal side-effects with methotrexate, folic acid 5 mg every week [unlicensed indication], on a different day from the methotrexate, may help to reduce the frequency of such side-effects.

**Azathioprine** is usually given in a dose of up to 2.5 mg/kg daily in divided doses. Blood counts are needed to detect possible neutropenia or thrombocytopenia (usually resolved by reducing the dose). Nausea, vomiting, and diarrhoea may occur, usually starting early

during the course of treatment, and may necessitate withdrawal of the drug; herpes zoster infection may also occur.

**Leflunomide** acts on the immune system as a disease-modifying antirheumatic drug. Its therapeutic effect starts after 4–6 weeks and improvement may continue for a further 4–6 months. Leflunomide, which is similar in efficacy to sulfasalazine and methotrexate, may be chosen when these drugs cannot be used. The active metabolite of leflunomide persists for a long period; active procedures to wash the drug out are required in case of serious adverse effects, or before starting treatment with another disease-modifying antirheumatic drug, or, in men or women, before conception. Side-effects of leflunomide include bone-marrow toxicity; its immunosuppressive effects increase the risk of infection and malignancy.

**Cyclosporin** is licensed for severe active rheumatoid arthritis when conventional second-line therapy is inappropriate or ineffective. There is some evidence that cyclosporin may retard the rate of erosive progression and improve symptom control in those who respond only partially to methotrexate.

**Cyclophosphamide** (section 8.1.1) may be used at a dose of 1 to 1.5 mg/kg daily by mouth for rheumatoid arthritis with severe systemic manifestations [unlicensed indication]; it is toxic and regular blood counts (including platelet counts) should be carried out. Cyclophosphamide can also be given intravenously in a dose of 0.5 to 1 g (with prophylactic mesna) for *severe systemic rheumatoid arthritis* and for other connective tissue diseases (especially with active vasculitis), repeated initially at fortnightly then at monthly intervals (according to clinical response and haematological monitoring).

Drugs that affect the immune response are also used in the management of severe cases of *systemic lupus erythematosus* and other connective tissue disorders. They are often given in conjunction with corticosteroids for patients with severe or progressive renal disease. They may be used in cases of *polymyositis* that are resistant to corticosteroids. They are used for their corticosteroid-sparing effect in patients whose corticosteroid requirements are excessive. **Azathioprine** is usually used.

**Azathioprine** and **methotrexate** are used in the treatment of *psoriatic arthropathy* [unlicensed indication] for severe or progressive cases that are not controlled with anti-inflammatory drugs.

**AZATHIOPRINE**

**Indications** see notes above; inflammatory bowel disease [unlicensed indication] (section 1.5.3); autoimmune conditions and prophylaxis of transplantation rejection (section 8.2.1); severe refractory eczema [unlicensed indication] (section 13.5.3)

**Cautions** section 8.2.1

**Contra-indications** section 8.2.1

**Hepatic impairment** section 8.2.1

**Renal impairment** section 8.2.1

**Pregnancy** section 8.2.1

**Breast-feeding** section 8.2.1

**Side-effects** section 8.2.1

**Dose**

- **By mouth**, initially, rarely more than 3 mg/kg daily, reduced according to response; maintenance 1–3 mg/kg daily; consider withdrawal if no improvement within 3 months

**Preparations**

Section 8.2.1

**CYCLOSPORIN**  
(Cyclosporin)

**Indications** severe active rheumatoid arthritis when conventional second-line therapy inappropriate or ineffective; severe acute ulcerative colitis [unlicensed indication] (section 1.5.3); graft-versus-host disease (section 8.2.2); atopic dermatitis and psoriasis (section 13.5.3)

**Cautions** section 8.2.2

**Additional cautions in rheumatoid arthritis** *Contra-indicated* in abnormal renal function, uncontrolled hypertension (see also below), uncontrolled infections, and malignancy. Measure serum creatinine at least twice before treatment and monitor every 2 weeks for first 3 months, then every 4 weeks (or more frequently if dose increased or concomitant NSAIDs introduced or increased (see also **interactions**: Appendix 1 (cyclosporin)), reduce dose if serum creatinine increases more than 30% above baseline in more than 1 measurement; if above 50%, reduce dose by 50% (even if within normal range) and discontinue if reduction not successful within 1 month; monitor blood pressure (discontinue if hypertension develops that cannot be controlled by antihypertensive therapy); monitor hepatic function if concomitant NSAIDs given.

**Hepatic impairment** section 8.2.2

**Renal impairment** see Cautions above

**Pregnancy** see section 8.2.2

**Breast-feeding** section 8.2.2

**Side-effects** section 8.2.2

**Dose**

- **By mouth**, administered in accordance with expert advice, initially 2.5 mg/kg daily in 2 divided doses, if necessary increased gradually after 6 weeks; max. 4 mg/kg daily (discontinue if response insufficient after 3 months); dose adjusted according to response for maintenance and treatment reviewed after 6 months (continue only if benefits outweigh risks); **CHILD** and under 18 years, not recommended
- Important** For preparations and counselling and for advice on conversion between the preparations, see section 8.2.2

**Preparations**

Section 8.2.2

**LEFLUNOMIDE**

**Indications** (specialist use only) moderate to severe active rheumatoid arthritis; active psoriatic arthritis

**Cautions** impaired bone-marrow function including anaemia, leucopenia or thrombocytopenia (avoid if significant and due to causes other than rheumatoid arthritis); recent treatment with other hepatotoxic or myelotoxic disease-modifying antirheumatic drugs; washout procedures recommended for serious adverse effects or before switching to other disease-modifying antirheumatic drugs (consult product lit-

erature and see Washout Procedure, below); history of tuberculosis; exclude pregnancy before treatment; effective contraception **essential** during treatment and for at least 2 years after treatment in women and at least 3 months after treatment in men (plasma concentration monitoring required; waiting time before conception may be reduced with washout procedure—consult product literature and see Washout Procedure, below); monitor full blood count (including differential white cell count and platelet count) before treatment and every 2 weeks for 6 months then every 8 weeks; monitor liver function—see Hepatotoxicity, below; monitor blood pressure; **interactions**: Appendix 1 (leflunomide)

**Hepatotoxicity** Potentially life-threatening hepatotoxicity reported usually in the first 6 months; monitor liver function before treatment and every 2 weeks for first 6 months then every 8 weeks. Discontinue treatment (and institute washout procedure—consult product literature and see Washout Procedure below) or reduce dose according to liver-function abnormality; if liver-function abnormality persists after dose reduction, discontinue treatment and institute washout procedure

**Washout procedure** To aid drug elimination in case of serious adverse effect, or before starting another disease-modifying antirheumatic drug, or before conception (see also **Pregnancy** below), stop treatment and give *either* colestyramine 8 g 3 times daily for 11 days or activated charcoal 50 g 4 times daily for 11 days; the concentration of the active metabolite after washout should be less than 20 micrograms/litre (measured on 2 occasions 14 days apart) in men or women before conception—consult product literature. Procedure may be repeated as necessary

**Contra-indications** severe immunodeficiency; severe hypoproteinaemia; serious infection

**Hepatic impairment** avoid—active metabolite may accumulate; see also Cautions above

**Renal impairment** manufacturer advises avoid in moderate or severe impairment—no information available

**Pregnancy** avoid—active metabolite teratogenic in *animal* studies; effective contraception essential during treatment and for at least 2 years after treatment in women and at least 3 months after treatment in men (see also Cautions above)

**Breast-feeding** present in milk in *animal* studies—manufacturer advises avoid

**Side-effects** diarrhoea, nausea, vomiting, anorexia, oral mucosal disorders, abdominal pain; increased blood pressure; headache, dizziness, asthenia, paraesthesia; leucopenia; tenosynovitis; alopecia, rash, dry skin, pruritus; *less commonly* taste disturbance, anxiety, hyperlipidaemia, hypokalaemia, hypophosphataemia, anaemia, thrombocytopenia, and tendon rupture; *rarely* hepatitis, jaundice (see Hepatotoxicity, above), interstitial lung disease, severe infection, eosinophilia, and pancytopenia; *very rarely* pancreatitis, hepatic failure (see Hepatotoxicity, above), peripheral neuropathy, vasculitis, progressive multifocal leucoencephalopathy, Stevens-Johnson syndrome, and toxic epidermal necrolysis; hypouricaemia, reduced sperm count, and renal failure also reported; **important**: discontinue treatment and institute washout procedure (see Washout Procedure under Cautions) in case of serious side-effect

**Dose**

- Rheumatoid arthritis, **ADULT** over 18 years, initially 100 mg once daily for 3 days, then 10–20 mg once daily
- Psoriatic arthritis, **ADULT** over 18 years, initially 100 mg once daily for 3 days, then 20 mg once daily

**Leflunomide** (Non-proprietary) [POM]

**Tablets**, leflunomide, 10 mg, net price 30-tab pack = £46.00; 20 mg, 30-tab pack = £46.00. Label: 4

**Arava**<sup>®</sup> (Sanofi-Aventis) [POM]

**Tablets**, f/c, leflunomide 10 mg (white), net price 30-tab pack = £51.13; 20 mg (yellow), 30-tab pack = £61.36; 100 mg (white), 3-tab pack = £30.67. Label: 4

**METHOTREXATE**

**Indications** moderate to severe active rheumatoid arthritis; Crohn's disease [unlicensed indication] (section 1.5.3); malignant disease (section 8.1.3); psoriasis (section 13.5.3)

**Cautions** section 8.1; see CSM advice below (blood count, liver and pulmonary toxicity); extreme caution in blood disorders (avoid if severe); peptic ulceration, ulcerative colitis, diarrhoea and ulcerative stomatitis (withdraw if stomatitis develops—may be first sign of gastro-intestinal toxicity); risk of accumulation in pleural effusion or ascites—drain before treatment; acute porphyria (section 9.8.2); **interactions**: see below and Appendix 1 (methotrexate)

**CSM advice**

In view of reports of blood dyscrasias (including fatalities) and liver cirrhosis with low-dose methotrexate, the CSM has advised:

- full blood count and renal and liver function tests before starting treatment and repeated weekly until therapy stabilised, thereafter patients should be monitored every 2–3 months
- that patients should be advised to report all symptoms and signs suggestive of infection, especially sore throat

Treatment with folic acid (as calcium folinate, section 8.1) may be required in acute toxicity

**Blood count** Bone marrow suppression can occur abruptly; factors likely to increase toxicity include advanced age, renal impairment, and concomitant use with another anti-folate drug. A clinically significant drop in white cell count or platelet count calls for immediate withdrawal of methotrexate and introduction of supportive therapy

**Liver toxicity** Liver cirrhosis reported. Treatment should not be started or should be discontinued if any abnormality of liver function tests or liver biopsy is present or develops during therapy. Abnormalities can return to normal within 2 weeks after which treatment may be recommenced if judged appropriate

**Pulmonary toxicity** Pulmonary toxicity may be a special problem in rheumatoid arthritis (patient to seek medical attention if dyspnoea, cough or fever); monitor for symptoms at each visit—discontinue if pneumonitis suspected.

**Aspirin and other NSAIDs** If aspirin or other NSAIDs are given concurrently the dose of methotrexate should be carefully monitored. Patients should be advised to avoid self-medication with over-the-counter aspirin or ibuprofen

**Contra-indications** see Cautions above; active infection and immunodeficiency syndromes

**Hepatic impairment** avoid—dose-related toxicity; see also Cautions above

**Renal impairment** reduce dose; risk of nephrotoxicity at high doses; avoid in severe impairment

**Pregnancy** avoid (teratogenic; fertility may be reduced during therapy but this may be reversible); effective contraception required during and for at least 3 months after treatment in men or women; see also section 8.1

**Breast-feeding** discontinue breast-feeding; present in milk

**Side-effects** section 8.1; also anorexia, abdominal discomfort, dyspepsia, gastro-intestinal ulceration

and bleeding, diarrhoea, toxic megacolon, hepatotoxicity (see Cautions above); hypotension, pericarditis, pericardial tamponade; pulmonary oedema, pleuritic pain, pulmonary fibrosis, interstitial pneumonitis (see also Pulmonary Toxicity above); anaphylactic reactions, urticaria; dizziness, fatigue, chills, fever, drowsiness, malaise, headache, mood changes, neurotoxicity, confusion, paraesthesia; precipitation of diabetes; menstrual disturbances, vaginitis, cystitis, reduced libido, impotence; blood disorders; haematuria, dysuria, renal failure; osteoporosis, arthralgia, myalgia, vasculitis; conjunctivitis, visual disturbance; rash, pruritus, Stevens-Johnson syndrome, toxic epidermal necrolysis, photosensitivity, changes in nail and skin pigmentation, telangiectasia, acne, furunculosis, ecchymosis; injection-site reactions

**Dose**

- Moderate to severe active rheumatoid arthritis, **by mouth**, 7.5 mg once weekly, adjusted according to response; max. weekly dose 20 mg
- Severe active rheumatoid arthritis, **by subcutaneous or by intramuscular or by intravenous injection**, 7.5 mg once weekly, increased according to response by 2.5 mg weekly; max. weekly dose 25 mg

**Important**

Note that the above dose is a **weekly** dose. To avoid error with low-dose methotrexate, it is recommended that:

- the patient is carefully advised of the **dose and frequency** and the reason for taking methotrexate and any other prescribed medicine (e.g. folic acid);
- only one strength of methotrexate tablet (usually 2.5 mg) is prescribed and dispensed;
- the prescription and the dispensing label clearly show the dose and frequency of methotrexate administration;
- the patient is warned to report immediately the onset of any feature of blood disorders (e.g. sore throat, bruising, and mouth ulcers), liver toxicity (e.g. nausea, vomiting, abdominal discomfort, and dark urine), and respiratory effects (e.g. shortness of breath).

**Methotrexate** (Non-proprietary) [POM]

**Tablets**, yellow, methotrexate 2.5 mg, net price 28-tab pack = £3.27. Counselling, dose, NSAIDs

**Brands include** *Maxtrex*<sup>®</sup>

**Tablets**, yellow, methotrexate 10 mg, net price 100-tab pack = £56.49. Counselling, dose, NSAIDs

**Parenteral preparations**

See also section 8.1.3

**Metoject**<sup>®</sup> (Medac) [POM]

**Injection**, prefilled syringe, methotrexate (as disodium salt) 50 mg/mL, net price 0.15 mL (7.5 mg) = £14.85, 0.2 mL (10 mg) = £15.29, 0.3 mL (15 mg) = £16.57, 0.4 mL (20 mg) = £17.84, 0.5 mL (25 mg) = £18.48, 0.6 mL (30 mg) = £18.95

**Cytokine modulators**

Cytokine modulators should be used under specialist supervision.

Adalimumab, certolizumab pegol, etanercept, golimumab, and infliximab inhibit the activity of tumour necrosis factor alpha (TNF- $\alpha$ ).

**Adalimumab** is licensed for moderate to severe active *rheumatoid arthritis* when response to other disease-

modifying antirheumatic drugs (including methotrexate) has been inadequate (see also NICE guidance October 2007, below and August 2010, p. 649); it can also be used for severe, active, and progressive disease in adults not previously treated with methotrexate. It is also licensed for active *polyarticular juvenile idiopathic arthritis* in adolescents who have not responded adequately to one or more disease-modifying antirheumatic drugs. In the treatment of rheumatoid arthritis and polyarticular juvenile idiopathic arthritis, adalimumab should be used in combination with methotrexate, but it can be given alone if methotrexate is inappropriate. Adalimumab is also licensed for the treatment of active and progressive *psoriatic arthritis* (see also NICE guidance, p. 649) and severe active *ankylosing spondylitis* (see also NICE guidance, p. 649) that have not responded adequately to other disease-modifying antirheumatic drugs. For the role of adalimumab in Crohn's disease, see section 1.5.3. For the role of adalimumab in plaque psoriasis, see section 13.5.3.

**Certolizumab pegol** is licensed for use in patients with moderate to severe active *rheumatoid arthritis* when response to disease-modifying antirheumatic drugs (including methotrexate) has been inadequate (see also NICE guidance, below). Certolizumab pegol can be used in combination with methotrexate, or as a monotherapy if methotrexate is not tolerated or is contra-indicated.

#### NICE guidance

##### Certolizumab pegol for the treatment of rheumatoid arthritis (February 2010)

Certolizumab pegol is recommended as an option for the treatment of patients with rheumatoid arthritis only if:

- certolizumab pegol is used as described in the NICE guidance (October 2007) for other tumour necrosis factor (TNF) inhibitor treatments, (see Adalimumab, Etanercept and Infliximab for the treatment of Rheumatoid Arthritis, below) and
- the manufacturer provides the first 12 weeks of certolizumab pegol (10 pre-filled 200-mg syringes) free of charge to all patients starting treatment.

**Etanercept** is licensed for the treatment of moderate to severe active *rheumatoid arthritis* either alone or in combination with methotrexate when the response to other disease-modifying antirheumatic drugs is inadequate and in severe, active and progressive *rheumatoid arthritis* in patients not previously treated with methotrexate (see also NICE guidance October 2007, below and August 2010, p. 649). It is also licensed for the treatment of active *polyarticular juvenile idiopathic arthritis* in children who have not responded adequately to or are intolerant of methotrexate (see also NICE guidance, p. 649), active and progressive *psoriatic arthritis* inadequately responsive to other disease-modifying antirheumatic drugs (see also NICE guidance, p. 649), and for severe *ankylosing spondylitis* inadequately responsive to conventional therapy (see also NICE guidance, p. 649). For the role of etanercept in plaque psoriasis, see section 13.5.3.

**Golimumab** is licensed in combination with methotrexate for the treatment of moderate to severe active *rheumatoid arthritis* when response to disease-modify-

ing antirheumatic drug (DMARD) therapy (including methotrexate) has been inadequate. Golimumab is also licensed for the treatment of active and progressive *psoriatic arthritis*, as monotherapy or in combination with methotrexate, when response to DMARD therapy has been inadequate; it is also licensed for the treatment of severe active *ankylosing spondylitis* when there is an inadequate response to conventional treatment.

**Infliximab** is licensed for the treatment of active *rheumatoid arthritis* in combination with methotrexate when the response to other disease-modifying antirheumatic drugs, including methotrexate, is inadequate (see also NICE guidance October 2007, below and August 2010, p. 649); it is also licensed in combination with methotrexate for patients not previously treated with methotrexate or other DMARDs who have severe, active, and progressive rheumatoid arthritis. Infliximab is also licensed for the treatment of *ankylosing spondylitis*, in patients with severe axial symptoms who have not responded adequately to conventional therapy (but see also NICE guidance, p. 649) and in combination with methotrexate (or alone if methotrexate is not tolerated or is contra-indicated) for the treatment of active and progressive *psoriatic arthritis* which has not responded adequately to disease-modifying antirheumatic drugs (see also NICE guidance, p. 649).

**Rituximab** is licensed in combination with methotrexate for the treatment of severe active *rheumatoid arthritis* in patients whose condition has not responded adequately to other disease-modifying antirheumatic drugs (including one or more tumour necrosis factor inhibitors) or who are intolerant of them (see also NICE guidance, p. 649). For the role of rituximab in malignant disease, see section 8.2.3.

#### NICE guidance

##### Adalimumab, etanercept, and infliximab for the treatment of rheumatoid arthritis (October 2007)

The tumour necrosis factor alpha (TNF- $\alpha$ ) inhibitors adalimumab, etanercept, and infliximab are options for the treatment of adults with active rheumatoid arthritis who have failed to respond to at least 2 disease-modifying antirheumatic drugs (DMARDs), including methotrexate (unless contra-indicated). TNF- $\alpha$  inhibitors should be given in combination with methotrexate; however, when methotrexate cannot be used because of intolerance or contra-indications, adalimumab or etanercept can be given as monotherapy.

Adalimumab, etanercept, and infliximab should be withdrawn if response is not adequate within 6 months. Response to treatment should be monitored at least every 6 months in patients who respond initially; treatment should be withdrawn if response is not maintained. An alternative TNF- $\alpha$  inhibitor may be considered for patients in whom treatment is withdrawn because of intolerance before the initial 6-month assessment of efficacy.

Use of TNF- $\alpha$  inhibitors for the treatment of severe, active, and progressive rheumatoid arthritis in adults not previously treated with methotrexate or other DMARDs is not recommended.

**NICE guidance****Adalimumab, etanercept, infliximab, rituximab, and abatacept for the treatment of rheumatoid arthritis after the failure of a TNF inhibitor (August 2010)**

Rituximab, in combination with methotrexate, is an option for the treatment of severe active rheumatoid arthritis in adults who have had an inadequate response to, or are intolerant of, other disease-modifying antirheumatic drugs (DMARDs), including at least 1 tumour necrosis factor (TNF) inhibitor. Repeat courses of rituximab should be given no more frequently than every 6 months, and should only be continued if an adequate response is achieved and maintained.

Adalimumab, etanercept, infliximab, or abatacept, in combination with methotrexate, are options for the treatment of severe active rheumatoid arthritis in adults who have had an inadequate response to, or have an intolerance of, other DMARDs including at least 1 TNF inhibitor, and who cannot use rituximab because of contra-indications or intolerance. In patients who cannot use methotrexate because of intolerance or contra-indications, adalimumab or etanercept can be given as monotherapy. Treatment should be continued only if there is adequate response. Patients should be monitored at least every 6 months.

**NICE guidance****Adalimumab, etanercept, and infliximab for the treatment of ankylosing spondylitis (May 2008)**

Adalimumab or etanercept are recommended as treatment options for adults with severe active ankylosing spondylitis whose disease satisfies specific criteria for diagnosis where there is confirmation of sustained active spinal disease, and where treatment with two or more NSAIDs taken sequentially at maximum tolerated or recommended doses for 4 weeks has failed to control symptoms.

Response to adalimumab or etanercept treatment should be assessed at 12-week intervals and continued only if response is adequate. If response to treatment is not maintained, a repeat assessment should be made after a further 6 weeks and treatment discontinued if there is an inadequate response. Patients who are intolerant of adalimumab or etanercept during the initial 12 weeks may receive the alternative TNF- $\alpha$  inhibitor (adalimumab or etanercept). However an alternative TNF- $\alpha$  inhibitor is not recommended in patients who fail to respond initially or fail to maintain an adequate response. Infliximab is not recommended for the treatment of ankylosing spondylitis. Patients who are already receiving infliximab for the treatment of ankylosing spondylitis can continue treatment until they and their specialist consider it appropriate to stop.

See full NICE guidance for specific criteria to diagnose severe active ankylosing spondylitis, confirm sustained active spinal disease, and assess response to treatment.

**NICE guidance****Etanercept for the treatment of juvenile idiopathic arthritis (March 2002)**

Etanercept is recommended in children aged 4–17 years with active polyarticular-course juvenile idiopathic arthritis who have not responded adequately to methotrexate or who are intolerant of it. Etanercept should be used under specialist supervision according to the guidelines of the British Society for Paediatric and Adolescent Rheumatology [previously the British Paediatric Rheumatology Group].

Etanercept should be withdrawn if severe side-effects develop or if there is no response after 6 months or if the initial response is not maintained. There is no evidence to support treatment for longer than 2 years; a decision to continue therapy should be based on disease activity and clinical effectiveness in individual cases.

Prescribers of etanercept should register consenting patients with the Biologics Registry of the British Society for Paediatric and Adolescent Rheumatology.

**NICE guidance****Etanercept, infliximab, and adalimumab for the treatment of psoriatic arthritis (August 2010)**

Etanercept, infliximab, or adalimumab are recommended for the treatment of active and progressive psoriatic arthritis in adults who have peripheral arthritis with at least 3 tender joints and at least 3 swollen joints, and who have not responded adequately to at least 2 standard disease-modifying antirheumatic drugs (used alone or in combination).

Etanercept, infliximab, and adalimumab should be discontinued if there is an inadequate response at 12 weeks.

**Side-effects** Adalimumab, certolizumab pegol, etanercept, golimumab, infliximab, and rituximab have been associated with infections, sometimes severe, including tuberculosis, septicæmia, and hepatitis B reactivation. Other side-effects include nausea, abdominal pain, worsening heart failure, hypersensitivity reactions, fever, headache, depression, antibody formation (including lupus erythematosus-like syndrome), pruritus, injection-site reactions, and blood disorders (including anaemia, leucopenia, thrombocytopenia, pancytopenia, and aplastic anaemia).

**Abatacept** prevents the full activation of T-lymphocytes. It is licensed for moderate to severe active *rheumatoid arthritis* in combination with methotrexate, in patients unresponsive to other disease-modifying antirheumatic drugs (including methotrexate or a tumour necrosis factor (TNF) inhibitor); see also NICE guidance, above. It is also licensed for the treatment of moderate to severe active *polyarticular juvenile idiopathic arthritis* (in combination with methotrexate) in children who have not responded adequately to other disease-modifying antirheumatic drugs (including at least one tumour necrosis factor (TNF) inhibitor). Abatacept is not recommended for use in combination with TNF inhibitors.

The *Scottish Medicines Consortium* (p. 4) has advised (August 2007) that abatacept is **not** recommended for the treatment of moderate to severe active rheumatoid arthritis within NHS Scotland.

**Anakinra** inhibits the activity of interleukin-1. Anakinra (in combination with methotrexate) is licensed for the treatment of *rheumatoid arthritis* which has not responded to methotrexate alone; it is not, however, recommended for routine management of *rheumatoid arthritis*, see NICE guidance below.

The *Scottish Medicines Consortium* (p. 4) has advised (July 2002) that anakinra is **not** recommended for the treatment of rheumatoid arthritis within NHS Scotland.

#### NICE guidance

##### Anakinra for the treatment of rheumatoid arthritis (February 2009)

Anakinra is **not** recommended for the treatment of rheumatoid arthritis except when used in a controlled long-term clinical study. Patients who are already receiving anakinra for rheumatoid arthritis should continue treatment until they and their specialist consider it appropriate to stop.

**Tocilizumab** antagonises the actions of interleukin-6. Tocilizumab is licensed for use in patients with moderate to severe active *rheumatoid arthritis* when response to at least one disease-modifying antirheumatic drug or tumour necrosis factor inhibitor has been inadequate, or in those who are intolerant of these drugs. Tocilizumab can be used in combination with methotrexate, or as monotherapy if methotrexate is not tolerated or is contra-indicated (see also NICE guidance below).

#### NICE guidance

##### Tocilizumab for the treatment of rheumatoid arthritis (August 2010)

Tocilizumab, in combination with methotrexate, is recommended for the treatment of moderate to severe active rheumatoid arthritis in patients who have had an inadequate response to 1 or more tumour necrosis factor alpha inhibitors **and**:

- whose rheumatoid arthritis has responded inadequately to rituximab *or*
- in whom rituximab is contra-indicated or not tolerated.

## ABATACEPT

**Indications** see under Cytokine Modulators, above

**Cautions** predisposition to infection (screen for latent tuberculosis and viral hepatitis); do not initiate until active infections are controlled; children should be brought up to date with current immunisation schedule (section 14.1) before initiating therapy; progressive multifocal leucoencephalopathy—discontinue treatment if neurological symptoms present; elderly (increased risk of side-effects); **interactions:** Appendix 1 (abatacept)

**Contra-indications** severe infection (see also Cautions)

**Pregnancy** manufacturer advises avoid unless essential—effective contraception required during treatment and for 14 weeks after last dose

**Breast-feeding** present in milk in *animal* studies—manufacturer advises avoid breast-feeding during treatment and for 14 weeks after last dose

**Side-effects** abdominal pain, diarrhoea, dyspepsia, nausea; flushing, hypertension; cough; dizziness, fatigue, headache; infection, rhinitis; rash; *less commonly* gastritis, stomatitis, tachycardia, bradycardia, palpitation, hypotension, dyspnoea, paraesthesia, weight gain, depression, anxiety, amenorrhoea, basal cell carcinoma, thrombocytopenia, leucopenia, arthralgia, pain in extremities, conjunctivitis, visual disturbance, vertigo, bruising, alopecia, and dry skin

#### Dose

- **By intravenous infusion**, rheumatoid arthritis (see notes above). **ADULT** over 18 years, body-weight less than 60 kg, 500 mg, repeated 2 weeks and 4 weeks after initial infusion, then every 4 weeks; body-weight 60–100 kg, 750 mg repeated 2 weeks and 4 weeks after initial infusion, then every 4 weeks; body-weight over 100 kg, 1 g repeated 2 weeks and 4 weeks after initial infusion, then every 4 weeks

Polyarticular juvenile idiopathic arthritis (see notes above). **CHILD** 6–17 years, body-weight less than 75 kg, 10 mg/kg, repeated 2 weeks and 4 weeks after initial infusion, then every 4 weeks; body-weight 75–100 kg, 750 mg, repeated 2 weeks and 4 weeks after initial infusion, then every 4 weeks; body-weight over 100 kg, 1 g, repeated 2 weeks and 4 weeks after initial infusion, then every 4 weeks

**Note** Review treatment if no response within 6 months

**Orencia**® (Bristol-Myers Squibb) ▼ (POM)

**Intravenous infusion**, powder for reconstitution, abatacept, net price 250-mg vial = £242.17  
Electrolytes Na<sup>+</sup> <0.5 mmol/vial

## ADALIMUMAB

**Indications** see under Cytokine Modulators above; Crohn's disease (section 1.5.3); psoriasis (section 13.5.3)

**Cautions** predisposition to infection; monitor for infections before, during, and for 5 months after treatment (see also Tuberculosis below); do not initiate until active infections are controlled; discontinue if new serious infection develops; hepatitis B virus—monitor for active infection; children should be brought up to date with current immunisation schedule (section 14.1) before initiating therapy; mild heart failure (discontinue if symptoms develop or worsen—avoid in moderate or severe heart failure); demyelinating CNS disorders (risk of exacerbation); history of malignancy; monitor for non-melanoma skin cancer before and during treatment, especially in patients with a history of PUVA treatment for psoriasis or extensive immunosuppressant therapy; **interactions:** Appendix 1 (adalimumab)

**Tuberculosis** Patients should be evaluated for tuberculosis before treatment. Active tuberculosis should be treated with standard treatment (section 5.1.9) for at least 2 months before starting adalimumab. Patients who have previously received adequate treatment for tuberculosis can start adalimumab but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting adalimumab. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with adalimumab. Patients should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop

**Contra-indications** severe infection (see also Cautions)

**Pregnancy** avoid; manufacturer advises effective contraception required during treatment and for at least 5 months after last dose

**Breast-feeding** avoid; manufacturer advises avoid for at least 5 months after last dose

**Side-effects** see under Cytokine Modulators (p. 649) and Cautions above; also vomiting, dyspepsia, gastro-intestinal haemorrhage; dizziness, hyperlipidaemia, hypertension, oedema, flushing, chest pain, tachycardia; cough, dyspnoea; mood changes, sleep disturbances, anxiety, paraesthesia; haematuria, renal impairment; benign tumours, non-melanoma skin cancers; electrolyte disturbances, hyperuricaemia; musculoskeletal pain; eye disorders; rash, dermatitis, onycholysis, impaired healing; *less commonly* dysphagia, pancreatitis, cholelithiasis, hepatic steatosis, cholecystitis, arrhythmias, interstitial lung disease, pneumonitis, tremor, erectile dysfunction, nocturia, malignancy, rhabdomyolysis, hearing loss, tinnitus; *rarely* vascular occlusion, myocardial infarction, demyelinating disorders, pulmonary embolism, pleural effusion, Stevens-Johnson syndrome, cutaneous vasculitis, new onset or worsening psoriasis, and hepatosplenic T-cell lymphoma also reported

#### Dose

- **By subcutaneous injection**, rheumatoid arthritis, **ADULT** over 18 years, 40 mg on alternate weeks; if necessary increased to 40 mg weekly in patients receiving adalimumab alone; review treatment if no response within 12 weeks

Polyarticular juvenile idiopathic arthritis, **CHILD** 13–17 years, 40 mg on alternate weeks; review treatment if no response within 12 weeks

Psoriatic arthritis, ankylosing spondylitis, **ADULT** over 18 years, 40 mg on alternate weeks; discontinue treatment if no response within 12 weeks

**Humira®** (Abbott) ▼ (PoM)

**Injection**, adalimumab, net price 40-mg prefilled pen or prefilled syringe = £357.50. Counselling, tuberculosis

## ANAKINRA

**Indications** see under Cytokine Modulators above

**Cautions** predisposition to infections; history of asthma (risk of serious infection); **interactions:** Appendix 1 (anakinra)

**Blood disorders** Neutropenia reported commonly. Monitor neutrophil count before treatment, then every month for 6 months, then every 3 months—discontinue if neutropenia develops. Patients should be instructed to seek medical advice if symptoms suggestive of neutropenia (such as fever, sore throat, infection) develop

**Contra-indications** neutropenia

**Renal impairment** caution if eGFR 30–50 mL/minute/1.73 m<sup>2</sup>; avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** manufacturer advises avoid; effective contraception must be used during treatment

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** injection-site reactions; headache; infections, neutropenia (see also Cautions), and antibody formation; *also reported* malignancy

#### Dose

- **By subcutaneous injection**, **ADULT** over 18 years, 100 mg once daily

**Kineret®** (Swedish Orphan) (PoM)

**Injection**, anakinra, net price 100-mg prefilled syringe = £26.23. Counselling, blood disorder symptoms

## CERTOLIZUMAB PEGOL

**Indications** see under Cytokine Modulators above

**Cautions** predisposition to infection; monitor for infections before, during, and for 5 months after treatment (see also Tuberculosis below); do not initiate until active infections are controlled; discontinue if new serious infection develops until infection controlled; hepatitis B virus—monitor for active infection; mild heart failure (discontinue if symptoms develop or worsen—avoid in moderate to severe heart failure); demyelinating CNS disorders (risk of exacerbation); history or development of malignancy; **interactions:** Appendix 1 (certolizumab pegol)

**Tuberculosis** Patients should be evaluated for tuberculosis before treatment. Active tuberculosis should be treated with standard treatment (section 5.1.9) for at least 2 months before starting certolizumab pegol. Patients who have previously received adequate treatment for tuberculosis can start certolizumab pegol but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting certolizumab pegol. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with certolizumab pegol. Patients should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop

**Blood disorders** Patients should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop

**Contra-indications** severe active infection (see also Cautions)

**Pregnancy** avoid; manufacturer advises adequate contraception during treatment and for at least 5 months after last dose

**Breast-feeding** manufacturer advises use only if potential benefit outweighs risk—no information available

**Side-effects** see under Cytokine Modulators (p. 649) and Cautions above; hypertension; sensory abnormalities; rash; *less commonly* ascites, cholestasis, gastro-intestinal disorders (including perforation and ulcer), hepatic disorders, appetite disorders; cardiomyopathies (including heart failure), dyslipidaemia, syncope, oedema, dizziness, ischaemic coronary artery disorders, arrhythmias; asthma, pleural effusion, cough; peripheral neuropathy, tremor, anxiety, mood disorders; influenza-like illness; menstrual disorders, renal impairment, haematuria; malignancy, non-melanoma skin cancer, benign tumours; haemorrhage, electrolyte disorders; muscle disorders; visual disturbance, ocular inflammation; ecchymosis, impaired healing, alopecia, photosensitivity, acne, skin discoloration, nail disorders, psoriasis, dermatitis; *rarely* cholelithiasis, splenomegaly, atrioventricular block, cerebrovascular accident, Raynaud's phenomenon, interstitial lung disease, impaired coordination, trigeminal neuralgia, thyroid disorders, sexual dysfunction, nephropathy, tinnitus; multiple sclerosis also reported

#### Dose

- **By subcutaneous injection**, **ADULT** over 18 years, 400 mg, repeated 2 weeks and 4 weeks after initial injection, then 200 mg every 2 weeks; review treatment if no response within 12 weeks

**Cimzia®** (UCB Pharma) ▼ (POM)

**Injection**, certolizumab pegol, net price 200-mg pre-filled syringe = £357.50. Label: 10, alert card, counselling, tuberculosis and blood disorders

**ETANERCEPT**

**Indications** see under Cytokine Modulators above

**Cautions** predisposition to infection (avoid if predisposition to septicaemia); significant exposure to herpes zoster virus—interrupt treatment and consider varicella-zoster immunoglobulin; hepatitis B virus—monitor for active infection; monitor for worsening hepatitis C infection; children should be brought up to date with current immunisation schedule (section 14.1) before initiating therapy; heart failure (risk of exacerbation); demyelinating CNS disorders (risk of exacerbation); history of malignancy; monitor for non-melanoma skin cancer before and during treatment in those at risk, including patients with psoriasis or a history of PUVA treatment; history of blood disorders; diabetes mellitus; **interactions:** Appendix 1 (etanercept)

**Tuberculosis** Patients should be evaluated for tuberculosis before treatment. Active tuberculosis should be treated with standard treatment (section 5.1.9) for at least 2 months before starting etanercept. Patients who have previously received adequate treatment for tuberculosis can start etanercept but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting etanercept. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with etanercept. Patients should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop

**Blood disorders** Patients should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop

**Contra-indications** active infection; avoid injections containing benzyl alcohol in neonates (see preparations below)

**Hepatic impairment** use with caution in moderate to severe alcoholic hepatitis

**Pregnancy** manufacturer advises avoid—no information available

**Breast-feeding** manufacturer advises avoid—present in milk in *animal* studies

**Side-effects** see under Cytokine Modulators (p. 649); also *less commonly* interstitial lung disease, non-melanoma skin cancer, rash, psoriasis (including new onset); *rarely* demyelinating disorders, seizures, Stevens-Johnson syndrome, and cutaneous vasculitis; *very rarely* toxic epidermal necrolysis; *also reported* appendicitis, cholecystitis, gastritis, gastro-intestinal haemorrhage, intestinal obstruction, liver damage, oesophagitis, pancreatitis, ulcerative colitis, vomiting, cerebral ischaemia, hypertension, hypotension, myocardial infarction, thrombophlebitis, thromboembolism, asthma, dyspnoea, aseptic meningitis, confusion, paresis, paraesthesia, vertigo, lymphadenopathy, diabetes mellitus, haematuria, malignancy, renal calculi, renal impairment, bone fracture, bursitis, polymyositis, scleritis, and cutaneous ulcer

**Dose**

• By **subcutaneous injection**, rheumatoid arthritis, psoriatic arthritis, ankylosing spondylitis, **ADULT** over 18 years, 25 mg twice weekly or 50 mg once weekly

Active polyarticular juvenile idiopathic arthritis, **CHILD** 4–17 years, 400 micrograms/kg (max. 25 mg) twice weekly, with an interval of 3–4 days between doses

**Enbrel®** (Wyeth) ▼ (POM)

**Injection**, powder for reconstitution, etanercept, net price 25-mg vial (with solvent) = £89.38. Label: 10, alert card, counselling, tuberculosis and blood disorders

**Paediatric injection**, powder for reconstitution, etanercept, net price 25-mg vial (with solvent) = £89.38. Label: 10, alert card, counselling, tuberculosis and blood disorders

**Excipients** include benzyl alcohol (avoid in neonates, see Excipients, p. 2)

**Injection**, etanercept, net price 25-mg pre-filled syringe = £89.38; 50-mg pre-filled pen or pre-filled syringe = £178.75. Label: 10, alert card, counselling, tuberculosis and blood disorders

**GOLIMUMAB**

**Indications** see under Cytokine Modulators above

**Cautions** predisposition to infection; monitor for infections before, during, and for 5 months after treatment (see also Tuberculosis below); do not initiate until active infections are controlled; discontinue if new serious infection develops until infection controlled; hepatitis B virus—monitor for active infection; mild heart failure (discontinue if symptoms develop or worsen); demyelinating CNS disorders (risk of exacerbation); history or development of malignancy; **interactions:** Appendix 1 (golimumab)

**Tuberculosis** Patients should be evaluated for tuberculosis before treatment. Active tuberculosis should be treated with standard treatment (section 5.1.9) for at least 2 months before starting golimumab. Patients who have previously received adequate treatment for tuberculosis can start golimumab but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting golimumab. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with golimumab. Patients should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop

**Blood disorders** Patients should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop

**Contra-indications** severe active infection (see also Cautions); moderate or severe heart failure

**Hepatic impairment** manufacturer advises caution—no information available

**Pregnancy** use only if essential; manufacturer advises adequate contraception during treatment and for at least 6 months after last dose

**Breast-feeding** manufacturer advises avoid during and for at least 6 months after treatment—present in milk in *animal* studies

**Side-effects** see under Cytokine Modulators (p. 649) and under Cautions above; also constipation, dyspepsia, hypertension, insomnia, dizziness, paraesthesia, asthenia, alopecia, dermatitis; *less commonly* taste disturbance, gastritis, colitis, stomatitis, gastro-oesophageal reflux disease, cholelithiasis, hepatic disorders, hyperlipidaemia, arrhythmia, ischaemic coronary artery disorders, Raynaud's syndrome, heart failure, thrombosis, flushing, bronchospasm, demyelinating disorders, hyperglycaemia, thyroid disorders, menstrual disorders, malignancy, bone fractures,

visual disturbance, eye irritation, new onset or worsening psoriasis; *rarely* interstitial lung disease, renal impairment

### Dose

- By **subcutaneous injection**, **ADULT** over 18 years, 50 mg once a month on the same date each month, review treatment if no response after 3–4 doses; body-weight over 100 kg, if inadequate response to 3–4 doses of 50 mg once a month, dose can be increased to 100 mg once a month, review treatment if inadequate response to this higher dose after 3–4 doses
- Note** If dose administered more than 2 weeks late, subsequent doses should be administered on the new monthly due date

### Simponi® (MSD) ▼ (Pom)

**Injection**, golimumab, net price 50-mg prefilled pen or prefilled syringe = £774.58. Label: 10, alert card, counselling, tuberculosis and blood disorders

## INFLIXIMAB

**Indications** see under Cytokine Modulators above; inflammatory bowel disease (section 1.5.3); psoriasis (section 13.5.3)

**Cautions** predisposition to infection; monitor for infections before, during, and for 6 months after treatment (see also Tuberculosis below); discontinue if new serious infection develops; hepatitis B virus—monitor for active infection; heart failure (discontinue if symptoms develop or worsen; avoid in moderate or severe heart failure); demyelinating CNS disorders (risk of exacerbation); history of malignancy (consider discontinuing treatment if malignancy develops); history of prolonged immunosuppressant or PUVA treatment in patients with psoriasis; **interactions:** Appendix 1 (infliximab)

**Tuberculosis** Patients should be evaluated for tuberculosis before treatment. Active tuberculosis should be treated with standard treatment (section 5.1.9) for at least 2 months before starting infliximab. Patients who have previously received adequate treatment for tuberculosis can start infliximab but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting infliximab. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with infliximab. Patients should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop

**Hypersensitivity reactions** Hypersensitivity reactions (including fever, chest pain, hypotension, hypertension, dyspnoea, pruritus, urticaria, serum sickness-like reactions, angioedema, anaphylaxis) reported during or within 1–2 hours after infusion (risk greatest during first or second infusion or in patients who discontinue other immunosuppressants). All patients should be observed carefully for 1–2 hours after infusion and resuscitation equipment should be available for immediate use. Prophylactic antipyretics, antihistamines, or hydrocortisone may be administered. Monitor for symptoms of delayed hypersensitivity if readministered after a prolonged period. Patients should be advised to keep Alert card with them at all times and seek medical advice if symptoms of delayed hypersensitivity develop

**Contra-indications** severe infections (see also under Cautions)

**Pregnancy** use only if essential; manufacturer advises adequate contraception during and for at least 6 months after last dose

**Breast-feeding** amount probably too small to be harmful

**Side-effects** see under Cytokine Modulators (p. 649) and under Cautions above; also diarrhoea, dyspepsia, hepatic impairment; flushing, chest pain; dyspnoea; dizziness, fatigue; sinusitis; rash, sweating, dry skin; *less commonly* constipation, gastro-oesophageal reflux, diverticulitis, cholecystitis, palpitation, arrhythmia, hypertension, hypotension, vasospasm, cyanosis, bradycardia, syncope, oedema, thrombophlebitis, epistaxis, bronchospasm, pleurisy, confusion, agitation, nervousness, amnesia, sleep disturbances, vaginitis, demyelinating disorders, antibody formation, pyelonephritis, myalgia, arthralgia, eye disorders, abnormal skin pigmentation, ecchymosis, cheilitis, and alopecia; *rarely* hepatitis, intestinal stenosis, intestinal perforation, gastro-intestinal haemorrhage, and circulatory failure, meningitis, seizure, pancreatitis, lymphoma; *very rarely* pericardial and pleural effusion, and skin reactions (including Stevens-Johnson syndrome, toxic epidermal necrolysis); neuropathy, paraesthesia, and transverse myelitis; interstitial lung disease, new onset or worsening psoriasis also reported

### Dose

- By **intravenous infusion**, rheumatoid arthritis (in combination with methotrexate), **ADULT** over 18 years, 3 mg/kg, repeated 2 weeks and 6 weeks after initial infusion, then every 8 weeks; if response inadequate after 12 weeks, dose may be increased in steps of 1.5 mg/kg every 8 weeks, up to max. 7.5 mg/kg every 8 weeks; alternatively, 3 mg/kg may be given every 4 weeks; discontinue if no response by 12 weeks of initial infusion or after dose adjustment
- Ankylosing spondylitis, **ADULT** over 18 years, 5 mg/kg, repeated 2 weeks and 6 weeks after initial infusion, then every 6–8 weeks; discontinue if no response by 6 weeks of initial infusion
- Psoriatic arthritis (in combination with methotrexate), **ADULT** over 18 years, 5 mg/kg, repeated 2 weeks and 6 weeks after initial infusion, then every 8 weeks

### Remicade® (Schering-Plough) (Pom)

**Intravenous infusion**, powder for reconstitution, infliximab, net price 100-mg vial = £419.62. Label: 10, alert card, counselling, tuberculosis and hypersensitivity reactions

## RITUXIMAB

**Indications** see under Cytokine Modulators above; malignant disease (section 8.2.3)

**Cautions** section 8.2.3; predisposition to infection; hepatitis B virus—monitor for active infection

**Alert card** Patients with rheumatoid arthritis should be provided with the patient alert card before administration

**Contra-indications** section 8.2.3; severe infection

**Pregnancy** section 8.2.3

**Breast-feeding** section 8.2.3

**Side-effects** section 8.2.3 and under Cytokine Modulators (p. 649); *also* dyspepsia; hypertension, hypotension; rhinitis, sore throat; asthenia, paraesthesia, migraine; arthralgia, muscle spasm; urticaria

### Dose

- By **intravenous infusion**, rheumatoid arthritis (in combination with methotrexate), 1 g, repeated 2 weeks after initial infusion; **CHILD** not recommended

### Preparations

Section 8.2.3

## TOCILIZUMAB

**Indications** see under Cytokine Modulators above

**Cautions** predisposition to infection or history of recurrent or chronic infection; interrupt treatment if serious infection occurs; history of intestinal ulceration or diverticulitis; monitor hepatic transaminases every 4–8 weeks for first 6 months, then every 12 weeks; monitor neutrophil and platelet counts 4–8 weeks after starting treatment and then as indicated; low platelet or absolute neutrophil count (avoid if absolute neutrophil count less than  $0.5 \times 10^9$ /litre or platelet count less than  $50 \times 10^3$ /microlitre); monitor lipid profile 4–8 weeks after starting treatment and then as indicated; monitor for demyelinating disorders; **interactions:** Appendix 1 (tocilizumab)

**Tuberculosis** Patients should be evaluated for tuberculosis before treatment. Patients with latent tuberculosis should be treated with standard therapy (section 5.1.9) before starting tocilizumab

**Counselling** Patients should be advised to seek immediate medical attention if symptoms of infection occur, or if symptoms of diverticular perforation such as abdominal pain, haemorrhage, or fever accompanying change in bowel habits occur

**Contra-indications** severe active infection (see also Cautions)

**Hepatic impairment** manufacturer advises caution (see also Dose below)

**Renal impairment** manufacturer advises monitor renal function closely in moderate or severe impairment

**Pregnancy** manufacturer advises avoid unless essential (toxicity in *animal* studies); effective contraception required during and for 6 months after treatment

**Breast-feeding** manufacturer advises use only if potential benefit outweighs risk —no information available

**Side-effects** abdominal pain, mouth ulceration, gastritis, raised hepatic transaminases; dizziness, peripheral oedema, hypertension, hypercholesterolaemia; headache; infection (including upper respiratory-tract infection); antibody formation, hypersensitivity, leucopenia, neutropenia; rash, pruritus; *less commonly* gastric ulcer, gastro-intestinal perforation, hypertriglyceridaemia, hypothyroidism, nephrolithiasis, infusion related reactions, anaphylaxis, and thrombocytopenia also reported

### Dose

- **By intravenous infusion, ADULT** over 18 years, 8 mg/kg (max. 800 mg) once every 4 weeks; for details of dose adjustment in patients with liver enzyme abnormalities, or low absolute neutrophil or platelet count, consult product literature

**RoActemra®** (Roche) ▼ [POM]

**Concentrate for intravenous infusion**, tocilizumab 20 mg/mL, net price 4 mL (80-mg) vial = £102.40, 10 mL (200-mg) vial = £256.00, 20 mL (400-mg) vial = £512.00. Alert card, counselling, see above

## Sulfasalazine

**Sulfasalazine** has a beneficial effect in suppressing the inflammatory activity of rheumatoid arthritis. Side-effects include rashes, gastro-intestinal intolerance and, especially in patients with rheumatoid arthritis, occasional leucopenia, neutropenia, and thrombocytopenia. These haematological abnormalities occur usually in the first 3 to 6 months of treatment and are reversible on cessation of treatment. Close monitoring of full blood counts (including differential white cell count and platelet count) is necessary initially, and at monthly intervals during the first 3 months (liver function tests also being performed at monthly intervals for the first 3 months). Although the manufacturer recommends renal function tests, evidence of practical value is unsatisfactory.

**Indications** active rheumatoid arthritis; inflammatory bowel disease, see section 1.5.1 and notes above

**Cautions** see section 1.5.1 and notes above

**Blood disorders** Patients should be advised to report any unexplained bleeding, bruising, purpura, sore throat, fever or malaise. A blood count should be performed and the drug stopped immediately if there is suspicion of a blood dyscrasia.

**Contra-indications** see section 1.5.1 and notes above

**Hepatic impairment** section 1.5.1

**Renal impairment** section 1.5.1

**Pregnancy** section 1.5.1

**Breast-feeding** section 1.5.1

**Side-effects** see section 1.5.1 and notes above

### Dose

- **By mouth**, administered on expert advice, as enteric-coated tablets, initially 500 mg daily, increased by 500 mg at intervals of 1 week to a max. of 2–3 g daily in divided doses

**Sulfasalazine** (Non-proprietary) [POM]

**Tablets, e/c**, sulfasalazine 500 mg, net price 112-tab pack = £14.46 Label: 5, 14, 25, counselling, blood disorder symptoms (see recommendation above), contact lenses may be stained

Brands include *Sulazine EC®*

**Salazopyrin EN-Tabs®** (Pharmacia) [POM]

**Tablets, e/c**, yellow, f/c, sulfasalazine 500 mg, net price 112-tab pack = £8.43. Label: 5, 14, 25, counselling, blood disorder symptoms (see recommendation above), contact lenses may be stained

## 10.1.4 Gout and cytotoxic-induced hyperuricaemia

It is important to distinguish drugs used for the treatment of acute attacks of gout from those used in the long-term control of the disease. The latter exacerbate and prolong the acute manifestations if started during an attack.

### Acute attacks of gout

Acute attacks of gout are usually treated with high doses of NSAIDs such as diclofenac, etoricoxib, indometacin, ketoprofen, naproxen, or sulindac (section 10.1.1). **Colchicine** is an alternative in patients in whom NSAIDs are contra-indicated. Aspirin is *not* indicated in gout. Allopurinol, febuxostat, and uricosurics are not effective in treating an acute attack and may prolong it indefinitely if started during the acute episode.

The use of colchicine is limited by the development of toxicity at higher doses, but it is of value in patients with heart failure since, unlike NSAIDs, it does not induce fluid retention; moreover, it can be given to patients receiving anticoagulants.

Oral or parenteral **corticosteroids** are an effective alternative in those who cannot tolerate NSAIDs or who are resistant to other treatments. Intra-articular injection of a corticosteroid can be used in acute mono-articular gout [unlicensed indication]. A corticosteroid by intramuscular injection can be effective in podagra.

## COLCHICINE

**Indications** acute gout; short-term prophylaxis during initial therapy with allopurinol and uricosuric drugs; prophylaxis of familial Mediterranean fever (recurrent polyserositis)

**Cautions** see notes above; also elderly; gastro-intestinal disease; cardiac disease; **interactions:** Appendix 1 (colchicine)

**Contra-indications** blood disorders

**Hepatic impairment** use with caution

**Renal impairment** reduce dose or increase dosage interval if eGFR 10–50 mL/minute/1.73 m<sup>2</sup>; avoid if eGFR less than 10 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** avoid—teratogenicity in *animal* studies

**Breast-feeding** present in milk but no adverse effects reported; manufacturers advise caution

**Side-effects** nausea, vomiting, and abdominal pain; excessive doses may cause profuse diarrhoea, gastro-intestinal haemorrhage, rash, renal and hepatic damage; *rarely* peripheral neuritis, inhibition of spermatogenesis, myopathy, alopecia, and with prolonged treatment blood disorders

### Dose

- Acute gout, 500 micrograms 2–4 times daily until symptoms relieved, max. 6 mg per course; course not to be repeated within 3 days
- Prevention of gout attacks during initial treatment with allopurinol or uricosuric drugs, 500 micrograms twice daily
- Prophylaxis of familial Mediterranean fever [unlicensed], 0.5–2 mg once daily

**Note** BNF doses may differ from those in the product literature

**Colchicine** (Non-proprietary) (POM)

**Tablets**, colchicine 500 micrograms, net price 10 = £31.33

## Long-term control of gout

Frequent recurrence of acute attacks of gout, the presence of tophi, or signs of chronic gouty arthritis may call for the initiation of long-term ('interval') treatment. For long-term control of gout the formation of uric acid from purines may be reduced with the xanthine-oxidase inhibitors allopurinol or febuxostat; alternatively the uricosuric drug sulfinpyrazone may be used to increase the excretion of uric acid in the urine. Treatment should be continued indefinitely to prevent further attacks of gout by correcting the hyperuricaemia. These drugs should never be started during an acute attack; they are usually started 1–2 weeks after the attack has settled. The initiation of treatment may precipitate an acute attack, and therefore an anti-inflammatory analgesic or colchicine should be used as a prophylactic

and continued for at least one month after the hyperuricaemia has been corrected. However, if an acute attack develops during treatment, then the treatment should continue at the same dosage and the acute attack treated in its own right.

**Allopurinol** is widely used and is especially useful in patients with renal impairment or urate stones when uricosuric drugs cannot be used; it is *not* indicated for the treatment of asymptomatic hyperuricaemia. It can cause rashes.

**Febuxostat** is licensed for the treatment of chronic hyperuricaemia where urate deposition has already occurred; it is *not* indicated for patients in whom the rate of urate formation is greatly increased, such as in malignant disease or in Lesch-Nyhan syndrome.

### NICE guidance<sup>1</sup>

#### Febuxostat for the management of hyperuricaemia in patients with gout (December 2008)

Febuxostat is recommended as an option for the management of chronic hyperuricaemia in gout only for patients who are intolerant of allopurinol or for whom allopurinol is contra-indicated.

For the purposes of this guidance, intolerance of allopurinol is defined as adverse effects that are sufficiently severe to warrant discontinuation, or to prevent full dose escalation for optimal effectiveness.

**Sulfinpyrazone** can be used instead of allopurinol, or in conjunction with it in cases that are resistant to treatment.

**Probenecid** (available from 'special-order' manufacturers or specialist importing companies, see p. 988) is a uricosuric drug used to prevent nephrotoxicity associated with cidofovir (section 5.3.2.2).

**Benzbromarone** (available from 'special-order' manufacturers or specialist importing companies, see p. 988) is a uricosuric drug that can be used in patients with mild renal impairment.

Crystallisation of urate in the urine can occur with the uricosuric drugs and it is important to ensure an adequate urine output especially in the first few weeks of treatment. As an additional precaution the urine may be rendered alkaline.

Aspirin and other salicylates antagonise the uricosuric drugs; they do not antagonise allopurinol but are nevertheless *not* indicated in gout.

## ALLOPURINOL

**Indications** prophylaxis of gout and of uric acid and calcium oxalate renal stones; prophylaxis of hyperuricaemia associated with cancer chemotherapy

**Cautions** administer prophylactic NSAID (*not* aspirin or salicylates) or colchicine until at least 1 month after hyperuricaemia corrected (usually for first 3 months) to avoid precipitating an acute attack; ensure adequate fluid intake (2–3 litres/day); for hyperuricaemia associated with cancer therapy, allopurinol treatment should be started before cancer therapy; **interactions:** Appendix 1 (allopurinol)

1. The *Scottish Medicines Consortium* issued similar advice in August 2010

**Contra-indications** not a treatment for acute gout but continue if attack develops when already receiving allopurinol, and treat attack separately (see notes above)

**Hepatic impairment** reduce dose

**Renal impairment** max. 100 mg daily, increased only if response inadequate; in severe impairment, reduce daily dose below 100 mg, or increase dose interval; if facilities available, adjust dose to maintain plasma-oxipurinol concentration below 100 micromol/litre

**Pregnancy** toxicity not reported; manufacturer advises use only if no safer alternative and disease carries risk for mother or child

**Breast-feeding** present in milk—not known to be harmful

**Side-effects** rashes (withdraw therapy; if rash mild re-introduce cautiously but **discontinue** promptly if recurrence—hypersensitivity reactions occur rarely and include exfoliation, fever, lymphadenopathy, arthralgia, and eosinophilia resembling Stevens-Johnson syndrome or toxic epidermal necrolysis, vasculitis, hepatitis, renal impairment, and very rarely seizures); gastro-intestinal disorders; rarely malaise, headache, vertigo, drowsiness, visual and taste disturbances, hypertension, alopecia, hepatotoxicity, paraesthesia and neuropathy, gynaecomastia, blood disorders (including leucopenia, thrombocytopenia, haemolytic anaemia and aplastic anaemia)

#### Dose

- Initially 100 mg daily, preferably after food, then adjusted according to plasma or urinary uric acid concentration; usual maintenance dose in mild conditions 100–200 mg daily, in moderately severe conditions 300–600 mg daily, in severe conditions 700–900 mg daily; doses over 300 mg daily given in divided doses; **CHILD** under 15 years, (in neoplastic conditions, enzyme disorders) 10–20 mg/kg daily (max. 400 mg daily)

**Allopurinol** (Non-proprietary) (P<sub>MI</sub>)

Tablets, allopurinol 100 mg, net price 28-tab pack = £1.18; 300 mg, 28-tab pack = £1.32. Label: 8, 21, 27  
Brands include Caplena<sup>®</sup>, Cosuric<sup>®</sup>, Rimapurinol<sup>®</sup>

**Zyloric<sup>®</sup>** (GSK) (P<sub>MI</sub>)

Tablets, allopurinol 100 mg, net price 100-tab pack = £10.19; 300 mg, 28-tab pack = £7.31. Label: 8, 21, 27

## FEBUXOSTAT

**Indications** treatment of chronic hyperuricaemia in gout (but see also NICE guidance above)

**Cautions** administer prophylactic NSAID (not aspirin or salicylates) or colchicine for at least 6 months after starting febuxostat to avoid precipitating an acute attack; transplant recipients; monitor liver function tests before and periodically during treatment as indicated; thyroid disorders; **interactions:** Appendix 1 (febuxostat)

**Contra-indications** not a treatment for acute gout but continue if attack develops when already receiving febuxostat, and treat attack separately (see notes above); ischaemic heart disease; congestive heart failure

**Hepatic impairment** max. 80 mg daily in mild impairment; no dose information available in moderate or severe impairment

**Renal impairment** use with caution if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>—no information available

**Pregnancy** manufacturer advises avoid—limited information available

**Breast-feeding** manufacturer advises avoid—present in milk in animal studies

**Side-effects** gastro-intestinal disturbances, abnormal liver function tests; headache; rash; *less commonly* taste disturbances, increased appetite; hypertension, oedema, flushing; dizziness, paraesthesia, drowsiness; influenza-like symptoms; haematuria, nephrolithiasis, increased urinary frequency, decreased libido; myalgia; dermatitis, pruritus, urticaria; *rarely* thirst, palpitation, asthenia, nervousness, insomnia, and renal impairment

#### Dose

- ADULT** over 18 years, 80 mg once daily, if after 2–4 weeks serum uric acid greater than 6 mg/100 mL, increase to 120 mg once daily

**Adenuric<sup>®</sup>** (Menarini) (P<sub>MI</sub>)

Tablets, both yellow, f/c, febuxostat 80 mg, net price 28-tab pack = £24.36; 120 mg 28-tab pack = £24.36

## PROBENECID

**Indications** prevention of nephrotoxicity associated with cidofovir (section 5.3.2.2)

**Cautions** ensure adequate fluid intake (about 2–3 litres daily) and render urine alkaline if uric acid overload is high; peptic ulceration; transient false-positive Benedict's test; G6PD-deficiency (section 9.1.5); **interactions:** Appendix 1 (probenecid)

**Contra-indications** history of blood disorders, nephrolithiasis, acute porphyria (section 9.8.2), acute gout attack; avoid aspirin and salicylates

**Renal impairment** avoid if eGFR less than 30 mL/minute/1.73m<sup>2</sup>

**Breast-feeding** present in milk

**Side-effects** gastro-intestinal disturbances; *less commonly* sore gums, flushing, headache, dizziness, urinary frequency, anaemia, alopecia; hepatic necrosis, hypersensitivity reactions (including anaphylaxis, pruritus, urticaria, fever, and Stevens-Johnson syndrome), nephrotic syndrome, haemolytic anaemia, leucopenia, and aplastic anaemia also reported

#### Dose

- Used with cidofovir, see section 5.3.2.2

**Probenecid** (Non-proprietary) (P<sub>MI</sub>)

Tablets, probenecid 500 mg. Label: 12, 21, 27  
Available from 'special-order' manufacturers or specialist importing companies, see p. 988

## SULFINPYRAZONE

(Sulphinpyrazone)

**Indications** gout prophylaxis, hyperuricaemia

**Cautions** see under Probenecid; regular blood counts advisable; cardiac disease (may cause salt and water retention); **interactions:** Appendix 1 (sulfinpyrazone)

**Contra-indications** see under Probenecid; avoid in hypersensitivity to NSAIDs

**Hepatic impairment** avoid in severe impairment

**Renal impairment** reduce dose; avoid in severe impairment

**Pregnancy** manufacturer advises caution—no information available

**Breast-feeding** no information available

**Side-effects** gastro-intestinal disturbances, occasionally allergic skin reactions, salt and water retention; rarely blood disorders, gastro-intestinal ulceration and bleeding, acute renal failure, raised liver enzymes, jaundice and hepatitis

**Dose**

- Initially 100–200 mg daily with food (or milk) increasing over 2–3 weeks to 600 mg daily (rarely 800 mg daily), continued until serum uric acid concentration normal then reduced for maintenance (maintenance dose may be as low as 200 mg daily)

**Sulfinpyrazone** (Non-proprietary) 

Tablets, sulfinpyrazone 100 mg, net price 84-tab pack = £13.09; 200 mg, 84-tab pack = £25.07. Label: 12, 21

## Hyperuricaemia associated with cytotoxic drugs

**Allopurinol** is used to prevent hyperuricaemia associated with cytotoxic drugs—see section 8.1 (Hyperuricaemia) and Allopurinol above.

**Rasburicase** is licensed for the prophylaxis and treatment of acute hyperuricaemia, before and during initiation of chemotherapy, in patients with haematological malignancy and a high tumour burden at risk of rapid lysis.

## RASBURICASE

**Indications** prophylaxis and treatment of acute hyperuricaemia with initial chemotherapy for haematological malignancy

**Cautions** monitor closely for hypersensitivity; atopic allergies; may interfere with test for uric acid—consult product literature

**Contra-indications** G6PD deficiency (section 9.1.5)

**Pregnancy** manufacturer advises avoid—no information available

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** fever; *less commonly* nausea, vomiting, diarrhoea, headache, hypersensitivity reactions (including rash, bronchospasm and anaphylaxis); haemolytic anaemia, methaemoglobinemia

**Dose**

- By intravenous infusion, 200 micrograms/kg once daily for up to 7 days according to plasma-uric acid concentration

**Fasurtec®** (Sanofi-Aventis) 

Intravenous infusion, powder for reconstitution, rasburicase, net price 1.5-mg vial (with solvent) = £57.88; 7.5-mg vial (with solvent) = £241.20

## 10.1.5 Other drugs for rheumatic diseases

### Glucosamine

**Glucosamine** is a natural substance found in mucopolysaccharides, mucoproteins, and chitin. It is licensed for symptomatic relief of mild to moderate osteoarthritis of the knee, but is not recommended. The mechanism of

action is not understood and there is limited evidence to show it is effective.

The *Scottish Medicines Consortium* (p. 4) has advised (May 2008) that glucosamine (*Alateris®*) is not recommended for use within NHS Scotland for the symptomatic relief of mild to moderate osteoarthritis of the knee.

## GLUCOSAMINE

**Indications** symptomatic relief of mild to moderate osteoarthritis of the knee

**Cautions** impaired glucose tolerance (monitor blood-glucose concentration before treatment and periodically thereafter); predisposition to cardiovascular disease (monitor cholesterol); asthma; **interactions:** Appendix 1 (glucosamine)

**Contra-indications** shellfish allergy

**Pregnancy** manufacturer advises avoid—no information available

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** nausea, abdominal pain, dyspepsia, flatulence, diarrhoea, constipation, drowsiness, headache, fatigue; *less commonly* flushing, rash, pruritus; *also reported* hypercholesterolaemia, visual disturbances, hair loss

**Dose**

- See under preparations

**Alateris®** (Dee) 

Tablets, glucosamine (as hydrochloride) 625 mg, net price 60-tab pack = £18.40

**Dose** ADULT over 18 years, 1.25 g once daily; review treatment if no benefit after 2–3 months

**Glusartel®** (HFA Healthcare) 

Oral powder, sugar-free, glucosamine sulphate (as sodium chloride) 1.5 g/sachet, net price 30-sachet pack = £18.40. Label: 13

**Electrolytes Na<sup>+</sup>** 6.6 mmol/sachet

**Excipients** include aspartame (section 9.4.1)

**Dose** ADULT over 18 years, 1 sachet (dissolved in at least 250 mL of water) once daily; review treatment if no benefit after 2–3 months

## 10.2 Drugs used in neuromuscular disorders

### 10.2.1 Drugs that enhance neuromuscular transmission

#### 10.2.2 Skeletal muscle relaxants

### 10.2.1 Drugs that enhance neuromuscular transmission

Anticholinesterases are used as first-line treatment in *ocular myasthenia gravis* and as an adjunct to immunosuppressant therapy for *generalised myasthenia gravis*.

Corticosteroids are used when anticholinesterases do not control symptoms completely. A second-line immunosuppressant such as azathioprine is frequently used to reduce the dose of corticosteroid.

Plasmapheresis or infusion of intravenous immunoglobulin [unlicensed indication] may induce temporary remission in severe relapses, particularly where bulbar or respiratory function is compromised or before thymectomy.

## Anticholinesterases

Anticholinesterase drugs enhance neuromuscular transmission in voluntary and involuntary muscle in myasthenia gravis. They prolong the action of acetylcholine by inhibiting the action of the enzyme acetylcholinesterase. Excessive dosage of these drugs can impair neuromuscular transmission and precipitate cholinergic crises by causing a depolarising block. This may be difficult to distinguish from a worsening myasthenic state.

Muscarinic side-effects of anticholinesterases include increased sweating, increased salivary and gastric secretions, increased gastro-intestinal and uterine motility, and bradycardia. These parasympathomimetic effects are antagonised by atropine.

**Edrophonium** has a very brief action and it is therefore used mainly for the diagnosis of myasthenia gravis. However, such testing should be performed only by those experienced in its use; other means of establishing the diagnosis are available. A single test-dose usually causes substantial improvement in muscle power (lasting about 5 minutes) in patients with the disease (if respiration already impaired, *only* in conjunction with someone skilled at intubation).

Edrophonium can also be used to determine whether a patient with myasthenia is receiving inadequate or excessive treatment with cholinergic drugs. If treatment is excessive an injection of edrophonium will either have no effect or will intensify symptoms (if respiration already impaired, give *only* in conjunction with someone skilled at intubation). Conversely, transient improvement may be seen if the patient is being inadequately treated. The test is best performed just before the next dose of anticholinesterase.

**Neostigmine** produces a therapeutic effect for up to 4 hours. Its pronounced muscarinic action is a disadvantage, and simultaneous administration of an antimuscarinic drug such as atropine or propantheline may be required to prevent colic, excessive salivation, or diarrhoea. In severe disease neostigmine can be given every 2 hours. The maximum that most patients can tolerate is 180 mg daily.

**Pyridostigmine** is less powerful and slower in action than neostigmine but it has a longer duration of action. It is preferable to neostigmine because of its smoother action and the need for less frequent dosage. It is particularly preferred in patients whose muscles are weak on waking. It has a comparatively mild gastro-intestinal effect but an antimuscarinic drug may still be required. It is inadvisable to exceed a total daily dose of 450 mg in order to avoid acetylcholine receptor down-regulation; patients requiring doses exceeding 450 mg daily will usually require input from a specialised neuromuscular service. Immunosuppressant therapy is usually considered if the dose of pyridostigmine exceeds 360 mg daily.

**Distigmine** has the longest action but the danger of a cholinergic crisis caused by accumulation of the drug is

greater than with shorter-acting drugs; it is rarely used in the management of myasthenia gravis.

Neostigmine and edrophonium are also used to reverse the actions of the non-depolarising neuromuscular blocking drugs (see section 15.1.6).

## NEOSTIGMINE

**Indications** myasthenia gravis; other indications (section 15.1.6)

**Cautions** asthma (*extreme* caution), bradycardia, arrhythmias, recent myocardial infarction, epilepsy, hypotension, parkinsonism, vagotonia, peptic ulceration, hyperthyroidism; atropine or other antidote to muscarinic effects may be necessary (particularly when neostigmine is given by injection), but not given routinely because it may mask signs of overdosage; **interactions:** Appendix 1 (parasympathomimetics)

**Contra-indications** intestinal or urinary obstruction

**Renal impairment** may need dose reduction

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** amount probably too small to be harmful

**Side-effects** nausea, vomiting, increased salivation, diarrhoea, abdominal cramps (more marked with higher doses); signs of overdosage include bronchoconstriction, increased bronchial secretions, lacrimation, excessive sweating, involuntary defaecation and micturition, miosis, nystagmus, bradycardia, heart block, arrhythmias, hypotension, agitation, excessive dreaming, and weakness eventually leading to fasciculation and paralysis

### Dose

- **By mouth**, neostigmine bromide 15–30 mg at suitable intervals throughout day, total daily dose 75–300 mg (but see also notes above); **NEONATE** 1–5 mg every 4 hours, half an hour before feeds; **CHILD** up to 6 years initially 7.5 mg, 6–12 years initially 15 mg, usual total daily dose 15–90 mg
- **By subcutaneous or intramuscular injection**, **ADULT** and **CHILD** over 12 years, neostigmine metilsulfate 1–2.5 mg at suitable intervals throughout day (usual total daily dose 5–20 mg); **NEONATE** 150 micrograms/kg every 6–8 hours 30 minutes before feeds, increased to max. 300 micrograms/kg every 4 hours, if necessary [unlicensed]; **CHILD** 1 month–12 years 200–500 micrograms as required

**Neostigmine** (Non-proprietary) (PwM)

**Tablets**, scored, neostigmine bromide 15 mg, net price 140 = £56.10

### Injection

Section 15.1.6

## EDROPHONIUM CHLORIDE

**Indications** see under Dose and notes above; reversal of non-depolarising neuromuscular blockade and diagnosis of dual block (section 15.1.6)

**Cautions** see under Neostigmine; have resuscitation facilities; *extreme* caution in respiratory distress (see notes above) and in asthma

**Note** Severe cholinergic reactions can be counteracted by injection of atropine sulphate (which should always be available)

**Contra-indications** see under Neostigmine

**Pregnancy** see under Neostigmine

**Breast-feeding** see under Neostigmine

**Side-effects** see under Neostigmine

#### Dose

- Diagnosis of myasthenia gravis, by **intravenous injection**, 2 mg followed after 30 seconds (if no adverse reaction has occurred) by 8 mg; in adults without suitable veins, by **intramuscular injection**, 10 mg; **CHILD** under 12 years see *BNF for Children*
- Detection of overdosage or underdosage of cholinergic drugs, by **intravenous injection**, 2 mg (preferably just before next dose of anticholinesterase, see notes above); **CHILD** under 12 years see *BNF for Children*

**Edrophonium** (Non-proprietary) (POM)

**Injection**, edrophonium chloride 10 mg/mL, net price 1-mL amp = £19.50

## PYRIDOSTIGMINE BROMIDE

**Indications** myasthenia gravis

**Cautions** see under Neostigmine; weaker muscarinic action

**Contra-indications** see under Neostigmine

**Renal impairment** reduce dose; excreted by kidney

**Pregnancy** see under Neostigmine

**Breast-feeding** see under Neostigmine

**Side-effects** see under Neostigmine

#### Dose

- By **mouth**, 30–120 mg at suitable intervals throughout day, total daily dose 0.3–1.2 g (but see also notes above); **CHILD** under 18 years, see *BNF for Children*

**Mestinon**<sup>®</sup> (Meda) (POM)

**Tablets**, scored, pyridostigmine (as bromide) 60 mg, net price 200 = £45.33

## Immunosuppressant therapy

**Corticosteroids** (section 6.3) are established as treatment for myasthenia gravis; although they are commonly given on alternate days there is little evidence of benefit over daily administration. Corticosteroid treatment is usually initiated under in-patient supervision and all patients should receive osteoporosis prophylaxis (section 6.6).

In *generalised myasthenia gravis* small initial doses of prednisolone (10 mg on alternate days) are increased in steps of 10 mg on alternate days to 1–1.5 mg/kg (max. 100 mg) on alternate days. When given daily, prednisolone is started at 5 mg daily and then increased in steps of 5 mg daily to 60 mg daily or occasionally up to 80 mg daily (0.75–1 mg/kg daily). About 10% of patients experience a transient but very serious worsening of symptoms in the first 2–3 weeks, especially if the corticosteroid is started at a high dose. However, ventilated patients may be started on 1.5 mg/kg (max. 100 mg) on alternate days. Smaller doses of corticosteroid are usually required in *ocular myasthenia*. Once clinical remission has occurred (usually after 2–6 months), the dose of prednisolone should be reduced slowly to the minimum effective dose (usually 10–40 mg on alternate days).

In generalised myasthenia gravis **azathioprine** (section 8.2.1) is usually started at the same time as the corticosteroid and it allows a lower maintenance dose of the corticosteroid to be used; azathioprine is initiated at a

dose of 0.5–1 mg/kg daily, which is increased over 3–4 weeks to 2–2.5 mg/kg daily. **Ciclosporin** (section 8.2.2), **methotrexate** (section 8.1.3), or **mycophenolate mofetil** (section 8.2.1) can be used in patients unresponsive or intolerant to other treatments [unlicensed indications].

## Acetylcholine-release enhancers

**Amifampridine** is licensed for the symptomatic treatment of Lambert-Eaton myasthenic syndrome (LEMS), a rare disorder of neuromuscular transmission.

### AMIFAMPRIDINE

**Indications** (specialist use only) symptomatic treatment of Lambert-Eaton myasthenic syndrome

**Cautions** concomitant use of drugs that lower convulsive threshold; non-paraneoplastic form of Lambert-Eaton myasthenic syndrome; clinical and ECG monitoring required at treatment initiation and yearly thereafter

**Contra-indications** epilepsy; uncontrolled asthma; congenital QT syndromes; avoid concomitant use of drugs that prolong QT interval; avoid concomitant use of drugs with a narrow therapeutic index

**Hepatic impairment** use with caution; in mild impairment reduce initial dose to 10 mg daily in divided doses, increased in steps of 5 mg every 7 days; in moderate or severe impairment reduce initial dose to 5 mg daily in divided doses, increased in steps of 5 mg every 7 days

**Renal impairment** use with caution; in mild impairment reduce initial dose to 10 mg daily in divided doses, increased in steps of 5 mg every 7 days; in moderate or severe impairment reduce initial dose to 5 mg daily divided doses, increased in steps of 5 mg every 7 days

**Pregnancy** manufacturer advises avoid—ensure effective contraception during treatment in men and women

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** gastro-intestinal disorders; paraesthesia; palpitations, arrhythmias, Raynaud's syndrome, cough, bronchial hypersecretion, exacerbation or precipitation of asthma, sleep disturbances, convulsions, anxiety, drowsiness, dizziness, weakness, headache, chorea, myoclonia, and blurred vision also reported

#### Dose

- **ADULT** over 18 years, initially 15 mg daily in 3 divided doses, increased in steps of 5 mg every 4–5 days, to max. 60 mg daily in 3–4 divided doses; max. single dose 20 mg

**Firdapse**<sup>®</sup> (BioMarin) (POM)

**Tablets**, scored, amifampridine (as phosphate) 10 mg, net price 100-tab pack = £1815.00. Label: 3, 21

## 10.2.2 Skeletal muscle relaxants

The drugs described below are used for the relief of chronic muscle spasm or spasticity associated with multiple sclerosis or other neurological damage; they are not indicated for spasm associated with minor

injuries. Baclofen, diazepam, and tizanidine act principally on the central nervous system. Dantrolene, has a peripheral site of action; cannabis extract has both a central and a peripheral action. Skeletal muscle relaxants differ in action from the muscle relaxants used in anaesthesia (section 15.1.5), which block transmission at the neuromuscular junction.

The underlying cause of spasticity should be treated and any aggravating factors (e.g. pressure sores, infection) remedied. Skeletal muscle relaxants are effective in most forms of spasticity except the rare alpha variety. The major disadvantage of treatment with these drugs is that reduction in muscle tone can cause a loss of splinting action of the spastic leg and trunk muscles and sometimes lead to an increase in disability.

**Baclofen** inhibits transmission at spinal level and also depresses the central nervous system. The dose should be increased slowly to avoid the major side-effects of sedation and muscular hypotonia (other adverse events are uncommon).

A **cannabis extract** containing dronabinol (delta-9-tetrahydrocannabinol) and cannabidiol is licensed as an adjunct treatment for moderate to severe spasticity associated with multiple sclerosis in patients who have not responded adequately to other skeletal muscle relaxants. The dose should be titrated over 2 weeks; response to treatment should be reviewed after 4 weeks and treatment stopped if an adequate response is not achieved.

**Dantrolene** acts directly on skeletal muscle and produces fewer central adverse effects making it a drug of choice. The dose should be increased slowly.

**Diazepam** can also be used. Sedation and occasionally extensor hypotonus are disadvantages. Other benzodiazepines also have muscle-relaxant properties. Muscle-relaxant doses of benzodiazepines are similar to anxiolytic doses (section 4.1.2).

**Tizanidine** is an alpha<sub>2</sub>-adrenoceptor agonist indicated for spasticity associated with multiple sclerosis or spinal cord injury.

## BACLOFEN

**Indications** chronic severe spasticity resulting from disorders such as multiple sclerosis or traumatic partial section of spinal cord

**Cautions** psychiatric illness, Parkinson's disease, cerebrovascular disease, elderly, respiratory impairment; epilepsy; history of peptic ulcer (avoid oral route in active peptic ulceration); diabetes; hypertonic bladder sphincter; avoid abrupt withdrawal (risk of hyperactive state, may exacerbate spasticity, and precipitate autonomic dysfunction including hyperthermia, psychiatric reactions and convulsions, see also under Withdrawal below); **interactions:** Appendix 1 (muscle relaxants)

**Withdrawal** Serious side-effects can occur on abrupt withdrawal; to minimise risk, discontinue by gradual dose reduction over at least 1–2 weeks (longer if symptoms occur)

**Driving** Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

**Hepatic impairment** manufacturer advises use by mouth with caution

**Renal impairment** risk of toxicity—use smaller doses (e.g. 5 mg daily by mouth) and if necessary increase dosage interval; if eGFR less than 15 mL/minute/1.73m<sup>2</sup> manufacturer advises use by mouth only if potential benefit outweighs risk; excreted by kidney

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk (toxicity in *animal* studies)

**Breast-feeding** present in milk—amount probably too small to be harmful

**Side-effects** gastro-intestinal disturbances, dry mouth; hypotension, respiratory or cardiovascular depression; sedation, drowsiness, confusion, dizziness, ataxia, hallucinations, nightmares, headache, euphoria, insomnia, depression, anxiety, agitation, tremor; seizure; urinary disturbances; myalgia; visual disorders; rash, hyperhidrosis; *rarely* taste disturbances, abdominal pain, changes in hepatic function, paraesthesia, erectile dysfunction, dysarthria; *very rarely* hypothermia

### Dose

- **By mouth, ADULT** and **CHILD** over 10 years, initially 5 mg 3 times daily, gradually increased; usual maintenance dose up to 60 mg daily in divided doses (max. 100 mg daily); **CHILD** 1–2 years, initially 300 micrograms/kg daily in 4 divided doses, increased gradually to usual maintenance dose 0.75–2 mg/kg daily in divided doses (*or* 10–20 mg daily in divided doses); **CHILD** 2–6 years, initially 300 micrograms/kg daily in 4 divided doses, increased gradually to usual maintenance dose of 0.75–2 mg/kg daily in divided doses (*or* 20–30 mg daily in divided doses); **CHILD** 6–8 years, initially 300 micrograms/kg daily in 4 divided doses, increased gradually to usual maintenance dose of 0.75–2 mg/kg daily in divided doses (*or* 30–40 mg daily in divided doses); **CHILD** 8–10 years, initially 300 micrograms/kg daily in 4 divided doses, increased gradually to usual maintenance dose of 0.75–2 mg/kg daily in divided doses (*or* up to 60 mg daily in divided doses)

**Note** Review treatment if no benefit within 6 weeks

- **By intrathecal injection**, see preparation below

**Baclofen** (Non-proprietary) (P<sub>M</sub>)

**Tablets**, baclofen 10 mg, net price 84-tab pack = £1.58. Label: 2, 8, 21

**Oral solution**, baclofen 5 mg/5 mL, net price 300 mL = £9.26. Label: 2, 8, 21

**Brands include** *Lyfiflex*<sup>®</sup> (sugar-free)

**Lioresal**<sup>®</sup> (Novartis) (P<sub>M</sub>)

**Tablets**, scored, baclofen 10 mg, net price 84-tab pack = £8.67. Label: 2, 8, 21

**Excipients** include gluten

**Liquid**, sugar-free, raspberry-flavoured, baclofen 5 mg/5 mL, net price 300 mL = £7.16. Label: 2, 8, 21

### By intrathecal injection

**Lioresal**<sup>®</sup> (Novartis) (P<sub>M</sub>)

**Intrathecal injection**, baclofen, 50 micrograms/mL, net price 1-mL amp (for test dose) = £2.19; 500 micrograms/mL, 20-mL amp (for use with implantable pump) = £48.62; 2 mg/mL, 5-mL amp (for use with implantable pump) = £48.62

**Important** Consult product literature for details on test dose and titration—important to monitor patients closely in appropriately equipped and staffed environment during screening and immediately after pump implantation. Resuscitation equipment must be available for immediate use

**Dose** by intrathecal injection, specialist use only, severe chronic spasticity unresponsive to oral antispastic drugs (or where side-effects of oral therapy unacceptable) or as alternative to ablative neurosurgical procedures, initial *test dose* 25–50 micrograms over at least 1 minute via catheter or lumbar puncture, increased in 25-microgram steps (not more often than every 24 hours) to max. 100 micrograms to determine appropriate dose *then dose-titration phase*, most often using infusion pump (implanted into chest wall or abdominal wall tissues) to establish *maintenance dose* (ranging

from 12 micrograms to 2 mg daily for spasticity of spinal origin or 22 micrograms to 1.4 mg daily for spasticity of cerebral origin) retaining some spasticity to avoid sensation of paralysis; **CHILD** 4–18 years (spasticity of cerebral origin only), initial *test dose* 25 micrograms then titrated as for **ADULT** to *maintenance dose* (ranging from 24 micrograms to 1.2 mg daily in children under 12 years)

## CANNABIS EXTRACT

**Indications** adjunct in moderate to severe spasticity in multiple sclerosis (specialist use only)

**Cautions** significant cardiovascular disease; history of epilepsy; monitor oral mucosa—interrupt treatment if lesions or persistent soreness; **interactions:** Appendix 1 (cannabis extract)

**Driving** May affect performance of skilled tasks (e.g. driving); effects of alcohol may be enhanced

**Contra-indications** personal or family history of psychosis; history of other severe psychiatric disorder

**Hepatic impairment** manufacturer advises more frequent monitoring in significant impairment—possible risk of prolonged or enhanced effect

**Renal impairment** manufacturer advises more frequent monitoring in significant impairment—possible risk of prolonged or enhanced effect

**Pregnancy** manufacturer advises use only if potential benefit outweighs risks, and recommends effective contraception during and for 3 months after treatment in men and women

**Breast-feeding** avoid—present in milk

**Side-effects** increased or decreased appetite, taste disturbance, constipation, diarrhoea, nausea, vomiting, dry mouth, mouth ulcers, oral pain, dizziness, vertigo, malaise, depression, disorientation, dissociation, mood disturbance, amnesia, impaired attention, drowsiness, dysarthria, blurred vision; *less commonly* abdominal pain, oromucosal and tooth discoloration, stomatitis, palpitation, tachycardia, hypertension, pharyngitis, syncope, hallucinations, paranoia, delusions, suicidal thoughts; *also reported* anxiety, seizures

### Dose

- Consult product literature

**1 Sativex®** (Bayer Schering) ▼ 

**Oromucosal spray**, *Cannabis sativa* extract (containing dronabinol (delta-9-tetrahydrocannabinol) 27 mg and cannabidiol 25 mg/mL), net price 3 × 10-mL units = £375.00. Counselling, driving see above  
**Excipients** include propylene glycol

## DANTROLENE SODIUM

**Indications** chronic severe spasticity of voluntary muscle; malignant hyperthermia (section 15.1.8)

**Cautions** impaired cardiac and pulmonary function; therapeutic effect may take a few weeks to develop—discontinue if no response within 45 days; **interactions:** Appendix 1 (muscle relaxants).

**Hepatotoxicity** Potentially life-threatening hepatotoxicity reported, usually if doses greater than 400 mg daily used, in females, patients over 30 years, if history of liver disorders, or concomitant use of hepatotoxic drugs; test liver function before and at intervals during therapy—discontinue if abnormal liver function tests or symptoms of liver disorder

1. Home Office assessing Controlled Drug status of preparation—currently in Schedule 1 of the Misuse of Drugs Regulations 2001, but prescriptions should comply with prescribing requirements for Schedule 2 drugs

(counselling, see below); re-introduce only if complete reversal of hepatotoxicity

**Counselling** Patients should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain, dark urine, or pruritus develop

**Driving** Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

**Contra-indications** acute muscle spasm; avoid when spasticity is useful, for example, locomotion

**Hepatic impairment** avoid—may cause severe liver damage; injection may be used in an emergency for malignant hyperthermia

**Pregnancy** avoid use in chronic spasticity—embryotoxic in *animal studies*

**Breast-feeding** present in milk—manufacturer advises avoid use in chronic spasticity

**Side-effects** diarrhoea (withdraw if severe, discontinue treatment if recurs on re-introduction), nausea, vomiting, anorexia, hepatotoxicity (see above), abdominal pain; pericarditis; pleural effusion, respiratory depression; headache, drowsiness, dizziness, asthenia, fatigue, seizures, fever, chills; speech and visual disturbances; rash; *less commonly* dysphagia, constipation, exacerbation of cardiac insufficiency, tachycardia, erratic blood pressure, dyspnoea, depression, confusion, nervousness, insomnia, increased urinary frequency, urinary incontinence or retention, haematuria, crystalluria, and increased sweating

### Dose

- Initially 25 mg daily, may be increased at weekly intervals to max. 100 mg 4 times daily; usual dose 75 mg 3 times daily; **CHILD** 5–18 years see *BNF for Children*

**Dantrium®** (SpePharm) 

**Capsules**, orange/brown, dantrolene sodium 25 mg, net price 100 = £16.87; 100 mg, 100 = £43.07. Label: 2, counselling, driving, hepatotoxicity

## DIAZEPAM

**Indications** muscle spasm of varied aetiology, including tetanus; other indications (section 4.1.2, section 4.8, section 15.1.4.1)

**Cautions** section 4.1.2; special precautions for intravenous injection (section 4.8.2)

**Contra-indications** section 4.1.2

**Hepatic impairment** section 4.1.2

**Renal impairment** section 4.1.2

**Pregnancy** section 4.1.2

**Breast-feeding** section 4.1.2

**Side-effects** section 4.1.2; also hypotonia

### Dose

- Muscle spasm, **by mouth**, 2–15 mg daily in divided doses, increased if necessary in spastic conditions to 60 mg daily according to response  
Cerebral spasticity in selected cases, **CHILD** 2–40 mg daily in divided doses

**By intramuscular or by slow intravenous injection** (into a large vein at a rate of not more than 5 mg/minute), in acute muscle spasm, 10 mg repeated if necessary after 4 hours

**Note** Only use intramuscular route when oral and intravenous routes not possible; emulsion formulation preferred for intravenous injection; special precautions for intravenous injection, see section 4.8.2

- Tetanus, **ADULT** and **CHILD**, by intravenous injection (emulsion preparation preferred), 100–300 micrograms/kg repeated every 1–4 hours; by intravenous infusion (or by nasoduodenal tube), 3–10 mg/kg over 24 hours, adjusted according to response

#### Preparations

Section 4.1.2

### TIZANIDINE

**Indications** spasticity associated with multiple sclerosis or spinal cord injury or disease

**Cautions** elderly; monitor liver function monthly for first 4 months and in those who develop unexplained nausea, anorexia or fatigue; concomitant administration of drugs that prolong QT interval; avoid abrupt withdrawal (risk of rebound hypertension and tachycardia, see under Withdrawal, below); **interactions:** Appendix 1 (muscle relaxants)

**Withdrawal** Rebound hypertension and tachycardia can occur on abrupt withdrawal; to minimise risk, discontinue gradually and monitor blood pressure

**Driving** Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

**Hepatic impairment** avoid in severe impairment

**Renal impairment** manufacturer advises caution

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk—no information available

**Breast-feeding** manufacturer advises use only if potential benefit outweighs risk—no information available

**Side-effects** drowsiness, fatigue, dizziness, dry mouth, nausea, gastro-intestinal disturbances, hypotension; also reported, bradycardia, insomnia, hallucinations and altered liver enzymes (discontinue if persistently raised—consult product literature); rarely acute hepatitis

#### Dose

- **ADULT** over 18 years, initially 2 mg daily as a single dose increased according to response at intervals of at least 3–4 days in steps of 2 mg daily (and given in divided doses) usually up to 24 mg daily in 3–4 divided doses; max. 36 mg daily

**Tizanidine** (Non-proprietary) 

**Tablets**, tizanidine (as hydrochloride) 2 mg net price 120-tab pack = £6.22; 4 mg, 120-tab pack = £8.64. Label: 2, 8

**Zanaflex**<sup>®</sup> (Cephalon) 

**Tablets**, scored, tizanidine (as hydrochloride) 2 mg, net price 120-tab pack = £63.00; 4 mg, 120-tab pack = £80.00. Label: 2, 8

### Other muscle relaxants

The clinical efficacy of methocarbamol and meprobamate (section 4.1.2) as muscle relaxants is **not** well established, although they have been included in compound analgesic preparations.

### METHOCARBAMOL

**Indications** short-term symptomatic relief of muscle spasm (but see notes above)

**Cautions** **interactions:** Appendix 1 (muscle relaxants)

**Driving** Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

**Contra-indications** coma or pre-coma, brain damage, epilepsy, myasthenia gravis

**Hepatic impairment** manufacturer advises caution; half-life may be prolonged

**Renal impairment** manufacturer advises caution

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk

**Breast-feeding** present in milk in *animal* studies—manufacturer advises caution

**Side-effects** nausea, vomiting, dyspepsia; hypersensitivity reactions (including urticaria, angioedema, anaphylaxis); fever, headache, drowsiness, dizziness, hypotension, bradycardia, confusion, amnesia, restlessness, anxiety, tremor, seizures; blurred vision, nasal congestion; rash, pruritus; leucopenia, cholestatic jaundice

#### Dose

- 1.5 g 4 times daily; may be reduced to 750 mg 3 times daily; **ELDERLY** up to 750 mg 4 times daily may be sufficient; **CHILD** not recommended

**Robaxin**<sup>®</sup> (Almirall) 

**750 Tablets**, f/c, scored, methocarbamol 750 mg, net price 100 = £12.65. Label: 2

### Nocturnal leg cramps

**Quinine** salts (section 5.4.1), such as quinine sulphate 200–300 mg at bedtime, are effective in reducing the frequency of nocturnal leg cramps by about 25% in ambulatory patients; however, because of potential toxicity, quinine is not recommended for routine treatment and should not be used unless cramps cause regular disruption to sleep. Quinine should only be considered when cramps are very painful or frequent; when other treatable causes of cramp have been excluded; and when non-pharmacological treatments have not worked (e.g. passive stretching exercises). It may take up to 4 weeks for improvement to become apparent; if there is benefit, quinine treatment can be continued. Patients should be monitored closely during the early stages for adverse effects as well as for benefit. Treatment should be interrupted at intervals of approximately 3 months to assess the need for further quinine treatment. In patients taking quinine long term, a trial discontinuation may be considered. Quinine is toxic in overdose and accidental fatalities have occurred (see also below).

### QUININE

**Indications** see notes above; malaria (section 5.4.1)

**Cautions** see section 5.4.1 and notes above

**Contra-indications** section 5.4.1

**Pregnancy** section 5.4.1

**Breast-feeding** section 5.4.1

**Side-effects** section 5.4.1; **important:** very toxic in overdose—immediate advice from poison centres essential (see also p. 37)

#### Dose

- See notes above

#### Preparations

Section 5.4.1

## 10.3 Drugs for the relief of soft-tissue inflammation and topical pain relief

### 10.3.1 Enzymes

### 10.3.2 Rubefacients, topical NSAIDs, capsaicin, and poultices

### Extravasation

Local guidelines for the management of extravasation should be followed where they exist or specialist advice sought.

Extravasation injury follows leakage of drugs or intravenous fluids from the veins or inadvertent administration into the subcutaneous or subdermal tissue. It must be dealt with **promptly** to prevent tissue necrosis.

Acidic or alkaline preparations and those with an osmolarity greater than that of plasma can cause extravasation injury; excipients including alcohol and polyethylene glycol have also been implicated. Cytotoxic drugs commonly cause extravasation injury. In addition, certain patients such as the very young and the elderly are at increased risk. Those receiving anticoagulants are more likely to lose blood into surrounding tissues if extravasation occurs, while those receiving sedatives or analgesics may not notice the early signs or symptoms of extravasation.

**Prevention of extravasation** Precautions should be taken to avoid extravasation; ideally, drugs likely to cause extravasation injury should be given through a central line and patients receiving repeated doses of hazardous drugs peripherally should have the cannula resited at regular intervals. Attention should be paid to the manufacturers' recommendations for administration. Placing a glyceryl trinitrate patch (section 2.6.1) distal to the cannula may improve the patency of the vessel in patients with small veins or in those whose veins are prone to collapse.

Patients should be asked to report any pain or burning at the site of injection immediately.

**Management of extravasation** If extravasation is suspected the infusion should be stopped immediately but the cannula should not be removed until after an attempt has been made to aspirate the area (through the cannula) in order to remove as much of the drug as possible. Aspiration is sometimes possible if the extravasation presents with a raised bleb or blister at the injection site and is surrounded by hardened tissue, but it is often unsuccessful if the tissue is soft or soggy. **Corticosteroids** are usually given to treat inflammation, although there is little evidence to support their use in extravasation. Hydrocortisone or dexamethasone (section 6.3.2) can be given either locally by subcutaneous injection or intravenously at a site distant from the injury. **Antihistamines** (section 3.4.1) and **analgesics** (section 4.7) may be required for symptom relief.

The management of extravasation beyond these measures is not well standardised and calls for specialist

advice. Treatment depends on the nature of the offending substance; one approach is to localise and neutralise the substance whereas another is to spread and dilute it. The first method may be appropriate following extravasation of vesicant drugs and involves administration of an antidote (if available) and the application of cold compresses 3–4 times a day (consult specialist literature for details of specific antidotes). Spreading and diluting the offending substance involves infiltrating the area with physiological saline, applying warm compresses, elevating the affected limb, and administering **hyaluronidase** (section 10.3.1). A saline flush-out technique (involving flushing the subcutaneous tissue with physiological saline) may be effective but requires specialist advice. Hyaluronidase should **not** be administered following extravasation of vesicant drugs (unless it is either specifically indicated or used in the saline flush-out technique). **Dextrazoxane** (section 8.1) is licensed for the treatment of anthracycline-induced extravasation.

### 10.3.1 Enzymes

**Hyaluronidase** is used to render the tissues more readily permeable to injected fluids, e.g. for introduction of fluids by subcutaneous infusion (termed hypodermoclysis).

### HYALURONIDASE

**Indications** enhance permeation of subcutaneous or intramuscular injections, local anaesthetics and subcutaneous infusions; promote resorption of excess fluids and blood

**Cautions** infants or elderly (control speed and total volume and avoid overhydration especially in renal impairment)

**Contra-indications** do not apply direct to cornea; avoid sites where infection or malignancy; not for anaesthesia in unexplained premature labour; not to be used to reduce swelling of bites or stings; not for intravenous administration

**Side-effects** oedema; *rarely* local irritation, infection, bleeding, bruising; occasional severe allergy (including anaphylaxis)

#### Dose

- With subcutaneous or intramuscular injection, 1500 units dissolved directly in solution to be injected (ensure compatibility)
- With local anaesthetics, 1500 units mixed with local anaesthetic solution (ophthalmology, 15 units/mL)
- Hypodermoclysis, 1500 units dissolved in 1 mL water for injections or 0.9% sodium chloride injection, administered before start of 500–1000 mL infusion fluid
- Extravasation (see notes above) or haematoma, 1500 units dissolved in 1 mL water for injections or 0.9% sodium chloride injection, infiltrated into affected area (as soon as possible after extravasation)

**Hyalase**<sup>®</sup> (Wockhardt) (PmM)

**Injection**, powder for reconstitution, hyaluronidase (ovine). Net price 1500-unit amp = £7.60

## 10.3.2 Rubefacients, topical NSAIDs, capsaicin, and poultices

**Rubefacients** act by counter-irritation. Pain, whether superficial or deep-seated, is relieved by any method that itself produces irritation of the skin. Topical rubefacient preparations may contain nicotinate and salicylate compounds, essential oils, capsicum, and camphor. The evidence available does not support the use of topical rubefacients in acute or chronic musculoskeletal pain.

### Topical NSAIDs

The use of a NSAID by mouth is effective for relieving musculoskeletal pain. **Topical NSAIDs** (e.g. felbinac, ibuprofen, ketoprofen, and piroxicam) may provide some relief of pain in musculoskeletal conditions; they can be considered as an adjunctive treatment in knee or hand osteoarthritis (see section 10.1).

**Cautions** Apply with gentle massage only. Avoid contact with eyes, mucous membranes, and inflamed or broken skin; discontinue if rash develops. Hands should be washed immediately after use. Not for use with occlusive dressings. Topical application of large amounts can result in systemic effects (see section 10.1.1), including hypersensitivity and asthma (renal disease has also been reported). Not generally suitable for children. Patient packs carry a **warning** to avoid during pregnancy or breast-feeding.

**Hypersensitivity** For NSAID hypersensitivity and asthma warning, see p. 631 and p. 632.

**Photosensitivity** Patients should be advised against excessive exposure to sunlight of area treated in order to avoid possibility of photosensitivity; patients using preparations containing ketoprofen should be advised to avoid exposure to sunlight of the area treated, and for two weeks after stopping treatment.

#### Non-proprietary preparations

##### Ibuprofen (Non-proprietary)

Gel, ibuprofen 5%, net price 30 g = £2.10, 50 g = £3.59, 100 g = £5.88  
**Dose** apply up to 3 times daily

##### Ketoprofen (Non-proprietary) <sup>(POM)</sup>

Gel, ketoprofen 2.5%, net price 30 g = £3.22, 50 g = £2.83, 100 g = £2.63  
**Dose** apply 2–4 times daily for up to 7 days (usual max. 15 g daily)

##### Piroxicam (Non-proprietary) <sup>(POM)</sup>

Gel, piroxicam 0.5%, net price 60 g = £2.01; 112 g = £2.93  
**Dose** apply 3–4 times daily

#### Proprietary preparations

##### Feldene® (Pfizer) <sup>(POM)</sup>

Gel, piroxicam 0.5%, net price 60 g = £6.00; 112 g = £9.41 (also 7.5 g starter pack, hosp. only)  
**Excipients** include benzyl alcohol, propylene glycol  
**Dose** apply 3–4 times daily; therapy should be reviewed after 4 weeks

##### <sup>1</sup>Fenbid® Forte Gel (Goldshield) <sup>(POM)</sup>

Gel, ibuprofen 10%, net price 100 g = £6.50  
**Excipients** include benzyl alcohol  
**Dose** apply up to 4 times daily; therapy should be reviewed after 14 days  
 1. Smaller pack sizes available on sale to the public

##### Ibugel® Forte (Dermal) <sup>(POM)</sup>

**Forte gel**, ibuprofen 10%, net price 100 g = £5.87  
**Excipients** none as listed in section 13.1.3  
**Dose** apply up to 3 times daily

##### <sup>1</sup>Mobigel® (Goldshield) <sup>(POM)</sup>

**Spray**, diclofenac sodium 4%, net price 25 g = £5.38  
**Excipients** include propylene glycol  
**Dose** apply 4–5 sprays up to 3 times daily; therapy should be reviewed after 7 days  
 1. Smaller pack sizes available on sale to the public

##### <sup>1</sup>Oruvail® (Sanofi-Aventis) <sup>(POM)</sup>

Gel, ketoprofen 2.5%, net price 100 g = £6.84  
**Excipients** include fragrance  
**Dose** apply 2–4 times daily for up to 7 days (usual recommended dose 15 g daily)  
 1. Smaller pack sizes available on sale to the public

##### Powergel® (Menarini) <sup>(POM)</sup>

Gel, ketoprofen 2.5%, net price 50 g = £3.06; 100 g = £5.89  
**Excipients** include fragrance  
**Dose** apply 2–3 times daily for up to max. 10 days

##### Traxam® (Goldshield) <sup>(POM)</sup>

**Foam**, felbinac 3.17%. Net price 100 g = £7.00.  
 Label: 15  
**Excipients** include cetostearyl alcohol  
**Gel**, felbinac 3%. Net price 100 g = £7.30  
**Excipients** none as listed in section 13.1.3  
**Dose** apply 2–4 times daily; max. 25 g daily; therapy should be reviewed after 14 days  
**Note** Felbinac is an active metabolite of the NSAID fenbufen

##### <sup>1</sup>Voltarol Emulgel® (Novartis) <sup>(POM)</sup>

Gel, diclofenac diethylammonium salt 1.16% (equivalent to diclofenac sodium 1%), net price 20 g (hosp. only) = £1.55; 100 g = £7.00  
**Excipients** include propylene glycol, fragrance  
**Dose** apply 3–4 times daily; therapy should be reviewed after 14 days (or after 28 days for osteoarthritis)  
 1. Various pack sizes available on sale to the public

##### Voltarol Gel Patch® (Novartis) <sup>(POM)</sup>

**Gel patch**, diclofenac epolamine (equivalent to 140 mg diclofenac sodium per patch), net price 10-patch pack = £14.09  
**Excipients** include hydroxybenzoates (parabens), propylene glycol  
**Dose** **ADULT** and **CHILD** over 15 years, ankle sprain, apply 1 patch daily for up to 3 days; epicondylitis, apply 1 patch twice daily for up to 14 days

## Capsaicin

A preparation containing capsaicin 0.025% can be considered as an adjunct in hand or knee osteoarthritis (see section 10.1). It may need to be used for 1–2 weeks before pain is relieved.

A capsaicin 0.075% cream is licensed for the symptomatic relief of postherpetic neuralgia (section 4.7.3) after lesions have healed, and for the relief of painful diabetic neuropathy (section 6.1.5).

A self-adhesive patch containing capsaicin 8% is licensed for the treatment of peripheral neuropathic pain in non-diabetic patients.

**Zacin®** (Cephalon) 

**Cream**, capsaicin 0.025%, net price 45 g = £17.71.

**Excipients** include benzyl alcohol, cetyl alcohol

**Cautions** avoid contact with eyes, inflamed or broken skin; wash hands immediately after use (or wash hands 30 minutes after application if hands treated); not to be used under tight bandages; avoid hot shower or bath just before or after application (burning sensation enhanced); avoid inhalation of vapours

**Side-effects** transient burning sensation during initial treatment (particularly if too much used or if administered less than 4 times daily); *rarely* cough, sneezing, eye irritation; dyspnoea and exacerbation of asthma also reported

**Dose** symptomatic relief in osteoarthritis, apply sparingly 4 times daily (not more often than every 4 hours)

**Axsain®** (Cephalon) 

**Cream**, capsaicin 0.075%, net price 45 g = £14.30.

**Excipients** include benzyl alcohol, cetyl alcohol

**Cautions** avoid contact with eyes, inflamed or broken skin; wash hands immediately after use (or wash hands 30 minutes after application if hands treated); not to be used under tight bandages; avoid hot shower or bath just before or after application (burning sensation enhanced); avoid inhalation of vapours

**Side-effects** transient burning sensation during initial treatment (particularly if too much used or if administered less than 3–4 times daily); *rarely* cough, sneezing, eye irritation; dyspnoea and exacerbation of asthma also reported

**Dose** post-herpetic neuralgia (**important:** after lesions have healed), apply sparingly up to 3–4 times daily (not more often than every 4 hours)

Painful diabetic neuropathy, under specialist supervision, apply sparingly 3–4 times daily (not more often than every 4 hours) for 8 weeks then review

**Qutenza®** (Astellas) 

**Patches**, self-adhesive, capsaicin 179 mg (8%), net price 1 × 280 cm<sup>2</sup> patch (with cleansing gel) = £210.00.

**Excipients** include butylated hydroxyanisole in cleansing gel (see section 13.1.3)

**Cautions** avoid holding near eyes or mucous membranes; avoid contact with inflamed or broken skin, the face, scalp or in proximity to mucous membranes; monitor blood pressure during treatment procedure; uncontrolled hypertension; recent cardiovascular events

**Side-effects** application site reactions including transient burning, erythema, pruritus; *less commonly* nausea; peripheral oedema, first degree AV block, tachycardia, palpitations, hypertension; cough, throat irritation; hypoaesthesia, burning sensation, dysgeusia; pain in extremities, muscle spasm; eye irritation; pruritus

**Dose** peripheral neuropathic pain in non-diabetic patients, applied under supervision of a physician, consult product literature

**Note** Nitrile gloves to be worn while handling patches and cleansing treatment areas (latex gloves do not provide adequate protection)

---

## Poultices

**Kaolin Poultice** 

**Poultice**, heavy kaolin 52.7%, thymol 0.05%, boric acid 4.5%, peppermint oil 0.05%, methyl salicylate 0.2%, glycerol 42.5%. Net price 200 g = £2.93

**Dose** warm and apply directly or between layers of muslin; avoid application of overheated poultice

**Kaolin Poultice K/L Pack®** (K/L) 

**Kaolin poultice** Net price 4 × 100-g pouches = £6.40

- 11.9 Contact lenses 684

## 11.1 Administration of drugs to the eye

Drugs are most commonly administered to the eye by topical application as eye drops or eye ointments. When a higher drug concentration is required within the eye, a local injection may be necessary.

Eye-drop dispenser devices are available to aid the instillation of eye drops from plastic bottles; they are particularly useful for the elderly, visually impaired, arthritic, or otherwise physically limited patients.

**Eye drops and eye ointments** Eye drops are generally instilled into the pocket formed by gently pulling down the lower eyelid and keeping the eye closed for as long as possible after application; one drop is all that is needed. Instillation of more than one drop should be discouraged because it may increase systemic side-effects. A small amount of eye ointment is applied similarly; the ointment melts rapidly and blinking helps to spread it.

When two different eye-drop preparations are used at the same time of day, dilution and overflow may occur when one immediately follows the other. The patient should therefore leave an interval of at least 5 minutes between the two.

Systemic effects may arise from absorption of drugs into the general circulation from conjunctival vessels or from the nasal mucosa after the excess preparation has drained down through the tear ducts. The extent of systemic absorption following ocular administration is highly variable; nasal drainage of drugs is associated with eye drops much more often than with eye ointments. Pressure on the lacrimal punctum for at least a minute after applying eye drops reduces nasolacrimal drainage and therefore decreases systemic absorption from the nasal mucosa.

Patients should be warned not to drive or perform other skilled tasks until vision is clear after using eye drops or eye ointments.

For warnings relating to eye drops and contact lenses, see section 11.9.

**Eye lotions** These are solutions for the irrigation of the conjunctival sac. They act mechanically to flush out irritants or foreign bodies as a first-aid treatment. Sterile sodium chloride 0.9% solution (section 11.8.1) is usually used. Clean water will suffice in an emergency.

**Other preparations** Subconjunctival injection may be used to administer anti-infective drugs, mydriatics, or corticosteroids for conditions not responding to topical therapy. The drug diffuses through the cornea and sclera to the anterior and posterior chambers and vitreous humour. However, because the dose-volume is limited (usually not more than 1 mL), this route is suitable only for drugs which are readily soluble.

Drugs such as antimicrobials and corticosteroids may be administered systemically to treat susceptible eye conditions.

**Preservatives and sensitisers** Information on preservatives and on substances identified as skin sensitisers (see section 13.1.3) is provided under preparation entries.

## 11.2 Control of microbial contamination

Preparations for the eye should be sterile when issued. Eye drops in multiple-application containers include a preservative but care should nevertheless be taken to avoid contamination of the contents during use.

Eye drops in multiple-application containers for *domestic* use should not be used for more than 4 weeks after first opening (unless otherwise stated).

Eye drops for use in *hospital wards* are normally discarded 1 week after first opening. Individual containers should be provided for each patient. A separate bottle should be supplied for each eye only if there are special concerns about contamination. Containers used before an eye operation should be discarded at the time of the operation and fresh containers supplied. A fresh supply should also be provided upon discharge from hospital; in specialist ophthalmology units, it may be acceptable to issue eye-drop bottles that have been dispensed to the patient on the day of discharge.

In *out-patient departments* single-application packs should preferably be used; if multiple-application packs are used, they should be discarded at the end of each day. In clinics for eye diseases and in accident and emergency departments, where the dangers of infection are high, single-application packs should be used; if a multiple-application pack is used, it should be discarded after single use.

Diagnostic dyes (e.g. fluorescein) should be used only from single-application packs.

In *eye surgery* single-application containers should be used if possible; if a multiple-application pack is used, it should be discarded after single use. Preparations used during intra-ocular procedures and others that may penetrate into the anterior chamber must be isotonic and without preservatives and buffered if necessary to a neutral pH. Specially formulated fluids should be used for intra-ocular surgery; intravenous infusion preparations are not suitable for this purpose. For all surgical procedures, a previously unopened container is used for each patient.

## 11.3 Anti-infective eye preparations

### 11.3.1 Antibacterials

### 11.3.2 Antifungals

### 11.3.3 Antivirals

**Eye infections** Most acute superficial eye infections can be treated topically. Blepharitis and conjunctivitis are often caused by staphylococci; keratitis and endophthalmitis may be bacterial, viral, or fungal.

Bacterial *blepharitis* is treated by application of an antibacterial eye ointment to the conjunctival sac or to the lid margins. Systemic treatment may occasionally be required and is usually undertaken after culturing organisms from the lid margin and determining their antimicrobial sensitivity; antibiotics such as the tetracyclines given for 3 months or longer may be appropriate.

Most cases of acute bacterial conjunctivitis are self-limiting; where treatment is appropriate, antibacterial eye drops or an eye ointment are used. A poor response might indicate viral or allergic conjunctivitis. *Gonococcal conjunctivitis* is treated with systemic and topical antibacterials.

*Corneal ulcer* and *keratitis* require specialist treatment and may call for hospital admission for intensive therapy.

*Endophthalmitis* is a medical emergency which also calls for specialist management and often requires paracental, subconjunctival, or intra-ocular administration of antimicrobials.

### 11.3.1 Antibacterials

Bacterial eye infections are generally treated topically with eye drops and eye ointments. Systemic administration is sometimes appropriate in blepharitis.

**Chloramphenicol** has a broad spectrum of activity and is the drug of choice for *superficial eye infections*. Chloramphenicol eye drops are well tolerated and the recommendation that chloramphenicol eye drops should be avoided because of an increased risk of aplastic anaemia is not well founded.

Other antibacterials with a broad spectrum of activity include the quinolones, **ciprofloxacin**, **levofloxacin**, **moxifloxacin**, and **ofloxacin**; the aminoglycosides, **gentamicin**, **neomycin** [unlicensed], and **tobramycin** are also active against a wide variety of bacteria. Gentamicin, quinolones (except moxifloxacin), and **polymyxin B** are effective for infections caused by *Pseudomonas aeruginosa*.

**Ciprofloxacin** eye drops are licensed for *corneal ulcers*; intensive application (especially in the first 2 days) is required throughout the day and night.

*Trachoma* which results from chronic infection with *Chlamydia trachomatis* can be treated with **azithromycin** by mouth [unlicensed indication].

**Fusidic acid** is useful for staphylococcal infections.

**Propamidine isetonate** is of little value in bacterial infections but is specific for the rare but potentially sight-threatening condition of *acanthamoeba keratitis* [unlicensed indication] (see also section 11.9).

**With corticosteroids** Many antibacterial preparations also incorporate a corticosteroid but such mixtures should **not** be used unless a patient is under close specialist supervision. In particular they should not be prescribed for undiagnosed 'red eye' which is sometimes caused by the herpes simplex virus and may be difficult to diagnose (section 11.4).

**Administration** Frequency of application depends on the severity of the infection and the potential for irreversible ocular damage; antibacterial eye preparations are usually administered as follows:

**Eye drops** Apply 1 drop at least every 2 hours then reduce frequency as infection is controlled and continue for 48 hours after healing.

**Eye ointment** Apply *either* at night (if eye drops used during the day) *or* 3–4 times daily (if eye ointment used alone).

## CHLORAMPHENICOL

**Indications** see notes above

**Side-effects** transient stinging; see also notes above  
**Dose**

• See Administration in notes above

**Chloramphenicol** (Non-proprietary) (POM)

**Eye drops**, chloramphenicol 0.5%. Net price 10 mL = £2.05

**Eye ointment**, chloramphenicol 1%. Net price 4 g = £2.04

**Note** Chloramphenicol 0.5% eye drops (in max. pack size 10 mL) and 1% eye ointment (in max. pack size 4 g) can be sold to the public for treatment of acute bacterial conjunctivitis in adults and children over 2 years; max. duration of treatment 5 days

**Chloromycetin**<sup>®</sup> (Goldshield) (POM)

**Redidrops** (= eye drops), chloramphenicol 0.5%. Net price 5 mL = £1.65; 10 mL = 90p

**Excipients** include phenylmercuric acetate

**Ophthalmic ointment** (= eye ointment), chloramphenicol 1%. Net price 4 g = £1.08

### Single use

**Minims**<sup>®</sup> Chloramphenicol (Bausch & Lomb) (POM)

**Eye drops**, chloramphenicol 0.5%. Net price 20 × 0.5 mL = £9.17

## CIPROFLOXACIN

**Indications** superficial bacterial infections, see notes above; corneal ulcers

**Cautions** not recommended for children under 1 year

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** manufacturer advises caution

**Side-effects** local burning and itching; lid margin crusting; hyperaemia; taste disturbances; corneal staining, keratitis, lid oedema, lacrimation, photophobia, corneal infiltrates; nausea and visual disturbances reported

### Dose

- Superficial bacterial infection, see Administration in notes above
- Corneal ulcer, apply *eye drops* throughout day and night, day 1 apply every 15 minutes for 6 hours then every 30 minutes, day 2 apply every hour, days 3–14 apply every 4 hours (max. duration of treatment 21 days)

Apply *eye ointment* throughout day and night; apply 1.25 cm ointment every 1–2 hours for 2 days then every 4 hours for next 12 days

**Ciloxan**<sup>®</sup> (Alcon) (POM)

**Ophthalmic solution** (= eye drops), ciprofloxacin (as hydrochloride) 0.3%. Net price 5 mL = £4.70

**Excipients** include benzalkonium chloride

**Eye ointment**, ciprofloxacin (as hydrochloride) 0.3%. Net price 3.5 g = £5.22

## FUSIDIC ACID

**Indications** see notes above

### Dose

- See under preparation below

**Fucithalmic**<sup>®</sup> (LEO) (POM)

**Eye drops**, m/r, fusidic acid 1% in gel basis (liquifies on contact with eye). Net price 5 g = £1.96

**Excipients** include benzalkonium chloride, disodium edetate

**Dose** apply twice daily

## GENTAMICIN

**Indications** see notes above

### Dose

- See Administration in notes above

**Genticin**<sup>®</sup> (Amdipharm) (POM)

**Drops** (for ear or eye), gentamicin 0.3% (as sulphate). Net price 10 mL = £2.13

**Excipients** include benzalkonium chloride

## LEVOFLOXACIN

**Indications** see notes above

**Cautions** not recommended for children under 1 year

**Pregnancy** manufacturer advises avoid—systemic quinolones have caused arthropathy in *animal* studies

**Breast-feeding** manufacturer advises avoid

**Side-effects** transient ocular irritation, visual disturbances, lid margin crusting, lid or conjunctival oedema, hyperaemia, conjunctival follicles, photophobia, headache, rhinitis

### Dose

- See Administration in notes above

**Oftaquix**<sup>®</sup> (Kestrel Ophthalmics) ▼ (POM)

**Eye drops**, levofloxacin 0.5%, net price 5 mL = £6.95

**Excipients** include benzalkonium chloride

**Eye drops**, levofloxacin 0.5%, net price 30 × 0.5-mL single use units = £17.95

## MOXIFLOXACIN

**Indications** see notes above

**Cautions** not recommended for neonates

**Side-effects** taste disturbances, ocular discomfort (including pain, irritation and dryness), hyperaemia; *less commonly* vomiting, headache, paraesthesia, corneal disorders (including keratitis, erosion, and staining), conjunctival haemorrhage, eyelid erythema, visual disturbances, nasal discomfort, pharyngolaryngeal pain; *also reported* nausea, palpitation, dyspnoea, dizziness, raised intra-ocular pressure, photophobia, rash, pruritus

### Dose

- **ADULT** and **CHILD** over 1 month, apply 3 times daily (continue treatment for 2–3 days after infection clears; review if no improvement within 5 days)

**Moxivig**<sup>®</sup> (Alcon) ▼ (POM)

**Eye drops**, moxifloxacin (as hydrochloride) 0.5%. Net price 5 mL = £9.80

## NEOMYCIN SULPHATE

**Indications** see notes above

### Dose

- See Administration in notes above

**Neomycin** (Non-proprietary) (POM)

**Eye drops**, neomycin sulphate 0.5% (3500 units/mL).

Net price 10 mL = £3.11

Available from 'special-order' manufacturers or specialist importing companies, p. 988

**Eye ointment**, neomycin sulphate 0.5% (3500 units/g). Net price 3 g = £2.44

Available from 'special-order' manufacturers or specialist importing companies, p. 988

**OFLOXACIN**

**Indications** see notes above

**Pregnancy** manufacturer advises use only if benefit outweighs risk; systemic quinolones have caused arthropathy in animal studies

**Breast-feeding** manufacturer advises avoid

**Side-effects** local irritation including photophobia; dizziness, numbness, nausea and headache reported

**Dose**

- Apply every 2–4 hours for the first 2 days then reduce frequency to 4 times daily (max. 10 days treatment)

**Exocin**<sup>®</sup> (Allergan) (POM)

**Ophthalmic solution** (= eye drops), ofloxacin 0.3%.

Net price 5 mL = £2.17

Excipients include benzalkonium chloride

**POLYMYXIN B SULPHATE**

**Indications** see notes above

**Side-effects** local irritation and dermatitis

**Dose**

- See Administration in notes above

**With other antibacterials****Polyfax**<sup>®</sup> (TEVA UK) (POM)

**Eye ointment**, polymyxin B sulphate 10 000 units, bacitracin zinc 500 units/g. Net price 4 g = £3.26

**PROPAMIDINE ISETIONATE**

**Indications** local treatment of infections (but see notes above)

**Dose**

- See preparations

**Brolene**<sup>®</sup> (Sanofi-Aventis)

**Eye drops**, propamidine isetionate 0.1%. Net price 10 mL = £2.80

Excipients include benzalkonium chloride

**Dose** apply 4 times daily

**Note** Eye drops containing propamidine isetionate 0.1% also available from Typharm (*Golden Eye Drops*)

**Eye ointment**, dibrompropamidine isetionate 0.15%. Net price 5 g = £2.92

**Dose** apply 1–2 times daily

**Note** Eye ointment containing dibrompropamidine isetionate 0.15% also available from Typharm (*Golden Eye Ointment*)

**TOBRAMYCIN**

**Indications** see notes above

**Dose**

- **ADULT** and **CHILD** over 1 year, apply twice daily for 6–8 days; in severe infection, apply 4 times daily on the first day, then twice daily for 5–7 days

**Tobramisc**<sup>®</sup> (Alcon) (POM)

**Eye drops**, tobramycin 0.3%, net price 5 mL = £4.74

Excipients include benzododecinium bromide

**11.3.2 Antifungals**

Fungal infections of the cornea are rare but can occur after agricultural injuries, especially in hot and humid climates. Orbital mycosis is rarer, and when it occurs it is usually because of direct spread of infection from the paranasal sinuses. Increasing age, debility, or immunosuppression can encourage fungal proliferation. The spread of infection through blood occasionally produces metastatic endophthalmitis.

Many different fungi are capable of producing ocular infection; they can be identified by appropriate laboratory procedures.

Antifungal preparations for the eye are not generally available. Treatment will normally be carried out at specialist centres, but requests for information about supplies of preparations not available commercially should be addressed to the Strategic Health Authority (or equivalent), or to the nearest hospital ophthalmology unit, or to Moorfields Eye Hospital, 162 City Road, London EC1V 2PD (tel. (020) 7253 3411) or [www.moorfields.nhs.uk](http://www.moorfields.nhs.uk)

**11.3.3 Antivirals**

Herpes simplex infections producing, for example, dendritic corneal ulcers can be treated with **aciclovir** or **ganciclovir**. Aciclovir eye ointment is used in combination with systemic treatment for ophthalmic zoster (section 5.3.2).

Slow-release ocular implants containing **ganciclovir** (available on a named-patient basis from specialist importing companies, see p. 988) may be inserted surgically to treat immediate sight-threatening CMV retinitis. Local treatments do not protect against systemic infection or infection in the other eye. For systemic treatment of CMV retinitis, see section 5.3.2.2.

**ACICLOVIR**

(Acyclovir)

**Indications** local treatment of herpes simplex infections

**Side-effects** local irritation and inflammation, superficial punctate keratopathy; *rarely* blepharitis; *very rarely* hypersensitivity reactions including angioedema

**Dose**

- Apply 5 times daily (continue for at least 3 days after complete healing)

**Zovirax**<sup>®</sup> (GSK) (POM)

**Eye ointment**, aciclovir 3%. Net price 4.5 g = £9.34

**GANCICLOVIR**

**Indications** local treatment of herpes simplex infections

**Side-effects** burning sensation, tingling, superficial punctate keratitis

**Dose**

- Apply 5 times daily until healing complete, then apply 3 times daily for a further 7 days

**Virgan**<sup>®</sup> (Spectrum Thea) (POM)

**Ophthalmic gel**, ganciclovir 0.15%, net price 5 g = £19.99

## 11.4 Corticosteroids and other anti-inflammatory preparations

### 11.4.1 Corticosteroids

### 11.4.2 Other anti-inflammatory preparations

### 11.4.1 Corticosteroids

Corticosteroids administered locally to the eye or given by mouth are effective for treating anterior segment inflammation, including that which results from surgery.

*Topical corticosteroids* are applied frequently for the first 24–48 hours; once inflammation is controlled, the frequency of application is reduced. They should normally only be used under expert supervision; three main dangers are associated with their use:

- a 'red eye', when the diagnosis is unconfirmed, may be due to herpes simplex virus, and a corticosteroid may aggravate the condition, leading to corneal ulceration, with possible damage to vision and even loss of the eye. Bacterial, fungal, and amoebic infections pose a similar hazard;
- 'steroid glaucoma' can follow the use of corticosteroid eye preparations in susceptible individuals;
- a 'steroid cataract' can follow prolonged use.

Other side-effects of ocular corticosteroids include thinning of the cornea and sclera.

Combination products containing a corticosteroid with an anti-infective drug are sometimes used after ocular surgery to reduce inflammation and prevent infection; use of combination products is otherwise rarely justified.

*Systemic corticosteroids* (section 6.3.2) may be useful for ocular conditions. The risk of producing a 'steroid cataract' increases with the dose and duration of corticosteroid use.

### BETAMETHASONE

**Indications** local treatment of inflammation (short-term)

**Cautions** see notes above

**Side-effects** see notes above

#### Dose

- Apply eye drops every 1–2 hours until controlled then reduce frequency; apply eye ointment 2–4 times daily or at night when used with eye drops

**Betnesol**<sup>®</sup> (UCB Pharma) (POM)

**Drops** (for ear, eye, or nose), betamethasone sodium phosphate 0.1%. Net price 10 mL = £2.23

**Excipients** include benzalkonium chloride, disodium edetate

**Eye ointment**, betamethasone sodium phosphate 0.1%. Net price 3 g = £1.36

**Vistamethasone**<sup>®</sup> (Martindale) (POM)

**Drops** (for ear, eye, or nose), betamethasone sodium phosphate 0.1%. Net price 5 mL = £1.02; 10 mL = £1.16

**Excipients** include benzalkonium chloride

#### With neomycin

**Betnesol-N**<sup>®</sup> (UCB Pharma) (POM)

**Drops** (for ear, eye, or nose), see section 12.1.1

**Dose** apply up to 6 times daily

### DEXAMETHASONE

**Indications** local treatment of inflammation (short-term)

**Cautions** see notes above

**Side-effects** see notes above

#### Dose

- Apply eye drops every 30–60 minutes until controlled then reduce frequency to 4–6 times daily

**Maxidex**<sup>®</sup> (Alcon) (POM)

**Eye drops**, dexamethasone 0.1%, hypromellose 0.5%. Net price 5 mL = £1.42; 10 mL = £2.80

**Excipients** include benzalkonium chloride, disodium edetate, polysorbate 80

#### Single use

**Minims**<sup>®</sup> **Dexamethasone** (Bausch & Lomb) (POM)

**Eye drops**, dexamethasone sodium phosphate 0.1%.

Net price 20 × 0.5 mL = £9.38

**Excipients** include disodium edetate

#### With antibacterials

**Maxitrol**<sup>®</sup> (Alcon) (POM)

**Eye drops**, dexamethasone 0.1%, neomycin 0.35% (as sulphate), polymyxin B sulphate 6000 units/mL. Net price 5 mL = £1.68

**Excipients** include benzalkonium chloride, polysorbate 20

**Eye ointment**, dexamethasone 0.1%, neomycin 0.35% (as sulphate), polymyxin B sulphate 6000 units/g. Net price 3.5 g = £1.44

**Excipients** include hydroxybenzoates (parabens), wool fat

**Dose** apply 3–4 times daily or at night when used with eye drops

**Sofradex**<sup>®</sup> (Sanofi-Aventis) (POM)

**Drops** (for ear or eye), see section 12.1.1

**Tobradex**<sup>®</sup> (Alcon) (POM)

**Eye drops**, dexamethasone 0.1%, tobramycin 0.3%. Net price 5 mL = £5.37

**Excipients** include benzalkonium chloride, disodium edetate

### FLUOROMETHOLONE

**Indications** local treatment of inflammation (short-term)

**Cautions** see notes above

**Side-effects** see notes above

#### Dose

- Apply every hour for 24–48 hours then reduce frequency to 2–4 times daily

**FML**<sup>®</sup> (Allergan) (POM)

**Ophthalmic suspension** (= eye drops), fluorometholone 0.1%, polyvinyl alcohol (*Liquifilm*<sup>®</sup>) 1.4%. Net price 5 mL = £1.71; 10 mL = £2.95

**Excipients** include benzalkonium chloride, disodium edetate, polysorbate 80

### HYDROCORTISONE ACETATE

**Indications** local treatment of inflammation (short-term)

**Cautions** see notes above

**Side-effects** see notes above

#### Dose

- Apply eye drops every 30–60 minutes until controlled then reduce frequency to every 4 hours

**Hydrocortisone** (Non-proprietary) (POM)

**Eye drops**, hydrocortisone acetate 1%. Net price 10 mL = £3.21

**Eye ointment**, hydrocortisone acetate 0.5%, net price 3 g = £2.88; 1%, 3 g = £6.71

## LOTEPREDNOL ETABONATE

**Indications** treatment of post-operative inflammation following ocular surgery

**Cautions** see notes above

**Side-effects** see notes above

### Dose

- Apply 4 times daily starting 24 hours after surgery; max. duration of treatment 14 days

**Lotemax**<sup>®</sup> (Bausch & Lomb) ▼ (POM)

**Ophthalmic suspension** (= eye drops), loteprednol etabonate 0.5%, net price 5 mL = £5.50

**Excipients** include benzalkonium chloride, disodium edetate

## PREDNISOLONE

**Indications** local treatment of inflammation (short-term)

**Cautions** see notes above

**Side-effects** see notes above

### Dose

- Apply every 1–2 hours until controlled then reduce frequency

**Predsol**<sup>®</sup> (UCB Pharma) (POM)

**Drops** (for ear or eye), prednisolone sodium phosphate 0.5%. Net price 10 mL = £1.92

**Excipients** include benzalkonium chloride, disodium edetate

**Pred Forte**<sup>®</sup> (Allergan) (POM)

**Eye drops**, prednisolone acetate 1%. Net price 5 mL = £1.52; 10 mL = £3.05

**Excipients** include benzalkonium chloride, disodium edetate, polysorbate 80

### Single use

**Minims<sup>®</sup> Prednisolone Sodium Phosphate** (Bausch & Lomb) (POM)

**Eye drops**, prednisolone sodium phosphate 0.5%. Net price 20 × 0.5 mL = £10.08

**Excipients** include disodium edetate

### With neomycin

**Predsol-N**<sup>®</sup> (UCB Pharma) (POM) 

**Drops** (for ear or eye), see section 12.1.1

**Dose** apply up to 6 times daily

## RIMEXOLONE

**Indications** local treatment of inflammation (short-term)

**Cautions** see notes above

**Side-effects** see notes above

### Dose

- Postoperative inflammation, apply 4 times daily for 2 weeks, beginning 24 hours after surgery
- Steroid-responsive inflammation, apply at least 4 times daily for up to 4 weeks
- Uveitis, apply every hour during daytime in week 1, then every 2 hours in week 2, then 4 times daily in week 3, then twice daily for first 4 days of week 4, then once daily for remaining 3 days of week 4

**Vexol**<sup>®</sup> (Alcon) (POM)

**Eye drops**, rimexolone 1%, net price 5 mL = £5.66

**Excipients** include benzalkonium chloride, disodium edetate, polysorbate 80

## Intravitreal corticosteroids

An intravitreal implant containing **dexamethasone** (**Ozurdex**<sup>®</sup>) is licensed for the treatment of adults with macular oedema following either branch retinal vein

occlusion or central retinal vein occlusion; it should be administered by specialists experienced in the use of intravitreal injections.

## DEXAMETHASONE

**Indications** see notes above—specialist use only

**Cautions** monitor intra-ocular pressure and for signs of ocular infection; history of ocular herpes simplex; aphakia; retinal vein occlusion with significant retinal ischaemia; concomitant administration of anti-coagulant or antiplatelet drugs

**Contra-indications** active or suspected ocular or peri-ocular infection; uncontrolled advanced glaucoma

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk—no information available

**Breast-feeding** manufacturer advises avoid unless potential benefit outweighs risk—no information available

**Side-effects** raised intra-ocular pressure, vitreous detachment, cataract, visual disturbance; *less commonly* headache; *also reported* glaucoma, ocular infection

### Dose

- **By intravitreal injection**, 700 micrograms into the affected eye

**Note** Concurrent administration to both eyes not recommended. For further information on administration and repeat dosing, consult product literature

**Ozurdex**<sup>®</sup> (Allergan) ▼ (POM)

**Intravitreal implant**, dexamethasone 700 micrograms in disposable applicator, net price = £870.00

## 11.4.2 Other anti-inflammatory preparations

Other preparations used for the topical treatment of inflammation and allergic conjunctivitis include antihistamines, lodoxamide, and sodium cromoglicate.

Eye drops containing antihistamines, such as **antazoline** (with xylometazoline as **Otrivine-Antistin**<sup>®</sup>), **azelastine**, **epinastine**, **ketotifen**, and **olopatadine**, can be used for allergic conjunctivitis.

**Sodium cromoglicate** (sodium cromoglycate) and **nedocromil sodium** eye drops can be useful for vernal keratoconjunctivitis and other allergic forms of conjunctivitis.

**Lodoxamide** eye drops are used for allergic conjunctival conditions including seasonal allergic conjunctivitis.

**Diclofenac** eye drops (section 11.8.2) and **emedastine** eye drops are also licensed for seasonal allergic conjunctivitis.

## ANTAZOLINE SULPHATE

**Indications** allergic conjunctivitis

**Otrivine-Antistin**<sup>®</sup> (Novartis Consumer Health)

**Eye drops**, antazoline sulphate 0.5%, xylometazoline hydrochloride 0.05%. Net price 10 mL = £2.35

**Excipients** include benzalkonium chloride, disodium edetate

**Dose** **ADULT** and **CHILD** over 12 years apply 2–3 times daily (max. 7 days)

**Note** Xylometazoline is a sympathomimetic; it should be used with caution in patients susceptible to angle-closure glaucoma; absorption of antazoline and xylometazoline may result in systemic side-effects and the possibility of interaction with other drugs

**AZELASTINE HYDROCHLORIDE****Indications** allergic conjunctivitis**Side-effects** mild transient irritation; bitter taste reported**Dose**

- Seasonal allergic conjunctivitis, **ADULT** and **CHILD** over 4 years, apply twice daily, increased if necessary to 4 times daily
- Perennial conjunctivitis, **ADULT** and **CHILD** over 12 years, apply twice daily, increased if necessary to 4 times daily; max. duration of treatment 6 weeks

**Optilast®** (Meda) (POM)**Eye drops**, azelastine hydrochloride 0.05%. Net price 8 mL = £6.40**Excipients** include benzalkonium chloride, disodium edetate**EMEDASTINE****Indications** seasonal allergic conjunctivitis**Side-effects** transient burning or stinging; blurred vision, local oedema, keratitis, irritation, dry eye, lacrimation, corneal infiltrates (discontinue) and staining; photophobia; headache, and rhinitis occasionally reported**Dose**

- **ADULT** and **CHILD** over 3 years, apply twice daily

**Emadine®** (Alcon) (POM)**Eye drops**, emedastine 0.05% (as difumarate), net price 5 mL = £7.31**Excipients** include benzalkonium chloride**EPINASTINE HYDROCHLORIDE****Indications** seasonal allergic conjunctivitis**Side-effects** burning; *less commonly* dry mouth, taste disturbance; nasal irritation, rhinitis; headache, blepharoptosis, conjunctival oedema and hyperaemia, dry eye, local irritation, photophobia, visual disturbance; pruritus**Dose**

- **ADULT** and **ADOLESCENT** over 12 years, apply twice daily; max. duration of treatment 8 weeks

**Relestat®** (Allergan) (POM)**Eye drops**, epinastine hydrochloride 500 micrograms/mL, net price 5 mL = £9.90**Excipients** include benzalkonium chloride, disodium edetate**KETOTIFEN****Indications** seasonal allergic conjunctivitis**Side-effects** burning or stinging, punctate corneal epithelial erosion; *less commonly* dry eye, subconjunctival haemorrhage, photophobia; headache, drowsiness, skin reactions, and dry mouth also reported**Dose**

- **ADULT** and **CHILD** over 3 years, apply twice daily

**Zaditen®** (Novartis) (POM)**Eye drops**, ketotifen (as fumarate) 250 micrograms/mL, net price 5 mL = £7.80**Excipients** include benzalkonium chloride**LODOXAMIDE****Indications** allergic conjunctivitis**Side-effects** burning, stinging, itching, blurred vision, tear production disturbance, and ocular discomfort; *less commonly* flushing, nasal dryness, dizziness, drowsiness, headache, blepharitis and keratitis**Dose**

- **ADULT** and **CHILD** over 4 years, apply 4 times daily; improvement of symptoms may sometimes require treatment for up to 4 weeks

**Alomide®** (Alcon) (POM)**Ophthalmic solution** (= eye drops), lodoxamide 0.1% (as trometamol). Net price 10 mL = £5.21**Excipients** include benzalkonium chloride, disodium edetate**Note** Lodoxamide 0.1% eye drops can be sold to the public for treatment of allergic conjunctivitis in adults and children over 4 years**NEDOCROMIL SODIUM****Indications** allergic conjunctivitis; seasonal keratoconjunctivitis**Side-effects** burning and stinging; distinctive taste reported**Dose**

- Seasonal and perennial conjunctivitis, **ADULT** and **CHILD** over 6 years, apply twice daily increased if necessary to 4 times daily; max. 12 weeks treatment for seasonal allergic conjunctivitis
- Seasonal keratoconjunctivitis, **ADULT** and **CHILD** over 6 years, apply 4 times daily

**Rapitil®** (Sanofi-Aventis) (POM)**Eye drops**, nedocromil sodium 2%. Net price 5 mL = £4.92**Excipients** include benzalkonium chloride, disodium edetate**OLOPATADINE****Indications** seasonal allergic conjunctivitis**Side-effects** local irritation; *less commonly* keratitis, dry eye, local oedema, photophobia; headache, asthenia, dizziness; dry nose also reported**Dose**

- **ADULT** and **CHILD** over 3 years, apply twice daily; max. duration of treatment 4 months

**Opatanol®** (Alcon) (POM)**Eye drops**, olopatadine (as hydrochloride) 1 mg/mL, net price 5 mL = £3.91**Excipients** include benzalkonium chloride**SODIUM CROMOGLICATE**  
(Sodium cromoglycate)**Indications** allergic conjunctivitis; seasonal keratoconjunctivitis**Side-effects** burning and stinging**Dose**

- **ADULT** and **CHILD** apply eye drops 4 times daily

**Sodium Cromoglicate** (Non-proprietary) (POM)**Eye drops**, sodium cromoglycate 2%. Net price 13.5 mL = £1.79Brands include *Hay-Crom® Aqueous*, *Opticrom® Aqueous*, *Vividrin®***Note** Sodium cromoglycate 2% eye drops can be sold to the public (in max. pack size of 10 mL) for treatment of acute seasonal and perennial allergic conjunctivitis

### Single use

#### Catachrom® (Moorfields)

Eye drops, sodium cromoglicate 2%, net price 30 × 0.3 mL = £8.99

## 11.5 Mydriatics and cycloplegics

Antimuscarinics dilate the pupil and paralyse the ciliary muscle; they vary in potency and duration of action.

Short-acting, relatively weak mydriatics, such as **tropicamide** 0.5% (action lasts for 4–6 hours), facilitate the examination of the fundus of the eye. **Cyclopentolate** 1% (action up to 24 hours) or **atropine** (action up to 7 days) are preferable for producing cycloplegia for refraction in young children. Atropine ointment 1% is sometimes preferred for children aged under 5 years because the ointment formulation reduces systemic absorption.

Mydriatics and cycloplegics are used in the treatment of anterior uveitis, usually as an adjunct to corticosteroids (section 11.4.1). Atropine is used in anterior uveitis mainly to prevent posterior synechiae and to relieve ciliary spasm, often in combination with phenylephrine eye drops; cyclopentolate or **homatropine** (action up to 3 days) can also be used and may be preferred because they have a shorter duration of action.

**Phenylephrine** is used for mydriasis in diagnostic or therapeutic procedures; mydriasis occurs within 60–90 minutes and lasts up to 5–7 hours. Phenylephrine 10% drops are contra-indicated in children and the elderly owing to the risk of systemic effects.

**Cautions** Darkly pigmented iris is more resistant to pupillary dilatation and caution should be exercised to avoid overdosage. Mydriasis can precipitate acute angle-closure glaucoma in a few patients, usually aged over 60 years and hypermetropic (long-sighted), who are predisposed to the condition because of a shallow anterior chamber. Phenylephrine may interact with systemically administered monoamine-oxidase inhibitors; other **interactions**: Appendix 1 (sympathomimetics).

**Driving** Patients should be warned not to drive until vision is clear after mydriasis.

**Side-effects** Ocular side-effects of mydriatics and cycloplegics include transient stinging and raised intra-ocular pressure; on prolonged administration, local irritation, hyperaemia, oedema and conjunctivitis can occur. Contact dermatitis can occur with the antimuscarinic mydriatic drugs, especially atropine.

Systemic side-effects of atropine and cyclopentolate can occur, particularly in children and the elderly; see section 1.2 for systemic side-effects of antimuscarinic drugs.

### Antimuscarinics

#### ATROPINE SULPHATE

**Indications** see notes above

**Cautions** risk of systemic effects with eye drops in infants under 3 months—eye ointment preferred; see also notes above

**Side-effects** see notes above

#### Atropine (Non-proprietary) <sup>(POM)</sup>

Eye drops, atropine sulphate 0.5%, net price 10 mL = £2.78

### Single use

#### Minims® Atropine Sulphate (Bausch & Lomb) <sup>(POM)</sup>

Eye drops, atropine sulphate 1%. Net price 20 × 0.5 mL = £12.71

### CYCLOPENTOLATE HYDROCHLORIDE

**Indications** see notes above

**Cautions** see notes above

**Side-effects** see notes above

#### Mydrilate® (Intrapharm) <sup>(POM)</sup>

Eye drops, cyclopentolate hydrochloride 0.5%, net price 5 mL = £6.73; 1%, 5 mL = £6.73

**Excipients** include benzalkonium chloride

### Single use

#### Minims® Cyclopentolate Hydrochloride (Bausch & Lomb) <sup>(POM)</sup>

Eye drops, cyclopentolate hydrochloride 0.5% and 1%. Net price 20 × 0.5 mL (both) = £9.64

### HOMATROPINE HYDROBROMIDE

**Indications** see notes above

**Cautions** see notes above

**Side-effects** see notes above

#### Homatropine (Non-proprietary) <sup>(POM)</sup>

Eye drops, homatropine hydrobromide 1%, net price 10 mL = £2.57; 2%, 10 mL = £2.71

### TROPICAMIDE

**Indications** see notes above

**Cautions** see notes above

**Side-effects** see notes above

#### Mydracil® (Alcon) <sup>(POM)</sup>

Eye drops, tropicamide 0.5%, net price 5 mL = £1.29; 1%, 5 mL = £1.60

**Excipients** include benzalkonium chloride, disodium edetate

### Single use

#### Minims® Tropicamide (Bausch & Lomb) <sup>(POM)</sup>

Eye drops, tropicamide 0.5% and 1%. Net price 20 × 0.5 mL (both) = £9.01

### Sympathomimetics

#### PHENYLEPHRINE HYDROCHLORIDE

**Indications** mydriasis; see also notes above

**Cautions** children and elderly (avoid 10% strength); cardiovascular disease (avoid or use 2.5% strength only); tachycardia; hyperthyroidism; diabetes; see also notes above

**Side-effects** eye pain and stinging; blurred vision, photophobia; systemic effects include palpitations, arrhythmias, hypertension, coronary artery spasm; very rarely angle-closure glaucoma

#### Phenylephrine (Non-proprietary)

Eye drops, phenylephrine hydrochloride 10%. Net price 10 mL = £4.86

### Single use

**Minims® Phenylephrine Hydrochloride** (Bausch & Lomb)

**Eye drops**, phenylephrine hydrochloride 2.5%, net price 20 × 0.5 mL = £9.53; 10%, 20 × 0.5 mL = £9.53

**Excipients** include disodium edetate, sodium metabisulphite

## 11.6 Treatment of glaucoma

Glaucoma describes a group of disorders characterised by a loss of visual field associated with cupping of the optic disc and optic nerve damage. While glaucoma is generally associated with raised intra-ocular pressure, it can occur when the intra-ocular pressure is within the normal range.

The commonest form of glaucoma is *primary open-angle glaucoma* (chronic simple glaucoma; wide-angle glaucoma), where the obstruction is in the trabecular meshwork. The condition is often asymptomatic and the patient may present with significant loss of visual-field. *Primary angle-closure glaucoma* (acute closed-angle glaucoma, narrow-angle glaucoma) results from blockage of aqueous humour flow into the anterior chamber and is a medical emergency.

Drugs that reduce intra-ocular pressure by different mechanisms are available for managing glaucoma. A topical beta-blocker or a prostaglandin analogue is usually the drug of first choice. It may be necessary to combine these drugs or add others, such as miotics, sympathomimetics, or carbonic anhydrase inhibitors, to control intra-ocular pressure.

For urgent reduction of intra-ocular pressure and before surgery, mannitol 20% (up to 500 mL) is given by slow intravenous infusion until the intra-ocular pressure has been satisfactorily reduced. Acetazolamide by intravenous injection can also be used for the emergency management of raised intra-ocular pressure.

Standard antiglaucoma therapy is used if supplementary treatment is required after iridotomy, iridectomy, or a drainage operation in either primary open-angle or primary angle-closure glaucoma.

### Beta-blockers

Topical application of a beta-blocker to the eye reduces intra-ocular pressure effectively in *primary open-angle glaucoma*, probably by reducing the rate of production of aqueous humour. Administration by mouth also reduces intra-ocular pressure but this route is not used since side-effects may be troublesome.

Beta-blockers used as eye drops include **betaxolol**, **carteolol**, **levobunolol**, **metipranolol**, and **timolol**.

#### Cautions, contra-indications, and side-effects

Systemic absorption can follow topical application to the eyes; therefore, eye drops containing a beta-blocker are contra-indicated in patients with bradycardia, heart block, or uncontrolled heart failure. **Important:** for a warning to avoid in asthma see below. Consider also other cautions, contra-indications, and side-effects of beta-blockers (p. 97). Local side-effects of eye drops include ocular stinging, burning, pain, itching, erythema, dry eyes and allergic reactions including anaphylaxis and blepharoconjunctivitis; occasionally corneal disorders have been reported.

**Important** Beta-blockers, even those with apparent cardioselectivity, should not be used in patients with asthma or a

history of obstructive airways disease, unless no alternative treatment is available. In such cases the risk of inducing bronchospasm should be appreciated and appropriate precautions taken.

**Interactions** Since systemic absorption may follow topical application the possibility of interactions, in particular, with drugs such as verapamil should be borne in mind. See also Appendix 1 (beta-blockers).

### BETAXOLOL HYDROCHLORIDE

**Indications** see notes above

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

#### Dose

- Apply twice daily

**Betaxolol** (Non-proprietary) (POM)

**Eye drops**, solution, betaxolol (as hydrochloride) 0.5%, net price 5 mL = £1.90

**Excipients** may include benzalkonium chloride, disodium edetate

**Betoptic®** (Alcon) (POM)

**Ophthalmic solution** (= eye drops), betaxolol (as hydrochloride) 0.5%, net price 5 mL = £1.90

**Excipients** include benzalkonium chloride, disodium edetate

**Ophthalmic suspension** (= eye drops), betaxolol (as hydrochloride) 0.25%, net price 5 mL = £2.66

**Excipients** include benzalkonium chloride, disodium edetate

**Unit dose eye drop suspension**, betaxolol (as hydrochloride) 0.25%, net price 50 × 0.25 mL = £13.77

### CARTEOLOL HYDROCHLORIDE

**Indications** see notes above

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

#### Dose

- Apply twice daily

**Teoptic®** (Spectrum Thea) (POM)

**Eye drops**, carteolol hydrochloride 1%, net price 5 mL = £7.60; 2%, 5 mL = £8.40

**Excipients** include benzalkonium chloride

### LEVOBUNOLOL HYDROCHLORIDE

**Indications** see notes above

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above; anterior uveitis occasionally reported

#### Dose

- Apply once or twice daily

**Levobunolol** (Non-proprietary) (POM)

**Eye drops**, levobunolol hydrochloride 0.5%. Net price 5 mL = £3.05

**Betagan®** (Allergan) (POM)

**Eye drops**, levobunolol hydrochloride 0.5%, polyvinyl alcohol (*Liquifilm®*) 1.4%. Net price 5-mL = £1.85

**Excipients** include benzalkonium chloride, disodium edetate, sodium metabisulphite

**Unit dose eye drops**, levobunolol hydrochloride 0.5%, polyvinyl alcohol (*Liquifilm®*) 1.4%. Net price 30 × 0.4 mL = £9.98

**Excipients** include disodium edetate

## METIPRANOLOL

**Indications** see notes above but in chronic open-angle glaucoma **restricted** to patients allergic to preservatives or to those wearing soft contact lenses (in whom benzalkonium chloride should be avoided)

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above; granulomatous anterior uveitis reported (discontinue treatment)

### Dose

- Apply twice daily

**Minims® Metipranolol** (Bausch & Lomb) (POM)

Eye drops, metipranolol 0.1%, net price 20 × 0.5 mL = £11.77

## TIMOLOL MALEATE

**Indications** see notes above

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

### Dose

- Apply twice daily; long-acting preparations, apply once daily

**Timolol** (Non-proprietary) (POM)

Eye drops, timolol (as maleate) 0.25%, net price 5 mL = £11.56; 0.5%, 5 mL = £11.56

**Timoptol®** (MSD) (POM)

Eye drops, in *Accumeter®* metered-dose unit, timolol (as maleate) 0.25%, net price 5 mL = £3.12; 0.5%, 5 mL = £3.12

Excipients include benzalkonium chloride

Unit dose eye drops, timolol (as maleate) 0.25%, net price 30 × 0.2 mL = £8.45; 0.5%, 30 × 0.2 mL = £9.65

### Once-daily preparations

**Nyogel®** (Novartis) (POM)

Eye gel (= eye drops), timolol (as maleate) 0.1%, net price 5 g = £2.85

Excipients include benzalkonium chloride

Dose apply once daily

**Timoptol®-LA** (MSD) (POM)

Ophthalmic gel-forming solution (= eye drops), timolol (as maleate) 0.25%, net price 2.5 mL = £3.12; 0.5%, 2.5 mL = £3.12

Excipients include benzododecinium bromide

Dose apply once daily

### With bimatoprost

See under Bimatoprost

### With brimonidine

See under Brimonidine

### With brinzolamide

See under Brinzolamide

### With dorzolamide

See under Dorzolamide

### With latanoprost

See under Latanoprost

### With travoprost

See under Travoprost

## Prostaglandin analogues and prostamides

The prostaglandin analogues **latanoprost**, **tafuprost**, and **travoprost**, and the synthetic prostamide, **bimato-**

**prost**, increase uveoscleral outflow and subsequently reduce intra-ocular pressure. They are used to reduce intra-ocular pressure in ocular hypertension or open-angle glaucoma.

**Cautions** Before initiating treatment, patients should be monitored for possible change in eye colour since an increase in the brown pigment in the iris may occur; particular care is required in those with mixed coloured irides and those receiving treatment to one eye only. Use with caution in patients with aphakia, pseudophakia with torn posterior lens capsule or anterior chamber lenses, and in those with known risk factors for cystoid macular oedema, iritis, or uveitis. Care is also needed in patients with brittle or severe asthma. Do not use within 5 minutes of thiomersal-containing preparations. For use in contact lens wearers see Contact Lenses, p. 684.

**Side-effects** Side-effects of prostaglandin analogues and prostamides include brown pigmentation particularly in those with mixed-colour irides, blepharitis, ocular irritation and pain, conjunctival hyperaemia, transient punctate epithelial erosion, skin rash, dry eyes, headache, and photophobia; they may also cause, darkening, thickening and lengthening of eye lashes. Less frequent side-effects include eyelid oedema and rash, keratitis, blurred vision, and conjunctivitis. There have been rare reports of dyspnoea, exacerbation of asthma, dizziness, arthralgia, myalgia, iritis, uveitis, local oedema, darkening of palpebral skin. Very rarely chest pain, palpitations, and exacerbation of angina has also been reported.

## BIMATOPROST

**Indications** raised intra-ocular pressure in open-angle glaucoma; ocular hypertension

**Cautions** see notes above

**Hepatic impairment** use with caution in moderate to severe impairment—no information available

**Renal impairment** use with caution—no information available

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** manufacturer advises avoid—present in milk in *animal* studies

**Side-effects** see notes above; also nausea, asthenia, hypertension

### Dose

- Apply once daily, preferably in the evening; **CHILD** under 18 years, not recommended

**Lumigan®** (Allergan) (POM)

Eye drops, bimatoprost 100 micrograms/mL, net price 3 mL = £12.43, triple pack (3 × 3 mL) = £37.29; 300 micrograms/mL, 3 mL = £10.30, triple pack (3 × 3 mL) = £30.90

Excipients include benzalkonium chloride

### With timolol

For prescribing information on timolol, see section 11.6, Beta-blockers

**Ganfort®** (Allergan) (POM)

Eye drops, bimatoprost 300 micrograms/mL, timolol (as maleate) 5 mg/mL, net price 3-mL = £13.95

Excipients include benzalkonium chloride

**Dose** for raised intra-ocular pressure in patients with open-angle glaucoma or ocular hypertension when beta-blocker or prostaglandin analogue alone not adequate; apply once daily, preferably in the morning

## LATANOPROST

**Indications** raised intra-ocular pressure in open-angle glaucoma; ocular hypertension

**Cautions** see notes above; also cataract surgery

**Pregnancy** manufacturer advises avoid

**Breast-feeding** may be present in milk—manufacturer advises avoid

**Side-effects** see notes above

### Dose

- Apply once daily, preferably in the evening; **CHILD** not recommended

**Xalatan**® (Pharmacia) (POM)

**Eye drops**, latanoprost 50 micrograms/mL, net price 2.5 mL = £12.48

**Excipients** include benzalkonium chloride

### With timolol

For prescribing information on timolol, see section 11.6, Beta-blockers

**Xalacom**® (Pharmacia) (POM)

**Eye drops**, latanoprost 50 micrograms, timolol (as maleate) 5 mg/mL, net price 2.5 mL = £14.32

**Excipients** include benzalkonium chloride

**Dose** for raised intra-ocular pressure in patients with open-angle glaucoma and ocular hypertension when beta-blocker alone not adequate, apply once daily

## T AFLUPROST

**Indications** raised intra-ocular pressure in open-angle glaucoma; ocular hypertension

**Cautions** see notes above

**Hepatic impairment** use with caution—no information available

**Renal impairment** use with caution—no information available

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies

**Breast-feeding** manufacturer advises avoid—present in milk in *animal* studies

**Side-effects** see notes above

### Dose

- Apply once daily, preferably in the evening; **CHILD** under 18 years, not recommended

**Saflutan**® (MSD) (POM)

**Unit dose eye drops**, tafluprost 15 micrograms/mL, net price 30 × 0.3 mL = £17.41

## TRAVOPROST

**Indications** raised intra-ocular pressure in open-angle glaucoma; ocular hypertension

**Cautions** see notes above

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** present in milk in *animal* studies; manufacturer advises avoid

**Side-effects** see notes above; also reported hypotension, bradycardia, browache

### Dose

- Apply once daily, preferably in the evening; **CHILD** under 18 years, not recommended

**Travatan**® (Alcon) (POM)

**Eye drops**, travoprost 40 micrograms/mL, net price 2.5 mL = £9.98

### With timolol

For prescribing information on timolol, see section 11.6, Beta-blockers

**DuoTrav**® (Alcon) (POM)

**Eye drops**, travoprost 40 micrograms, timolol (as maleate) 5 mg/mL, net price 2.5 mL = £12.54

**Excipients** include benzalkonium chloride, disodium edetate

**Dose** for raised intra-ocular pressure in patients with open-angle glaucoma or ocular hypertension when beta-blocker or prostaglandin analogue alone not adequate; apply once daily; **CHILD** and **ADOLESCENT** under 18 years, not recommended

## Sympathomimetics

**Brimonidine**, a selective  $\alpha_2$ -adrenoceptor agonist, is licensed for the reduction of intra-ocular pressure in open-angle glaucoma or ocular hypertension in patients for whom beta-blockers are inappropriate; it may also be used as adjunctive therapy when intra-ocular pressure is inadequately controlled by other antiglaucoma therapy.

**Apraclonidine** (section 11.8.2) is another  $\alpha_2$ -adrenoceptor agonist. Eye drops containing apraclonidine 0.5% are used for a short term to delay laser treatment or surgery for glaucoma in patients not adequately controlled by another drug; eye drops containing 1% are used for control of intra-ocular pressure after anterior segment laser surgery.

## BRIMONIDINE TARTRATE

**Indications** raised intra-ocular pressure, see notes above

**Cautions** severe cardiovascular disease; cerebral or coronary insufficiency, Raynaud's syndrome, thromboangiitis obliterans, postural hypotension, depression; children 2–12 years (increased risk of drowsiness); **interactions:** Appendix 1 (brimonidine)

**Driving** Drowsiness may affect performance of skilled tasks (e.g. driving)

**Contra-indications** neonate or child under 2 years

**Hepatic impairment** manufacturer advises use with caution

**Renal impairment** manufacturer advises use with caution

**Pregnancy** manufacturer advises use only if benefit outweighs risk

**Breast-feeding** manufacturer advises avoid

**Side-effects** dry mouth, gastro-intestinal disturbances, taste disturbances, upper respiratory symptoms, headache, drowsiness, dizziness, malaise, ocular disturbances (including hyperaemia, burning, stinging, pruritus, pain and dryness), visual disturbances, eyelid inflammation, photophobia, corneal erosion and staining, conjunctival disturbances (including blanching, follicles, and infection); *less commonly* palpitation, arrhythmia, bradycardia, tachycardia, depression, nasal dryness; *rarely* dyspnoea; *very rarely* hypertension, hypotension, syncope, insomnia, iritis, miosis

### Dose

- Apply twice daily

**Brimonidine Tartrate** (Non-proprietary) (Pom)

**Eye drops**, brimonidine tartrate 0.2%, net price 5 mL = £6.55

Brands include *Brymont®*

Excipients may include benzalkonium chloride

**Alphagan®** (Allergan) (Pom)

**Eye drops**, brimonidine tartrate 0.2%, net price 5 mL = £6.85

Excipients include benzalkonium chloride

▲ **With timolol**

For prescribing information on timolol, see section 11.6, Beta-blockers

**Combigan®** (Allergan) (Pom)

**Eye drops**, brimonidine tartrate 0.2%, timolol (as maleate) 0.5%, net price 5-mL = £10.00

Excipients include benzalkonium chloride

**Dose** for raised intra-ocular pressure in open-angle glaucoma and for ocular hypertension when beta-blocker alone not adequate, apply twice daily

## Carbonic anhydrase inhibitors and systemic drugs

The **carbonic anhydrase inhibitors**, acetazolamide, brinzolamide, and dorzolamide, reduce intra-ocular pressure by reducing aqueous humour production. Systemic use also produces weak diuresis.

**Acetazolamide** is given by mouth or by intravenous injection (intramuscular injections are painful because of the alkaline pH of the solution). It is used as an adjunct to other treatment for reducing intra-ocular pressure. Acetazolamide is a sulphonamide; blood disorders, rashes, and other sulphonamide-related side-effects occur occasionally; patients should be told to report any unusual skin rash. It is not generally recommended for long-term use; electrolyte disturbances and metabolic acidosis that occur can be corrected by administering potassium bicarbonate (as effervescent potassium tablets, section 9.2.1.3).

**Dorzolamide** and **brinzolamide** are topical carbonic anhydrase inhibitors. They are licensed for use in patients resistant to beta-blockers or those in whom beta-blockers are contra-indicated. They are used alone or as an adjunct to a topical beta-blocker. Systemic absorption can rarely cause sulphonamide-like side-effects and may require discontinuation if severe.

The **osmotic diuretics**, intravenous hypertonic mannitol (section 2.2.5) or glycerol by mouth are useful short-term ocular hypotensive drugs.

## ACETAZOLAMIDE

**Indications** reduction of intra-ocular pressure in open-angle glaucoma, secondary glaucoma, and perioperatively in angle-closure glaucoma; diuresis (section 2.2.7); epilepsy

**Cautions** not generally recommended for prolonged use but if given monitor blood count and plasma-electrolyte concentration; pulmonary obstruction and impaired alveolar ventilation (risk of acidosis); elderly; diabetes mellitus; renal calculi; avoid extravasation at injection site (risk of necrosis); **interactions:** Appendix 1 (diuretics)

**Contra-indications** hypokalaemia, hyponatraemia, hyperchloraemic acidosis; adrenocortical insufficiency; long-term administration in chronic angle-closure glaucoma; sulfonamide hypersensitivity

**Hepatic impairment** manufacturer advises avoid

**Renal impairment** avoid—risk of metabolic acidosis

**Pregnancy** manufacturer advises avoid, especially in first trimester (toxicity in animal studies)

**Breast-feeding** amount too small to be harmful

**Side-effects** see notes above; also nausea, vomiting, diarrhoea, taste disturbance, loss of appetite, paraesthesia, flushing, headache, dizziness, fatigue, irritability, excitement, ataxia, depression; thirst, polyuria, reduced libido, *less commonly* melaena, drowsiness, confusion, hearing disturbances, fever, glycosuria, metabolic acidosis and electrolyte disturbances on long-term therapy, haematuria, crystalluria, renal and ureteric colic, renal lesions or calculi, renal failure, blood disorders, bone marrow suppression, rash (including Stevens-Johnson syndrome and toxic epidermal necrosis); *rarely* fulminant hepatic necrosis, hepatitis, cholestatic jaundice, flaccid paralysis, convulsions, photosensitivity; *also reported* transient myopia

**Dose**

- Glaucoma, by mouth or by intravenous injection, 0.25–1 g daily in divided doses
- Epilepsy, by mouth or by intravenous injection, 0.25–1 g daily in divided doses; CHILD 8–30 mg/kg daily, max. 750 mg daily

**Note** Dose by intramuscular injection, as for intravenous injection but preferably avoided because of alkalinity

**Diamox®** (Goldshield) (Pom)

**Tablets**, acetazolamide 250 mg. Net price 112-tablet pack = £12.68. Label: 3

**Sodium Parenteral** (= injection), powder for reconstitution, acetazolamide (as sodium salt). Net price 500-mg vial = £14.76

▲ **Modified release****Diamox® SR** (Goldshield) (Pom)

**Capsules**, m/r, orange, enclosing orange f/c pellets, acetazolamide 250 mg. Net price 30-cap pack = £13.88. Label: 3, 25

**Dose** glaucoma, 1–2 capsules daily

## BRINZOLAMIDE

**Indications** adjunct to beta-blockers or used alone in raised intra-ocular pressure in ocular hypertension and in open-angle glaucoma if beta-blocker alone inadequate or inappropriate

**Cautions** systemic absorption follows topical application; **interactions:** Appendix 1 (brinzolamide)

**Contra-indications** hyperchloraemic acidosis

**Hepatic impairment** manufacturer advises avoid

**Renal impairment** avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** manufacturer advises avoid unless essential—toxicity in animal studies

**Breast-feeding** manufacturer advises avoid

**Side-effects** local irritation, taste disturbance; less commonly nausea, dyspepsia, dry mouth, chest pain, epistaxis, haemoptysis, dyspnoea, rhinitis, pharyngitis, bronchitis, paraesthesia, depression, dizziness, headache, dermatitis, alopecia, corneal erosion

**Dose**

- Apply twice daily increased to 3 times daily if necessary

**Azoft®** (Alcon) (Pom)

**Eye drops**, brinzolamide 10 mg/mL, net price 5 mL = £6.56

Excipients include benzalkonium chloride, disodium edetate

**▲ With timolol**

For prescribing information on timolol, see section 11.6, Beta blockers

**Azarga®** (Alcon) ▼ (POM)

**Ophthalmic suspension** (= eye drops), brinzolamide 10 mg, timolol (as maleate) 5 mg/mL, net price 5 mL = £11.05

**Excipients** include benzalkonium chloride, disodium edetate

**Dose** for raised intra-ocular pressure in open-angle glaucoma or ocular hypertension when beta-blocker alone not adequate, **ADULT** over 18 years apply twice daily

**DORZOLAMIDE**

**Indications** raised intra-ocular pressure in ocular hypertension, open-angle glaucoma, pseudo-exfoliative glaucoma *either* as adjunct to beta-blocker *or* used alone in patients unresponsive to beta-blockers *or* if beta-blockers contra-indicated

**Cautions** systemic absorption follows topical application; history of renal calculi; chronic corneal defects, history of intra-ocular surgery; **interactions:** Appendix 1 (dorzolamide)

**Contra-indications** hyperchloraemic acidosis

**Hepatic impairment** manufacturer advises caution—no information available

**Renal impairment** avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** manufacturer advises avoid—toxicity in animal studies

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** nausea, bitter taste, dry mouth; headache, asthenia; ocular irritation, blurred vision, lacrimation, conjunctivitis, superficial punctate keratitis, eyelid inflammation; *less commonly* iridocyclitis; *rarely* hypersensitivity reactions (including urticaria, angioedema, bronchospasm), dizziness, paraesthesia, urolithiasis, eyelid crusting, transient myopia, corneal oedema, epistaxis, throat irritation

**Dose**

- Used alone, apply 3 times daily
- With topical beta-blocker, apply twice daily

**Dorzolamide** (Non-proprietary) (POM)

**Eye drops**, dorzolamide (as hydrochloride) 2%, net price 5 mL = £5.61

**Excipients** may include benzalkonium chloride

**Trusopt®** (MSD) (POM)

**Ophthalmic solution** (= eye drops), in *Ocumeter® Plus* metered-dose unit, dorzolamide (as hydrochloride) 2%, net price 5 mL = £6.33

**Excipients** include benzalkonium chloride

**Unit dose eye drops**, dorzolamide (as hydrochloride) 2%, net price 60 × 0.2 mL = £24.18

**▲ With timolol**

For prescribing information on timolol, see section 11.6, Beta-blockers

**Dorzolamide with Timolol** (Non-proprietary) (POM)

**Eye drops**, dorzolamide (as hydrochloride) 2%, timolol (as maleate) 0.5%, net price 5 mL = £10.05

**Excipients** may include benzalkonium chloride

**Cosopt®** (MSD) (POM)

**Ophthalmic solution** (= eye drops), in *Ocumeter® Plus* metered-dose unit, dorzolamide (as hydrochloride) 2%, timolol (as maleate) 0.5%, net price 5 mL = £10.05

**Excipients** include benzalkonium chloride

**Unit dose eye drops**, dorzolamide (as hydrochloride) 2%, timolol (as maleate) 0.5%, net price 60 × 0.2 mL = £28.59

**Miotics**

The small pupil is an unfortunate side-effect of these drugs (except when pilocarpine is used temporarily before an operation for *angle-closure glaucoma*). They act by opening up the inefficient drainage channels in the trabecular meshwork resulting from contraction or spasm of the ciliary muscle.

**Pilocarpine**, a miotic, is used in the management of raised intra-ocular pressure.

**Cautions** A darkly pigmented iris may require higher concentration of the miotic or more frequent administration and care should be taken to avoid overdosage. Retinal detachment has occurred in susceptible individuals and those with retinal disease; therefore fundus examination is advised before starting treatment with a miotic. Care is also required in conjunctival or corneal damage. Intra-ocular pressure and visual fields should be monitored in those with chronic simple glaucoma and those receiving long-term treatment with a miotic. Miotics should be used with caution in patients with peptic ulceration, gastro-intestinal spasm, cardiac disease, hypertension, hypotension, marked vasomotor instability, asthma, epilepsy, Parkinson's disease, hyperthyroidism, and urinary-tract obstruction.

**Counselling** Blurred vision may affect performance of skilled tasks (e.g. driving) particularly at night or in reduced lighting

**Contra-indications** Miotics are contra-indicated in conditions where pupillary constriction is undesirable such as acute iritis, anterior uveitis and some forms of secondary glaucoma. They should be avoided in acute inflammatory disease of the anterior segment.

**Pregnancy** avoid unless potential benefit outweighs risk—limited information available

**Breast-feeding** avoid unless potential benefit outweighs risk—no information available

**Side-effects** Ciliary spasm leads to headache and browache which may be more severe in the initial 2–4 weeks of treatment (a particular disadvantage in patients under 40 years of age). Ocular side-effects include burning, itching, smarting, blurred vision, conjunctival vascular congestion, myopia, lens changes with chronic use, vitreous haemorrhage, and pupillary block. Systemic side-effects (see under Parasympathomimetics, section 7.4.1) are rare following application to the eye.

**PILOCARPINE**

**Indications** see notes above; dry mouth (section 12.3.5)

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Dose**

- Apply up to 4 times daily; long-acting preparations, see under preparations below

**Pilocarpine Hydrochloride** (Non-proprietary) (PoM)  
**Eye drops**, pilocarpine hydrochloride 1%, net price 10 mL = £3.00; 2%, 10 mL = £2.87; 4%, 10 mL = £3.83  
 Excipients may include benzalkonium chloride

#### Single use

**Minims® Pilocarpine Nitrate** (Bausch & Lomb) (PoM)  
**Eye drops**, pilocarpine nitrate 2%, net price 20 × 0.5 mL = £10.04

#### Long acting

**Pilogel®** (Alcon) (PoM)  
**Ophthalmic gel**, pilocarpine hydrochloride 4%, net price 5 g = £6.52  
 Excipients include benzalkonium chloride, disodium edetate  
**Dose** apply 1–1.5 cm gel once daily at bedtime

## 11.7 Local anaesthetics

Oxybuprocaine and tetracaine (amethocaine) are widely used topical local anaesthetics. Proxymetacaine causes less initial stinging and is useful for children. Oxybuprocaine or a combined preparation of lidocaine and fluorescein is used for tonometry. Tetracaine produces a more profound anaesthesia and is suitable for use before minor surgical procedures, such as the removal of corneal sutures. It has a temporary disruptive effect on the corneal epithelium. Lidocaine, with or without adrenaline (epinephrine), is injected into the eyelids for minor surgery, while retrobulbar or peribulbar injections are used for surgery of the globe itself. Local anaesthetics should never be used for the management of ocular symptoms.

Local anaesthetic eye drops should be avoided in pre-term neonates because of the immaturity of the metabolising enzyme system.

### LIDOCAINE HYDROCHLORIDE

(Lignocaine hydrochloride)

**Indications** local anaesthetic

**Minims® Lidocaine and Fluorescein** (Bausch & Lomb) (PoM)

**Eye drops**, lidocaine hydrochloride 4%, fluorescein sodium 0.25%. Net price 20 × 0.5 mL = £10.61

### OXYBUPROCAINE HYDROCHLORIDE

(Benoxinate hydrochloride)

**Indications** local anaesthetic

**Minims® Oxybuprocaine Hydrochloride** (Bausch & Lomb) (PoM)

**Eye drops**, oxybuprocaine hydrochloride 0.4%. Net price 20 × 0.5 mL = £8.92

### PROXYMETACAINE HYDROCHLORIDE

**Indications** local anaesthetic

**Minims® Proxymetacaine** (Bausch & Lomb) (PoM)  
**Eye drops**, proxymetacaine hydrochloride 0.5%. Net price 20 × 0.5 mL = £9.51

#### With fluorescein

**Minims® Proxymetacaine and Fluorescein** (Bausch & Lomb) (PoM)

**Eye drops**, proxymetacaine hydrochloride 0.5%, fluorescein sodium 0.25%. Net price 20 × 0.5 mL = £10.59

### TETRACAINE HYDROCHLORIDE

(Amethocaine hydrochloride)

**Indications** local anaesthetic

**Minims® Tetracaine Hydrochloride** (Bausch & Lomb) (PoM)

**Eye drops**, tetracaine hydrochloride 0.5% and 1%. Net price 20 × 0.5 mL (both) = £8.93

## 11.8 Miscellaneous ophthalmic preparations

**11.8.1** Tear deficiency, ocular lubricants, and astringents

**11.8.2** Ocular diagnostic and peri-operative preparations and photodynamic treatment

Certain eye drops, e.g. amphotericin, ceftazidime, cefuroxime, colistin, desferrioxamine, dexamethasone, gentamicin, and vancomycin can be prepared aseptically from material supplied for injection.

### 11.8.1 Tear deficiency, ocular lubricants, and astringents

Chronic soreness of the eyes associated with reduced or abnormal tear secretion (e.g. in Sjögren's syndrome) often responds to tear replacement therapy or pilocarpine given by mouth (section 12.3.5). The severity of the condition and patient preference will often guide the choice of preparation.

**Hypromellose** is the traditional choice of treatment for tear deficiency. It may need to be instilled frequently (e.g. hourly) for adequate relief. Ocular surface mucin is often abnormal in tear deficiency and the combination of hypromellose with a mucolytic such as **acetylcysteine** can be helpful.

The ability of **carbomers** to cling to the eye surface may help reduce frequency of application to 4 times daily.

**Polyvinyl alcohol** increases the persistence of the tear film and is useful when the ocular surface mucin is reduced.

**Povidone** and **sodium hyaluronate** eye drops are also used in the management of tear deficiency.

**Sodium chloride** 0.9% drops are sometimes useful in tear deficiency, and can be used as 'comfort drops' by contact lens wearers, and to facilitate lens removal. Special presentations of sodium chloride 0.9% and other irrigation solutions are used routinely for intra-ocular surgery.

Eye ointments containing a **paraffin** can be used to lubricate the eye surface, especially in cases of recurrent corneal epithelial erosion. They may cause temporary visual disturbance and are best suited for application

before sleep. Ointments should not be used during contact lens wear.

## ACETYL CYSTEINE

**Indications** tear deficiency, impaired or abnormal mucus production

### Dose

- Apply 3–4 times daily

**Ilube**<sup>®</sup> (Moorfields) (POM)

Eye drops, acetylcysteine 5%, hypromellose 0.35%.

Net price 10 mL = £4.40

Excipients include benzalkonium chloride, disodium edetate

## CARBOMERS

(Polyacrylic acid)

**Note** Synthetic high molecular weight polymers of acrylic acid cross-linked with either allyl ethers of sucrose or allyl ethers of pentaerythritol

**Indications** dry eyes including keratoconjunctivitis sicca, unstable tear film

### Dose

- Apply 3–4 times daily or as required

**Clinitas Gel**<sup>®</sup> (Altacor)

Gel (= eye drops), carbomer 980 (polyacrylic acid)

0.2%, net price 10 g = £1.49

**GelTears**<sup>®</sup> (Bausch & Lomb)

Gel (= eye drops), carbomer 980 (polyacrylic acid)

0.2%, net price 10 g = £2.80

Excipients include benzalkonium chloride

**Liposic**<sup>®</sup> (Bausch & Lomb)

Gel (= eye drops), carbomer 980 (polyacrylic acid)

0.2%, net price 10 g = £2.96

Excipients include cetrimide

**Liquivisc**<sup>®</sup> (Spectrum Tea)

Gel (= eye drops), carbomer 974P (polyacrylic acid)

0.25%, net price 10 g = £4.50

Excipients include benzalkonium chloride

**Lumecare**<sup>®</sup> Long Lasting Tear Gel (Medicom)

Gel (= eye drops), carbomer 980 (polyacrylic acid)

0.2%, net price 10 g = £2.10

Excipients include cetrimide

**Viscotears**<sup>®</sup> (Novartis)

Liquid gel (= eye drops), carbomer 980 (polyacrylic acid)

0.2%, net price 10 g = £2.94

Excipients include cetrimide

Liquid gel (= eye drops), carbomer 980 (polyacrylic acid)

0.2%, net price 30 × 0.6-mL single-dose units = £5.42

## CARMELOSE SODIUM

**Indications** dry eye conditions

### Dose

- Apply as required

**Optive**<sup>®</sup> (Allergan)

Eye drops, carmellose sodium 0.5%, glycerol, net

price 10 mL = £7.49

### Single use

**Celluvisc**<sup>®</sup> (Allergan)

Eye drops, carmellose sodium 0.5%, net price 30 ×

0.4 mL = £5.75, 90 × 0.4 mL = £15.53; 1%, 30 ×

0.4 mL = £3.00, 60 × 0.4 mL = £10.99

## HYDROXYETHYLCELLULOSE

**Indications** tear deficiency

**Minims**<sup>®</sup> Artificial Tears (Bausch & Lomb)

Eye drops, hydroxyethylcellulose 0.44%, sodium chloride 0.35%. Net price 20 × 0.5 mL = £8.21

## HYDROXYPROPYL GUAR

**Indications** dry eye conditions

### Dose

- Apply as required

**Systane**<sup>®</sup> (Alcon)

Eye drops, hydroxypropyl guar, net price 10 mL = £4.66

### Single use

**Systane**<sup>®</sup> (Alcon)

Eye drops, hydroxypropyl guar, net price 28 × 0.8 mL = £4.66

## HYPROMELLOSE

**Indications** tear deficiency

**Note** The Royal Pharmaceutical Society has stated that where it is not possible to ascertain the strength of hypromellose prescribed, the prescriber should be contacted to clarify the strength intended.

**Hypromellose** (Non-proprietary)

Eye drops, hypromellose 0.3%, net price 10 mL = £1.61

Excipients may include benzalkonium chloride

Brands include *Artelac*<sup>®</sup>, *Lumecare*<sup>®</sup> *Hypromellose*

**Isopto Alkaline**<sup>®</sup> (Alcon)

Eye drops, hypromellose 1%, net price 10 mL = 94p

Excipients include benzalkonium chloride

**Isopto Plain**<sup>®</sup> (Alcon)

Eye drops, hypromellose 0.5%, net price 10 mL = 81p

Excipients include benzalkonium chloride

**Tears Naturale**<sup>®</sup> (Alcon)

Eye drops, hypromellose 0.3%, dextran '70' 0.1%, net price 15 mL = £1.60

Excipients include benzalkonium chloride, disodium edetate

### Single use

**Artelac**<sup>®</sup> SDU (Pharma-Global)

Eye drops, hypromellose 0.32%, net price 30 × 0.5 mL = £16.95

**Hidromoor**<sup>®</sup> (Moorfields)

Eye drops, hypromellose 0.3%, net price 30 × 0.4 mL = £5.75

**Lumecare**<sup>®</sup> Preservative Free Tear Drops (Medicom)

Eye drops, hypromellose 0.3%, net price 30 × 0.5 mL = £5.72

**Tears Naturale**<sup>®</sup> Single Dose (Alcon)

Eye drops, hypromellose 0.3%, dextran '70' 0.1%, net price 28 × 0.4 mL = £13.26

## LIQUID PARAFFIN

**Indications** dry eye conditions

**Lacri-Lube**<sup>®</sup> (Allergan)

Eye ointment, white soft paraffin 57.3%, liquid paraffin 42.5%, wool alcohols 0.2%. Net price 3.5 g = £2.51, 5 g = £3.32

**PARAFFIN, YELLOW, SOFT****Indications** see notes above**Simple Eye Ointment****Ointment**, liquid paraffin 10%, wool fat 10%, in yellow soft paraffin. Net price 4 g = £3.06**POLYVINYL ALCOHOL****Indications** tear deficiency**Liquifilm Tears®** (Allergan)**Ophthalmic solution** (= eye drops), polyvinyl alcohol 1.4%. Net price 15 mL = £1.93**Excipients** include benzalkonium chloride, disodium edetate**Ophthalmic solution** (= eye drops), polyvinyl alcohol 1.4%, povidone 0.6%. Net price 30 × 0.4 mL = £5.35**Sno Tears®** (Bausch & Lomb)**Eye drops**, polyvinyl alcohol 1.4%. Net price 10 mL = £1.06**Excipients** include benzalkonium chloride, disodium edetate**POVIDONE****Indications** dry eye conditions**Dose**

- Apply 4 times daily or as required

**Oculotect®** (Novartis)**Eye drops**, povidone 5%. Net price 20 × 0.4 mL = £3.40**SODIUM CHLORIDE****Indications** irrigation, including first-aid removal of harmful substances**Sodium Chloride 0.9% Solutions**

See section 13.11.1

**Balanced Salt Solution****Solution** (sterile), sodium chloride 0.64%, sodium acetate 0.39%, sodium citrate 0.17%, calcium chloride 0.048%, magnesium chloride 0.03%, potassium chloride 0.075%For intra-ocular or topical irrigation during surgical procedures  
**Brands** include *Iocare®***Single use****Minims® Saline** (Bausch & Lomb)**Eye drops**, sodium chloride 0.9%. Net price 20 × 0.5 mL = £6.59**SODIUM HYALURONATE****Indications** dry eye conditions**Dose**

- Apply as required

**Hybak®** (Spectrum Thea)**Eye drops**, sodium hyaluronate 0.15%, net price 10 mL = £7.99**Hylo-Care®** (Scope Ophthalmics)**Eye drops**, sodium hyaluronate 0.1%, dexpanthenol 2%, net price 10 mL = £10.30**Hylo-Forte®** (Scope Ophthalmics)**Eye drops**, sodium hyaluronate 0.2%, net price 10 mL = £10.80**Hylo-Tear®** (Scope Ophthalmics)**Eye drops**, sodium hyaluronate 0.1%, net price 10 mL = £9.80**Oxyl®** (Kestrel Ophthalmics)**Eye drops**, sodium hyaluronate 0.15%, net price 10 mL = £4.15**Vismed® Multi** (TRB Chemedica)**Eye drops**, sodium hyaluronate 0.18%, net price 10 mL = £6.81**Single use****Clinitas®** (Altacor)**Eye drops**, sodium hyaluronate 0.4%, net price 30 × 0.5 mL = £5.70**Note** Each unit is resealable for up to 12 hours**Ocusan®** (Agepha)**Eye drops**, sodium hyaluronate 0.2%, net price 20 × 0.5 mL = £5.25**Vismed®** (TRB Chemedica)**Eye drops**, sodium hyaluronate 0.18%, net price 20 × 0.3 mL = £5.10**11.8.2 Ocular diagnostic and peri-operative preparations and photodynamic treatment****Ocular diagnostic preparations****Fluorescein sodium** is used in diagnostic procedures and for locating damaged areas of the cornea due to injury or disease.**FLUORESCIN SODIUM****Indications** detection of lesions and foreign bodies**Minims® Fluorescein Sodium** (Bausch & Lomb)**Eye drops**, fluorescein sodium 1% or 2%. Net price 20 × 0.5 mL (both) = £7.53**With local anaesthetic**

Section 11.7

**Ocular peri-operative drugs**

Drugs used to prepare the eye for surgery, drugs that are injected into the anterior chamber at the time of surgery, and those used after eye surgery, are included here.

Non-steroidal anti-inflammatory eye drops such as **diclofenac**, **flurbiprofen**, **ketorolac**, and **nepafenac**, are used for the prophylaxis and treatment of inflammation, pain, and other symptoms associated with ocular surgery or laser treatment of the eye. Diclofenac and flurbiprofen are also used to prevent miosis during ocular surgery.**Apraclonidine**, an  $\alpha_2$ -adrenoreceptor agonist, reduces intra-ocular pressure possibly by reducing the production of aqueous humour. It is used to control increases in intra-ocular pressure associated with ocular surgery and as short-term treatment to reduce intra-ocular pressure prior to surgery.**Acetylcholine**, instilled into the anterior chamber of the eye during surgery, rapidly produces miosis which lasts approximately 20 minutes. If prolonged miosis is required, it can be applied again.

Intra-ocular **sodium hyaluronate** and balanced salt solution (section 11.8.1) are used during surgical procedures on the eye.

## ACETYLCHOLINE CHLORIDE

**Indications** cataract surgery, penetrating keratoplasty, iridectomy, and other anterior segment surgery requiring rapid complete miosis

**Cautions** gastro-intestinal spasm, peptic ulcer; heart failure; asthma; hyperthyroidism, urinary-tract obstruction; parkinsonism

**Pregnancy** avoid unless potential benefit outweighs risk—no information available

**Breast-feeding** avoid unless potential benefit outweighs risk—no information available

**Side-effects** rarely bradycardia, hypotension, breathing difficulty, sweating, flushing

**Miochol-E®** (Novartis) (POM)  
Intra-ocular irrigation, powder for reconstitution, acetylcholine chloride 10 mg/mL (1%) when reconstituted, net price 20-mg vial (with solvent) = £7.28

**Miphtel®** (SD Healthcare) (POM)  
Intra-ocular irrigation, powder for reconstitution, acetylcholine chloride 10 mg/mL (1%) when reconstituted, net price 20-mg vial (with solvent) = £7.28

## APRACLONIDINE

Note Apraclonidine is a derivative of clonidine

**Indications** control of intra-ocular pressure

**Cautions** history of angina, severe coronary insufficiency, recent myocardial infarction, heart failure, cerebrovascular disease, vasovagal attack, chronic renal failure; depression; monitor intra-ocular pressure and visual fields; loss of effect may occur over time; suspend treatment if reduction in vision occurs in end-stage glaucoma; monitor for excessive reduction in intra-ocular pressure following peri-operative use; **interactions:** Appendix 1 (apraclonidine)

**Driving** Drowsiness may affect performance of skilled tasks (e.g. driving)

**Contra-indications** history of severe or unstable and uncontrolled cardiovascular disease

**Pregnancy** manufacturer advises caution—toxicity in animal studies

**Breast-feeding** manufacturer advises caution—no information available

**Side-effects** dry mouth, taste disturbance; hyperaemia, ocular pruritus, discomfort and lacrimation (withdraw if ocular intolerance including oedema of lids and conjunctiva); headache, asthenia, dry nose; lid retraction, conjunctival blanching and mydriasis reported after peri-operative use; since absorption may follow topical application systemic effects (see Clonidine, section 2.5.2) may occur

### Dose

- See under preparations below

**lopidine®** (Alcon) (POM)  
Ophthalmic solution (= eye drops), apraclonidine 1% (as hydrochloride), net price 12 × 2 single use 0.25-mL units = £77.81

**Dose** control or prevention of postoperative elevation of intra-ocular pressure after anterior segment laser surgery, apply 1 drop 1 hour before laser procedure then 1 drop immediately after completion of procedure; CHILD not recommended

**lopidine 0.5% ophthalmic solution** (= eye drops), apraclonidine 0.5% (as hydrochloride), net price 5 mL = £10.88

**Excipients** include benzalkonium chloride

**Dose** short-term adjunctive treatment of chronic glaucoma in patients not adequately controlled by another drug (see note below), apply 1 drop 3 times daily usually for max. 1 month; CHILD not recommended

**Note** May not provide additional benefit if patient already using two drugs that suppress the production of aqueous humour

## DICLOFENAC SODIUM

**Indications** inhibition of intra-operative miosis during cataract surgery (but does not possess intrinsic mydriatic properties); postoperative inflammation in cataract surgery, strabismus surgery or argon laser trabeculoplasty; pain in corneal epithelial defects after photorefractive keratectomy, radial keratotomy or accidental trauma; seasonal allergic conjunctivitis (section 11.4.2)

**Voltarol® Ophtha Multidose** (Novartis) (POM)  
Eye drops, diclofenac sodium 0.1%, net price 5 mL = £6.68

**Excipients** include benzalkonium chloride, disodium edetate, propylene glycol

### Single use

**Voltarol® Ophtha** (Novartis) (POM)  
Eye drops, diclofenac sodium 0.1%, net price pack of 5 single-dose units = £4.00, 40 single-dose units = £32.00

## FLURBIPROFEN SODIUM

**Indications** inhibition of intra-operative miosis (but does not possess intrinsic mydriatic properties); anterior segment inflammation following postoperative and post-laser trabeculoplasty when corticosteroids contra-indicated

**Ocufen®** (Allergan) (POM)  
Ophthalmic solution (= eye drops), flurbiprofen sodium 0.03%, polyvinyl alcohol (*Liquifilm®*) 1.4%, net price 40 × 0.4 mL = £37.15

## KETOROLAC TROMETAMOL

**Indications** prophylaxis and reduction of inflammation and associated symptoms following ocular surgery

**Acular®** (Allergan) (POM)  
Eye drops, ketorolac trometamol 0.5%, net price 5 mL = £3.00

**Excipients** include benzalkonium chloride, disodium edetate

## NEPAFENAC

**Indications** prophylaxis and treatment of postoperative pain and inflammation associated with cataract surgery

**Cautions** avoid sunlight; discontinue immediately if evidence of corneal epithelial breakdown

**Side-effects** headache; punctate keratitis, blurred vision, eye pruritus, dry eye; *less commonly* nausea, dry mouth; iritis; keratitis, corneal deposits, choroidal effusion, allergic conjunctivitis, increased lacrimation, photophobia, conjunctival hyperaemia

**Nevanac®** (Alcon) ▼ (POM)  
Ophthalmic suspension (= eye drops), nepafenac 1 mg/mL, net price 5 mL = £14.92  
**Excipients** include benzalkonium chloride, disodium edetate

## Subfoveal choroidal neovascularisation

**Pegaptanib** and **ranibizumab** are vascular endothelial growth factor inhibitors licensed for the treatment of neovascular (wet) age-related macular degeneration; they are given by intravitreal injection by specialists experienced in the management of this condition.

### NICE guidance

#### Ranibizumab and pegaptanib for the treatment of wet age-related macular degeneration (August 2008)

Ranibizumab is recommended for the treatment of wet age-related macular degeneration if all of the following apply:

- the best corrected visual acuity is between 6/12 and 6/96;
- there is no permanent structural damage to the central fovea;
- the lesion size is less than or equal to 12 disc areas in greatest linear dimension;
- there is evidence of recent disease progression;
- the cost of ranibizumab beyond 14 injections is met by the manufacturer.

Ranibizumab should only be continued in patients who maintain adequate response to therapy. Pegaptanib is not recommended for the treatment of wet age-related macular degeneration; patients currently receiving pegaptanib for any lesion type can continue therapy until they and their specialist consider it appropriate to stop.

**Verteporfin** is licensed for use in the photodynamic treatment of age-related macular degeneration associated with predominantly classic subfoveal choroidal neovascularisation or with pathological myopia (see NICE guidance below). Following intravenous infusion, verteporfin is activated by local irradiation using non-thermal red light to produce cytotoxic derivatives. Only specialists experienced in the management of these conditions should use it.

### NICE guidance

#### Photodynamic therapy for wet age-related macular degeneration (September 2003)

Photodynamic therapy is recommended for wet age-related macular degeneration with a confirmed diagnosis of classic (no occult) subfoveal choroidal neovascularisation and best-corrected visual acuity of 6/60 or better.

Photodynamic therapy is **not** recommended for wet age-related macular degeneration with predominantly classic but partly occult subfoveal choroidal neovascularisation *except* in clinical studies.

## PEGAPTANIB SODIUM

**Indications** see notes above—specialist use only

**Cautions** monitor intra-ocular pressure following injection

**Contra-indications** ocular or periocular infection

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** rhinorrhoea; headache; eye pain, anterior chamber inflammation, raised intra-ocular pressure, punctate keratitis, vitreous floaters, cataract, conjunctival and retinal haemorrhage, local oedema, conjunctivitis, corneal dystrophy, dry eye, endophthalmitis, eye discharge, eye irritation, macular degeneration, mydriasis, periorbital haematoma, photophobia, flashing lights, vitreous disorders; *less commonly* vomiting, dyspepsia, palpitation, chest pain, hypertension, aortic aneurysm, influenza-like symptoms, nightmares, depression, back pain, asthenopia, blepharitis, corneal deposits, vitreous haemorrhage, chalazion, retinal exudates, eyelid ptosis, decreased intra-ocular pressure, injection-site reactions, retinal detachment, occlusion of retinal blood vessels, ectropion, eye movement disorder, pupillary disorder, iritis, optic nerve cupping, nasopharyngitis, deafness, vertigo, eczema, changes in hair colour, rash, pruritus, night sweats

### Dose

- **By intravitreal injection**, 300 micrograms once every 6 weeks into the affected eye

**Note** For further information on administration, consult product literature. Review treatment if no benefit after 2 consecutive injections

**Macugen**® (Pfizer) (POM)

Solution for intravitreal injection, pegaptanib (as sodium salt), net price 300-microgram vial = £514.00

## RANIBIZUMAB

**Indications** see notes above—specialist use only

**Cautions** monitor intra-ocular pressure and for signs of ocular infection following injection

**Contra-indications** ocular or periocular infection; severe intra-ocular inflammation

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk and recommends effective contraception during treatment

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** nausea; headache; nasopharyngitis, cough; anxiety; anaemia; arthralgia; raised intra-ocular pressure, visual disturbance, conjunctival retinal and vitreous disorders, eye inflammation and irritation, eye haemorrhage; allergic skin reactions; *less commonly* atrial fibrillation, blindness, corneal disorders, iris adhesion, injection site reactions

### Dose

- **By intravitreal injection**, initially 500 micrograms once a month for 3 months into the affected eye, thereafter monitor visual acuity once a month; if necessary subsequent doses may be given at least 1 month apart

**Note** For further information on administration, consult product literature

Antimicrobial eye drops should be administered into the affected eye for 3 days before and 3 days after each injection

**Lucentis**® (Novartis) ▼ (POM)

Solution for intravitreal injection, ranibizumab 10 mg/mL, net price 0.23-mL vial = £761.20

## VERTEPORFIN

**Indications** see notes above—specialist use only

**Cautions** photosensitivity—avoid exposure of unprotected skin and eyes to bright light during infusion and for 48 hours afterwards; concomitant use with other

photosensitising drugs; biliary obstruction; avoid extravasation

**Contra-indications** acute porphyria

**Hepatic impairment** use with caution in moderate impairment; avoid in severe impairment

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk (teratogenic in *animal* studies)

**Breast-feeding** no information available—manufacturer advises avoid breast-feeding for 48 hours after administration

**Side-effects** nausea, hypercholesterolaemia, malaise, back pain, photosensitivity, visual disturbances (including reduced visual acuity, flashing lights, visual-field defects), *less commonly* hypertension, hyperaesthesia, pyrexia, retinal detachment, haemorrhage, *rarely* retinal or choroidal vessel non-perfusion; *also reported* chest pain, myocardial infarction

#### Dose

- By intravenous infusion over 10 minutes, 6 mg/m<sup>2</sup>

**Note** For information on administration and light activation, consult product literature

**Visudyne**<sup>®</sup> (Novartis) (P<sub>M</sub>)

**Injection**, powder for reconstitution, verteporfin, net price 15-mg vial = £850.00

**Excipients** include butylated hydroxytoluene

used in conjunction with contact lens wear; oily eye drops should also be avoided.

Many drugs given systemically can also have adverse effects on contact lens wear. These include oral contraceptives (particularly those with a higher oestrogen content), drugs which reduce blink rate (e.g. anxiolytics, hypnotics, antihistamines, and muscle relaxants), drugs which reduce lacrimation (e.g. antihistamines, antimuscarinics, phenothiazines and related drugs, some beta-blockers, diuretics, and tricyclic antidepressants), and drugs which increase lacrimation (including ephedrine and hydalazine). Other drugs that may affect contact lens wear are isotretinoin (can cause conjunctival inflammation), aspirin (salicylic acid appears in tears and can be absorbed by contact lenses—leading to irritation), and rifampicin and sulfasalazine (can discolour lenses).

## 11.9 Contact lenses

For cosmetic reasons many people prefer to wear contact lenses rather than spectacles; contact lenses are also sometimes required for medical indications. Visual defects are corrected by either rigid ('hard' or gas permeable) lenses or soft (hydrogel or silicone hydrogel) lenses; soft lenses are the most popular type, because they are initially the most comfortable, but they may not give the best vision. Lenses should usually be worn for a specified number of hours each day and removed for sleeping. Continuous (extended) wear involves much greater risks to eye health and is not generally recommended except where medically indicated.

Contact lenses require meticulous care. Poor compliance with directions for use, and with daily cleaning and disinfection, can result in complications including ulcerative keratitis or conjunctivitis. One-day disposable lenses, which are worn only once and therefore require no disinfection or cleaning, are becoming increasingly popular.

*Acanthamoeba keratitis*, a painful and sight-threatening condition, is associated with ineffective lens cleaning and disinfection, the use of contaminated lens cases, or tap water coming into contact with the lenses. The condition is especially associated with the use of soft lenses (including frequently replaced lenses) and should be treated by specialists.

**Contact lenses and drug treatment** Special care is required in prescribing eye preparations for contact lens users. Some drugs and preservatives in eye preparations can accumulate in hydrogel lenses and may induce toxic reactions. Therefore, unless medically indicated, the lenses should be removed before drop instillation and not worn during the period of treatment. Alternatively, unpreserved drops can be used. Eye drops may, however, be instilled while patients are wearing rigid corneal contact lenses. Ointment preparations should never be

## 12.1 Drugs acting on the ear

12.1.1	Otitis externa
12.1.2	Otitis media
12.1.3	Removal of ear wax

### 12.1.1 Otitis externa

Otitis externa is an inflammatory reaction of the meatal skin. It is important to exclude an underlying chronic otitis media before treatment is commenced. Many cases recover after thorough cleansing of the external ear canal by suction or dry mopping. A frequent problem in resistant cases is the difficulty in applying lotions and ointments satisfactorily to the relatively inaccessible affected skin. The most effective method is to introduce a ribbon gauze dressing or sponge wick soaked with **corticosteroid** ear drops or with an astringent such as **aluminium acetate** solution. When this is not practical, the ear should be gently cleansed with a probe covered in cotton wool and the patient encouraged to lie with the affected ear uppermost for ten minutes after the canal has been filled with a liberal quantity of the appropriate solution.

If infection is present, a topical anti-infective which is not used systemically (such as **neomycin** or **clioquinol**) may be used, but for only about a week as excessive use may result in fungal infections; these may be difficult to treat and require expert advice. Sensitivity to the anti-infective or solvent may occur and resistance to antibacterials is a possibility with prolonged use. Aluminium acetate ear drops are also effective against bacterial infection and inflammation of the ear. **Chloramphenicol** may be used but the ear drops contain propylene glycol and cause hypersensitivity reactions in about 10% of patients. Solutions containing an anti-infective and a corticosteroid (such as *Locorten-Vioform*<sup>®</sup>) are used for treating cases where infection is present with inflammation and eczema.

In view of reports of ototoxicity in patients with a perforated tympanic membrane (eardrum), manufacturers contra-indicate treatment with a topical aminoglycoside antibiotic in those with a tympanic perforation. However, many specialists do use these drops cautiously in the presence of a perforation in patients with otitis media (section 12.1.2) and when other measures have failed for otitis externa.

A solution of **acetic acid 2%** acts as an antifungal and antibacterial in the external ear canal. It may be used to treat mild otitis externa but in severe cases an anti-inflammatory preparation with or without an anti-infective drug is required. A proprietary preparation containing acetic acid 2% (*EarCalm*<sup>®</sup> spray) is on sale to the public.

For severe pain associated with otitis externa, a simple analgesic, such as **paracetamol** (section 4.7.1) or **ibu-**

**profen** (section 10.1.1), can be used. A systemic antibacterial (Table 1, section 5.1) can be used if there is spreading cellulitis or if the patient is systemically unwell. When a resistant staphylococcal infection (a boil) is present in the external auditory meatus, **flucloxacillin** is the drug of choice; **ciprofloxacin** (or an aminoglycoside) may be needed in pseudomonal infections which may occur if the patient has diabetes or is immunocompromised.

The skin of the pinna adjacent to the ear canal is often affected by eczema. Topical corticosteroid creams and ointments (section 13.4) are then required, but prolonged use should be avoided.

## Astringent preparations

### ALUMINIUM ACETATE

**Indications** inflammation in otitis externa (see notes above)

#### Dose

- Insert into meatus or apply on a ribbon gauze dressing or sponge wick which should be kept saturated with the ear drops

**Aluminium Acetate** (Non-proprietary)

**Ear drops 13%**, aluminium sulphate 2.25 g, calcium carbonate 1 g, tartaric acid 450 mg, acetic acid (33%) 2.5 mL, purified water 7.5 mL

Available from manufacturers of 'special order' products

**Ear drops 8%**, dilute 8 parts aluminium acetate ear drops (13%) with 5 parts purified water. Must be freshly prepared

## Anti-inflammatory preparations

### Corticosteroids

Topical corticosteroids are used to treat inflammation and eczema in otitis externa.

**Cautions** Prolonged use of topical corticosteroid ear preparations should be avoided.

**Contra-indications** Corticosteroid ear preparations should be avoided in the presence of an untreated ear infection. If infection is present, the corticosteroid should be used in combination with a suitable anti-infective (see notes above).

**Side-effects** Local sensitivity reactions may occur.

### BETAMETHASONE SODIUM PHOSPHATE

**Indications** eczematous inflammation in otitis externa (see notes above)

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Betnesol**® (UCB Pharma) (POM)

**Drops** (for ear, eye, or nose), betamethasone sodium phosphate 0.1%. Net price 10 mL = £2.23

**Excipients** include benzalkonium chloride, disodium edetate

**Dose** ear, apply 2–3 drops every 2–3 hours; reduce frequency when relief obtained; **eye**, section 11.4.1; **nose**, section 12.2.1

**Vistamethasone**® (Martindale) (POM)

**Drops** (for ear, eye, or nose), betamethasone sodium phosphate 0.1%. Net price 5 mL = £1.02; 10 mL = £1.16

**Excipients** include benzalkonium chloride, disodium edetate

**Dose** ear, apply 2–3 drops every 3–4 hours; reduce frequency when relief obtained; **eye**, section 11.4.1; **nose**, section 12.2.1

#### With antibacterial

**Betnesol-N**® (UCB Pharma) (POM)

**Drops** (for ear, eye, or nose), betamethasone sodium phosphate 0.1%, neomycin sulphate 0.5%. Net price 10 mL = £2.30

**Excipients** include benzalkonium chloride, disodium edetate

**Dose** ear, apply 2–3 drops 3–4 times daily; **eye**, section 11.4.1; **nose**, section 12.2.3

## DEXAMETHASONE

**Indications** eczematous inflammation in otitis externa (see notes above)

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

#### With antibacterial

**Otomize**® (GSK Consumer Healthcare) (POM)

**Ear spray**, dexamethasone 0.1%, neomycin sulphate 3250 units/mL, glacial acetic acid 2%. Net price 5-mL pump-action aerosol unit = £3.71

**Excipients** include hydroxybenzoates (parabens)

**Dose** ear, apply 1 metered spray 3 times daily

**Sofradex**® (Sanofi-Aventis) (POM) 

**Drops** (for ear or eye), dexamethasone (as sodium metasulphobenzoate) 0.05%, framycetin sulphate 0.5%, gramicidin 0.005%. Net price 10 mL = £6.25

**Excipients** include polysorbate 80

**Dose** ear, apply 2–3 drops 3–4 times daily; **eye**, section 11.4.1

## FLUMETASONE PIVALATE (Flumethasone Pivalate)

**Indications** eczematous inflammation in otitis externa (see notes above)

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

#### With antibacterial

**Locorten-Vioform**® (Amdipharm) (POM)

**Ear drops**, flumetasone pivalate 0.02%, clioquinol 1%. Net price 7.5 mL = £1.76

**Contra-indications** iodine sensitivity

**Dose** ADULT and CHILD over 2 years apply 2–3 drops into the ear twice daily for 7–10 days

**Note** Clioquinol stains skin and clothing

## HYDROCORTISONE

**Indications** eczematous inflammation in otitis externa (see notes above)

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**With antibacterial****Gentisone® HC** (Amdipharm) 

Ear drops, hydrocortisone acetate 1%, gentamicin 0.3% (as sulphate). Net price 10 mL = £3.92

Excipients include benzalkonium chloride, disodium edetate

**Dose** ear, apply 2–4 drops 3–4 times daily and at night

**Otosporin®** (GSK) 

Ear drops, hydrocortisone 1%, neomycin sulphate 3400 units, polymyxin B sulphate 10 000 units/mL. Net price 5 mL = £2.00; 10 mL = £4.00

Excipients include cetostearyl alcohol, hydroxybenzoates (parabens), polysorbate 20

**Dose** ADULT and CHILD over 3 years, ear, apply 3 drops 3–4 times daily

**PREDNISOLONE SODIUM PHOSPHATE**

**Indications** eczematous inflammation in otitis externa (see notes above)

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Predsol®** (UCB Pharma) 

Drops (for ear or eye), prednisolone sodium phosphate 0.5%. Net price 10 mL = £1.92

Excipients include benzalkonium chloride, disodium edetate

**Dose** ear, apply 2–3 drops every 2–3 hours; reduce frequency when relief obtained; **eye**, section 11.4.1

**With antibacterial****Predsol-N®** (UCB Pharma) 

Drops (for ear or eye), prednisolone sodium phosphate 0.5%, neomycin sulphate 0.5%. Net price 10 mL = £2.27

Excipients include benzalkonium chloride, disodium edetate

**Dose** ear, apply 2–3 drops 3–4 times daily; **eye**, section 11.4.1

**Anti-infective preparations****CHLORAMPHENICOL** 

**Indications** bacterial infection in otitis externa (but see notes above)

**Cautions** avoid prolonged use (see notes above)

**Side-effects** high incidence of sensitivity reactions to vehicle

**Chloramphenicol** (Non-proprietary) 

Ear drops, chloramphenicol in propylene glycol, net price 5%, 10 mL = £6.22; 10%, 10 mL = £5.62

**Dose** ear, apply 2–3 drops 2–3 times daily

**CLIOQUINOL**

**Indications** mild bacterial or fungal infections in otitis externa (see notes above)

**Cautions** avoid prolonged use (see notes above); manufacturer advises avoid in perforated tympanic membrane (but used by specialists for short periods)

**Side-effects** local sensitivity; stains skin and clothing

**With corticosteroid**

**Locorten-Vioform®** see Flumetasone, p. 686

**CLOTRIMAZOLE**

**Indications** fungal infection in otitis externa (see notes above)

**Side-effects** occasional local irritation or sensitivity

**Canesten®** (Bayer Consumer Care)

**Solution**, clotrimazole 1% in polyethylene glycol 400 (macrogol 400). Net price 20 mL = £2.43

**Dose** ear, apply 2–3 times daily continuing for at least 14 days after disappearance of infection; **skin**, section 13.10.2

**FRAMYCETIN SULPHATE**

**Indications** bacterial infection in otitis externa (see notes above)

**Cautions** avoid prolonged use (see notes above)

**Contra-indications** perforated tympanic membrane (see p. 685)

**Side-effects** local sensitivity

**With corticosteroid**

**Sofradex®** see Dexamethasone, p. 686

**GENTAMICIN**

**Indications** bacterial infection in otitis externa (see notes above)

**Cautions** avoid prolonged use (see notes above)

**Contra-indications** perforated tympanic membrane (but see also p. 685 and section 12.1.2)

**Side-effects** local sensitivity

**Genticin®** (Amdipharm) 

Drops (for ear or eye), gentamicin 0.3% (as sulphate). Net price 10 mL = £2.13

Excipients include benzalkonium chloride

**Dose** ear, apply 2–3 drops 3–4 times daily and at night; **eye**, section 11.3.1

**With corticosteroid**

**Gentisone® HC** see Hydrocortisone, above

**NEOMYCIN SULPHATE**

**Indications** bacterial infection in otitis externa (see notes above)

**Cautions** avoid prolonged use (see notes above)

**Contra-indications** perforated tympanic membrane (see p. 685)

**Side-effects** local sensitivity

**With corticosteroid**

**Betnesol-N®** see Betamethasone, p. 686

**Otomize®** see Dexamethasone, p. 686

**Otosporin®** see Hydrocortisone, above

**Predsol-N®** see Prednisolone, above

**12.1.2 Otitis media**

**Acute otitis media** Acute otitis media is the commonest cause of severe aural pain in small children. Many infections, especially those accompanying coryza,

are caused by viruses. Most uncomplicated cases resolve without antibacterial treatment and a **simple analgesic**, such as paracetamol, may be sufficient. In children without systemic features, a **systemic antibacterial** (Table 1, section 5.1) may be started after 72 hours if there is no improvement, or earlier if there is deterioration, if the patient is systemically unwell, if the patient is at high risk of serious complications (e.g. in immunosuppression, cystic fibrosis), if mastoiditis is present, or in children under 2 years of age with bilateral otitis media. Perforation of the tympanic membrane in patients with *acute otitis media* usually heals spontaneously without treatment; if there is no improvement, e.g. pain or discharge persists, a systemic antibacterial (Table 1, section 5.1) can be given. Topical treatment of acute otitis media is ineffective and there is no place for drops containing a local anaesthetic.

**Otitis media with effusion** Otitis media with effusion ('glue ear') occurs in about 10% of children and in 90% of children with cleft palates. Systemic antibacterials are not usually required. If 'glue ear' persists for more than a month or two, the child should be referred for assessment and follow up because of the risk of long-term hearing impairment which can delay language development. Untreated or resistant glue ear may be responsible for some types of *chronic otitis media*.

**Chronic otitis media** Opportunistic organisms are often present in the debris, keratin, and necrotic bone of the middle ear and mastoid in patients with chronic otitis media. The mainstay of treatment is thorough cleansing with aural micro suction which may completely resolve long-standing infection. Local cleansing of the meatal and middle ear may be followed by treatment with a sponge wick or ribbon gauze dressing soaked with corticosteroid ear drops or with an astringent such as aluminium acetate solution; this is particularly beneficial for discharging ears or infections of the mastoid cavity. An antibacterial ear ointment may also be used. Acute exacerbations of chronic infection may also require systemic treatment with amoxicillin (or erythromycin if penicillin-allergic); treatment is adjusted according to the results of sensitivity testing. Parenteral antibacterials are required if *Pseudomonas aeruginosa* and *Proteus* spp. are present.

Manufacturers contra-indicate topical treatment with ototoxic antibacterials in the presence of a perforation (section 12.1.1). However, many specialists use ear drops containing **aminoglycosides** (e.g. neomycin) or **polymyxins** if the otitis media has failed to settle with systemic antibacterials; it is considered that the pus in the middle ear associated with otitis media carries a higher risk of ototoxicity than the drops themselves. Ciprofloxacin or ofloxacin ear drops [both unlicensed; available from 'special-order' manufacturers or specialist importing companies, see p. 988] or eye drops used in the ear [unlicensed indication] are an effective alternative to aminoglycoside ear drops for chronic otitis media in patients with perforation of the tympanic membrane.

### 12.1.3 Removal of ear wax

Wax is a normal bodily secretion which provides a protective film on the meatal skin and need only be removed if it causes hearing loss or interferes with a proper view of the ear drum.

Wax can be softened using simple remedies such as **olive oil** ear drops or **almond oil** ear drops; **sodium bicarbonate** ear drops are also effective, but may cause dryness of the ear canal. If the wax is hard and impacted, the drops can be used twice daily for several days and this may reduce the need for mechanical removal of the wax. The patient should lie with the affected ear uppermost for 5 to 10 minutes after a generous amount of the softening remedy has been introduced into the ear. Some proprietary preparations containing organic solvents can irritate the meatal skin, and in most cases the simple remedies indicated above are just as effective and less likely to cause irritation. Docusate sodium or urea-hydrogen peroxide are ingredients in a number of proprietary preparations for softening ear wax.

If necessary, wax may be removed by irrigation with water (warmed to body temperature). Ear irrigation is generally best avoided in young children, in patients unable to co-operate with the procedure, in those with otitis media in the last six weeks, in otitis externa, in patients with cleft palate, a history of ear drum perforation, or previous ear surgery. A person who has hearing in one ear only should not have that ear irrigated because even a very slight risk of damage is unacceptable in this situation.

#### Almond Oil (Non-proprietary)

**Ear drops**, almond oil in a suitable container  
Allow to warm to room temperature before use

#### Olive Oil (Non-proprietary)

**Ear drops**, olive oil in a suitable container  
Allow to warm to room temperature before use

#### Sodium Bicarbonate (Non-proprietary)

**Ear drops**, sodium bicarbonate 5%, net price 10 mL = £1.25

#### Cerumol® (Thornton & Ross)

**Ear drops**, chlorobutanol 5%, arachis (peanut) oil 57.3%. Net price 11 mL = £1.76

#### Exterol® (Dermal)

**Ear drops**, urea-hydrogen peroxide complex 5% in glycerol. Net price 8 mL = £1.75

#### Molcer® (Wallace Mfg)

**Ear drops**, docusate sodium 5%. Net price 15 mL = £5.60  
**Excipients** include propylene glycol

#### Otex® (DDD)

**Ear drops**, urea-hydrogen peroxide 5%. Net price 8 mL = £2.64

#### Waxsol® (Norgine)

**Ear drops**, docusate sodium 0.5%. Net price 10 mL = £1.21

## 12.2 Drugs acting on the nose

### 12.2.1 Drugs used in nasal allergy

### 12.2.2 Topical nasal decongestants

### 12.2.3 Nasal preparations for infection

Rhinitis is often self-limiting but bacterial sinusitis may require treatment with antibacterials (Table 1, section 5.1). There are few indications for nasal sprays and drops except in allergic rhinitis and perennial rhinitis (section 12.2.1). Many nasal preparations contain sympathomimetic drugs which may damage the nasal cilia

(section 12.2.2). **Sodium chloride 0.9%** solution may be used as a douche or 'sniff' following endonasal surgery.

**Nasal polyps** Short-term use of corticosteroid nasal drops helps to shrink nasal polyps; to be effective, the drops must be administered with the patient in the 'head down' position. A short course of a systemic corticosteroid (section 6.3.2) may be required initially to shrink large polyps. A corticosteroid nasal spray can be used to maintain the reduction in swelling and also for the initial treatment of small polyps.

## 12.2.1 Drugs used in nasal allergy

Mild allergic rhinitis is controlled by **antihistamines** (see also section 3.4.1) or topical **nasal corticosteroids**; systemic nasal decongestants are of doubtful value (section 3.10). Topical nasal decongestants can be used for a short period to relieve congestion and allow penetration of a topical nasal corticosteroid.

More persistent symptoms and nasal congestion can be relieved by topical nasal **corticosteroids**; **cromoglicate** (cromoglycate) is an alternative, but may be less effective. The topical antihistamine **azelastine** is useful for controlling breakthrough symptoms in allergic rhinitis. Topical antihistamines are considered less effective than topical corticosteroids but probably more effective than cromoglicate. In seasonal allergic rhinitis (e.g. hay fever), treatment should begin 2 to 3 weeks before the season commences and may have to be continued for several months; continuous treatment may be required for years in perennial rhinitis.

**Montelukast** (section 3.3.2) is less effective than topical nasal corticosteroids; montelukast can be used in patients with seasonal allergic rhinitis and concomitant asthma.

Sometimes allergic rhinitis is accompanied by vasomotor rhinitis. In this situation, the addition of topical nasal ipratropium bromide (section 12.2.2) can reduce watery rhinorrhoea.

Very disabling symptoms occasionally justify the use of **systemic corticosteroids** for short periods (section 6.3), for example, in students taking important examinations. They may also be used at the beginning of a course of treatment with a corticosteroid spray to relieve severe mucosal oedema and allow the spray to penetrate the nasal cavity.

**Pregnancy** If a pregnant woman cannot tolerate the symptoms of allergic rhinitis, treatment with nasal beclomethasone, budesonide, fluticasone, or sodium cromoglicate may be considered.

### Antihistamines

#### AZELASTINE HYDROCHLORIDE

**Indications** allergic rhinitis

**Side-effects** irritation of nasal mucosa; bitter taste (if applied incorrectly)

#### Rhinolast® (Meda) (POM)

**Nasal spray**, azelastine hydrochloride 140 micrograms (0.14 mL)/metered spray. Net price 22 mL (157-spray unit with metered pump) = £10.45  
**Excipients** include sodium edetate

**Dose** **ADULT** and **CHILD** over 5 years, 140 micrograms (1 spray) into each nostril twice daily

**Note** Preparations of azelastine hydrochloride can be sold to the public for nasal administration in aqueous form (other than by aerosol) if supplied for the treatment of seasonal allergic rhinitis or perennial allergic rhinitis in adults and children over 5 years, subject to max. single dose of 140 micrograms per nostril, max. daily dose of 280 micrograms per nostril, and a pack size limit of 36 doses

### Corticosteroids

Nasal preparations containing corticosteroids (beclomethasone, budesonide, flunisolide, fluticasone, mometasone, and triamcinolone) have a useful role in the prophylaxis and treatment of allergic rhinitis (see notes above).

**Cautions** Corticosteroid nasal preparations should be avoided in the presence of untreated nasal infections, and also after nasal surgery (until healing has occurred); they should also be avoided in pulmonary tuberculosis. Patients transferred from systemic corticosteroids may experience exacerbation of some symptoms. Systemic absorption may follow nasal administration particularly if high doses are used or if treatment is prolonged; for cautions and side-effects of systemic corticosteroids, see section 6.3.2. The risk of systemic effects may be greater with nasal drops than with nasal sprays; drops are administered incorrectly more often than sprays. The height of children receiving prolonged treatment with nasal corticosteroids should be monitored; if growth is slowed, referral to a paediatrician should be considered.

**Side-effects** Local side-effects include dryness, irritation of nose and throat, and epistaxis. Nasal ulceration has been reported, but occurs commonly with nasal preparations containing fluticasone furoate or mometasone furoate. Nasal septal perforation (usually following nasal surgery) occurs very rarely. Raised intra-ocular pressure or glaucoma may occur rarely. Headache, smell and taste disturbances may also occur. Hypersensitivity reactions, including bronchospasm, have been reported.

#### BECLOMETASONE DIPROPIONATE (Beclomethasone Dipropionate)

**Indications** prophylaxis and treatment of allergic and vasomotor rhinitis

**Cautions** see notes above

**Side-effects** see notes above

#### Dose

- **ADULT** and **CHILD** over 6 years, 100 micrograms (2 sprays) into each nostril twice daily; max. total 400 micrograms (8 sprays) daily; when symptoms controlled, dose reduced to 50 micrograms (1 spray) into each nostril twice daily

**1 Beclomethasone** (Non-proprietary) (POM)

Nasal spray, beclomethasone dipropionate 50 micrograms/metered spray. Net price 200-spray unit = £2.52

Brands include *Nasobec Aqueous*<sup>®</sup>

- Can be sold to the public for nasal administration (other than by aerosol) if supplied for the prevention and treatment of allergic rhinitis in adults over 18 years subject to max. single dose of 100 micrograms per nostril, max. daily dose of 200 micrograms per nostril for max. 3 months, and a pack size of 20 mg

**Beconase**<sup>®</sup> (A&H) (POM)

Nasal spray (aqueous suspension), beclomethasone dipropionate 50 micrograms/metered spray. Net price 200-spray unit with applicator = £2.19

Excipients include benzalkonium chloride, polysorbate 80

**BETAMETHASONE SODIUM PHOSPHATE**

**Indications** non-infected inflammatory conditions of nose

**Cautions** see notes above

**Side-effects** see notes above

**Betnesol**<sup>®</sup> (UCB Pharma) (POM)

Drops (for ear, eye, or nose), betamethasone sodium phosphate 0.1%, net price 10 mL = £2.23

Excipients include benzalkonium chloride, disodium edetate

**Dose** nose, 2–3 drops into each nostril 2–3 times daily; ear, section 12.1.1; eye, section 11.4.1

**Vistamethasone**<sup>®</sup> (Martindale) (POM)

Drops (for ear, eye, or nose), betamethasone sodium phosphate 0.1%. Net price 5 mL = £1.02, 10 mL = £1.16

Excipients include benzalkonium chloride, disodium edetate

**Dose** nose, 2–3 drops into each nostril twice daily; ear, section 12.1.1; eye, section 11.4.1

**BUDESONIDE**

**Indications** prophylaxis and treatment of allergic and vasomotor rhinitis; nasal polyps

**Cautions** see notes above; **interactions:** Appendix 1 (corticosteroids)

**Side-effects** see notes above

**Dose**

- See preparations

**1 Budesonide** (Non-proprietary) (POM)

Nasal spray, budesonide 100 micrograms/metered spray, net price 100-spray unit = £5.90

**Dose** rhinitis, **ADULT** and **CHILD** over 12 years, 200 micrograms (2 sprays) into each nostril once daily in the morning or 100 micrograms (1 spray) into each nostril twice daily; when control achieved reduce to 100 micrograms (1 spray) into each nostril once daily

Nasal polyps, **ADULT** and **CHILD** over 12 years, 100 micrograms (1 spray) into each nostril twice daily for up to 3 months

- Can be sold to the public for nasal administration (other than by aerosol) if supplied for the prevention and treatment of seasonal allergic rhinitis in adults over 18 years subject to max. single dose of 200 micrograms per nostril, max. daily dose of 200 micrograms per nostril for max. period of 3 months, and a pack size of 10 mg

**Rhinocort Aqua**<sup>®</sup> (AstraZeneca) (POM)

Nasal spray, budesonide 64 micrograms/metered spray. Net price 120-spray unit = £2.49

Excipients include disodium edetate, polysorbate 80, potassium sorbate

**Dose** rhinitis, **ADULT** and **CHILD** over 12 years, 128 micrograms (2 sprays) into each nostril once daily in the morning or 64 micrograms (1 spray) into each nostril twice daily; when control

achieved reduce to 64 micrograms (1 spray) into each nostril once daily; max. duration of treatment 3 months

Nasal polyps, **ADULT** and **CHILD** over 12 years, 64 micrograms (1 spray) into each nostril twice daily for up to 3 months

**FLUNISOLIDE**

**Indications** prophylaxis and treatment of allergic rhinitis

**Cautions** see notes above

**Side-effects** see notes above

**Syntaris**<sup>®</sup> (IVAX) (POM)

Aqueous nasal spray, flunisolide 25 micrograms/metered spray. Net price 240-spray unit with pump and applicator = £5.05

Excipients include benzalkonium chloride, butylated hydroxytoluene, disodium edetate, polysorbate 20, propylene glycol

**Dose** **ADULT**, 50 micrograms (2 sprays) into each nostril twice daily, increased if necessary to max. 3 times daily then reduced for maintenance; **CHILD** 5–14 years initially 25 micrograms (1 spray) into each nostril up to 3 times daily

**FLUTICASONE PROPIONATE**

**Indications** prophylaxis and treatment of allergic rhinitis and perennial rhinitis; nasal polyps

**Cautions** see notes above; **interactions:** Appendix 1 (corticosteroids)

**Side-effects** see notes above

**Dose**

- Rhinitis, 100 micrograms (2 sprays) into each nostril once daily, preferably in the morning, increased to max. twice daily if required; when control achieved reduce to 50 micrograms (1 spray) into each nostril once daily; **CHILD** 4–11 years, 50 micrograms (1 spray) into each nostril once daily, preferably in the morning, increased to max. twice daily if required
- Nasal polyps, see *Flixonase Nasule*<sup>®</sup> below

**Flixonase**<sup>®</sup> (A&H) (POM)

Aqueous nasal spray, fluticasone propionate 50 micrograms/metered spray. Net price 150-spray unit with applicator = £11.01

Excipients include benzalkonium chloride, polysorbate 80

**Note** Preparations of fluticasone propionate can be sold to the public for nasal administration (other than by pressurised nasal spray) if supplied for the prevention and treatment of allergic rhinitis in adults over 18 years, subject to max. single dose of 100 micrograms per nostril, max. daily dose of 200 micrograms per nostril for max. 3 months, and a pack size of 3 mg

**Flixonase Nasule**<sup>®</sup> (A&H) (POM)

Nasal drops, fluticasone propionate 400 micrograms/unit dose, net price 28 × 0.4-mL units = £12.99

Excipients include polysorbate 20

**Dose** nasal polyps, **ADULT** and **ADOLESCENT** over 16 years, 200 micrograms (approx. 6 drops) into each nostril once or twice daily; consider alternative treatment if no improvement after 4–6 weeks

**Nasofan**<sup>®</sup> (IVAX) (POM)

Aqueous nasal spray fluticasone propionate 50 micrograms/metered spray. Net price 150-spray unit = £8.41

Excipients include benzalkonium chloride, polysorbate 80

**Fluticasone furoate****Avamys®** (GSK) ▼ (P<sub>o</sub>M)

**Nasal spray**, fluticasone furoate 27.5 micrograms/metered spray, net price 120-spray unit = £6.44

**Excipients** include benzalkonium chloride, disodium edetate, polysorbate 80

**Dose** prophylaxis and treatment of allergic rhinitis, **ADULT** and **CHILD** over 12 years, 55 micrograms (2 sprays) into each nostril once daily; when control achieved reduce to minimum effective dose, 27.5 micrograms (1 spray) into each nostril once daily may be sufficient; **CHILD** 6–12 years, 27.5 micrograms (1 spray) into each nostril once daily, increased if necessary to 55 micrograms (2 sprays) into each nostril once daily; when control achieved reduce to 27.5 micrograms (1 spray) into each nostril once daily

**MOMETASONE FUROATE****Indications** see preparations**Cautions** see notes above**Side-effects** see notes above**Nasonex®** (Schering-Plough) (P<sub>o</sub>M)

**Nasal spray**, mometasone furoate 50 micrograms/metered spray. Net price 140-spray unit = £7.68

**Excipients** include benzalkonium chloride, polysorbate 80

**Dose** prophylaxis and treatment of allergic rhinitis, **ADULT** and **CHILD** over 12 years, 100 micrograms (2 sprays) into each nostril once daily, increased if necessary to max. 200 micrograms (4 sprays) into each nostril once daily; when control achieved reduce to 50 micrograms (1 spray) into each nostril once daily; **CHILD** 6–11 years, 50 micrograms (1 spray) into each nostril once daily

**Nasal polyps**, **ADULT** over 18 years, 100 micrograms (2 sprays) into each nostril once daily, increased if necessary after 5–6 weeks to 100 micrograms (2 sprays) into each nostril twice daily (consider alternative treatment if no improvement after further 5–6 weeks); reduce to the lowest effective dose when control achieved

**TRIAMCINOLONE ACETONIDE****Indications** prophylaxis and treatment of allergic rhinitis**Cautions** see notes above**Side-effects** see notes above**Nasacort®** (Sanofi-Aventis) (P<sub>o</sub>M)

**Aqueous nasal spray**, triamcinolone acetonide 55 micrograms/metered spray. Net price 120-spray unit = £7.39

**Excipients** include benzalkonium chloride, disodium edetate, polysorbate 80

**Dose** **ADULT** and **CHILD** over 12 years, 110 micrograms (2 sprays) into each nostril once daily; when control achieved, reduce to 55 micrograms (1 spray) into each nostril once daily; **CHILD** 6–12 years, 55 micrograms (1 spray) into each nostril once daily, increased if necessary to 110 micrograms (2 sprays) into each nostril once daily; when control achieved, reduce to 55 micrograms (1 spray) into each nostril once daily; max. duration of treatment 3 months; **CHILD** 2–6 years see *BNF for Children*

**Note** Preparations of triamcinolone acetonide can be sold to the public for nasal administration as a non-pressurised nasal spray if supplied for the symptomatic treatment of seasonal allergic rhinitis in adults over 18 years, subject to max. daily dose of 110 micrograms per nostril for max. 3 months, and a pack size of 3.575 mg

**Cromoglicate****SODIUM CROMOGLICATE**  
(Sodium Cromoglycate)**Indications** prophylaxis of allergic rhinitis**Side-effects** local irritation; rarely transient bronchospasm**Rynacrom®** (Sanofi-Aventis)

**4% aqueous nasal spray**, sodium cromoglicate 4% (5.2 mg/spray). Net price 22 mL (150-spray unit with pump) = £17.07

**Excipients** include benzalkonium chloride, disodium edetate

**Dose** **ADULT** and **CHILD**, 1 spray into each nostril 2–4 times daily

**Vividrin®** (Pharma-Global)

**Nasal spray**, sodium cromoglicate 2%. Net price 15 mL (approx. 110-spray unit) = £11.60

**Excipients** include benzalkonium chloride, edetic acid, polysorbate 80

**Dose** **ADULT** and **CHILD**, 1 spray into each nostril 4–6 times daily

**12.2.2 Topical nasal decongestants**

The nasal mucosa is sensitive to changes in atmospheric temperature and humidity and these alone may cause slight nasal congestion. The nose and nasal sinuses produce a litre of mucus in 24 hours and much of this finds its way silently into the stomach via the nasopharynx. Slight changes in the nasal airway, accompanied by an awareness of mucus passing along the nasopharynx causes some patients to be inaccurately diagnosed as suffering from chronic sinusitis. These symptoms are particularly noticeable in the later stages of the common cold. **Sodium chloride** 0.9% given as nasal drops or spray may relieve nasal congestion by helping to liquefy mucous secretions.

Inhalation of **warm moist air** is useful in the treatment of symptoms of acute infective conditions. The addition of volatile substances such as menthol and eucalyptus may encourage the use of warm moist air (section 3.8).

Symptoms of nasal congestion associated with vasomotor rhinitis and the common cold can be relieved by the short-term use (usually not longer than 7 days) of decongestant nasal drops and sprays. These all contain sympathomimetic drugs which exert their effect by vasoconstriction of the mucosal blood vessels which in turn reduces oedema of the nasal mucosa. They are of limited value because they can give rise to a rebound congestion (rhinitis medicamentosa) on withdrawal, due to a secondary vasodilatation with a subsequent temporary increase in nasal congestion. This in turn tempts the further use of the decongestant, leading to a vicious cycle of events. **Ephedrine nasal drops** is the safest sympathomimetic preparation and can give relief for several hours. The more potent sympathomimetic drugs oxymetazoline and xylometazoline are more likely to cause a rebound effect. Sympathomimetics may cause a hypertensive crisis if used during treatment with a monoamine-oxidase inhibitor including moclobemide.

The CHM/MHRA has stated that non-prescription cough and cold medicines containing ephedrine, oxymetazoline, or xylometazoline can be considered for up to 5 days in children aged 6–12 years after basic principles of best care have been tried; these medicines should not be used in children under 6 years of age (section 3.9.1).

Non-allergic watery rhinorrhoea often responds well to treatment with the antimuscarinic **ipratropium bromide**.

Systemic nasal decongestants—see section 3.10.

**Sinusitis and oral pain** Sinusitis affecting the maxillary antrum can cause pain in the upper jaw. Where

this is associated with blockage of the opening from the sinus into the nasal cavity, it may be helpful to relieve the congestion with inhalation of warm moist air (section 3.8) or with **ephedrine nasal drops** (see above). For antibacterial treatment of sinusitis, see Table 1, section 5.1.

## Sympathomimetics

### EPHEDRINE HYDROCHLORIDE

**Indications** nasal congestion

**Cautions** see section 3.1.1.2 and notes above; also avoid excessive or prolonged use; **interactions:** Appendix 1 (sympathomimetics)

**Pregnancy** see section 3.1.1.2

**Breast-feeding** see section 3.1.1.2

**Side-effects** local irritation, nausea, headache; after excessive use tolerance with diminished effect, rebound congestion; cardiovascular effects also reported

#### Dose

- See below

**<sup>1</sup>Ephedrine** (Non-proprietary)

**Nasal drops, ephedrine hydrochloride** 0.5%, net price 10 mL = £1.39; 1%, 10 mL = £1.63

**Note** The BP directs that if no strength is specified 0.5% drops should be supplied

**Dose** ADULT and CHILD over 12 years, 1–2 drops into each nostril up to 3 or 4 times daily when required, max. duration 7 days; CHILD under 12 years see *BNF for Children*

**Dental prescribing on NHS** Ephedrine nasal drops may be prescribed

1. Can be sold to the public provided no more than 180 mg of ephedrine base (or salts) are supplied at one time, and pseudoephedrine salts are not supplied at the same time; for conditions that apply to supplies made at the request of a patient, see *Medicines, Ethics and Practice*, No. 34, London, Pharmaceutical Press, 2010 (and subsequent editions)

### XYLOMETAZOLINE HYDROCHLORIDE

**Indications** nasal congestion

**Cautions** see under Ephedrine Hydrochloride section 3.1.1.2 and notes above; also avoid excessive or prolonged use

**Pregnancy** manufacturer advises avoid

**Side-effects** see under Ephedrine Hydrochloride and notes above; in small children, also restlessness, sleep disturbances, and hallucinations (discontinue treatment)

#### Dose

- See below

**Xylometazoline** (Non-proprietary)

**Nasal drops, xylometazoline hydrochloride** 0.1%, net price 10 mL = £1.91

**Dose** 2–3 drops into each nostril 2–3 times daily when required; max. duration 7 days; not recommended for children under 12 years

**Brands include** Otradrops<sup>®</sup>, Otrivine<sup>®</sup> 

**Paediatric nasal drops, xylometazoline hydrochloride** 0.05%, net price 10 mL = £1.59

**Dose** CHILD 6–12 years 1–2 drops into each nostril 1–2 times daily when required; max. duration 5 days

**Brands include** Otradrops<sup>®</sup>, Otrivine<sup>®</sup> 

**Nasal spray, xylometazoline hydrochloride** 0.1%, net price 10 mL = £1.91

**Dose** 1 spray into each nostril 1–3 times daily when required; max. duration 7 days; not recommended for children under 12 years

**Brands include** Otrivine<sup>®</sup> 

## Antimuscarinic

### IPRATROPIUM BROMIDE

**Indications** rhinorrhoea associated with allergic and non-allergic rhinitis

**Cautions** see section 3.1.2; avoid spraying near eyes

**Side-effects** epistaxis, nasal dryness, and irritation; less frequently nausea, headache, and pharyngitis; *very rarely* antimuscarinic effects such as gastrointestinal motility disturbances, palpitations, and urinary retention

#### Dose

- ADULT and CHILD over 12 years, 42 micrograms (2 sprays) into each nostril 2–3 times daily

**Rinatec<sup>®</sup>** (Boehringer Ingelheim) 

**Nasal spray 0.03%**, ipratropium bromide 21 micrograms/metered spray. Net price 180-dose unit = £3.99

**Excipients** include benzalkonium chloride, disodium edetate

## 12.2.3 Nasal preparations for infection

There is **no** evidence that topical anti-infective nasal preparations have any therapeutic value in rhinitis or sinusitis; for elimination of nasal staphylococci, see below.

Systemic treatment of sinusitis—see Table 1 section 5.1.

**Betnesol-N<sup>®</sup>** (UCB Pharma) 

**Drops** (for ear, eye, or nose), betamethasone sodium phosphate 0.1%, neomycin sulphate 0.5%. Net price 10 mL = £2.30

**Excipients** include benzalkonium chloride, disodium edetate

**Dose** nose, 2–3 drops into each nostril 2–3 times daily; eye, section 11.4.1; ear, section 12.1.1

## Nasal staphylococci

Elimination of organisms such as staphylococci from the nasal vestibule can be achieved by the use of a cream containing **chlorhexidine** and **neomycin** (*Naseptin<sup>®</sup>*), but re-colonisation frequently occurs. Coagulase-positive staphylococci are present in the noses of 40% of the population.

A nasal ointment containing **mupirocin** is also available; it should probably be held in reserve for resistant cases. In hospital or in care establishments, mupirocin nasal ointment should be reserved for the eradication (in both patients and staff) of nasal carriage of meticillin-resistant *Staphylococcus aureus* (MRSA). The ointment should be applied 3 times daily for 5 days and a sample taken 2 days after treatment to confirm eradication. The course may be repeated if the sample is positive (and the throat is not colonised). To avoid the development of resistance, the treatment course should not exceed 7 days and the course should not be repeated on more

than one occasion. If the MRSA strain is mupirocin-resistant or does not respond after 2 courses, consider alternative products such as chlorhexidine and neomycin cream.

#### **Bactroban Nasal**<sup>®</sup> (GSK) (PmM)

**Nasal ointment**, mupirocin 2% (as calcium salt) in white soft paraffin basis. Net price 3 g = £5.80

**Dose** for eradication of nasal carriage of staphylococci, including methicillin-resistant *Staphylococcus aureus* (MRSA), apply 2–3 times daily to the inner surface of each nostril

#### **Naseptin**<sup>®</sup> (Alliance) (PmM)

**Cream**, chlorhexidine hydrochloride 0.1%, neomycin sulphate 0.5%, net price 15 g = £1.90

**Excipients** include arachis (peanut) oil, cetostearyl alcohol

**Dose** for eradication of nasal carriage of staphylococci, apply to nostrils 4 times daily for 10 days; for preventing nasal carriage of staphylococci, apply to nostrils twice daily

## 12.3 Drugs acting on the oropharynx

- 12.3.1 **Drugs for oral ulceration and inflammation**
- 12.3.2 **Oropharyngeal anti-infective drugs**
- 12.3.3 **Lozenges and sprays**
- 12.3.4 **Mouthwashes, gargles, and dentifrices**
- 12.3.5 **Treatment of dry mouth**

### 12.3.1 Drugs for oral ulceration and inflammation

Ulceration of the oral mucosa may be caused by trauma (physical or chemical), recurrent aphthae, infections, carcinoma, dermatological disorders, nutritional deficiencies, gastro-intestinal disease, haematopoietic disorders, and drug therapy (see also Chemotherapy-induced mucositis and myelosuppression, section 8.1). It is important to establish the diagnosis in each case as the majority of these lesions require specific management in addition to local treatment. Local treatment aims to protect the ulcerated area, to relieve pain, to reduce inflammation, or to control secondary infection. Patients with an unexplained mouth ulcer of more than 3 weeks' duration require urgent referral to hospital to exclude oral cancer.

**Simple mouthwashes** A saline mouthwash (section 12.3.4) may relieve the pain of traumatic ulceration. The mouthwash is made up with warm water and used at frequent intervals until the discomfort and swelling subsides.

**Antiseptic mouthwashes** Secondary bacterial infection may be a feature of any mucosal ulceration; it can increase discomfort and delay healing. Use of **chlorhexidine** mouthwash (section 12.3.4) is often beneficial and may accelerate healing of recurrent aphthae.

**Mechanical protection** Carmellose gelatin paste may relieve some discomfort arising from ulceration by protecting the ulcer site. As the paste adheres to dry

mucosa, it is difficult to apply it effectively to the tongue and oropharynx.

**Corticosteroids** Topical corticosteroid therapy may be used for some forms of oral ulceration. In the case of aphthous ulcers it is most effective if applied in the 'prodromal' phase.

Thrush or other types of candidiasis are recognised complications of corticosteroid treatment.

**Hydrocortisone oromucosal tablets** are allowed to dissolve next to an ulcer and are useful in recurrent aphthae and erosive lichenoid lesions.

**Beclometasone dipropionate** inhaler 50–100 micrograms sprayed twice daily on the oral mucosa is used to manage oral ulceration [unlicensed indication]. Alternatively, **betamethasone** soluble tablets dissolved in water can be used as a mouthwash to treat oral ulceration [unlicensed indication].

Systemic corticosteroid therapy (section 6.3.2) is reserved for severe conditions such as pemphigus vulgaris.

**Local analgesics** Local analgesics have a limited role in the management of oral ulceration. When applied topically their action is of a relatively short duration so that analgesia cannot be maintained continuously throughout the day. The main indication for a topical local analgesic is to relieve the pain of otherwise intractable oral ulceration particularly when it is due to major aphthae. For this purpose lidocaine 5% ointment or lozenges containing a local anaesthetic are applied to the ulcer. Lidocaine 10% solution as spray (section 15.2) can be applied thinly to the ulcer [unlicensed indication] using a cotton bud. When local anaesthetics are used in the mouth care must be taken not to produce anaesthesia of the pharynx before meals as this might lead to choking.

**Benzylamine** mouthwash or spray may be useful in reducing the discomfort associated with a variety of ulcerative conditions. It has also been found to be effective in reducing the discomfort of post-irradiation mucositis. Some patients find the full-strength mouthwash causes some stinging and, for them, it should be diluted with an equal volume of water.

**Flurbiprofen** lozenges are licensed for the relief of sore throat.

**Choline salicylate** dental gel has some analgesic action and may provide relief for recurrent aphthae, but excessive application or confinement under a denture irritates the mucosa and can itself cause ulceration.

**Other preparations** Doxycycline rinsed in the mouth may be of value for recurrent aphthous ulceration.

**Periodontitis** Low-dose doxycycline (*Periostat*<sup>®</sup>) is licensed as an adjunct to scaling and root planing for the treatment of periodontitis; a low dose of doxycycline reduces collagenase activity without inhibiting bacteria associated with periodontitis. For anti-infectives used in the treatment of destructive (refractory) forms of periodontal disease, see section 12.3.2 and Table 1, section 5.1. For mouthwashes used for oral hygiene and plaque inhibition, see section 12.3.4.

**BENZDAMINE HYDROCHLORIDE**

**Indications** painful inflammatory conditions of oropharynx

**Side-effects** occasional numbness or stinging; rarely hypersensitivity reactions

**Diffiam®** (3M)

**Oral rinse**, green, benzydamine hydrochloride 0.15%, net price 200 mL (*Diffiam® Sore Throat Rinse*) = £2.50; 300 mL = £4.01

**Dose** **ADULT** and **ADOLESCENT** over 12 years, rinse or gargle, using 15 mL (dilute with an equal volume of water if stinging occurs) every 1½–3 hours as required, usually for not more than 7 days

**Dental prescribing on NHS** May be prescribed as Benzhydamine Mouthwash 0.15%

**Spray**, benzydamine hydrochloride 0.15%. Net price 30-mL unit = £3.17

**Dose** **ADULT**, 4–8 sprays onto affected area every 1½–3 hours; **CHILD** under 6 years 1 spray per 4 kg body-weight to max. 4 sprays every 1½–3 hours; 6–12 years 4 sprays every 1½–3 hours

**Dental prescribing on NHS** May be prescribed as Benzhydamine Oromucosal Spray 0.15%

**CARMELOSE SODIUM**

**Indications** mechanical protection of oral and perioral lesions

**Orabase®** (ConvaTec)

**Protective paste** (= oral paste), carmellose sodium 16.7%, pectin 16.7%, gelatin 16.7%, in *Plastibase®*. Net price 30 g = £2.02; 100 g = £4.48

**Dose** apply a thin layer when necessary after meals

**Dental prescribing on NHS** May be prescribed as Carmellose Gelatin Paste

**Orahesive®** (ConvaTec)

**Powder**, carmellose sodium, pectin, gelatin, equal parts. Net price 25 g = £2.28

**Dose** sprinkle on the affected area

**CORTICOSTEROIDS**

**Indications** oral and perioral lesions

**Contra-indications** untreated oral infection

**Side-effects** occasional exacerbation of local infection; thrush or other candidal infections

**Hydrocortisone** (Non-proprietary)

**Mucoadhesive buccal tablets** (= oromucosal tablets), hydrocortisone 2.5 mg (as sodium succinate). Net price 20 = £2.03

**Dose** **ADULT** and **CHILD** over 12 years, 1 lozenge 4 times daily, allowed to dissolve slowly in the mouth in contact with the ulcer; **CHILD** under 12 years, only on medical advice

**Dental prescribing on NHS** May be prescribed as Hydrocortisone Oromucosal Tablets

**Betnesol®** (UCB Pharma) (POM)

**Soluble tablets**, pink, scored, betamethasone 500 micrograms (as sodium phosphate), net price 100-tab pack = £4.97. Label: 10, steroid card, 13, 21

**Dose** oral ulceration, [unlicensed indication] **ADULT** and **CHILD** over 12 years, 500 micrograms dissolved in 20 mL water and rinsed around the mouth 4 times daily; not to be swallowed

**Dental prescribing on the NHS** May be prescribed as Betamethasone Soluble Tablets 500 micrograms

**DOXYCYCLINE**

**Indications** see preparations; oral herpes (section 12.3.2); other indications (section 5.1.3)

**Cautions** section 5.1.3; monitor for superficial fungal infection, particularly if predisposition to oral candidiasis

**Contra-indications** section 5.1.3

**Hepatic impairment** section 5.1.3

**Renal impairment** section 5.1.3

**Pregnancy** section 5.1.3

**Breast-feeding** section 5.1.3

**Side-effects** section 5.1.3; fungal superinfection

**Dose**

• See preparations

**Note** Doxycycline stains teeth; avoid in children under 12 years of age

**Periostat®** (Alliance) (POM)

**Tablets**, f/c, doxycycline (as hyclate) 20 mg, net price 56-tab pack = £16.50. Label: 6, 11, 27, counselling, posture

**Dose** periodontitis (as an adjunct to gingival scaling and root planing), 20 mg twice daily for 3 months; **CHILD** under 12 years not recommended

**Counselling** Tablets should be swallowed whole with plenty of fluid (at least 100 mL), while sitting or standing

**Dental prescribing on NHS** May be prescribed as Doxycycline Tablets 20 mg

▲ **Local application**

For recurrent aphthous ulceration, a 100 mg doxycycline dispersible tablet can be stirred into a small amount of water then rinsed around the mouth for 2–3 minutes 4 times daily usually for 3 days; it should preferably not be swallowed [unlicensed indication].

**FLURBIPROFEN**

**Indications** relief of sore throat

**Cautions** section 10.1.1

**Contra-indications** section 10.1.1

**Hepatic impairment** section 10.1.1

**Renal impairment** section 10.1.1

**Pregnancy** section 10.1.1

**Breast-feeding** section 10.1.1

**Side-effects** taste disturbance, mouth ulcers (move lozenge around mouth); see also section 10.1.1

**Strefen®** (Reckitt Benckiser)

**Lozenges**, flurbiprofen 8.75 mg, net price 16 = £2.24

**Dose** **ADULT** and **CHILD** over 12 years, allow 1 lozenge to dissolve slowly in the mouth every 3–6 hours, max. 5 lozenges in 24 hours, for max. 3 days

**LOCAL ANAESTHETICS**

**Indications** relief of pain in oral lesions

**Cautions** avoid prolonged use; hypersensitivity; avoid anaesthesia of the pharynx before meals—risk of choking

**Hepatic impairment** see Lidocaine section 15.2

**Renal impairment** see Lidocaine section 15.2

**Pregnancy** see Lidocaine section 15.2

**Breast-feeding** see Lidocaine section 15.2

**Lidocaine** (Non-proprietary)

**Ointment**, lidocaine 5% in a water-miscible basis, net price 15 g = 80p

**Dose** rub sparingly and gently on affected areas

**Dental prescribing on NHS** Lidocaine 5% Ointment may be prescribed

**Xylocaine®** (AstraZeneca)

**Spray** (= pump spray), lidocaine 10% (100 mg/g) supplying 10 mg lidocaine/spray; 500 spray doses per container. Net price 50-mL bottle = £3.13

**Dose** apply thinly to the ulcer [unlicensed indication] using a cotton bud

**Dental prescribing on NHS** May be prescribed as Lidocaine Spray 10%

#### Preparations on sale to the public

Many mouth ulcer preparations, throat lozenges, and throat sprays on sale to the public contain a **local anaesthetic**. To identify the active ingredients in such preparations, consult the product literature of the manufacturer.

**Note** The correct proprietary name should be ascertained—many products have very similar names but different active ingredients

## SALICYLATES

**Indications** mild oral and perioral lesions

**Cautions** not to be applied to dentures—leave at least 30 minutes before re-insertion of dentures; frequent application, especially in children, may give rise to salicylate poisoning

**Contra-indications** children under 16 years

**Reye's syndrome** The CHM has advised that topical oral pain relief products containing salicylate salts should not be used in children under 16 years, as a cautionary measure due to the theoretical risk of Reye's syndrome

#### Choline salicylate

##### Choline Salicylate Dental Gel, BP

**Oral gel**, choline salicylate 8.7% in a flavoured gel basis, net price 15 g = £1.89

**Brands include** *Bonjela®* (sugar-free)

**Dose** ADULT and CHILD over 16 years, apply ½-inch of gel with gentle massage not more often than every 3 hours

**Dental prescribing on NHS** Choline Salicylate Dental Gel may be prescribed

#### Salicylic acid

##### Pyralvex® (Norgine)

**Oral paint**, brown, rhubarb extract (anthraquinone glycosides 0.5%), salicylic acid 1%. Net price 10 mL with brush = £3.25

**Dose** ADULT and CHILD over 16 years, apply 3–4 times daily

## 12.3.2 Oropharyngeal anti-infective drugs

The most common cause of a sore throat is a viral infection which does not benefit from anti-infective treatment. Streptococcal sore throats require systemic penicillin therapy (Table 1, section 5.1). Acute ulcerative gingivitis (Vincent's infection) responds to systemic metronidazole (section 5.1.11).

Preparations administered in the dental surgery for the local treatment of periodontal disease include gels of metronidazole (*Elyzol®*, Colgate-Palmolive) and of minocycline (*Dentomycin®*, Blackwell).

## Oropharyngeal fungal infections

Fungal infections of the mouth are usually caused by *Candida* spp. (candidiasis or candidosis). Different types of oropharyngeal candidiasis are managed as follows:

**Thrush** Acute pseudomembranous candidiasis (thrush), is usually an acute infection but it may persist for months in patients receiving inhaled corticosteroids, cytotoxics or broad-spectrum antibacterials. Thrush also occurs in patients with serious systemic disease associated with reduced immunity such as leukaemia, other malignancies, and HIV infection. Any predisposing condition should be managed appropriately. When thrush is associated with corticosteroid inhalers, rinsing the mouth with water (or cleaning a child's teeth) immediately after using the inhaler may avoid the problem. Treatment with **nystatin** or **miconazole** may be needed. **Fluconazole** (section 5.2.1) is effective for unresponsive infections or if a topical antifungal drug cannot be used or if the patient has dry mouth. Topical therapy may not be adequate in immunocompromised patients and an oral triazole antifungal is preferred (section 5.2.1).

**Acute erythematous candidiasis** Acute erythematous (atrophic) candidiasis is a relatively uncommon condition associated with corticosteroid and broad-spectrum antibacterial use and with HIV disease. It is usually treated with **fluconazole** (section 5.2.1).

**Denture stomatitis** Patients with denture stomatitis (chronic atrophic candidiasis), should cleanse their dentures thoroughly and leave them out as often as possible during the treatment period. To prevent recurrence of the problem, dentures should not normally be worn at night. New dentures may be required if these measures fail despite good compliance.

**Miconazole** oral gel can be applied to the fitting surface of the denture before insertion (for short periods only). Denture stomatitis is not always associated with candidiasis and other factors such as mechanical or chemical irritation, bacterial infection, or rarely allergy to the dental base material, may be the cause.

**Chronic hyperplastic candidiasis** Chronic hyperplastic candidiasis (candidal leucoplakia) carries an increased risk of malignancy; biopsy is essential—this type of candidiasis may be associated with varying degrees of dysplasia, with oral cancer present in a high proportion of cases. Chronic hyperplastic candidiasis is treated with a systemic antifungal such as **fluconazole** (section 5.2.1) to eliminate candidal overgrowth. Patients should avoid the use of tobacco.

**Angular cheilitis** Angular cheilitis (angular stomatitis) is characterised by soreness, erythema and fissuring at the angles of the mouth. It is commonly associated with denture stomatitis but may represent a nutritional deficiency or it may be related to orofacial granulomatosis or HIV infection. Both yeasts (*Candida* spp.) and bacteria (*Staphylococcus aureus* and beta-haemolytic streptococci) are commonly involved as interacting, infective factors. A reduction in facial height related to ageing and tooth loss with maceration in the deep occlusive folds that may subsequently arise, predisposes to such infection. While the underlying cause is being identified and treated, it is often helpful to apply **micon-**

azole cream (see p. 737) or **sodium fusidate** ointment (see p. 735); if the angular cheilitis is unresponsive to treatment, **miconazole** and **hydrocortisone** cream or ointment (see p. 707) can be used.

**Immunocompromised patients** For advice on prevention of fungal infections in immunocompromised patients see p. 374.

**Drugs used in oropharyngeal candidiasis** Nystatin is not absorbed from the gastro-intestinal tract and is applied locally (as a suspension) to the mouth for treating local fungal infections. Miconazole is applied locally (as an oral gel) in the mouth but it is absorbed to the extent that potential interactions need to be considered. Miconazole also has some activity against Gram-positive bacteria including streptococci and staphylococci. Fluconazole (section 5.2.1) is given by mouth for infections that do not respond to topical therapy or when topical therapy cannot be used. It is reliably absorbed and effective. Itraconazole (section 5.2.1) can be used for fluconazole-resistant infections.

If candidal infection fails to respond to 1 to 2 weeks of treatment with antifungal drugs the patient should be sent for investigation to eliminate the possibility of underlying disease. Persistent infection may also be caused by reinfection from the genito-urinary or gastro-intestinal tract. Infection can be eliminated from these sources by appropriate anticandidal therapy; the patient's partner may also require treatment to prevent reinfection.

For the role of antiseptic mouthwashes in the prevention of oral candidiasis in immunocompromised patients and treatment of denture stomatitis, see section 12.3.4.

## MICONAZOLE

**Indications** see preparations

**Cautions** avoid in acute porphyria (section 9.8.2); **interactions:** Appendix 1 (antifungals, imidazole)

**Contra-indications** with oral gel, impaired swallowing reflex in infants, first 5–6 months of life of an infant born preterm

**Hepatic impairment** avoid

**Pregnancy** manufacturer advises avoid if possible—**toxicity** at high doses in animal studies

**Breast-feeding** manufacturer advises caution—no information available

**Side-effects** nausea, vomiting; rash; with buccal tablets, abdominal pain, taste disturbance, burning sensation at application site, pruritus, and oedema; with oral gel, very rarely diarrhoea (usually on long-term treatment), hepatitis, toxic epidermal necrolysis, and Stevens-Johnson syndrome

### Dose

• see preparations

<sup>1</sup>**Daktarin**® (Janssen-Cilag) (P<sub>M</sub>)

**Oral gel**, sugar-free, orange-flavoured, miconazole 24 mg/mL (20 mg/g). Net price 15-g tube = £2.85, 80-g tube = £4.38. Label: 9, counselling, hold in mouth, after food

**Dose** prevention and treatment of oral and intestinal fungal infections, 5–10 mL in the mouth after food 4 times daily, retained near oral lesions before swallowing; CHILD 4 months–2 years 2.5 mL twice daily, smeared around the mouth; 2–6 years 5 mL

twice daily, retained near lesions before swallowing; over 6 years 5 mL 4 times daily, retained near lesions before swallowing

**Note** Treatment should be continued for 48 hours after lesions have healed

Localised lesions, ADULT and CHILD over 2 years, smear small amount on affected area with clean finger 4 times daily for 5–7 days (dental prostheses should be removed at night and brushed with gel); treatment continued for 48 hours after lesions have healed

**Dental prescribing on NHS** May be prescribed as Miconazole Oromucosal Gel

1. 15-g tube can be sold to the public

## Buccal preparation

**Loramyc**® (Therabel) ▼ (P<sub>M</sub>)

**Mucoadhesive buccal tablets**, white-yellow, miconazole 50 mg, net price 14-tablet pack = £45.61. Label: 10, counselling, administration

**Dose** oropharyngeal candidiasis in immunocompromised ADULT, 50 mg daily preferably taken in the morning for 7 days; if no improvement, continue treatment for a further 7 days

**Counselling** Place rounded side of tablet on upper gum above an incisor tooth and hold upper lip firmly over the gum for 30 seconds using a finger. If tablet detaches within 6 hours, replace with a new tablet. With each dose, use alternate sides of the gum

**Note** The Scottish Medicines Consortium (p. 4) has advised (November 2008) that miconazole mucoadhesive buccal tablets (Loramyc®) are not recommended for use within NHS Scotland.

## NYSTATIN

**Indications** oral and perioral fungal infections

**Side-effects** oral irritation and sensitisation, nausea reported

### Dose

• Treatment, ADULT and CHILD, 100 000 units 4 times daily after food, usually for 7 days (continued for 48 hours after lesions have resolved)

**Note** Unlicensed for treating candidiasis in NEONATE

**Nystan**® (Squibb) (P<sub>M</sub>)

**Oral suspension**, yellow, nystatin 100 000 units/mL.

Net price 30 mL with pipette = £1.91. Label: 9, counselling, use of pipette, hold in mouth, after food

**Dental prescribing on NHS** Nystatin Oral Suspension may be prescribed

## Oropharyngeal viral infections

The management of primary herpetic gingivostomatitis is a soft diet, adequate fluid intake, and analgesics as required, including local use of **benzydamine** (section 12.3.1). The use of chlorhexidine mouthwash (section 12.3.4) will control plaque accumulation if toothbrushing is painful and will also help to control secondary infection in general.

In the case of severe herpetic stomatitis, a systemic antiviral such as aciclovir is required (section 5.3.2.1). Valaciclovir and famciclovir are suitable alternatives for oral lesions associated with herpes zoster. Aciclovir and valaciclovir are also used for the prevention of frequently recurring herpes simplex lesions of the mouth, particularly when implicated in the initiation of erythema multiforme. See section 13.10.3 for the treatment of labial herpes simplex infections.

Herpes infections of the mouth may also respond to rinsing the mouth with **doxycycline**, see p. 694.

### 12.3.3 Lozenges and sprays

There is no convincing evidence that antiseptic lozenges and sprays have a beneficial action and they sometimes irritate and cause sore tongue and sore lips. Some of these preparations also contain local anaesthetics which relieve pain but may cause sensitisation.

### 12.3.4 Mouthwashes, gargles, and dentifrices

Superficial infections of the mouth are often helped by warm mouthwashes which have a mechanical cleansing effect and cause some local hyperaemia. However, to be effective, they must be used frequently and vigorously. A warm saline mouthwash is ideal and can be prepared either by dissolving half a teaspoonful of salt in a glassful of warm water or by diluting **compound sodium chloride mouthwash** with an equal volume of warm water. **Mouthwash solution-tablets** are used to remove unpleasant tastes.

Mouthwashes containing an oxidising agent, such as **hydrogen peroxide**, may be useful in the treatment of acute ulcerative gingivitis (Vincent's infection) since the organisms involved are anaerobes. It also has a mechanical cleansing effect arising from frothing when in contact with oral debris.

**Chlorhexidine** is an effective antiseptic which has the advantage of inhibiting plaque formation on the teeth. It does not, however, completely control plaque deposition and is not a substitute for effective toothbrushing. Moreover, chlorhexidine preparations do not penetrate significantly into stagnation areas and are therefore of little value in the control of dental caries or of periodontal disease once pocketing has developed. Chlorhexidine mouthwash is used in the treatment of denture stomatitis. It is also used in the prevention of oral candidiasis in immunocompromised patients. Chlorhexidine mouthwash reduces the incidence of alveolar osteitis following tooth extraction. Chlorhexidine mouthwash should not be used for the prevention of endocarditis in patients undergoing dental procedures.

Chlorhexidine can be used as a mouthwash, spray or gel for secondary infection in mucosal ulceration and for controlling gingivitis, as an adjunct to other oral hygiene measures. These preparations may also be used instead of toothbrushing where there is a painful periodontal condition (e.g. primary herpetic stomatitis) or if the patient has a haemorrhagic disorder, or is disabled. Chlorhexidine preparations are of little value in the control of acute necrotising ulcerative gingivitis.

There is no convincing evidence that gargles are effective.

#### CHLORHEXIDINE GLUCONATE

**Indications** see under preparations below

**Side-effects** mucosal irritation (if desquamation occurs, discontinue treatment or dilute mouthwash with an equal volume of water); taste disturbance; reversible brown staining of teeth, and of silicate or composite restorations; tongue discoloration; parotid gland swelling reported

**Note** Chlorhexidine gluconate may be incompatible with some ingredients in toothpaste; leave an interval of at least 30 minutes between using mouthwash and toothpaste

#### Chlorhexidine (Non-proprietary)

**Mouthwash**, chlorhexidine gluconate 0.2%, net price 300 mL = £2.51

**Dose** oral hygiene and plaque inhibition, oral candidiasis, gingivitis, and management of aphthous ulcers, rinse mouth with 10 mL for about 1 minute twice daily

Denture stomatitis, cleanse and soak dentures in mouthwash solution for 15 minutes twice daily

**Dental prescribing on NHS** Chlorhexidine Mouthwash may be prescribed

#### Corsodyl® (GSK Consumer Healthcare)

**Dental gel**, chlorhexidine gluconate 1%. Net price 50 g = £1.21

**Dose** oral hygiene and plaque inhibition and gingivitis, brush on the teeth once or twice daily

Oral candidiasis and management of aphthous ulcers, apply to affected areas once or twice daily

**Dental prescribing on NHS** May be prescribed as Chlorhexidine Gluconate Gel

**Mouthwash**, chlorhexidine gluconate 0.2%. Net price 300 mL (original or mint) = £2.18, 600 mL (mint) = £3.85

**Dose** oral hygiene and plaque inhibition, oral candidiasis, gingivitis, and management of aphthous ulcers, rinse mouth with 10 mL for about 1 minute twice daily

Denture stomatitis, cleanse and soak dentures in mouthwash solution for 15 minutes twice daily

**Oral spray**, chlorhexidine gluconate 0.2% (mint-flavoured). Net price 60 mL = £4.10

**Dose** oral hygiene and plaque inhibition, oral candidiasis, gingivitis, and management of aphthous ulcers, apply as required to tooth, gingival, or ulcer surfaces using up to 12 actuations (approx. 0.14 mL/actuation) twice daily

**Dental prescribing on NHS** May be prescribed as Chlorhexidine Oral Spray

#### Periogard® (Colgate-Palmolive)

**Oromucosal solution**, alcohol-free, chlorhexidine gluconate 0.2%, net price 300 mL = £1.96

**Dose** short-term treatment of inflammation of gingival and oral mucosa, **ADULT** and **CHILD** over 6 years, rinse mouth with 10 mL for about 1 minute twice daily

**Dental prescribing on NHS** May be prescribed as Chlorhexidine Oromucosal Solution, Alcohol-free, 0.2%

#### With chlorobutanol

#### Eludril® (Fabre)

**Mouthwash or gargle**, chlorhexidine gluconate 0.1%, chlorobutanol 0.5% (mint-flavoured), net price 90 mL = £1.36, 250 mL = £2.83, 500 mL = £5.06

**Dose** oral hygiene and plaque inhibition, use 10–15 mL (diluted with warm water in measuring cup provided) 2–3 times daily  
Denture disinfection, soak previously cleansed dentures in mouthwash (diluted with 2 volumes of water) for 60 minutes

#### HEXETIDINE

**Indications** oral hygiene

**Side-effects** local irritation; *very rarely* taste disturbance and transient anaesthesia

#### Oraldene® (McNeil)

**Mouthwash or gargle**, red or blue-green (mint-flavoured), hexetidine 0.1%. Net price 100 mL = £1.31; 200 mL = £2.02

**Dose** **ADULT** and **CHILD** over 6 years, use 15 mL undiluted 2–3 times daily

#### HYDROGEN PEROXIDE

**Indications** oral hygiene, see notes above

**Side-effects** hypertrophy of papillae of tongue on prolonged use

**Hydrogen Peroxide Mouthwash, BP**

**Mouthwash**, consists of Hydrogen Peroxide Solution 6% (= approx. 20 volume) BP

**Dose** rinse the mouth for 2–3 minutes with 15 mL diluted in half a tumblerful of warm water 2–3 times daily

**Dental prescribing on NHS** Hydrogen Peroxide Mouthwash may be prescribed

**Peroxyl®** (Colgate-Palmolive)

**Mouthwash**, hydrogen peroxide 1.5%, net price 300 mL = £2.54

**Dose** rinse the mouth with 10 mL for about 1 minute up to 4 times daily (after meals and at bedtime)

**SODIUM CHLORIDE**

**Indications** oral hygiene, see notes above

**Sodium Chloride Mouthwash, Compound, BP**

**Mouthwash**, sodium bicarbonate 1%, compound chloride 1.5% in a suitable vehicle with a peppermint flavour.

**Dose** extemporaneous preparations should be prepared according to the following formula: sodium chloride 1.5 g, sodium bicarbonate 1 g, concentrated peppermint emulsion 2.5 mL, double-strength chloroform water 50 mL, water to 100 mL.

To be diluted with an equal volume of warm water

**Dental prescribing on NHS** Compound Sodium Chloride Mouthwash may be prescribed

**THYMOL**

**Indications** oral hygiene, see notes above

**Mouthwash Solution-tablets**

Consist of tablets which may contain antimicrobial, colouring, and flavouring agents in a suitable soluble effervescent basis to make a mouthwash suitable for dental purposes. Net price 100-tab pack = £15.09

**Dose** dissolve 1 tablet in a tumblerful of warm water

**Note** Mouthwash solution tablets may contain ingredients such as thymol

**Dental prescribing on NHS** Mouthwash Solution-tablets may be prescribed

giving rise to a dry mouth. *Biotène Oralbalance®*, *BioXtra®*, *Glandosane®*, *Saliva Orthana®*, and *Saliveze®*, have ACBS approval for dry mouth associated only with radiotherapy or sicca syndrome. *Salivix®* pastilles, which act locally as salivary stimulants, are also available and have similar ACBS approval. *SST* tablets may be prescribed for dry mouth in patients with salivary gland impairment (and patent salivary ducts).

**Pilocarpine** tablets are licensed for the treatment of xerostomia following irradiation for head and neck cancer and for dry mouth and dry eyes (xerophthalmia) in Sjögren's syndrome. They are effective only in patients who have some residual salivary gland function, and therefore should be withdrawn if there is no response.

**Local treatment****AS Saliva Orthana®** (AS Pharma)

**Oral spray**, gastric mucin (porcine) 3.5%, xylitol 2%, sodium fluoride 4.2 mg/litre, with preservatives and flavouring agents, pH neutral. Net price 50-mL bottle = £4.92; 450-mL refill = £34.27

**Dose** ACBS: patients suffering from dry mouth as a result of having (or having undergone) radiotherapy, or sicca syndrome, spray 2–3 times onto oral and pharyngeal mucosa, when required

**Dental prescribing on NHS** *AS Saliva Orthana®* Oral Spray may be prescribed

**Lozenges**, mucin 65 mg, xylitol 59 mg, in a sorbitol basis, pH neutral. Net price 30-lozenge pack = £3.50

**Dose** ACBS: patients suffering from dry mouth as a result of having (or having undergone) radiotherapy, or sicca syndrome

**Note** *AS Saliva Orthana®* lozenges do not contain fluoride

**Dental prescribing on NHS** *AS Saliva Orthana®* Lozenges may be prescribed

**Biotène Oralbalance®** (GSK)

**Saliva replacement gel**, lactoperoxidase, lactoferrin, lysozyme, glucose oxidase, xylitol in a gel basis, net price 50-g tube = £4.10, 24 × 12.4-mL tube = £30.40 (for hospital use)

**Dose** ACBS: patients suffering from dry mouth as a result of having (or having undergone) radiotherapy, or sicca syndrome, apply to gums and tongue as required

**Note** Avoid use with toothpastes containing detergents (including foaming agents)

**Dental prescribing on NHS** *Biotène Oralbalance®* Saliva Replacement Gel may be prescribed

**BioXtra®** (RIS Products)

**Gel**, lactoperoxidase, lactoferrin, lysozyme, whey colostrum, xylitol and other ingredients, net price 40-mL tube = £3.94, 50-mL spray = £3.94

**Dose** ACBS: patients suffering from dry mouth as a result of having (or having undergone) radiotherapy, or sicca syndrome, apply to oral mucosa as required

**Dental prescribing on NHS** *BioXtra®* Gel may be prescribed

**Glandosane®** (Fresenius Kabi)

**Aerosol spray**, carmellose sodium 500 mg, sorbitol 1.5 g, potassium chloride 60 mg, sodium chloride 42.2 mg, magnesium chloride 2.6 mg, calcium chloride 7.3 mg, and dipotassium hydrogen phosphate 17.1 mg/50 g, pH 5.75. Net price 50-mL unit (neutral, lemon or peppermint flavoured) = £4.82

**Dose** ACBS: patients suffering from dry mouth as a result of having (or having undergone) radiotherapy, or sicca syndrome, spray onto oral and pharyngeal mucosa as required

**Dental prescribing on NHS** *Glandosane®* Aerosol Spray may be prescribed

**12.3.5 Treatment of dry mouth**

Dry mouth (xerostomia) may be caused by drugs with antimuscarinic (anticholinergic) side-effects (e.g. antispasmodics, tricyclic antidepressants, and some anti-psychotics), by diuretics, by irradiation of the head and neck region or by damage to or disease of the salivary glands. Patients with a persistently dry mouth may develop a burning or scalded sensation and have poor oral hygiene; they may develop increased dental caries, periodontal disease, intolerance of dentures, and oral infections (particularly candidiasis). Dry mouth may be relieved in many patients by simple measures such as frequent sips of cool drinks or sucking pieces of ice or sugar-free fruit pastilles. Sugar-free chewing gum stimulates salivation in patients with residual salivary function.

**Artificial saliva** can provide useful relief of dry mouth. A properly balanced artificial saliva should be of a neutral pH and contain electrolytes (including fluoride) to correspond approximately to the composition of saliva. The acidic pH of some artificial saliva products may be inappropriate. Of the proprietary preparations, *Salinum®* or *Xerotin®* can be used for any condition

**Saliveze®** (Wyvern)

**Oral spray**, carmellose sodium (sodium carboxymethylcellulose), calcium chloride, magnesium chloride, potassium chloride, sodium chloride, and dibasic sodium phosphate, pH neutral. Net price 50-mL bottle (mint-flavoured) = £3.50

**Dose** ACBS: patients suffering from dry mouth as a result of having (or having undergone) radiotherapy, or sicca syndrome, 1 spray onto oral mucosa as required

**Dental prescribing on NHS** *Saliveze®* Oral Spray may be prescribed

**Salivix®** (Galen)

**Pastilles**, sugar-free, reddish-amber, acacia, malic acid and other ingredients. Net price 50-pastille pack = £3.50

**Dose** ACBS: patients suffering from dry mouth as a result of having (or having undergone) radiotherapy, or sicca syndrome, suck 1 pastille when required

**Dental prescribing on NHS** *Salivix®* Pastilles may be prescribed

**SST** (Medac)

**Tablets**, sugar-free, citric acid, malic acid and other ingredients in a sorbitol base, net price 100-tab pack = £4.86

**Dose** symptomatic treatment of dry mouth in patients with impaired salivary gland function and patent salivary ducts, allow 1 tablet to dissolve slowly in the mouth when required

**Dental prescribing on NHS** May be prescribed as Saliva Stimulating Tablets

**Xerotin®** (SpePharm)

**Oral spray**, sugar-free, water, sorbitol, carmellose (carboxymethylcellulose), potassium chloride, sodium chloride, potassium phosphate, magnesium chloride, calcium chloride and other ingredients, pH neutral. Net price 100-mL unit = £6.86

**Dose** symptomatic treatment of dry mouth, spray as required

**Dental prescribing on NHS** *Xerotin®* Oral Spray may be prescribed as Artificial Saliva Oral Spray

**Pregnancy** avoid—smooth muscle stimulant; toxicity in *animal* studies

**Breast-feeding** manufacturer advises avoid—present in milk in *animal* studies

**Side-effects** dyspepsia, diarrhoea, abdominal pain, nausea, vomiting, constipation; flushing, hypertension, palpitation, headache, dizziness, asthenia, influenza-like symptoms, sweating; increased urinary frequency; visual disturbances, lacrimation, ocular pain, conjunctivitis; rhinitis; rash, pruritus; *less commonly* flatulence, urinary urgency

**Dose**

- Xerostomia following irradiation for head and neck cancer, 5 mg 3 times daily with or immediately after meals (last dose always with evening meal); if tolerated but response insufficient after 4 weeks, may be increased to max. 30 mg daily in divided doses; max. therapeutic effect normally within 4–8 weeks; discontinue if no improvement after 2–3 months; **CHILD** not recommended
- Dry mouth and dry eyes in Sjögren's syndrome, 5 mg 4 times daily (with meals and at bedtime); if tolerated but response insufficient, may be increased to max. 30 mg daily in divided doses; discontinue if no improvement after 2–3 months; **CHILD** not recommended

**Salagen®** (Novartis) <sup>(Pm)</sup>

**Tablets**, f/c, pilocarpine hydrochloride 5 mg. Net price 84-tab pack = £41.14. Label: 21, 27, counselling, driving

**Systemic treatment****PILOCARPINE HYDROCHLORIDE**

**Indications** xerostomia following irradiation for head and neck cancer (see also notes above); dry mouth and dry eyes in Sjögren's syndrome

**Cautions** asthma and chronic obstructive pulmonary disease (avoid if uncontrolled, see Contra-indications), cardiovascular disease (avoid if uncontrolled); cholelithiasis or biliary-tract disease, peptic ulcer, risk of increased urethral smooth muscle tone and renal colic; maintain adequate fluid intake to avoid dehydration associated with excessive sweating; cognitive or psychiatric disturbances; susceptibility to angle-closure glaucoma; **interactions:** Appendix 1 (parasympathomimetics)

**Counselling** Blurred vision or dizziness may affect performance of skilled tasks (e.g. driving) particularly at night or in reduced lighting

**Contra-indications** uncontrolled asthma and chronic obstructive pulmonary disease (increased bronchial secretions and increased airways resistance); uncontrolled cardiorenal disease; acute iritis

**Hepatic impairment** reduce initial oral dose in moderate or severe cirrhosis

**Renal impairment** manufacturer advises caution with tablets

- scabies, p. 740

For information on wound management products and elastic hosiery see Appendix 8, p. 935.

The British Association of Dermatologists list of preferred unlicensed dermatological preparations (specials) is available at <http://www.bad.org.uk/site/495/default.aspx>

## 13.1 Management of skin conditions

### 13.1.1 Vehicles

Both vehicle and active ingredients are important in the treatment of skin conditions; the vehicle alone may have more than a mere placebo effect. The vehicle affects the degree of hydration of the skin, has a mild anti-inflammatory effect, and aids the penetration of active drug.

**Applications** are usually viscous solutions, emulsions, or suspensions for application to the skin (including the scalp) or nails.

**Collodions** are painted on the skin and allowed to dry to leave a flexible film over the site of application.

**Creams** are emulsions of oil and water and are generally well absorbed into the skin. They may contain an antimicrobial preservative unless the active ingredient or basis is intrinsically bactericidal and fungicidal. Generally, creams are cosmetically more acceptable than ointments because they are less greasy and easier to apply.

**Gels** consist of active ingredients in suitable hydrophilic or hydrophobic bases; they generally have a high water content. Gels are particularly suitable for application to the face and scalp.

**Lotions** have a cooling effect and may be preferred to ointments or creams for application over a hairy area. Lotions in alcoholic basis can sting if used on broken skin. *Shake lotions* (such as calamine lotion) contain insoluble powders which leave a deposit on the skin surface.

**Ointments** are greasy preparations which are normally anhydrous and insoluble in water, and are more occlusive than creams. They are particularly suitable for chronic, dry lesions. The most commonly used ointment bases consist of soft paraffin or a combination of soft, liquid and hard paraffin. Some ointment bases have both *hydrophilic* and *lipophilic* properties; they may have occlusive properties on the skin surface, encourage hydration, and also be miscible with water; they often have a mild anti-inflammatory effect. *Water-soluble ointments* contain macrogols which are freely soluble in water and are therefore readily washed off; they have a limited but useful role where ready removal is desirable.

**Pastes** are stiff preparations containing a high proportion of finely powdered solids such as zinc oxide and starch suspended in an ointment. They are used for circumscribed lesions such as those which occur in lichen simplex, chronic eczema, or psoriasis. They are less occlusive than ointments and can be used to protect inflamed, lichenified, or excoriated skin.

**Dusting powders** are used only rarely. They reduce friction between opposing skin surfaces. Dusting powders should not be applied to moist areas because they can cake and abrade the skin. Talc is a lubricant but it does not absorb moisture; it can cause respiratory irritation. Starch is less lubricant but absorbs water.

**Dilution** The BP directs that creams and ointments should **not** normally be diluted but that should dilution be necessary care should be taken, in particular, to prevent microbial contamination. The appropriate diluent should be used and heating should be avoided during mixing; excessive dilution may affect the stability of some creams. Diluted creams should normally be used within 2 weeks of preparation.

### 13.1.2 Suitable quantities for prescribing

#### Suitable quantities of dermatological preparations to be prescribed for specific areas of the body

	Creams and Ointments	Lotions
Face	15–30 g	100 mL
Both hands	25–50 g	200 mL
Scalp	50–100 g	200 mL
Both arms or both legs	100–200 g	200 mL
Trunk	400 g	500 mL
Groins and genitalia	15–25 g	100 mL

These amounts are usually suitable for an adult for twice daily application for 1 week. The recommendations do **not** apply to corticosteroid preparations—for suitable quantities of corticosteroid preparations see section 13.4.

### 13.1.3 Excipients and sensitisation

Excipients in topical products rarely cause problems. If a patch test indicates allergy to an excipient, products containing the substance should be avoided (see also Anaphylaxis, p. 197). The following excipients in topical preparations are rarely associated with sensitisation; the presence of these excipients is indicated in the entries for topical products. See also Excipients, under General Guidance, p. 2.

Beeswax	Imidurea
Benzyl alcohol	Isopropyl palmitate
Butylated hydroxyanisole	<i>N</i> -(3-Chloroallyl)hexamini-um chloride (quater-nium 15)
Butylated hydroxytoluene	Polysorbates
Cetostearyl alcohol (includ-ing cetyl and stearyl alcohol)	Propylene glycol
Chlorocresol	Sodium metabisulphite
Edetic acid (EDTA)	Sorbic acid
Ethylendiamine	Wool fat and related sub-stances including lanolin <sup>1</sup>
Fragrances	
Hydroxybenzoates (para-bens)	

1. Purified versions of wool fat have reduced the problem

## 13.2 Emollient and barrier preparations

### 13.2.1 Emollients

### 13.2.2 Barrier preparations

**Borderline substances** The preparations marked 'ACBS' are regarded as drugs when prescribed in accordance with the advice of the Advisory Committee on Borderline Substances for the clinical conditions listed. Prescriptions issued in accordance with this advice and endorsed 'ACBS' will normally not be investigated. See Appendix 7 for listing by clinical condition.

### 13.2.1 Emollients

**Emollients** soothe, smooth and hydrate the skin and are indicated for all dry or scaling disorders. Their effects are short-lived and they should be applied frequently even after improvement occurs. They are useful in dry and eczematous disorders, and to a lesser extent in psoriasis (section 13.5.2). The choice of an appropriate emollient will depend on the severity of the condition, patient preference, and the site of application. Emollients should be applied in the direction of hair growth. Ointments may exacerbate acne and folliculitis. Some ingredients rarely cause sensitisation (section 13.1.3) and this should be suspected if an eczematous reaction

occurs. The use of aqueous cream as a leave-on emollient may increase the risk of skin reactions, particularly in eczema.

#### Fire hazard with paraffin-based emollients

Emulsifying ointment or 50% Liquid Paraffin and 50% White Soft Paraffin Ointment in contact with dressings and clothing is easily ignited by a naked flame. The risk is greater when these preparations are applied to large areas of the body, and clothing or dressings become soaked with the ointment. Patients should be told to keep away from fire or flames, and not to smoke when using these preparations. The risk of fire should be considered when using large quantities of any paraffin-based emollient.

Preparations such as aqueous cream and emulsifying ointment can be used as soap substitutes for hand washing and in the bath; the preparation is rubbed on the skin before rinsing off completely. The addition of a bath oil (section 13.2.1.1) may also be helpful.

Preparations containing an antibacterial (section 13.10) should be avoided unless infection is present or is a frequent complication.
