Although minocycline p. 608 is as effective as other tetracyclines for acne, it is associated with a greater risk of lupus erythematosus-like syndrome. Minocycline sometimes causes irreversible pigmentation; it is given in a once or twice daily dose.

Erythromycin in a twice daily dose is an alternative for the management of acne but *propionibacteria* strains resistant to erythromycin are becoming widespread and this may explain poor response.

Trimethoprim p. 616 may be used for acne resistant to other antibacterials [unlicensed indication]. Prolonged treatment with trimethoprim may depress haematopoiesis; it should generally be initiated by specialists.

Concomitant use of different topical and systemic antibacterials is undesirable owing to the increased likelihood of the development of bacterial resistance.

Hormone treatment for acne

Co-cyprindiol (cyproterone acetate with ethinylestradiol) contains an anti-androgen. It is licensed for use in women with moderate to severe acne that has not responded to topical therapy or oral antibacterials, and for moderately severe hirsutism. Although it is an effective hormonal contraceptive, it should not be used solely for contraception.

Improvement of acne with co-cyprindiol probably occurs because of decreased sebum secretion which is under androgen control. Some women with moderately severe hirsutism may also benefit because hair growth is also androgen-dependent.

The MHRA/CHM have released important safety information regarding the use of cyproterone acetate and the risk of meningioma. For further information, see *Important safety information for co-cyprindiol*. The Faculty of Sexual and Reproductive Healthcare have released a statement in response to the MHRA/CHM information (available at: www.fsrh.org/standards-and-guidance/documents/fsrh-cu-statement-new-advice-from-the-mhra-regarding/).

Oral retinoid for acne

The retinoid isotretinoin reduces sebum secretion. It is used for the systemic treatment of severe acne (such as nodular or conglobate acne or acne at risk of permanent scarring) resistant to adequate courses of standard therapy with systemic antibacterials and topical therapy.

Isotretinoin is a toxic drug that should be prescribed **only** by, or under the supervision of, a consultant dermatologist. It is given for at least 16 weeks; repeat courses are not normally required.

Side-effects of isotretinoin p. 1324 include severe dryness of the skin and mucous membranes, nose bleeds, and joint pains. The drug is **teratogenic** and must **not** be given to women of child-bearing age unless they practise effective contraception (oral progestogen-only contraceptives not considered effective) and then only after detailed assessment and explanation by the physician. Women must also be registered with a pregnancy prevention programme.

Although a causal link between isotretinoin use and psychiatric changes (including suicidal ideation) has not been established, the possibility should be considered before initiating treatment; if psychiatric changes occur during treatment, isotretinoin should be stopped, the prescriber informed, and specialist psychiatric advice should be sought.

The MHRA/CHM have released important safety information on the risks and precautions for the use of isotretinoin. For further information, see *Important safety information for isotretinoin*.

Rosacea

Rosacea is not comedonal (but may exist with acne which may be comedonal). Brimonidine tartrate p. 1327 is licensed for the treatment of facial erythema in rosacea. The pustules and papules of rosacea respond to topical azelaic acid p. 1323, topical ivermectin p. 1327 or to topical metronidazole p. 1285. Alternatively oral administration of oxytetracycline p. 609 or tetracycline p. 609, or erythromycin p. 577, can be used; courses usually last 6–12 weeks and are repeated intermittently. Doxycycline p. 606 can be used [unlicensed indication] if oxytetracycline or tetracycline is inappropriate (e.g. in renal impairment). A modified-release preparation of doxycycline is licensed in low daily doses for the treatment of facial rosacea. Camouflagers may be required for the redness.

6.1 Acne

ANTI-ANDROGENS

Co-cyprindiol

18-Aug-2020

● INDICATIONS AND DOSE

Moderate to severe acne in females of child-bearing age refractory to topical therapy or oral antibacterials | Moderately severe hirsutism

► BY MOUTH

- Females of childbearing potential: 1 tablet daily for 21 days, to be started on day 1 of menstrual cycle; subsequent courses repeated after a 7-day interval (during which withdrawal bleeding occurs), time to symptom remission, at least 3 months; review the need for treatment regularly

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CYPROTERONE ACETATE: NEW ADVICE TO MINIMISE RISK OF MENINGIOMA (JUNE 2020)

Cyproterone acetate has been associated with an overall rare, but cumulative dose-dependent, increased risk of meningioma (single and multiple), mainly at doses of 25 mg/day and higher. Healthcare professionals are advised to monitor patients for meningiomas, and to permanently discontinue treatment if diagnosed. Use of cyproterone acetate, including co-cyprindiol, for all indications is contra-indicated in those with meningioma or a history of meningioma.

- **CONTRA-INDICATIONS** Acute porphyrias p. 1114 · current breast cancer · heart disease associated with pulmonary hypertension or risk of embolus · history of stroke (including transient ischaemic attack) · ischaemic heart disease · known thrombogenic mutations (e.g. factor V Leiden, prothrombin mutation, protein S, protein C and antithrombin deficiencies) · medical treatment for varicose veins · migraine with aura · positive antiphospholipid antibodies · presence or history of liver tumours · previous or current venous or arterial thrombosis · severe or multiple risk factors for arterial or venous thromboembolism · systemic lupus erythematosus with antiphospholipid antibodies
- **CAUTIONS** Cardiac disease · cervical cancer · cholestasis with previous use of combined oral contraception—seek specialist advice before use · gallbladder disease—seek specialist advice before use · gene mutations associated with breast cancer (e.g. BRCA 1)—seek specialist advice before use · history of breast cancer—seek specialist advice before use · history of cholestasis during pregnancy · history of depression · hyperprolactinaemia—seek specialist advice before use · inflammatory bowel disease including Crohn's disease · migraine · personal or family history of hypertriglyceridaemia (increased risk of pancreatitis) · risk factors for arterial thromboembolism · risk factors for venous thromboembolism · sickle-cell disease · systemic lupus erythematosus · undiagnosed breast mass—seek specialist advice before use · undiagnosed vaginal bleeding
- **CAUTIONS, FURTHER INFORMATION**
 - Venous thromboembolism There is an increased risk of venous thromboembolism in women taking co-cyprindiol, particularly during the first year of use. The incidence of venous thromboembolism is 1.5–2 times higher in women using co-cyprindiol than in women using combined oral contraceptives containing levonorgestrel, but the risk may be similar to that associated with use of combined oral contraceptives containing third generation progestogens (desogestrel and gestodene) or drospirenone. Women

requiring co-cyprindiol may have an inherently increased risk of cardiovascular disease.

For more information about the risk factors for venous thromboembolism, see combined hormonal contraceptives p. 844.

- **INTERACTIONS** → Appendix 1: anti-androgens
- **SIDE-EFFECTS**
 - **Common or very common** Abdominal pain · breast abnormalities · depression · headaches · mood altered · nausea · weight changes
 - **Uncommon** Diarrhoea · fluid retention · sexual dysfunction · skin reactions · vomiting
 - **Rare or very rare** Contact lens intolerance · erythema nodosum · thromboembolism · vaginal discharge
 - **Frequency not known** Amenorrhoea (on discontinuation) · angioedema aggravated · chorea exacerbated · hepatic function abnormal · hepatic neoplasm · hypertension · hypertriglyceridaemia · inflammatory bowel disease · menstrual cycle irregularities · suicidal behaviours
- **PREGNANCY** Avoid—risk of feminisation of male fetus with cyproterone.
- **BREAST FEEDING** Manufacturer advises avoid; possibility of anti-androgen effects in neonate with cyproterone.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution; avoid in severe or active disease
- **PRESCRIBING AND DISPENSING INFORMATION** A mixture of cyproterone acetate and ethinylestradiol in the mass proportions 2000 parts to 35 parts, respectively.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
 - Tablet**

Isotretinoin

24-Sep-2020

● INDICATIONS AND DOSE

Severe acne [(such as nodular or conglobate acne or acne at risk of permanent scarring) resistant to adequate courses of standard therapy with systemic antibacterials and topical therapy] (under expert supervision)

▶ BY MOUTH

- ▶ **Adult:** Initially 500 micrograms/kg daily in 1–2 divided doses, increased if necessary to 1 mg/kg daily for 16–24 weeks, repeat treatment course after a period of at least 8 weeks if relapse after first course; maximum 150 mg/kg per course

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: ISOTRETINOIN (*ROACCUTANE*®): RARE REPORTS OF ERECTILE DYSFUNCTION AND DECREASED LIBIDO (OCTOBER 2017)

An EU-wide review has concluded that on rare occasions, oral isotretinoin, indicated for severe acne, may cause sexual side-effects, including erectile dysfunction and decreased libido.

MHRA/CHM ADVICE: ORAL RETINOID MEDICINES: REVISED AND SIMPLIFIED PREGNANCY PREVENTION EDUCATIONAL MATERIALS FOR HEALTHCARE PROFESSIONALS AND WOMEN (JUNE 2019)

New prescriber checklists, patient reminder cards, and pharmacy checklists are available to support the Pregnancy Prevention Programme in women and girls of childbearing potential taking oral acitretin, alitretinoin,

or isotretinoin. Healthcare professionals are reminded that the use of oral retinoids is contra-indicated in pregnancy due to a high risk of serious congenital malformations, and any use in females must be within the conditions of the Pregnancy Prevention Programme (see *Conception and contraception* and *Prescribing and dispensing information*).

Neuropsychiatric reactions have been reported in patients taking oral retinoids. Healthcare professionals are advised to monitor patients for signs of depression or suicidal ideation and refer for appropriate treatment, if necessary; particular care is needed in those with a history of depression. Patients should be advised to speak to their doctor if they experience any changes in mood or behaviour, and encouraged to ask family and friends to look out for any change in mood.

MHRA/CHM ADVICE: ISOTRETINOIN (ROACCUTANE®): REMINDER OF IMPORTANT RISKS AND PRECAUTIONS (AUGUST 2020)

The MHRA reminds healthcare professionals that isotretinoin should only be prescribed for the treatment of severe forms of acne resistant to adequate courses of standard therapy with systemic antibacterials and topical therapy. Isotretinoin should be given under the supervision of physicians with expertise in the use of systemic retinoids, and a complete understanding of the risks of therapy and monitoring requirements (including signs of depression).

Healthcare professionals are also advised to counsel patients on the potential risks of isotretinoin, including neuropsychiatric reactions and sexual dysfunction.

The MHRA further reminds healthcare professionals that isotretinoin is a powerful teratogen associated with a high frequency of severe and life-threatening birth defects if there is exposure in utero; females of childbearing potential must meet the conditions of the Pregnancy Prevention Programme (see *Conception and contraception* and *Prescribing and dispensing information*).

- **CONTRA-INDICATIONS** Hyperlipidaemia · hypervitaminosis A
 - **CAUTIONS** Avoid blood donation during treatment and for at least 1 month after treatment · diabetes · dry eye syndrome (associated with risk of keratitis) · history of depression (risk of neuropsychiatric reactions)
 - **INTERACTIONS** → Appendix 1: retinoids
 - **SIDE-EFFECTS**
 - ▶ **Common or very common** Anaemia · arthralgia · back pain · cheilitis · dry eye · eye discomfort · eye inflammation · haemorrhage · headache · increased risk of infection · myalgia · nasal dryness · neutropenia · proteinuria · skin fragility (trauma may cause blistering) · skin reactions · thrombocytopenia · thrombocytosis
 - ▶ **Rare or very rare** Alopecia · anxiety · arthritis · behaviour abnormal · bone disorders · bronchospasm · cataract · corneal opacity · depression · diabetes mellitus · dizziness · drowsiness · dry throat · gastrointestinal disorders · glomerulonephritis · hair changes · hearing impairment · hepatitis · hoarseness · hyperhidrosis · hyperuricaemia · idiopathic intracranial hypertension · inflammatory bowel disease · lymphadenopathy · malaise · mood altered · nail dystrophy · nausea · pancreatitis · photosensitivity reaction · psychotic disorder · pyogenic granuloma · seizure · suicidal behaviours · tendinitis · vasculitis · vision disorders
 - ▶ **Frequency not known** Psychiatric disorder · rhabdomyolysis · severe cutaneous adverse reactions (SCARs) · sexual dysfunction · vulvovaginal dryness
 - SIDE-EFFECTS, FURTHER INFORMATION** Risk of pancreatitis if triglycerides above 9 mmol/litre—discontinue if uncontrolled hypertriglyceridaemia or pancreatitis.
- Discontinue treatment if skin peeling severe or haemorrhagic diarrhoea develops.

Visual disturbances require expert referral and possible withdrawal.

Psychiatric side-effects could require expert referral.

- **CONCEPTION AND CONTRACEPTION** The MHRA advises that women and girls of childbearing potential being treated with the oral retinoids acitretin, alitretinoin, or isotretinoin must be supported on a Pregnancy Prevention Programme with regular follow-up and pregnancy testing. Pregnancy prevention Effective contraception must be used.

In females of childbearing potential, exclude pregnancy a few days before treatment, every month during treatment (unless there are compelling reasons to indicate that there is no risk of pregnancy), and 4 weeks after stopping treatment. Females must practise effective contraception for at least 1 month before starting treatment, during treatment, and for at least 1 month after stopping treatment. They should be advised to use at least 1 method of contraception, but ideally they should use 2 methods of contraception. Oral progestogen-only contraceptives are not considered effective. Barrier methods should not be used alone, but can be used in conjunction with other contraceptive methods. Females should be advised to discontinue treatment and to seek prompt medical attention if they become pregnant during treatment or within 1 month of stopping treatment.

- **PREGNANCY** Manufacturer advises avoid—teratogenic.
- **BREAST FEEDING** Avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid—limited information available.
- **RENAL IMPAIRMENT**

Dose adjustments In severe impairment, reduce initial dose (e.g. 10 mg daily) and increase gradually up to 1 mg/kg daily as tolerated.
- **MONITORING REQUIREMENTS** Measure hepatic function and serum lipids before treatment, 1 month after starting and then every 3 months (reduce dose or discontinue if transaminase or serum lipids persistently raised).
- **PRESCRIBING AND DISPENSING INFORMATION** Isotretinoin is an isomer of tretinoin.

Prescribing for females of childbearing potential The Pregnancy Prevention Programme is supported by the following materials provided by the manufacturer: *Checklists for prescribers and pharmacists*, and *Patient reminder cards*.

Each prescription for oral isotretinoin should be limited to a supply of up to 30 days' treatment. Pregnancy testing should ideally be carried out on the same day as prescription issuing and dispensing.

- **PATIENT AND CARER ADVICE** Warn patient to avoid wax epilation (risk of epidermal stripping), dermabrasion, and laser skin treatments (risk of scarring) during treatment and for at least 6 months after stopping; patient should avoid exposure to UV light (including sunlight) and use sunscreen and emollient (including lip balm) preparations from the start of treatment.

Risk of neuropsychiatric reactions The MHRA advises patients and carers to seek medical attention if changes in mood or behaviour occur.

Pregnancy Prevention Programme Pharmacists must ensure that female patients have a patient card—see also *Important safety information*.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tretinoin with clindamycin

10-Mar-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, tretinoin p. 988, clindamycin p. 1322.

● INDICATIONS AND DOSE

Facial acne

- ▶ TO THE SKIN
- ▶ Child 12-17 years: Apply daily, (to be applied thinly at bedtime)
- ▶ Adult: Apply daily, (to be applied thinly at bedtime)

- **CONTRA-INDICATIONS** Perioral dermatitis · personal or familial history of skin cancer · rosacea
- **CAUTIONS** Allow peeling (resulting from other irritant treatments) to subside before using a topical retinoid · avoid accumulation in angles of the nose · avoid contact with eyes, nostrils, mouth and mucous membranes, eczematous, broken or sunburned skin · avoid exposure to UV light (including sunlight, solariums) · avoid use of topical retinoids with keratolytic agents, abrasive cleaners, comedogenic or astringent cosmetics · caution in sensitive areas such as the neck · severe acne
- **INTERACTIONS** → Appendix 1: clindamycin · retinoids
- **SIDE-EFFECTS** Dry skin (discontinue if severe) · eye irritation · oedema · photosensitivity reaction · skin pigmentation change (transient) · skin reactions
- **CONCEPTION AND CONTRACEPTION** Females of child-bearing age must use effective contraception (oral progestogen-only contraceptives not considered effective).
- **PREGNANCY** Contra-indicated in pregnancy.
- **BREAST FEEDING** Amount of drug in milk after topical application probably too small to be harmful; ensure infant does not come in contact with treated areas.
- **PATIENT AND CARER ADVICE** If sun exposure is unavoidable, an appropriate sunscreen or protective clothing should be used.

Patients and carers should be warned that some redness and skin peeling can occur initially but settles with time. If undue irritation occurs, the frequency of application should be reduced or treatment suspended until the reaction subsides; if irritation persists, discontinue treatment. Several months of treatment may be needed to achieve an optimal response and the treatment should be continued until no new lesions develop.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Gel

CAUTIONARY AND ADVISORY LABELS 11

- ▶ Adult: Apply 1–2 times a day, apply thinly

- **CONTRA-INDICATIONS** Perioral dermatitis · personal or familial history of skin cancer · rosacea
- **CAUTIONS** Allow peeling (resulting from other irritant treatments) to subside before using a topical retinoid · avoid accumulation in angles of the nose · avoid contact with eyes, nostrils, mouth and mucous membranes, eczematous, broken or sunburned skin · avoid exposure to UV light (including sunlight, solariums) · avoid use of topical retinoids with keratolytic agents, abrasive cleaners, comedogenic or astringent cosmetics · caution in sensitive areas such as the neck · severe acne
- **INTERACTIONS** → Appendix 1: macrolides · retinoids
- **SIDE-EFFECTS** Dry skin (discontinue if severe) · eye irritation · oedema · photosensitivity reaction · skin eruption · skin pigmentation change (transient)
- **CONCEPTION AND CONTRACEPTION** Females of child-bearing age must use effective contraception (oral progestogen-only contraceptives not considered effective).
- **PREGNANCY** Contra-indicated in pregnancy.
- **BREAST FEEDING** Amount of drug in milk after topical application probably too small to be harmful; ensure infant does not come in contact with treated areas.
- **PATIENT AND CARER ADVICE** Patients and carers should be warned that some redness and skin peeling can occur initially but settles with time. If undue irritation occurs, the frequency of application should be reduced or treatment suspended until the reaction subsides; if irritation persists, discontinue treatment. Several months of treatment may be needed to achieve an optimal response and the treatment should be continued until no new lesions develop. If sun exposure is unavoidable, an appropriate sunscreen or protective clothing should be used.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

- ▶ **Soolantra** (Galderma (UK) Ltd)
Ivermectin 10 mg per 1 gram Soolantra 10mg/g cream | 30 gram [PoM] £18.29 DT = £18.29

SYMPATHOMIMETICS > ALPHA₂-ADRENOCEPTOR AGONISTS

Brimonidine tartrate

11-May-2021

- **DRUG ACTION** Brimonidine, an alpha₂-adrenoceptor agonist, is used to reduce erythema in rosacea by cutaneous vasoconstriction.

- **INDICATIONS AND DOSE**

Facial erythema in rosacea

- ▶ **TO THE SKIN**
- ▶ **Adult:** Apply once daily until erythema subsides, apply thinly, divide dose over forehead, chin, nose, and cheeks, max. 1 g of gel per day

DOSE EQUIVALENCE AND CONVERSION

- ▶ 1 g of gel contains 5 mg of brimonidine tartrate (equivalent to 3.3 mg of brimonidine).

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: BRIMONIDINE GEL (*MIRVASO*[®]): RISK OF SYSTEMIC CARDIOVASCULAR EFFECTS (JUNE 2017)

Systemic cardiovascular effects including bradycardia, hypotension, and dizziness have been reported after application of brimonidine gel. To minimise the possibility of systemic absorption, it is important to avoid application to irritated or damaged skin, including after laser therapy.

MHRA/CHM ADVICE: BRIMONIDINE GEL (*MIRVASO*[®]): RISK OF EXACERBATION OF ROSACEA (NOVEMBER 2016)

Symptom exacerbation has been reported very commonly in patients treated with brimonidine gel. Treatment should be initiated with a small amount of gel (less than the maximum dose) for at least 1 week, then increased gradually, based on tolerability and response. Patients should be counselled on the importance of not exceeding the maximum daily dose, and advised to stop treatment and seek medical advice if symptoms worsen during treatment.

- **CAUTIONS** Cerebral insufficiency · coronary insufficiency · depression · postural hypotension · Raynaud's syndrome · severe cardiovascular disease · thromboangiitis obliterans
- **INTERACTIONS** → Appendix 1: brimonidine
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Dizziness · dry mouth · flushing · headache · skin reactions
 - ▶ **Uncommon** Angioedema · eyelid oedema · feeling hot · nasal congestion · paraesthesia · peripheral coldness
 - ▶ **Rare or very rare** Bradycardia · hypotension
- **PREGNANCY** Manufacturer advises avoid—limited information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (no information available).
- **RENAL IMPAIRMENT** Manufacturer advises use with caution.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises avoid contact with eyes, mouth, and mucous membranes; avoid use on irritated or damaged skin or open wounds; apply other topical preparations (including cosmetics) only after brimonidine gel has dried on skin.
- **PATIENT AND CARER ADVICE** Patients should be advised on administration of gel.
- **NATIONAL FUNDING/ACCESS DECISIONS**

7 Scalp and hair conditions

Scalp and hair conditions

14-Aug-2020

Overview

Dandruff is considered to be a mild form of seborrhoeic dermatitis. Shampoos containing antimicrobial agents such as **pyrithione zinc** (which are widely available) and selenium below may have beneficial effects. Shampoos containing **tar** extracts may be useful and they are also used in *psoriasis*. Ketoconazole shampoo p. 1287 should be considered for more persistent or severe dandruff or for seborrhoeic dermatitis of the scalp.

Corticosteroid gels and lotions can also be used.

Shampoos containing coal tar with salicylic acid p. 1308 may also be useful. A cream or an ointment containing coal tar with salicylic acid is very helpful in *Psoriasis* p. 1293 that affects the scalp. Patients who do not respond to these treatments may need to be referred to exclude the possibility of other skin conditions.

Cradle cap in infants may be treated with **coconut oil** or **olive oil** applications followed by shampooing.

Hirsutism

Hirsutism may result from hormonal disorders or as a side-effect of drugs such as minoxidil p. 1329, corticosteroids, anabolic steroids, androgens, danazol, and progestogens.

Weight loss can reduce hirsutism in obese women.

Women should be advised about local methods of hair removal, and in the mildest cases this may be all that is required.

Eflornithine p. 1329 an antiprotozoal drug, inhibits the enzyme ornithine decarboxylase in hair follicles. Topical eflornithine can be used as an adjunct to laser therapy for facial hirsutism in women.

Co-cyprindiol p. 1322 (cyproterone acetate with ethinylestradiol) may be effective for moderately severe hirsutism. Metformin hydrochloride p. 735 is an alternative in women with polycystic ovary syndrome [unlicensed indication]. Systemic treatment is required for 6–12 months before benefit is seen. The MHRA/CHM have released important safety information regarding the use of cyproterone acetate and the risk of meningioma. For further information, see *Important safety information* for co-cyprindiol. The Faculty of Sexual and Reproductive Healthcare have released a statement in response to the MHRA/CHM information (available at: www.fsrh.org/standards-and-guidance/documents/fsrh-ceu-statement-new-advice-from-the-mhra-regarding/).

Androgenetic alopecia

Finasteride p. 834 is licensed for the treatment of androgenetic alopecia in men. Continuous use for 3–6 months is required before benefit is seen, and effects are reversed 6–12 months after treatment is discontinued.

Topical application of minoxidil may stimulate limited hair growth in a small proportion of adults but only for as long as it is used.

Other drugs used for Scalp and hair conditions Coal tar, p. 1307 · Coal tar with salicylic acid and precipitated sulfur, p. 1309

ANTISEPTICS AND DISINFECTANTS > UNDECENOATES

Cetrimide with undecenoic acid

● **INDICATIONS AND DOSE**

Scalp psoriasis | Seborrhoeic dermatitis | Dandruff

- ▶ TO THE SKIN
- ▶ Child: Apply 3 times a week for 1 week, then apply twice weekly
- ▶ Adult: Apply 3 times a week for 1 week, then apply twice weekly

- **MEDICINAL FORMS** No licensed medicines listed.

ANTISEPTICS AND DISINFECTANTS > OTHER

Benzalkonium chloride

26-Mar-2020

● **INDICATIONS AND DOSE**

Seborrhoeic scalp conditions associated with dandruff and scaling

- ▶ TO THE SKIN
- ▶ Child: Apply as required
- ▶ Adult: Apply as required

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Shampoo

- ▶ **Dermax** (Dermal Laboratories Ltd)

8 Skin cleansers, antiseptics and desloughing agents

Skin cleansers, antiseptics and desloughing agents

Skin cleansers and antiseptics

Soap or detergent is used with water to cleanse intact skin; emollient preparations such as aqueous cream or emulsifying ointment can be used in place of soap or detergent for cleansing dry skin.

An antiseptic is used for skin that is infected or that is susceptible to recurrent infection. Detergent preparations containing chlorhexidine p. 1331 or povidone-iodine below, which should be thoroughly rinsed off, are used. Emollients may also contain antiseptics.

Antiseptics such as chlorhexidine or povidone-iodine are used on intact skin before surgical procedures; their antiseptic effect is enhanced by an alcoholic solvent. Antiseptic solutions containing cetrimide can be used if a detergent effect is also required.

Hydrogen peroxide p. 1332, an oxidising agent, can be used in solutions of up to 6% for skin disinfection, such as cleansing and deodorising wounds and ulcers. Hydrogen peroxide is also available as a cream for superficial bacterial skin infections.

For irrigating ulcers or wounds, lukewarm sterile sodium chloride 0.9% solution is used, but tap water is often appropriate.

Potassium permanganate solution 1 in 10 000 below, a mild antiseptic with astringent properties, can be used for exudative eczematous areas; treatment should be stopped when the skin becomes dry.

Desloughing agents

Alginate, hydrogel and hydrocolloid dressings are effective at wound debridement. Sterile larvae (maggots) (available from BioMonde) are also used for managing sloughing wounds and are prescribable on the NHS.

Desloughing solutions and creams are of little clinical value. Substances applied to an open area are easily absorbed and perilesional skin is easily sensitised. Gravitational dermatitis may be complicated by superimposed contact sensitivity to substances such as neomycin sulfate p. 1284 or lanolin.

ANTISEPTICS AND DISINFECTANTS

Potassium permanganate

16-Dec-2020

● INDICATIONS AND DOSE

Cleansing and deodorising suppurating eczematous reactions and wounds

▶ TO THE SKIN

- ▶ Adult: For wet dressings or baths, use approximately 0.01% (1 in 10 000) solution

IMPORTANT SAFETY INFORMATION

NHS IMPROVEMENT PATIENT SAFETY ALERT: RISK OF DEATH OR SERIOUS HARM FROM ACCIDENTAL INGESTION OF POTASSIUM PERMANGANATE PREPARATIONS (DECEMBER 2014)

Potassium permanganate is for external use only. Oral ingestion can cause fatality due to local inflammatory reactions that block the airways or cause perforations of the gastrointestinal tract, or through toxicity and organ failure. Following a number of reports of ingestion, NHS England advises that healthcare professionals should

consider whether action needs to be taken locally to reduce the risk of accidental ingestion occurring. Potassium permanganate is subject to the requirements of Control of Substances Hazardous to Health including: separate storage, additional hazard labelling, and issue only to staff and patients who have been educated to understand its safe use. Accidental ingestion should be treated as a medical emergency.

- **CAUTIONS** Irritant to mucous membranes
- **DIRECTIONS FOR ADMINISTRATION** With potassium permanganate tablets for solution, 1 tablet dissolved in 4 litres of water provides a 0.01% (1 in 10 000) solution.
- **PATIENT AND CARER ADVICE** Can stain clothing, skin and nails (especially with prolonged use).
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: liquid
 - Tablet for cutaneous solution**
 - ▶ **Permitabs** (Alliance Pharmaceuticals Ltd)
 - Potassium permanganate 400 mg Permitabs 400mg tablets for cutaneous solution | 30 tablet £21.50 DT = £21.50

ANTISEPTICS AND DISINFECTANTS > ALCOHOL DISINFECTANTS

Alcohol

(Industrial methylated spirit)

● INDICATIONS AND DOSE

Skin preparation before injection

▶ TO THE SKIN

- ▶ Child: Apply as required
- ▶ Adult: Apply as required

- **CONTRA-INDICATIONS** Neonates
- **CAUTIONS** Avoid broken skin · flammable · patients have suffered severe burns when diathermy has been preceded by application of alcoholic skin disinfectants
- **INTERACTIONS** → Appendix 1: alcohol
- **SIDE-EFFECTS**
 - Overdose** Features of acute alcohol intoxication include ataxia, dysarthria, nystagmus, and drowsiness, which may progress to coma, with hypotension and acidosis.
 - For details on the management of poisoning, see Alcohol, under Emergency treatment of poisoning p. 1430.
- **PRESCRIBING AND DISPENSING INFORMATION** Industrial methylated spirits defined by the BP as a mixture of 19 volumes of ethyl alcohol of an appropriate strength with 1 volume of approved wood naphtha.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

8.1 Minor cuts and abrasions**Minor cuts and abrasions****Management**

Many preparations traditionally used to manage minor burns, and abrasions have fallen out of favour. Preparations containing camphor and sulfonamides should be avoided. Preparations such as magnesium sulfate paste are now rarely used to treat carbuncles and boils as these are best treated with antibiotics.

Cetrimide is used to treat minor cuts and abrasions and proflavine above may be used to treat infected wounds or

burns, but its use has now been largely superseded by other antiseptics or suitable antibacterials. The effervescent effect of hydrogen peroxide p. 1332 is used to clean minor cuts and abrasions.

Flexible collodion (see castor oil with collodion and colophony below) may be used to seal minor cuts and wounds that have partially healed; skin tissue adhesives are used similarly, and also for additional suture support.

ANTISEPTICS AND DISINFECTANTS

Glycerol with magnesium sulfate and phenol

14-Dec-2020

INDICATIONS AND DOSE

Treat carbuncles and boils

▶ TO THE SKIN

▶ Adult: To be applied under dressing

• **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises paste should be stirred before use.

• **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Paste

▶ **Glycerol with magnesium sulfate and phenol (Non-proprietary)**

Phenol 5 mg per 1 gram, Magnesium sulfate dried 450 mg per 1 gram, Glycerol 550 mg per 1 gram | Magnesium sulfate paste | 25 gram [GSL] £0.79-£2.05 | 50 gram [GSL] £1.03-£3.55 DT = £3.55

DERMATOLOGICAL DRUGS > COLLODIONS

Castor oil with collodion and colophony

16-Dec-2020

9 Skin disfigurement

Camouflagers

Overview

Disfigurement of the skin can be very distressing to patients and may have a marked psychological effect. In skilled hands, or with experience, camouflage cosmetics can be very effective in concealing scars and birthmarks. The depigmented patches in vitiligo are also very disfiguring and camouflage creams are of great cosmetic value.

Opaque cover foundation or cream is used to mask skin pigment abnormalities; careful application using a combination of dark- and light-coloured cover creams set with powder helps to minimise the appearance of skin deformities.

Borderline substances

The preparations marked 'ACBS' can be prescribed on the NHS for postoperative scars and other deformities and as adjunctive therapy in the relief of emotional disturbances due to disfiguring skin disease, such as vitiligo.

Camouflages

CAMOUFLAGES

Covermark classic foundation (Derma UK Ltd)

10 Sun protection and photodamage

Sunscreen

05-Feb-2020

Sunscreen preparations

Solar ultraviolet irradiation can be harmful to the skin. It is responsible for disorders such as *polymorphic light eruption*, *solar urticaria*, and it provokes the various *cutaneous porphyrias*. It also provokes (or at least aggravates) skin lesions of *lupus erythematosus* and may aggravate *rosacea* and some other *dermatoses*. Certain drugs, such as demeclocycline, phenothiazines, or amiodarone, can cause photosensitivity. All these conditions (as well as *sunburn*) may occur after relatively short periods of exposure to the sun. Solar ultraviolet irradiation may provoke attacks of recurrent herpes labialis (but it is not known whether the effect of sunlight exposure is local or systemic).

The effects of exposure over longer periods include *ageing changes* and more importantly the initiation of *skin cancer*.

Solar ultraviolet radiation is approximately 200–400 nm in wavelength. The medium wavelengths (290–320 nm, known as UVB) cause *sunburn*. The long wavelengths (320–400 nm, known as UVA) are responsible for many *photosensitivity reactions* and *photodermatoses*. Both UVA and UVB contribute to long-term *photodamage* and to the changes responsible for *skin cancer* and ageing.

Sunscreen preparations contain substances that protect the skin against UVA and UVB radiation, but they are no substitute for covering the skin and avoiding sunlight. The sun protection factor (SPF, usually indicated in the preparation title) provides guidance on the degree of protection offered against UVB; it indicates the multiples of protection provided against burning, compared with unprotected skin; for example, an SPF of 8 should enable a person to remain 8 times longer in the sun without burning. However, in practice, users do not apply sufficient sunscreen product and the protection is lower than that found in experimental studies.

Some manufacturers use a star rating system to indicate the protection against UVA relative to protection against UVB for sunscreen products. However, the usefulness of the star rating system remains controversial. The EU Commission (September 2006) has recommended that the UVA protection factor for a sunscreen should be at least one-third of the sun protection factor (SPF); products that achieve this requirement will be labelled with a UVA logo alongside the SPF classification. Preparations that also contain reflective substances, such as titanium dioxide, provide the most effective protection against UVA.

Sunscreen preparations may rarely cause allergic reactions.

For optimum photoprotection, sunscreen preparations should be applied **thickly** and **frequently** (approximately 2 hourly). In photodermatoses, they should be used from spring to autumn. As maximum protection from sunlight is desirable, preparations with the highest SPF should be prescribed.

Ingredient nomenclature in sunscreen preparations

rINN	INCI
amiloxate	isoamyl <i>p</i> -methoxycinnamate
avobenzone	butyl methoxydibenzoylmethane
bemotrizinol	bis-ethylhexyloxyphenyl methoxyphenyl triazine

rINN	INCI
bisotrizole	methylene bis-benzotriazolyl tetramethylbutylphenol
ecamsule	terephthalylidene dicamphor sulfonic acid
ensulizole	phenylbenzimidazole sulfonic acid
enzacamene	4-methylbenzylidene camphor
octinoxate	octyl (<i>or</i> ethylhexyl) methoxycinnamate
octocriylene	octocrylene
oxybenzone	benzophenone-3

The European Commission Cosmetic Products Regulation (EC) 1223/2009 requires the use of INCI (International Nomenclature of Cosmetic Ingredients) for cosmetics and sunscreens. This table includes the rINN and the INCI synonym for the active ingredients of sunscreen preparations in the BNF

Borderline substances

LA Roche-Posay Anthelios® XL SPF 50+ Cream; *Sunsense*® Ultra (Ego) SPF 50+; *Uvistat*® Lipscream SPF 50; and *Uvistat*® Suncream SPF 30 and 50 (see *About Borderline Substances*) are regarded as drugs when prescribed for skin protection against ultraviolet radiation and/or visible light in abnormal cutaneous photosensitivity causing severe cutaneous reactions in genetic disorders (including xeroderma pigmentosum and porphyrias), severe photodermatoses (both idiopathic and acquired) and in those with increased risk of ultraviolet radiation causing adverse effects due to chronic disease (such as haematological malignancies), medical therapies and/or procedures.

Photodamage

18-Nov-2020

Overview

EvGr Patients should be advised on the harms of prolonged sunlight exposure and how to adequately protect their skin from strong sunlight (e.g. use of topical sun protection preparations).

Topical treatments can be used for actinic (solar) keratoses. An emollient can be used as part of the management regimen for dry, sun-damaged elderly skin although the direct effect of emollient treatment is unclear; addition of urea or salicylic acid may provide benefit. Diclofenac sodium gel p. 1336 may be suitable for the treatment of superficial lesions in mild disease. Fluorouracil cream p. 1336 is effective against most types of non-hypertrophic actinic keratosis; a solution containing fluorouracil with salicylic acid p. 1336 can be used for the treatment of low or moderately thick hyperkeratotic actinic keratosis. Imiquimod p. 1340 can be used for lesions on the face and scalp when cryotherapy or other topical treatments cannot be used. Fluorouracil and imiquimod produce a more marked inflammatory reaction than diclofenac sodium but lesions resolve faster. Photodynamic therapy in combination with methyl-5-aminolevulinate cream (Metvix®) or 5-aminolevulinic acid gel (Ameluz®) is used in specialist centres for treating superficial and confluent, non-hypertrophic actinic keratosis when other treatments are inadequate or unsuitable; it is particularly suitable for multiple and large-area lesions, cosmetically sensitive sites, lesions located at sites of poor healing, or where pain is likely to be an issue. **⚠**

Imiquimod and topical fluorouracil are licensed for treating superficial basal cell carcinomas. **EvGr** Patients with skin lesions suspected to be a basal cell carcinoma should be considered for routine referral; a suspected cancer pathway referral should only be considered if there are concerns that

delay may have a significant impact (due to factors such as lesion size and site). Photodynamic therapy in combination with methyl-5-aminolevulinate cream is used in specialist centres for treating thin nodular basal cell carcinomas when other treatments are unsuitable. It may also be used for superficial basal cell carcinomas, particularly for multiple and large-area lesions, cosmetically sensitive sites, and lesions located at sites of poor healing. 

ANALGESICS > NON-STEROIDAL ANTI-INFLAMMATORY DRUGS

Diclofenac sodium

18-Nov-2020

● INDICATIONS AND DOSE

SOLARAZE[®]

Actinic keratosis

▶ TO THE SKIN

▶ **Adult:** Apply twice daily for 60–90 days, to be applied thinly; maximum 8 g per day

● **CAUTIONS** Avoid contact with eyes · avoid contact with inflamed or broken skin · avoid contact with mucous membranes · not for use with occlusive dressings · topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported)

● **INTERACTIONS** → Appendix 1: NSAIDs

● SIDE-EFFECTS

▶ **Common or very common** Conjunctivitis · muscle tone increased · oedema · rash (discontinue) · sensation abnormal · skin reactions · skin ulcer

▶ **Uncommon** Abdominal pain · alopecia · diarrhoea · eye pain · haemorrhage · lacrimation disorder · nausea · seborrhoea

▶ **Rare or very rare** Acute kidney injury · angioedema · asthma · hypersensitivity · photosensitivity reaction · rash pustular

▶ **Frequency not known** Hair colour changes

SIDE-EFFECTS, FURTHER INFORMATION Topical application of large amounts of diclofenac can result in systemic effects.

● **ALLERGY AND CROSS-SENSITIVITY**  Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID. 

● **PREGNANCY** Patient packs for topical preparations carry a warning to avoid during pregnancy.

● **BREAST FEEDING** Patient packs for topical preparations carry a warning to avoid during breast-feeding.

● **DIRECTIONS FOR ADMINISTRATION** For topical preparations, apply with gentle massage only.

● **PRESCRIBING AND DISPENSING INFORMATION** Caution—topical preparations not generally suitable for children.

● **PATIENT AND CARER ADVICE** For topical preparations, patients and their carers should be advised to wash hands immediately after use.

Photosensitivity Patients should be advised against excessive exposure to sunlight of area treated in order to avoid possibility of photosensitivity.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Gel

EXCIPIENTS: May contain Benzyl alcohol, fragrances, propylene glycol

▶ **Solaraze** (Almirall Ltd)

▶ **Diclofenac sodium 30 mg per 1 gram** Solaraze 3% gel | 50 gram  £38.30 DT = £38.30 | 100 gram  £76.60

ANTINEOPLASTIC DRUGS > ANTIMETABOLITES

Fluorouracil

19-Jan-2021

● INDICATIONS AND DOSE

Superficial malignant and pre-malignant skin lesions

▶ TO THE SKIN USING CREAM

▶ **Adult:** Apply 1–2 times a day for 3–4 weeks (usual duration of initial therapy), apply thinly to the affected area, maximum area of skin 500 cm² (e.g. 23 cm × 23 cm) treated at one time, alternative regimens may be used in some settings

● **CAUTIONS** Avoid contact with eyes and mucous membranes · dihydropyrimidine dehydrogenase deficiency · do not apply to bleeding lesions

● **INTERACTIONS** → Appendix 1: fluorouracil

● SIDE-EFFECTS

▶ **Common or very common** Alopecia · diarrhoea · mucositis · nausea · neutropenia · skin reactions · stomatitis · thrombocytopenia · vomiting

▶ **Uncommon** Dizziness · headache

▶ **Rare or very rare** Abdominal pain · chills · diarrhoea haemorrhagic · fever · leucocytosis · pancytopenia · skin irritation (use a topical corticosteroid for severe discomfort associated with inflammatory reactions) · skin ulcer

▶ **Frequency not known** Conjunctival irritation · excessive tearing · keratitis · taste altered

● **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.

● **PREGNANCY** Manufacturers advise avoid (teratogenic).

● **BREAST FEEDING** Manufacturers advise avoid.

● **HANDLING AND STORAGE** Caution in handling—irritant to tissues.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Cream

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens), polysorbates, propylene glycol

▶ **Carac** (imported (United States))

▶ **Fluorouracil 5 mg per 1 gram** Carac 0.5% cream | 30 gram 

▶ **Efudix** (Mylan)

▶ **Fluorouracil 50 mg per 1 gram** Efudix 5% cream | 40 gram  £32.90 DT = £32.90

Fluorouracil with salicylic acid

The properties listed below are those particular to the combination only. For the properties of the components please consider, fluorouracil above, salicylic acid p. 1340.

● INDICATIONS AND DOSE

Low or moderately thick hyperkeratotic actinic keratosis

▶ TO THE SKIN

▶ **Adult:** Apply once daily for up to 12 weeks, reduced to 3 times a week if severe side effects occur and until side-effects improve, to be applied to the affected area, if treating area with thin epidermis, reduce frequency of application and monitor response more often; maximum area of skin treated at one time, 25 cm² (e.g. 5 cm × 5 cm)

● **INTERACTIONS** → Appendix 1: fluorouracil

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Cutaneous solution

CAUTIONARY AND ADVISORY LABELS 15

- ▶ **Actikerall** (Almirall Ltd)

Fluorouracil 5 mg/g, Salicylic acid 100 mg/g Actikerall 5mg/g / 100mg/g cutaneous solution | 25 ml [PoM] £38.30 DT = £38.30

PROTEIN KINASE C ACTIVATORS

Ingenol mebutate

09-Mar-2020

● INDICATIONS AND DOSE

Actinic keratosis on face and scalp

- ▶ TO THE SKIN

- ▶ Adult: Apply once daily for 3 days, use the 150 microgram/g gel

Actinic keratosis on trunk and extremities

- ▶ TO THE SKIN

- ▶ Adult: Apply once daily for 2 days, use the 500 microgram/g gel

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (UPDATED FEBRUARY 2020): INGENOL MEBUTATE GEL (PICATO[®]): SUSPENSION OF THE LICENCE DUE TO RISK OF SKIN MALIGNANCY

Clinical studies have shown an increased incidence of benign and malignant skin tumours (such as basal and squamous cell carcinoma, Bowen's disease, and keratoacanthoma) in patients using ingenol mebutate gel; cases of neuroendocrine carcinoma of the skin, and atypical fibroxanthoma have also been reported. Healthcare professionals are advised to stop prescribing ingenol mebutate gel and consider alternative treatment options for actinic keratosis. The licence of ingenol mebutate has been suspended as a precautionary measure while investigations are carried out. Healthcare professionals should advise patients to be vigilant for the development of any new skin lesions within the treatment area and to seek immediate medical advice if any occur.

- **CAUTIONS** Avoid contact with broken skin · avoid contact with eyes · avoid contact with inside of ears · avoid contact with inside of nostrils · avoid contact with lips · avoid occlusive dressings on treated area
- **SIDE-EFFECTS**
 - ▶ Common or very common Headache
 - ▶ Frequency not known Neoplasms · skin eruption localised
- **PREGNANCY** Not absorbed from skin, but manufacturer advises avoid.
- **BREAST FEEDING** Not absorbed from skin; ensure infant does not come in contact with treated area for 6 hours after application.
- **DIRECTIONS FOR ADMINISTRATION** One tube covers skin area of 25 cm². Allow gel to dry on treatment area for 15 minutes. Avoid washing or touching the treated area for 6 hours after application; after this time, area may be washed with mild soap and water. Avoid use immediately after shower or less than 2 hours before bedtime.
- **MEDICINAL FORMS** No licensed medicines listed.

11 Superficial soft-tissue injuries and superficial thrombophlebitis

Topical circulatory preparations

Overview

These preparations are used to improve circulation in conditions such as bruising, superficial thrombophlebitis, chilblains and varicose veins but are of little value. Chilblains are best managed by avoidance of exposure to cold; neither systemic nor topical vasodilator therapy is established as being effective.

HEPARINOIDS

Heparinoid

● INDICATIONS AND DOSE

Superficial thrombophlebitis | Bruising | Haematoma

- ▶ TO THE SKIN

- ▶ Adult: Apply up to 4 times a day

- **CONTRA-INDICATIONS** Should not be used on large areas of skin, broken or sensitive skin, or mucous membranes
- **LESS SUITABLE FOR PRESCRIBING** Hirudoid[®] is less suitable for prescribing.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Cream

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens)

- ▶ **Hirudoid** (Genus Pharmaceuticals Ltd)

Heparinoid 3 mg per 1 gram Hirudoid 0.3% cream | 50 gram [P] £3.99 DT = £3.99

Gel

EXCIPIENTS: May contain Fragrances, propylene glycol

- ▶ **Hirudoid** (Genus Pharmaceuticals Ltd)

Heparinoid 3 mg per 1 gram Hirudoid 0.3% gel | 50 gram [P] £3.99 DT = £3.99

12 Warts and calluses

Warts and calluses

12-Feb-2021

Cutaneous warts

Cutaneous warts are caused by infection of keratinocytes with the human papillomavirus (HPV). They can appear on any part of the body but commonly affect the feet (also known as plantar warts or verrucas) and hands. In most cases, warts resolve spontaneously usually within 2 years; sometimes within months. [EvGr] Treatment is required only if the warts are painful, unsightly, persistent, or are causing distress and the patient requests treatment.

Treatment choice is dependent on patient preference and response to previous treatments. Patients with facial warts should be referred to a specialist for treatment. Options for non-facial warts include either the topical keratolytic salicylic acid p. 1340 (or salicylic acid with lactic acid p. 1341), or cryotherapy using liquid nitrogen, or a combination of both. A shorter cryotherapy freeze or weaker salicylic acid preparation is recommended for warts on the back of the hands, as scarring is more likely to occur. Cryotherapy is unlikely to help in the treatment of plantar warts as they can be difficult to treat. When indicated,

cryotherapy should be provided by an appropriately trained healthcare professional. 

Preparations of formaldehyde p. 1339, glutaraldehyde p. 1339, and silver nitrate p. 1339 are also licensed for the treatment of warts on hands and feet.

Salicylic acid with lactic acid p. 1341 is also licensed for the removal of *corns and calluses*.

Anogenital warts

Anogenital warts (condylomata acuminata) are caused by the human papillomavirus.  Patients with anogenital warts should be referred to a sexual health specialist where possible, and treatment should be accompanied by screening for other sexually transmitted infections. Treatment is not always required, as warts may resolve spontaneously, usually within 6 months.

Topical podophyllotoxin below (the major active ingredient of podophyllum) may be used to treat soft, non-keratinised external anogenital warts. Topical imiquimod cream p. 1340 may also be used to treat external anogenital warts; it is suitable for both keratinised and non-keratinised lesions. Cryotherapy or other forms of physical ablative therapy (e.g. surgery, laser treatment) may also be considered, particularly for patients with a small number of low-volume warts, irrespective of type. 

Camellia sinensis ointment below is licensed for the treatment of external anogenital warts.

ANTINEOPLASTIC DRUGS > PLANT ALKALOIDS

Camellia sinensis

20-Aug-2020

- **DRUG ACTION** Camellia sinensis is an extract from green tea leaves. The exact mechanism of action is not known; non-clinical studies have shown inhibition of the growth of activated keratinocytes, and anti-oxidative effects at the site of application.

● INDICATIONS AND DOSE

Warts (external genital and perianal) in immunocompetent patients

▶ TO THE LESION

- ▶ Adult: Apply up to 250 mg 3 times a day until complete clearance of warts (maximum 16 weeks), do not exceed treatment period even if new warts develop; maximum 750 mg per day

DOSE EQUIVALENCE AND CONVERSION

- ▶ 250 mg is equivalent to 0.5 cm of ointment.

- **CAUTIONS** Avoid broken skin · avoid contact with eyes · avoid contact with lips · avoid contact with mouth · avoid contact with nostrils · avoid inflamed skin · uncircumcised males (risk of phimosis) · vulvar region

● SIDE-EFFECTS

- ▶ Uncommon Balanoposthitis · increased risk of infection · lymphatic abnormalities · necrosis · painful sexual intercourse · phimosis · skin reactions · urinary disorders

- ▶ **Frequency not known** Urinary tract stenosis · vaginal discharge

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises *Catephen*[®] may weaken condoms and vaginal diaphragms—alternative methods of contraception should be considered.

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

- **BREAST FEEDING** Manufacturer advises risk to infant cannot be excluded—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment (limited information available).

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises apply to each wart, ensuring a thin layer is left on the wart.

It is not necessary to wash off the ointment from the area before next application.

- **PATIENT AND CARER ADVICE** Manufacturer advises the ointment should be washed off before sexual activity. Manufacturer advises female patients using tampons should insert tampon before applying the ointment.

● NATIONAL FUNDING/ACCESS DECISIONS

For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

- ▶ **Camellia sinensis (green tea leaf) (*Catephen*[®])** for the cutaneous treatment of external genital and perianal warts (condylomata acuminata) in immunocompetent patients from the age of 18 years (April 2016) SMC No. 1133/16 Recommended with restrictions

All Wales Medicines Strategy Group (AWMSG) decisions

- ▶ **Green tea leaf extract (*Catephen*[®])** for cutaneous treatment of external genital and perianal warts (condylomata acuminata) in immunocompetent patients from the age of 18 years (October 2016) AWMSG No. 2739 Recommended with restrictions

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Ointment

▶ *Catephen* (Kora Healthcare)

Camellia sinensis extract 100 mg per 1 gram *Catephen* 10% ointment | 15 gram  £39.00 DT = £39.00

Podophyllotoxin

28-Jul-2020

● INDICATIONS AND DOSE

CONDYLINE[®]

Condylomata acuminata affecting the penis or the female external genitalia

▶ TO THE LESION

- ▶ Adult: Apply twice daily for 3 consecutive days, treatment may be repeated at weekly intervals if necessary for a total of five 3-day treatment courses, direct medical supervision for lesions in the female and for lesions greater than 4 cm² in the male, maximum 50 single applications ('loops') per session (consult product literature)

WARTICON[®] CREAM

Condylomata acuminata affecting the penis or the female external genitalia

▶ TO THE LESION

- ▶ Adult: Apply twice daily for 3 consecutive days, treatment may be repeated at weekly intervals if necessary for a total of four 3-day treatment courses, direct medical supervision for lesions greater than 4 cm²

WARTICON[®] LIQUID

Condylomata acuminata affecting the penis or the female external genitalia

▶ TO THE LESION

- ▶ Adult: Apply twice daily for 3 consecutive days, treatment may be repeated at weekly intervals if necessary for a total of four 3-day treatment courses, direct medical supervision for lesions greater than 4 cm², maximum 50 single applications ('loops') per session (consult product literature)

- **CAUTIONS** Avoid normal skin · avoid open wounds · keep away from face · very irritant to eyes

- **SIDE-EFFECTS** Balanoposthitis · skin irritation

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Avoid.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

ANTIVIRALS > IMMUNE RESPONSE MODIFIERS

Imiquimod

09-Nov-2020

● INDICATIONS AND DOSE

ALDARA®

Warts (external genital and perianal)

▶ TO THE LESION

- ▶ Adult: Apply 3 times a week until lesions resolve (maximum 16 weeks), to be applied thinly at night

Superficial basal cell carcinoma

▶ TO THE LESION

- ▶ Adult: Apply daily for 5 nights of each week for 6 weeks, to be applied to lesion and 1 cm beyond it, assess response 12 weeks after completing treatment

Actinic keratosis

▶ TO THE LESION

- ▶ Adult: Apply 3 times a week for 4 weeks, to be applied to lesion at night, assess response after a 4 week treatment-free interval; repeat 4-week course if lesions persist, maximum 2 courses

ZYCLARA®

Actinic keratosis

▶ TO THE SKIN

- ▶ Adult: Apply once daily for 2 weeks, to be applied at bedtime to lesion on face or balding scalp, repeat course after a 2-week treatment-free interval, assess response 8 weeks after second course; maximum 2 sachets per day

- **CAUTIONS** Autoimmune disease · avoid broken skin · avoid contact with eyes · avoid contact with lips · avoid contact with nostrils · avoid open wounds · immunosuppressed patients · not suitable for internal genital warts · uncircumcised males (risk of phimosis or stricture of foreskin)

● **SIDE-EFFECTS**

- ▶ **Common or very common** Appetite decreased · arthralgia · asthenia · headaches · increased risk of infection · lymphadenopathy · myalgia · nausea · pain
- ▶ **Uncommon** Anorectal disorder · chills · conjunctival irritation · depression · diarrhoea · dizziness · drowsiness · dry mouth · dysuria · erectile dysfunction · eyelid oedema · face oedema · fever · flushing · gastrointestinal discomfort · genital pain · hyperhidrosis · inflammation · influenza like illness · insomnia · irritability · laryngeal pain · malaise · nasal congestion · painful sexual intercourse · paraesthesia · penis disorder · skin reactions · skin ulcer · tinnitus · uterovaginal prolapse · vomiting · vulvovaginal disorders
- ▶ **Rare or very rare** Autoimmune disorder exacerbated
- ▶ **Frequency not known** Alopecia · cutaneous lupus erythematosus · severe cutaneous adverse reactions (SCARs)

- **CONCEPTION AND CONTRACEPTION** May damage latex condoms and diaphragms.

- **PREGNANCY** No evidence of teratogenicity or toxicity in animal studies; manufacturer advises caution.

- **BREAST FEEDING** No information available.

● **DIRECTIONS FOR ADMINISTRATION**

ZYCLARA® ▶ **Important** Manufacturer advises cream should be rubbed in and allowed to stay on the treated area for 8 hours, then washed off with mild soap and water.

ALDARA® ▶ **Important** Manufacturer advises cream should be rubbed in and allowed to stay on the treated area for 6–10 hours for warts or for 8 hours for basal cell carcinoma and actinic keratosis, then washed off with mild soap and water (uncircumcised males treating warts under foreskin should wash the area daily). The cream should be washed off before sexual contact.

- **PATIENT AND CARER ADVICE** A patient information leaflet should be provided.

● **NATIONAL FUNDING/ACCESS DECISIONS**

For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

- ▶ **Imiquimod (Zyclara®)** for the topical treatment of clinically typical, nonhyperkeratotic, nonhypertrophic, visible or palpable actinic keratosis (AK) of the full face or balding scalp in immunocompetent adults when other topical treatment options are contra-indicated or less appropriate (November 2019) SMC No. SMC2211 Recommended with restrictions

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

1 Immunoglobulin therapy

IMMUNE SERA AND IMMUNOGLOBULINS > IMMUNOGLOBULINS

Immunoglobulins

28-Oct-2020

Passive immunity

Immunity with protection against certain infective organisms can be obtained by injecting preparations made from the plasma of immune individuals with adequate levels of antibody to the disease for which protection is sought. The duration of this passive immunity varies according to the dose and the type of immunoglobulin. Passive immunity may last only a few weeks; when necessary, passive immunisation can be repeated. Antibodies of human origin are usually termed immunoglobulins. The term antiserum is applied to material prepared in animals. Because of serum sickness and other allergic-type reactions that may follow injections of antisera, this therapy has been replaced wherever possible by the use of immunoglobulins. Reactions are theoretically possible after injection of human immunoglobulins but reports of such reactions are very rare.

Two types of human immunoglobulin preparation are available, normal immunoglobulin p. 1346 and **disease-specific immunoglobulins**.

Human normal immunoglobulin (HNIG) is prepared from pooled plasma obtained from donors outside the UK, tested and found non-reactive for hepatitis B surface antigen and for antibodies against hepatitis C virus and human immunodeficiency virus (types 1 and 2). A global shortage of human immunoglobulin and the rapidly increasing range of clinical indications for treatment with immunoglobulins has resulted in the need for a Demand Management programme in the UK, for further information consult the Department of Health and Social Care's **National Demand Management Programme for Immunoglobulin and Clinical Guidelines for Immunoglobulin Use** (both available at: igd.mdsas.com/).

For further information on the use of immunoglobulins, see Public Health England (PHE) guidance:

Immunoglobulin: when to use (www.gov.uk/government/publications/immunoglobulin-when-to-use) and **Immunisation against Infectious Disease** (www.gov.uk/government/collections/immunisation-against-infectious-disease-the-green-book).

Availability

Human normal immunoglobulin for intramuscular administration is available from the Immunisation, Hepatitis and Blood Safety Department of PHE's Centre for Infectious Disease Surveillance and some regional PHE and NHS laboratories, for the protection of contacts and the control of outbreaks of hepatitis A, measles, and rubella only. For other indications, subcutaneous or intravenous normal

immunoglobulin may be purchased from the manufacturer (see Index of manufacturers p. 1731).

Various **disease-specific immunoglobulins** for intramuscular use are available from either the Immunisation, Hepatitis and Blood Safety Department of PHE's Centre for Infectious Disease Surveillance; some regional PHE and NHS laboratories; PHE's Rabies and Immunoglobulin Service; and/or through Bio Products Laboratory (BPL). Tetanus immunoglobulin p. 1348 is available from BPL, hospital pharmacies, or blood transfusion departments. Hepatitis B immunoglobulin p. 1345 required by transplant centres should be obtained commercially.

In Scotland all immunoglobulins are available from the *Scottish National Blood Transfusion Service* (SNBTS).

In Wales all immunoglobulins are available from the *Welsh Blood Service* (WBS).

In Northern Ireland all immunoglobulins are available from the *Northern Ireland Blood Transfusion Service* (NIBTS).

Normal immunoglobulin

Human normal immunoglobulin is prepared from pools of at least 1000 donations of human plasma; it contains immunoglobulin G (IgG) and antibodies to hepatitis A, measles, mumps, rubella, varicella, and other viruses that are currently prevalent in the general population.

Uses

Normal immunoglobulin (containing 10%–18% protein) is administered by *intramuscular injection* for the protection of susceptible contacts against **hepatitis A** virus (infectious hepatitis), **measles** and, to a lesser extent, **rubella**. Injection of immunoglobulin produces immediate protection lasting several weeks.

Normal immunoglobulin (containing 3%–12% protein) for *intravenous administration* is used as *replacement therapy* for patients with congenital agammaglobulinaemia and hypogammaglobulinaemia, and for the short-term treatment of idiopathic thrombocytopenic purpura and Kawasaki disease; it is also used for the prophylaxis of infection following bone-marrow transplantation and in children with symptomatic HIV infection who have recurrent bacterial infections. Normal immunoglobulin for replacement therapy may also be given intramuscularly or subcutaneously, but intravenous formulations are normally preferred. Intravenous immunoglobulin is also used in the treatment of Guillain-Barré syndrome as an alternative to plasma exchange.

For information on the use of intravenous normal immunoglobulin and alternative therapies for certain conditions, see the Department of Health and Social Care guideline: **Immunoglobulin Use** (www.gov.uk/government/publications/clinical-guidelines-for-immunoglobulin-use-second-edition-update).

Hepatitis A

For close contacts (of the index case) who have chronic liver disease (including chronic hepatitis B or C infection), HIV infection (with a CD4 count < 200 cells per microlitre), are

immunosuppressed, or are aged 60 years or over, normal immunoglobulin in addition to the monovalent hepatitis A vaccine p. 1384 is recommended within 14 days of exposure to the index case (up to 28 days in those with chronic liver disease). Normal immunoglobulin and the monovalent hepatitis A vaccine can be given at the same time, but should be given at separate injection sites.

For further information on post-exposure prophylaxis and information on risk assessment, see Hepatitis A vaccine p. 1359.

Measles

Intravenous or subcutaneous normal immunoglobulin may be given to prevent or attenuate an attack of measles in individuals who do not have adequate immunity. Patients with compromised immunity who have come into contact with measles should receive intravenous or subcutaneous normal immunoglobulin as soon as possible after exposure. It is most effective if given within 72 hours but can be effective if given within 6 days.

Subcutaneous or intramuscular normal immunoglobulin should also be considered for the following individuals if they have been in contact with a confirmed case of measles or with a person associated with a local outbreak:

- non-immune pregnant women
- infants under 9 months

Further advice should be sought from the Centre for Infections, Public Health England (tel. (020) 8200 6868).

Individuals with normal immunity who are not in the above categories and who have not been fully immunised against measles, can be given measles, mumps and rubella vaccine, live p. 1390 for prophylaxis following exposure to measles.

Rubella

Intramuscular immunoglobulin after exposure to rubella does **not** prevent infection in non-immune contacts and is **not** recommended for protection of pregnant women exposed to rubella. It may, however, reduce the likelihood of a clinical attack which may possibly reduce the risk to the fetus. Risk of intra-uterine transmission is greatest in the first 11 weeks of pregnancy, between 16 and 20 weeks there is minimal risk of deafness only, after 20 weeks there is no increased risk. Intramuscular normal immunoglobulin should be used only if termination of pregnancy would be unacceptable to the pregnant woman—it should be given as soon as possible after exposure. Serological follow-up of recipients is essential to determine if the woman has become infected despite receiving immunoglobulin.

For routine prophylaxis against Rubella, see measles, mumps and rubella vaccine, live p. 1390.

Disease-specific immunoglobulins

Specific immunoglobulins are prepared by pooling the plasma of selected human donors with high levels of the specific antibody required. For further information, see PHE guidance: **Immunoglobulin: when to use** (www.gov.uk/government/publications/immunoglobulin-when-to-use).

There are no specific immunoglobulins for hepatitis A, measles, or rubella— normal immunoglobulin p. 1346 is used in certain circumstances. There is no specific immunoglobulin for mumps; neither normal immunoglobulin nor measles, mumps and rubella vaccine, live is effective as post-exposure prophylaxis.

Hepatitis B immunoglobulin

Hepatitis B immunoglobulin p. 1345 (HBIG) in addition to the hepatitis B vaccine p. 1386 is recommended for post-exposure prophylaxis of individuals in certain high-risk groups to provide rapid protection against hepatitis B until the vaccine becomes effective. HBIG is also recommended in some known non-responders to the hepatitis B vaccine. The administration of HBIG at the same time as the vaccine will not inhibit the antibody response, but they should be given

at different sites. For further information on high-risk groups and post-exposure management, see Hepatitis B vaccine p. 1360.

An intravenous and subcutaneous preparation of hepatitis B immunoglobulin is licensed for the prevention of hepatitis B recurrence in HBV-DNA negative patients who have undergone liver transplantation for liver failure caused by the virus.

Rabies immunoglobulin

Rabies immunoglobulin p. 1348 should be considered following high risk exposure to rabies to give rapid protection until rabies vaccine p. 1391 (administered at a separate site) becomes effective. When indicated for post-exposure treatment, rabies immunoglobulin should be injected around the site of the wound where possible, rather than intramuscularly, as it neutralises rabies virus before the immune system can respond. There is limited benefit of intramuscular administration away from the wound site. For information about dosing and administration, see rabies immunoglobulin.

Rabies immunoglobulin is not recommended if:

- an individual is already partially or previously immunised (unless immunocompromised);
- more than 7 days have passed since the first dose of rabies vaccine or more than 1 day since the second dose of rabies vaccine;
- the rabies exposure was more than 12 months prior.

For further information on risk assessment and post-exposure treatment, see Rabies vaccine p. 1369.

Tetanus immunoglobulin

For the management of tetanus-prone wounds, tetanus immunoglobulin p. 1348 should be used in addition to wound cleansing and, where appropriate, antibacterial prophylaxis and a tetanus-containing vaccine. Tetanus immunoglobulin, together with metronidazole p. 580 and wound cleansing, should also be used for the treatment of established cases of tetanus.

Varicella-zoster immunoglobulin

Varicella infection in immunosuppressed individuals and pregnant women can lead to severe and even life-threatening varicella disease. Post-exposure prophylaxis is recommended to attenuate disease and to reduce the risk of complications.

Varicella-zoster immunoglobulin p. 1349 (VZIG) is recommended for individuals who have:

- had a significant exposure to varicella (chickenpox) or herpes zoster (shingles)—this depends on the type of varicella-zoster infection in the index case, the timing of the exposure in relation to onset of rash in the index case, and/or closeness and duration of contact; **and**
- a clinical condition that increases the risk of severe chickenpox; **and**
- no antibodies to varicella-zoster virus.

Due to a significant shortage of varicella-zoster immunoglobulin, stock has been prioritised for the most vulnerable groups, such as susceptible women exposed in the first 20 weeks of pregnancy. For susceptible pregnant women exposed after 20 weeks (from 21 weeks to delivery), either varicella-zoster immunoglobulin or aciclovir p. 676 [unlicensed] is recommended; valaciclovir p. 679 [unlicensed] may be used as an alternative. Varicella-zoster immunoglobulin may also be considered in susceptible individuals with renal impairment or intestinal malabsorption (such as inflammatory bowel disease).

For susceptible immunosuppressed individuals, an antiviral [unlicensed] is recommended unless there are significant concerns about renal toxicity or malabsorption. Aciclovir [unlicensed] is recommended first-line; valaciclovir [unlicensed] may be used as an alternative. Immunosuppressed individuals on long term aciclovir or

valaciclovir prophylaxis, may require their dose to be temporarily increased.

For further information on risk assessment and the use of VZIG or an antiviral for post-exposure prophylaxis, see the PHE guidance: **Varicella-zoster immunoglobulin** (available at: www.gov.uk/government/publications/varicella-zoster-immunoglobulin). Refer to the British HIV Association for use of VZIG in individuals with HIV infection. See www.bhiva.org/guidelines for further information.

Individuals who develop chickenpox despite post-exposure prophylaxis require treatment with an antiviral; there is no evidence that VZIG is effective in the treatment of disease. For information on the treatment of chickenpox or shingles, see *Varicella-zoster infections* in Herpesvirus infections p. 675.

Anti-D (Rh₀) immunoglobulin

Anti-D (Rh₀) immunoglobulin below is prepared from plasma taken from rhesus-negative donors who have been immunised against the anti-D-antigen. Anti-D (Rh₀) immunoglobulin is used to prevent a rhesus-negative mother from forming antibodies to fetal rhesus-positive cells which may pass into the maternal circulation. The objective is to protect any subsequent child from the hazard of haemolytic disease of the newborn.

Anti-D (Rh₀) immunoglobulin should be administered to the mother following any sensitising episode (e.g. abortion, miscarriage and birth); it should be injected within 72 hours of the episode but even if a longer period has elapsed it may still give protection and should be administered. Anti-D (Rh₀) immunoglobulin is also given when significant foeto-maternal haemorrhage occurs in rhesus-negative women during delivery. The dose of anti-D (Rh₀) immunoglobulin is determined according to the level of exposure to rhesus-positive blood.

Use of routine *antenatal* anti-D prophylaxis should be given irrespective of previous anti-D prophylaxis for a sensitising event early in the same pregnancy. Similarly, *postpartum* anti-D prophylaxis should be given irrespective of previous routine antenatal anti-D prophylaxis or antenatal anti-D prophylaxis for a sensitising event in the same pregnancy.

Anti-D (Rh₀) immunoglobulin is also given to women of child-bearing potential after the inadvertent transfusion of rhesus-incompatible blood components and is used for the treatment of idiopathic thrombocytopenia purpura.

MMR vaccine

Measles, mumps and rubella vaccine, live may be given in the postpartum period with anti-D (Rh₀) immunoglobulin injection provided that separate syringes are used and the products are administered into different limbs. If blood is transfused, the antibody response to the vaccine may be inhibited—measure rubella antibodies after 6–8 weeks and revaccinate if necessary.

Anti-D (Rh₀) immunoglobulin

03-Mar-2020

● INDICATIONS AND DOSE

To rhesus-negative woman for prevention of Rh₀(D) sensitisation, following birth of rhesus-positive infant

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Females of childbearing potential: 500 units, dose to be administered immediately or within 72 hours; for transplacental bleed of over 4 mL fetal red cells, extra 100–125 units per mL fetal red cells, subcutaneous route used for patients with bleeding disorders

To rhesus-negative woman for prevention of Rh₀(D) sensitisation, following any potentially sensitising episode (e.g. stillbirth, abortion, amniocentesis) up to 20 weeks' gestation

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Females of childbearing potential: 250 units per episode, dose to be administered immediately or within 72 hours, subcutaneous route used for patients with bleeding disorders

To rhesus-negative woman for prevention of Rh₀(D) sensitisation, following any potentially sensitising episode (e.g. stillbirth, abortion, amniocentesis) after 20 weeks' gestation

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Females of childbearing potential: 500 units per episode, dose to be administered immediately or within 72 hours, subcutaneous route used for patients with bleeding disorders

To rhesus-negative woman for prevention of Rh₀(D) sensitisation, antenatal prophylaxis

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Females of childbearing potential: 500 units, dose to be given at weeks 28 and 34 of pregnancy, if infant rhesus-positive, a further dose is still needed immediately or within 72 hours of delivery, subcutaneous route used for patients with bleeding disorders

To rhesus-negative woman for prevention of Rh₀(D) sensitisation, antenatal prophylaxis (alternative NICE recommendation)

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Females of childbearing potential: 1000–1650 units, dose to be given at weeks 28 and 34 of pregnancy, alternatively 1500 units for 1 dose, dose to be given between 28 and 30 weeks gestation

To rhesus-negative woman for prevention of Rh₀(D) sensitisation, following Rh₀(D) incompatible blood transfusion

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Females of childbearing potential: 100–125 units per mL of transfused rhesus-positive red cells, subcutaneous route used for patients with bleeding disorders

RHOPHYLAC®

To rhesus-negative woman for prevention of Rh₀(D) sensitisation, following birth of rhesus-positive infant

- ▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- ▶ Females of childbearing potential: 1000–1500 units, dose to be administered immediately or within 72 hours; for large transplacental bleed, extra 100 units per mL fetal red cells (preferably by intravenous injection), intravenous route recommended for patients with bleeding disorders

To rhesus-negative woman for prevention of Rh₀(D) sensitisation, following any potentially sensitising episode (e.g. abortion, amniocentesis, chorionic villous sampling) up to 12 weeks' gestation

- ▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- ▶ Females of childbearing potential: 1000 units per episode, dose to be administered immediately or within 72 hours, intravenous route recommended for patients with bleeding disorders, higher doses may be required after 12 weeks gestation

To rhesus-negative woman for prevention of Rh₀(D) sensitisation, antenatal prophylaxis

- ▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- ▶ Females of childbearing potential: 1500 units, dose to be given between weeks 28–30 of pregnancy; if infant rhesus-positive, a further dose is still needed

immediately or within 72 hours of delivery, intravenous route recommended for patients with bleeding disorders

To rhesus-negative woman for prevention of Rh₀(D) sensitisation, following Rh₀(D) incompatible blood transfusion

► BY INTRAVENOUS INJECTION

- Females of childbearing potential: 50 units per mL of transfused rhesus-positive blood, alternatively 100 units per mL of erythrocyte concentrate, intravenous route recommended for patients with bleeding disorders

- **CAUTIONS** Immunoglobulin A deficiency · possible interference with live virus vaccines

CAUTIONS, FURTHER INFORMATION

- **MMR vaccine** MMR vaccine may be given in the postpartum period with anti-D (Rh₀) immunoglobulin injection provided that separate syringes are used and the products are administered into different limbs. If blood is transfused, the antibody response to the vaccine may be inhibited—measure rubella antibodies after 6–8 weeks and revaccinate if necessary.

- **INTERACTIONS** → Appendix 1: immunoglobulins

● **SIDE-EFFECTS**

- **Uncommon** Chills · fever · headache · malaise · skin reactions
- **Rare or very rare** Arthralgia · dyspnoea · hypersensitivity · hypotension · nausea · tachycardia · vomiting
- **Frequency not known** Intravascular haemolysis

- **HANDLING AND STORAGE** Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. **Refrigerated storage** is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.

● **NATIONAL FUNDING/ACCESS DECISIONS**

For full details see funding body website

NICE decisions

- **Routine antenatal anti-D prophylaxis for rhesus-negative women (August 2008)** NICE TA156 Recommended

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► **D-Gam** (Bio Products Laboratory Ltd)

Anti-D (RHO) immunoglobulin 500 unit D-Gam Anti-D immunoglobulin 500unit solution for injection vials | 1 vial [PoM] £38.25

Anti-D (RHO) immunoglobulin 1500 unit D-Gam Anti-D immunoglobulin 1,500unit solution for injection vials | 1 vial [PoM] £58.00

► **Rhophylac** (CSL Behring UK Ltd)

Anti-D (RHO) immunoglobulin 750 unit per 1 ml Rhophylac 1,500units/2ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £76.50

- **CONTRA-INDICATIONS** Selective IgA deficiency with IgA antibodies

- **CAUTIONS** Interference with live virus vaccines

CAUTIONS, FURTHER INFORMATION

- Interference with live virus vaccines Cytomegalovirus immunoglobulin may impair the immune response to live virus vaccines; such vaccines should only be given 3 months after CMV immunoglobulin treatment. Patients receiving measles vaccines should have their antibody status checked as impairment of immune response may persist for up to 1 year.

- **INTERACTIONS** → Appendix 1: immunoglobulins

- **SIDE-EFFECTS** Arthralgia · back pain · chills · cutaneous lupus erythematosus · dizziness · embolism and thrombosis · fatigue · fever · haemolysis · haemolytic anaemia · headache · hypotension · infusion related reaction · meningitis aseptic · myocardial infarction · nausea · neutropenia · renal impairment · skin reactions · stroke · transfusion-related acute lung injury · vomiting

● **MONITORING REQUIREMENTS**

- Manufacturer advises monitor for signs of infusion-related reactions during and for at least one hour after each infusion in patients receiving cytomegalovirus immunoglobulin for the first time, or following a prolonged period between treatments, or when a different human immunoglobulin has been used previously; monitor all other patients for at least 20 minutes after each infusion—in case of reaction, reduce rate or stop infusion as clinically appropriate.
- Manufacturer advises monitor urine output and serum creatinine.

- **HANDLING AND STORAGE** Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. **Refrigerated storage** is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

► **Cytotect CP Biotest** (Biotest (UK) Ltd)

Cytomegalovirus immunoglobulin human 100 unit per

1 ml Cytotect CP Biotest 5,000units/50ml solution for infusion vials |

1 vial [PoM] £917.70

Cytotect CP Biotest 1,000units/10ml solution for infusion vials |

1 vial [PoM] £183.54

Hepatitis B immunoglobulin

06-Mar-2020

● **INDICATIONS AND DOSE**

Prophylaxis against hepatitis B infection

► BY INTRAMUSCULAR INJECTION

- Adult: 500 units, dose to be administered as soon as possible after exposure; ideally within 12–48 hours, but no later than 7 days after exposure

Prophylaxis against hepatitis B infection, after exposure to hepatitis B virus-contaminated material

► BY INTRAVENOUS INFUSION

- Adult: Dose to be administered as soon as possible after exposure, but no later than 72 hours (consult product literature)

Prevention of hepatitis B in haemodialysed patients

► BY INTRAVENOUS INFUSION

- Adult: (consult product literature)

continued →

Cytomegalovirus immunoglobulin

16-Apr-2020

● **INDICATIONS AND DOSE**

Prophylaxis of cytomegalovirus infection in patients taking immunosuppressants, particularly transplant recipients (specialist use only)

► BY INTRAVENOUS INFUSION

- Adult: (consult product literature)

Prophylaxis against re-infection of transplanted liver

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: (consult product literature)

Prevention of hepatitis B re-infection more than 6 months after liver transplantation in stable HBV-DNA negative patients

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult (body-weight up to 75 kg): 500 units once weekly, increased if necessary up to 1000 units once weekly, dose to be started 2–3 weeks after last dose of intravenous hepatitis B immunoglobulin
- ▶ Adult (body-weight 75 kg and above): 1000 units once weekly, dose to be started 2–3 weeks after last dose of intravenous hepatitis B immunoglobulin

- **CAUTIONS** IgA deficiency · interference with live virus vaccines
- **INTERACTIONS** → Appendix 1: immunoglobulins
- **SIDE-EFFECTS**
 - ▶ **Uncommon** Abdominal pain upper · headache
 - ▶ **Rare or very rare** Cardiac discomfort · fatigue · hypersensitivity · hypertension · hypotension · muscle spasms · nasopharyngitis · oropharyngeal pain · palpitations · skin reactions
- **PRESCRIBING AND DISPENSING INFORMATION** Vials containing 200 units or 500 units (for intramuscular injection), available from selected Public Health England and NHS laboratories (except for Transplant Centres), also available from BPL.
- **HANDLING AND STORAGE** Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. **Refrigerated storage** is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection▶ **Hepatitis B immunoglobulin (Non-proprietary)**

Hepatitis B immunoglobulin human 200 unit Hepatitis B immunoglobulin human 200unit solution for injection vials | 1 vial [PoM] £200.00

Hepatitis B immunoglobulin human 500 unit Hepatitis B immunoglobulin human 500unit solution for injection vials | 1 vial [PoM] £500.00

- ▶ **Zutectra** (Biotest (UK) Ltd)
Zutectra 500units/1ml solution for injection pre-filled syringes | 5 syringe [PoM] £1,500.00

Solution for infusion▶ **Hepatect CP** (Biotest (UK) Ltd)

Hepatitis B immunoglobulin human 50 unit per 1 ml Hepatect CP 100units/2ml solution for infusion vials | 1 vial [PoM] £55.00

Hepatect CP 2000units/40ml solution for infusion vials | 1 vial [PoM] £1,100.00

Hepatect CP 500units/10ml solution for infusion vials | 1 vial [PoM] £275.00

Hepatect CP 5000units/100ml solution for infusion vials | 1 vial [PoM] £2,750.00

▶ **Omri-Hep-B** (Imported (Israel))

Hepatitis B immunoglobulin human 50 unit per 1 ml Omri-Hep-B 5000units/100ml solution for infusion vials | 1 vial [PoM] 

Normal immunoglobulin

29-Mar-2021

● **INDICATIONS AND DOSE****Post-exposure prophylaxis against hepatitis A infection [using Subgam[®]]**

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 1000 mg for 1 dose

Rubella in pregnancy, prevention of clinical attack

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Females of childbearing potential: 750 mg

Replacement therapy in primary immunodeficiency disorders (specialist use only) | Replacement therapy in secondary immunodeficiency disorders (specialist use only)

- ▶ BY SUBCUTANEOUS INFUSION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: (consult product literature)

Immune-mediated disorders (specialist use only)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: For some indications, subcutaneous infusion may be used for maintenance treatment—consult product information (consult product literature)

- **UNLICENSED USE** PHE advises normal immunoglobulin (as Subgam[®]) is used for post-exposure prophylaxis against hepatitis A infection, but it is not licensed for this indication. PHE advises normal immunoglobulin is used for rubella in pregnancy for prevention of clinical attack, but it is not licensed for this indication.

- **CONTRA-INDICATIONS** Patients with selective IgA deficiency who have known antibodies against IgA
- CONTRA-INDICATIONS, FURTHER INFORMATION** For full details on contra-indications, consult product literature.

● **CAUTIONS**

GENERAL CAUTIONS Agammaglobulinaemia with or without IgA deficiency · hypogammaglobulinaemia with or without IgA deficiency · interference with live virus vaccines

SPECIFIC CAUTIONS

- ▶ With intravenous use Ensure adequate hydration · obesity · renal insufficiency · risk factors for arterial or venous thromboembolic events · thrombophilic disorders

CAUTIONS, FURTHER INFORMATION For full details on cautions, consult product literature.

- ▶ Interference with live virus vaccines Normal immunoglobulin may **interfere with the immune response to live virus vaccines** which should therefore only be given at **least 3 weeks before or 3 months after** an injection of normal immunoglobulin (this does not apply to yellow fever vaccine since normal immunoglobulin does not contain antibody to this virus).

- **INTERACTIONS** → Appendix 1: immunoglobulins

● **SIDE-EFFECTS****GENERAL SIDE-EFFECTS**

- ▶ **Common or very common** Diarrhoea · dizziness · fatigue · gastrointestinal discomfort · myalgia · nausea · pain · skin reactions

SPECIFIC SIDE-EFFECTS▶ **Common or very common**

- ▶ With intravenous use Arthralgia · chills · embolism and thrombosis · feeling hot · fever · haemolysis · headache · hyperaemia · hypersensitivity · hypertension · infusion related reaction · palpitations · sensory disorder · taste altered · vomiting
- ▶ With subcutaneous use Drowsiness · headaches · hypotension · local reaction
- ▶ **Uncommon**
 - ▶ With intravenous use Hypothermia
 - ▶ With subcutaneous use Paraesthesia

► **Frequency not known**

- With intravenous use Acute kidney injury · angina pectoris · cutaneous lupus erythematosus · dyspnoea · leucopenia · meningitis aseptic · neutropenia · shock · transfusion-related acute lung injury

SIDE-EFFECTS, FURTHER INFORMATION Adverse reactions are more likely to occur in patients receiving normal immunoglobulin for the first time, or following a prolonged period between treatments, or when a different brand of normal immunoglobulin is administered.

- **MONITORING REQUIREMENTS** Monitor for acute renal failure; consider discontinuation if renal function deteriorates. Intravenous preparations with added sucrose have been associated with cases of renal dysfunction and acute renal failure.

- **DIRECTIONS FOR ADMINISTRATION** Administration advice (including licensed route of administration, recommended rate of infusion and reconstitution requirements) varies widely between normal immunoglobulin preparations from different manufacturers—formulations are **not interchangeable**; consult product literature.

- **PRESCRIBING AND DISPENSING INFORMATION** Antibody titres can vary widely between normal immunoglobulin preparations from different manufacturers—formulations are **not interchangeable**; patients should be maintained on the same formulation throughout long-term treatment to avoid adverse effects.

[EVG] The brand name and batch number should be recorded after each administration (in case of transmission of infective agents). **[M]**

Indications, licensed age groups, and excipients differ between preparations. Some manufacturers also provide hyaluronidase to enhance the absorption of normal immunoglobulin. Further information can be found in the product literature for the individual preparations.

- With intramuscular use Available from ImmForm and from some Public Health England and NHS laboratories (for hepatitis A and rubella prophylaxis).

- **HANDLING AND STORAGE** Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. **Refrigerated storage** is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Rabies immunoglobulin

16-Mar-2020

• INDICATIONS AND DOSE**Post-exposure treatment against rabies infection**

- ▶ BY LOCAL INFILTRATION, OR BY INTRAMUSCULAR INJECTION
- ▶ Child: 20 units/kg, dose administered by infiltration in and around the cleansed wound; if wound not visible or healed or if infiltration of whole volume not possible, give remainder by intramuscular injection into anterolateral thigh (remote from vaccination site). If more than 2 mL to be given by intramuscular injection then give in divided doses at different sites, to be given in combination with rabies vaccine, not required if more than 7 days have elapsed after the first dose of vaccine, or more than 1 day after the second dose of vaccine
- ▶ Adult: 20 units/kg, dose administered by infiltration in and around the cleansed wound; if wound not visible or healed or if infiltration of whole volume not possible, give remainder by intramuscular injection into anterolateral thigh (remote from vaccination site). If more than 5 mL to be given by intramuscular injection then give in divided doses at different sites, to be given in combination with rabies vaccine, not required if more than 7 days have elapsed after the first dose of vaccine, or more than 1 day after the second dose of vaccine

- **CAUTIONS** IgA deficiency · interference with live virus vaccines
- **INTERACTIONS** → Appendix 1: immunoglobulins
- **SIDE-EFFECTS**
- ▶ **Rare or very rare** Arthralgia · chills · fatigue · fever · headache · hypersensitivity · hypotension · influenza like illness · malaise · nausea · skin reactions · tachycardia · vomiting
- **PRESCRIBING AND DISPENSING INFORMATION** The potency of individual batches of rabies immunoglobulin from the manufacturer may vary; potency may also be described differently by different manufacturers. It is therefore critical to know the potency of the batch to be used and the weight of the patient in order to calculate the specific volume required to provide the necessary dose.
 Available from Specialist and Reference Microbiology Division, Public Health England (also from BPL).
- **HANDLING AND STORAGE** Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. **Refrigerated storage** is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Rabies immunoglobulin (Non-proprietary)**

Tetanus immunoglobulin

16-Mar-2020

• INDICATIONS AND DOSE**Post-exposure prophylaxis**

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child: Initially 250 units, then increased to 500 units, dose is only increased if more than 24 hours have

elapsed or there is risk of heavy contamination or following burns

- ▶ **Adult:** Initially 250 units, then increased to 500 units, dose is only increased if more than 24 hours have elapsed or there is risk of heavy contamination or following burns

Treatment of tetanus infection

- ▶ **BY INTRAMUSCULAR INJECTION**
- ▶ **Child:** 150 units/kg, dose may be given over multiple sites
- ▶ **Adult:** 150 units/kg, dose may be given over multiple sites

● **CAUTIONS** IgA deficiency · interference with live virus vaccines

● **INTERACTIONS** → Appendix 1: immunoglobulins

● SIDE-EFFECTS

- ▶ **Rare or very rare** Anaphylactic reaction · hypotension
- ▶ **Frequency not known** Arthralgia · chest pain · dizziness · dyspnoea · face oedema · oral disorders · tremor

● **HANDLING AND STORAGE** Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. **Refrigerated storage** is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ Tetanus immunoglobulin (Non-proprietary)

Varicella-zoster immunoglobulin

16-Oct-2020

(Antivaricella-zoster Immunoglobulin)

● INDICATIONS AND DOSE

Prophylaxis against varicella infection

- ▶ **BY INTRAMUSCULAR INJECTION**
- ▶ **Adult:** 1 g, to be administered as soon as possible—not later than 10 days after exposure, second dose to be given if further exposure occurs more than 3 weeks after first dose

● **CAUTIONS** IgA deficiency · interference with live virus vaccines

● **INTERACTIONS** → Appendix 1: immunoglobulins

● **SIDE-EFFECTS** Arthralgia · chills · fever · headache · hypersensitivity · hypotension · malaise · nausea · skin reactions · tachycardia · vomiting

● **DIRECTIONS FOR ADMINISTRATION** Public Health England advises normal immunoglobulin for intravenous use may be used in those unable to receive intramuscular injections.

Manufacturer advises if a large volume (>5 mL) is to be given by intramuscular injection then administer in divided doses at different sites.

● **PRESCRIBING AND DISPENSING INFORMATION** Available from selected Public Health England and NHS laboratories (also from Bio Products Laboratory).

● **HANDLING AND STORAGE** Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the

preparation may become ineffective. **Refrigerated storage** is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Varicella-Zoster** (Bio Products Laboratory Ltd)
- ▶ **Varicella-Zoster immunoglobulin human 250 mg** Varicella-Zoster immunoglobulin human 250mg solution for injection vials | 1 vial [PoM] £750.00 DT = £750.00

2 Post-exposure prophylaxis

Botulism antitoxin

12-Jan-2021

Overview

Botulism antitoxin (botulinum antitoxin) p. 1350 [unlicensed] is a polyvalent preparation that contains equine-derived immune globulins against multiple *Clostridium botulinum* serotypes. It is used for the treatment of suspected cases of botulism, such as foodborne (preformed toxins ingested from contaminated food) and wound botulism (associated with parenteral drug abuse). Human-derived botulism immune globulin [unlicensed] is used for the treatment of infant botulism as part of the Infant Botulism Treatment and Prevention Program. In infant botulism, neurotoxins are formed in the large intestine after ingestion of *Clostridium botulinum* spores, which are harmless to older children and adults.

Botulism is a notifiable disease in the UK, especially foodborne botulism, which is considered a public health emergency as contaminated food may be available to other individuals. For further information on reporting of suspected cases, see *Notifiable diseases* in Antibacterials, principles of therapy p. 531.

All cases of suspected botulism should be managed promptly—treatment should not be delayed while awaiting laboratory diagnosis. Supportive care (including artificial ventilation) and symptomatic treatment may also be necessary.

For individuals with wound botulism, surgical debridement and antibacterial therapy are recommended in addition to botulism antitoxin, to help reduce the organism load and toxin production.

For further information on the management of infant, foodborne and wound botulism, see Public Health England guidance: **Botulism: clinical and public health management** (see *Useful resources*).

Useful Resources

Recommendations reflect Botulism: clinical and public health management. Public Health England, December 2018. www.gov.uk/government/publications/botulism-clinical-and-public-health-management

IMMUNE SERA AND IMMUNOGLOBULINS > ANTITOXINS

Bezlotoxumab

18-Aug-2017

- **DRUG ACTION** Bezlotoxumab is a human monoclonal antitoxin antibody; it binds to *Clostridioides difficile* toxin B and neutralises its activity, preventing recurrence of *Clostridioides difficile* infection.

● INDICATIONS AND DOSE

Prevention of recurrence of *Clostridioides difficile* infection in patients at high risk of reinfection

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 10 mg/kg for 1 dose, to be administered during the course of antibacterial therapy for *Clostridioides difficile* infection

● SIDE-EFFECTS

- ▶ Common or very common Dizziness · dyspnoea · fatigue · fever · headache · hypertension · infusion related reaction · nausea

- **PREGNANCY** Manufacturer advises avoid unless essential—limited information available.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises for intravenous infusion (Zinplava[®]), give intermittently in Glucose 5% or Sodium Chloride 0.9%, dilute requisite dose to a concentration of 1–10 mg/mL with infusion fluid; give over 60 minutes via a central venous catheter or peripheral catheter using a low-protein binding filter (0.2–5 micron).

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8 °C)—consult product literature for further information regarding storage conditions outside refrigerator and after preparation of the infusion.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Polysorbates

ELECTROLYTES: May contain Sodium

- ▶ **Zinplava** (Merck Sharp & Dohme (UK) Ltd) ▼
Bezlotoxumab 25 mg per 1 ml Zinplava 1g/40ml concentrate for solution for infusion vials | 1 vial [PoM] £2,470.00 (Hospital only)

Botulism antitoxin

13-May-2021

● INDICATIONS AND DOSE

Treatment of botulism [suspected or confirmed]

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: (consult product literature)

- **SIDE-EFFECTS** Hypersensitivity

SIDE-EFFECTS, FURTHER INFORMATION It is essential to read the contra-indications, warnings, and details of sensitivity tests on the package insert. Prior to treatment checks should be made regarding previous administration of any antitoxin and history of any allergic condition, e.g. asthma, hay fever, etc.

- **PRE-TREATMENT SCREENING** All patients should be tested for sensitivity (diluting the antitoxin if history of allergy).

- **PRESCRIBING AND DISPENSING INFORMATION** Available from designated centres after discussion with the on-call duty doctor at Colindale, Public Health England (during and outside of working hours) for risk assessment and further advice on treatment (Tel: (020) 8200 4400).

For non-urgent queries, contact Botulism@phe.gov.uk.

- **MEDICINAL FORMS** No licensed medicines listed.

Diphtheria antitoxin

(Dip/Ser)

● INDICATIONS AND DOSE

Passive immunisation in suspected cases of diphtheria

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: Dose should be given without waiting for bacteriological confirmation (consult product literature)

● CAUTIONS

- ▶ Hypersensitivity Hypersensitivity is common after administration; resuscitation facilities should be available. Diphtheria antitoxin is no longer used for prophylaxis because of the risk of hypersensitivity; unimmunised contacts should be promptly investigated and given antibacterial prophylaxis and vaccine.

● SIDE-EFFECTS

- ▶ Common or very common Hypersensitivity

- **PRE-TREATMENT SCREENING** Diphtheria antitoxin is derived from horse serum and reactions are common; tests for hypersensitivity should be carried out before use.

- **PRESCRIBING AND DISPENSING INFORMATION** Available from Centre for Infections (Tel (020) 8200 6868) or in Northern Ireland from Public Health Laboratory, Belfast City Hospital (Tel (028) 9032 9241).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Diphtheria antitoxin (Non-proprietary)**

Diphtheria antitoxin 1000 unit per 1 ml Antidiphtheria serum 10,000units/10ml solution for injection ampoules | 1 ampoule [PoM] ☒

3 Tuberculosis diagnostic test

DIAGNOSTIC AGENTS

Tuberculin purified protein derivative (Tuberculin PPD)

● INDICATIONS AND DOSE

Mantoux test

- ▶ BY INTRADERMAL INJECTION
- ▶ Child: 2 units for one dose
- ▶ Adult: 2 units for one dose

Mantoux test (if first test is negative and a further test is considered appropriate)

- ▶ BY INTRADERMAL INJECTION
- ▶ Child: 10 units for 1 dose
- ▶ Adult: 10 units for 1 dose

DOSE EQUIVALENCE AND CONVERSION

- ▶ 2 units is equivalent to 0.1 mL of 20 units/mL strength.
- ▶ 10 units is equivalent to 0.1 mL of 100 units/mL strength.

● CAUTIONS

- ▶ Mantoux test Response to tuberculin may be suppressed by viral infection, sarcoidosis, corticosteroid therapy, or immunosuppression due to disease or treatment and the MMR vaccine. If a tuberculin skin test has already been initiated, then the MMR should be delayed until the skin test has been read unless protection against measles is required urgently. If a child has had a recent MMR, and requires a tuberculin test, then a 4 week interval should be

observed. Apart from tuberculin and MMR, all other live vaccines can be administered at any time before or after tuberculin.

- **PRESCRIBING AND DISPENSING INFORMATION** Available from ImmForm (SSI brand).

The strength of tuberculin PPD in currently available products may be different to the strengths of products used previously for the Mantoux test; care is required to select the correct strength.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection

▶ Tuberculin purified protein derivative (Non-proprietary)

Tuberculin purified protein derivative 20 tuberculin unit per 1 ml Tuberculin PPD RT 23 SSI 20 tuberculin units/ml solution for injection 1.5ml vials | 1 vial 

Tuberculin purified protein derivative 100 tuberculin unit per 1 ml Tuberculin PPD RT 23 SSI 100 tuberculin units/ml solution for injection 1.5ml vials | 1 vial 

4 Vaccination

Vaccination, general principles

09-Feb-2021

Active immunity

Active immunity can be acquired by natural disease or by vaccination. Vaccines induce active immunity and provide immunological memory by stimulating the production of antibodies and cells involved in the immune response. As a result, the immune system is able to recognise and respond rapidly to natural infection at a later date. Antibodies can be detected in the patient's blood or serum, but even in the absence of detectable antibodies, immunological memory may still be present. Vaccines consist of either:

- a *live attenuated* form of the virus (e.g. measles, mumps and rubella vaccine) or bacteria (e.g. Bacillus Calmette-Guérin vaccine);
- *inactivated* preparations of the virus (e.g. tick-borne encephalitis vaccine) or bacteria (e.g. meningococcal vaccine);
- *inactivated toxins (toxoids)* produced by a micro-organism (e.g. tetanus and diphtheria vaccines);
- *extracts* of a micro-organism which may be derived from the organism (e.g. pneumococcal vaccine), or produced by recombinant DNA technology (e.g. hepatitis B vaccine);
- *viral vectors* of replicating (attenuated or low pathogenicity viruses) or non-replicating viruses (e.g. Oxford/AstraZeneca COVID-19 vaccine), produced using recombinant technology; or
- *nucleic acid (DNA or RNA)* of an antigen derived from the virus (e.g. Pfizer/BioNTech or Moderna COVID-19 vaccines) or bacteria.

Live attenuated and replicating viral vector vaccines usually promote a full, long-lasting antibody response. In rare cases, a mild form of the disease may occur with some vaccines, such as a rash following a measles-containing vaccine.

Inactivated or non-replicating vaccines (including toxoids) produce an antibody response following a primary course, which may last for months or years. In most cases booster (reinforcing) injections are required for long-term protection. To stimulate the immune system more broadly, some polysaccharide vaccines have been enhanced by conjugation (such as the *Haemophilus influenzae* type B and meningococcal group C vaccines), while some inactivated vaccines contain an adjuvant (such as aluminium hydroxide or aluminium phosphate) to enhance the antibody response.

Inactivated vaccines cannot cause the disease that they are designed to prevent.

For further information on how vaccines are made and what they contain, see Chapter 1, Immunity and how vaccines work, in *Immunisation against infectious disease* – 'The Green Book' (see *Useful resources*).

Passive immunity

Passive immunity is acquired through the transfer of antibodies from immune individuals either across the placenta, or from the transfusion of blood or blood products including immunoglobulins (for further information, see Immunoglobulins p. 1342). Protection provided by the cross-placental transfer of antibodies provides the infant with temporary protection (commonly for a few weeks to months), and is more effective against some infections (e.g. tetanus and measles) than others (e.g. polio and pertussis).

Vaccination during pregnancy

Live vaccines should not be administered routinely to pregnant females due to the theoretical risk of fetal infection; these should generally be delayed until after delivery. The Immunisation Department of Public Health England (PHE) run a UK-wide surveillance programme on the safety of certain vaccines (measles, mumps, rubella, varicella-zoster, COVID-19, and human papillomavirus) given inadvertently during pregnancy or shortly before conception. For advice on the reporting, risk assessment, and management of inadvertent vaccination in pregnancy, see PHE guidance: **Vaccination in pregnancy** (available at: www.gov.uk/guidance/vaccination-in-pregnancy-vip).

There is no evidence of risk from vaccinating pregnant females with inactivated vaccines; they do not replicate so cannot harm the fetus. Some inactivated vaccines are actively recommended to prevent severe complications during pregnancy or to the new-born infant, such as the influenza vaccine, and diphtheria with tetanus, pertussis and poliomyelitis vaccine.

For further information on vaccination in pregnancy, see individual vaccine treatment summaries.

Vaccines in immunosuppression and HIV infection

Almost all individuals can be safely vaccinated; in only a few individuals is vaccination either contra-indicated or should be deferred. Specialist advice should be sought when in doubt, if using live vaccines, or if there are queries about an individual's degree of immunosuppression. In some situations, the specialist may decide that the risk of a specific disease outweighs any potential risk from the vaccine. Antibody responses may be lower in immunosuppressed individuals, therefore additional vaccine doses may be required.

Live vaccines can cause severe or fatal infections in some immunosuppressed individuals due to extensive replication of the vaccine strain. Live vaccines are therefore not recommended for individuals with some types of severe primary or acquired immunodeficiency, or for those who are on or have recently received high doses of certain immunosuppressive or biological therapies.

Inactivated vaccines cannot replicate so may be given to immunosuppressed individuals.

Wherever possible, immunisation or additional booster doses for individuals with immunosuppression, should be carried out either before immunosuppression occurs or deferred until an improvement in immunity has been seen. The optimal timing for any vaccination should be based upon a judgement about the relative need for rapid protection and the likely response. For infants born to females taking immunosuppressive biological therapy during pregnancy, live vaccines should be delayed by 6 months; therefore, the infant will not be eligible to receive the

rotavirus vaccine, and if indicated, will need to have their Bacillus Calmette–Guérin vaccine deferred.

Most live vaccines used in the UK immunisation schedule can be safely given to close contacts of an immunosuppressed individual. They carry a low risk of transmission (or the risk can be minimised with simple precautions) from a recently vaccinated close contact to an immunosuppressed individual. Close contacts of immunosuppressed individuals should be fully immunised according to the national Immunisation schedule p. 1353 to reduce the risk of exposure to vaccine preventable conditions, and they should also be offered the annual Influenza vaccine p. 1362.

For further information on vaccines in immunosuppression, see Chapter 6, Contra-indications and special considerations, and Chapter 7, Immunisation of individuals with underlying medical conditions in *Immunisation against infectious disease* - 'The Green Book' (see *Useful resources*).

For further information on vaccines for individuals with HIV infection, see the British HIV Association guideline: **Use of vaccines in HIV-positive adults** (available at: www.bhiva.org/vaccination-guidelines), or the Children's HIV Association guidelines: **Vaccination of HIV infected children and Preparing HIV-infected children and adolescents for travel** (available at: www.chiva.org.uk).

Vaccines and asplenia, splenic dysfunction, or complement disorders

The following vaccines are recommended for individuals with asplenia, splenic dysfunction, or complement disorders (including those taking complement inhibitors) depending on the age at which their condition is diagnosed:

- Influenza vaccine p. 1389;
- Meningococcal groups A with C and W135 and Y vaccine p. 1380 and meningococcal group B vaccine (rDNA, component, adsorbed) p. 1379;
- 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) p. 1381 and/or 23-valent pneumococcal polysaccharide vaccine p. 1382. Patients on complement inhibitor therapy with eculizumab p. 1071 are not at increased risk of pneumococcal disease and do not require 23-valent pneumococcal polysaccharide vaccine p. 1382 or additional doses of 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) p. 1381.

Additional booster doses of other vaccines should be considered depending on the individual's underlying condition—specialist advice may be required. For information on specific indications for immunisation of vulnerable groups, see Chapter 7, Immunisation of individuals with underlying medical conditions, in *Immunisation against infectious disease* - 'The Green Book' (see *Useful resources*).

Children first diagnosed or presenting aged under 1 year should be immunised according to the Immunisation schedule p. 1353. During their first year they should also be given 2 doses of meningococcal groups A with C and W135 and Y vaccine at least 4 weeks apart, and a dose of 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) p. 1381 (in order to have received a total of 2 doses of 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) with an 8 week interval). 8 weeks following their routine 1 year booster vaccines, they should receive a booster dose of meningococcal groups A with C and W135 and Y vaccine. An additional dose of 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) p. 1381 should be given at least 8 weeks after the routine 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) p. 1381 booster scheduled at 1 year. After their second birthday, a dose of 23-valent pneumococcal polysaccharide vaccine p. 1382 should be given at least 8 weeks after the last dose of 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) p. 1381. The

influenza vaccine should be given annually in children aged 6 months or older.

Children first diagnosed or presenting aged 1 year to under 2 years should be immunised according to the Immunisation schedule p. 1353, including any routine vaccines due at 1 year of age if not yet administered. 8 weeks following the routine 1 year booster vaccines a dose of meningococcal groups A with C and W135 and Y vaccine should be given. An additional dose of 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) p. 1381 should be given at least 8 weeks after the 1 year 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) p. 1381 booster dose. After their second birthday, a dose of 23-valent pneumococcal polysaccharide vaccine p. 1382 should be given at least 8 weeks after the last dose of 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) p. 1381. The influenza vaccine should be given annually.

Children first diagnosed or presenting aged 2 years to under 10 years should be immunised according to the Immunisation schedule p. 1353. Additionally, they should be given a dose of meningococcal groups A with C and W135 and Y vaccine and 23-valent pneumococcal polysaccharide vaccine p. 1382. For children who have not received the full routine immunisation for meningococcal group B vaccine (rDNA, component, adsorbed), ensure that 2 doses, 8 weeks apart have been given since their first birthday. For children who have not received any 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) p. 1381 previously, a single dose should be given, followed by a dose of 23-valent pneumococcal polysaccharide vaccine p. 1382 at least 8 weeks later. The influenza vaccine should be given annually.

Individuals first diagnosed aged 10 years and over regardless of previous immunisations, should be given a dose of 23-valent pneumococcal polysaccharide vaccine p. 1382, meningococcal group B vaccine (rDNA, component, adsorbed) and meningococcal groups A with C and W135 and Y vaccine. After 4 weeks, an additional dose of meningococcal group B vaccine (rDNA, component, adsorbed) should be given. The influenza vaccine should be given annually.

Vaccines and antitoxins availability

For information on availability of vaccines and antitoxins, see individual monographs.

For antivenom, see Poisoning, emergency treatment p. 1430.

Enquiries for vaccines not available commercially can also be made to:

Vaccines and Countermeasures Response Department
Public Health England
vaccinesupply@phe.gov.uk

In Northern Ireland, enquiries for vaccines not available commercially should be directed to Northern Health and Social Care Trust's Pharmacy Services (www.northerntrust.hscni.net/services/pharmaceutical-services/).

In Scotland, information about availability of vaccines can be obtained from a Specialist in Pharmaceutical Public Health.

In Wales, enquiries for vaccines not available commercially should be directed to the Welsh Medicines Information Centre (www.wmic.wales.nhs.uk/about/contactus/).

Useful Resources

Recommendations reflect advice from *Immunisation against infectious disease* - 'The Green Book'. Public Health England, 2013. Chapters from the handbook (including updates since 2013) are available at: www.gov.uk/government/collections/immunisation-against-infectious-disease-the-green-book

Immunisation schedule

05-Jan-2021

Routine immunisations, sources of information

The Joint Committee on Vaccination and Immunisation (JCVI) have issued statements on immunisation prioritisation, and delivery of the routine human papillomavirus vaccination programme for children, during the COVID-19 pandemic, available at: tinyurl.com/yygw3ea4 and tinyurl.com/yyflaflue

The following recommendations reflect advice produced by Public Health England. Recommendations specific to each vaccine can be found in *Immunisation against infectious disease* – ‘The Green Book’. Public Health England at: www.gov.uk/government/collections/immunisation-against-infectious-disease-the-green-book

The immunisation schedule reflects advice from ‘The complete routine immunisation schedule’ produced by Public Health England (2019). For the most up to date immunisation schedule, see: www.gov.uk/government/publications/the-complete-routine-immunisation-schedule

The Influenza immunisation recommendations reflect advice from the ‘National flu immunisation programme plan 2020/2021’ produced by Public Health England, Department of Health and Social Care, and NHS England. For the most up to date letter, see: www.gov.uk/government/publications/national-flu-immunisation-programme-plan

Vaccines for the immunisation schedule should be obtained from ImmForm at: portal.immform.phe.gov.uk

Preterm birth

Babies born preterm should receive all routine immunisations based on their actual date of birth. The risk of apnoea following vaccination is increased in preterm babies, particularly in those born at or before 28 weeks gestational age. If babies at risk of apnoea are in hospital at the time of their first immunisation, they should be monitored for respiratory complications for 48–72 hours after

immunisation. If a baby develops apnoea, bradycardia, or desaturation after the first immunisation, the second immunisation should also be given in hospital with similar monitoring.

Individuals with unknown or incomplete immunisation history

For children born in the UK who present with an inadequate or unknown immunisation history, investigation into immunisations received should be carried out. Outstanding doses should be administered where the routine childhood immunisation schedule has not been completed.

For advice on dosing schedules for missed vaccinations, and the immunisation of individuals coming to the UK, consult Chapter 11, The UK immunisation schedule, in *Immunisation against infectious disease* – ‘The Green Book’. Public Health England, available at: www.gov.uk/government/publications/immunisation-schedule-the-green-book-chapter-11

Immunisations for healthcare and laboratory staff

Vaccine-preventable diseases that can be transmitted from person to person are a risk for staff and patients in healthcare environments, and staff in laboratory environments. Therefore, all staff must be up-to-date with their routine immunisations. In addition, specific immunisations are recommended for certain staff groups due to the risk of acquiring or passing on infection. For detailed recommendations, consult Chapter 12, Immunisation of healthcare and laboratory staff in *Immunisation against infectious disease* – ‘The Green Book’. Public Health England, available at: www.gov.uk/government/publications/immunisation-of-healthcare-and-laboratory-staff-the-green-book-chapter-12

Vaccines

Routine immunisation schedule

When to immunise	Vaccine given and dose schedule (for details of dose, see under individual vaccines)
Neonates at risk only	<ul style="list-style-type: none"> ▶ Bacillus Calmette-Guérin vaccine p. 1377 (at birth, see Bacillus Calmette-Guérin vaccine p. 1354). ▶ Hepatitis B vaccine p. 1386 (at birth, 4 weeks, and 1 year, see Hepatitis B vaccine p. 1360).
8 weeks	<ul style="list-style-type: none"> ▶ Diphtheria with tetanus, pertussis, hepatitis B, poliomyelitis and haemophilus influenzae type b vaccine p. 1377 (<i>Infanrix hexa</i>[®]). First dose. ▶ Meningococcal group B vaccine (rDNA, component, adsorbed) p. 1379 (<i>Bexsero</i>[®]). First dose. ▶ Changes have been made to the immunisation schedule for children born on or after 1st January 2020, see 12 weeks. For children born on or before 31st December 2019, give pneumococcal polysaccharide conjugate vaccine (adsorbed) p. 1381 (<i>Prevenar 13</i>[®]). First dose. ▶ Rotavirus vaccine p. 1392 (<i>Rotarix</i>[®]). First dose.
12 weeks	<ul style="list-style-type: none"> ▶ Diphtheria with tetanus, pertussis, hepatitis B, poliomyelitis and haemophilus influenzae type b vaccine (<i>Infanrix hexa</i>[®]). Second dose. ▶ For children born on or after 1st January 2020, give pneumococcal polysaccharide conjugate vaccine (adsorbed) (<i>Prevenar 13</i>[®]). Single dose. ▶ Rotavirus vaccine (<i>Rotarix</i>[®]). Second dose.
16 weeks	<ul style="list-style-type: none"> ▶ Diphtheria with tetanus, pertussis, hepatitis B, poliomyelitis and haemophilus influenzae type b vaccine (<i>Infanrix hexa</i>[®]). Third dose. ▶ Meningococcal group B vaccine (rDNA, component, adsorbed) (<i>Bexsero</i>[®]). Second dose. ▶ For children born on or before 31st December 2019, give pneumococcal polysaccharide conjugate vaccine (adsorbed) (<i>Prevenar 13</i>[®]). Second dose.
1 year (on or after first birthday)	<ul style="list-style-type: none"> ▶ Measles, mumps and rubella vaccine, live p. 1390 (<i>MMR VaxPRO</i>[®] or <i>Priorix</i>[®]). First dose. ▶ Meningococcal group B vaccine (rDNA, component, adsorbed) (<i>Bexsero</i>[®]). Single booster dose. ▶ Pneumococcal polysaccharide conjugate vaccine (adsorbed) (<i>Prevenar 13</i>[®]). Single booster dose regardless of birth date. ▶ Haemophilus influenzae type b with meningococcal group C vaccine p. 1379 (<i>Menitorix</i>[®]). Single booster dose.

continued →

When to immunise	Vaccine given and dose schedule (for details of dose, see under individual vaccines)
2–11 years on 31st August 2020 (including children in reception class and school years 1, 2, 3, 4, 5, 6, and 7).	► Influenza vaccine p. 1389. Each year from September. Note: live attenuated influenza nasal spray is recommended (<i>Fluenz Tetra</i> [®]); if contra-indicated or unsuitable, see Influenza vaccine p. 1362.
3 years and 4 months, or soon after	► Diphtheria with tetanus, pertussis and poliomyelitis vaccine p. 1376 (<i>Boostrix-IPV</i> [®] or <i>Repevax</i> [®]). Single booster dose. ► Measles, mumps and rubella vaccine, live (<i>MMR VaxPRO</i> [®] or <i>Priorix</i> [®]). Second dose.
11–14 years. First dose of HPV vaccine will be offered to individuals aged 12–13 years in England, Wales, and Northern Ireland, and those aged 11–13 years in Scotland. For individuals aged 15 years and over, see Human papillomavirus vaccine p. 1362.	► Human papillomavirus vaccines p. 1388 (<i>Gardasil</i> [®]). 2 dose schedule; second dose 6–24 months after first dose. Only <i>Gardasil</i> [®] is offered as part of the national immunisation programme. For individuals who started the schedule with <i>Cervarix</i> [®] , but did not complete the vaccination course, the course can be completed with <i>Gardasil</i> [®] . Ideally one vaccine should be used for the entire course.
13–15 years	► Meningococcal groups A with C and W135 and Y vaccine p. 1380 (<i>Nimenrix</i> [®] or <i>Menveo</i> [®]). Single booster dose.
13–18 years	► Diphtheria with tetanus and poliomyelitis vaccine p. 1376 (<i>Revaxis</i> [®]). Single booster dose. Note: Can be given at the same time as the dose of meningococcal groups A with C and W135 and Y vaccine at 13–15 years of age.
Females of child-bearing age susceptible to rubella	► Measles, mumps and rubella vaccine, live. Females of child-bearing age who have not received 2 doses of a rubella-containing vaccine or who do not have a positive antibody test for rubella should be offered rubella immunisation (using the MMR vaccine)—exclude pregnancy before immunisation, and avoid pregnancy for one month after vaccination.
Pregnant females	► Acellular pertussis-containing vaccine administered as diphtheria with tetanus, pertussis and poliomyelitis vaccine (<i>Boostrix-IPV</i> [®] or <i>Repevax</i> [®]). 1 dose from the 16th week of pregnancy, preferably after the fetal anomaly scan (weeks 18–20). ► Influenza vaccine (inactivated). Single dose administered from September, regardless of the stage of pregnancy (see Influenza vaccine p. 1362).

Routine immunisations during adult life

When to immunise	Vaccine given and dose schedule (for details of dose, see under individual vaccines)
Under 25 years, those entering university who are at risk of meningococcal disease	► Meningococcal groups A with C and W135 and Y vaccine (<i>Nimenrix</i> [®] or <i>Menveo</i> [®]). Single dose. Note: Should be offered to those aged under 25 years entering university who have not received the meningococcal groups A with C and W135 and Y vaccine over the age of 10 years.
During adult life, if not previously immunised or 5 dose course is incomplete	► Diphtheria with tetanus and poliomyelitis vaccine.
65 years	► Pneumococcal polysaccharide vaccine p. 1382.
From 50 years	► Influenza vaccine (inactivated). Each year from September (see Influenza vaccine p. 1362).
70 years	► Varicella-zoster vaccine p. 1393. Single dose.

Anthrax vaccine

04-May-2021

Overview

Anthrax vaccine p. 1377 is made from antigens from inactivated *Bacillus anthracis* adsorbed onto an adjuvant. Anthrax immunisation is indicated for individuals who handle infected animals or process infected animal products where there is a potential risk of occupational exposure to *B. anthracis*. It is also recommended for occupations where workers are at risk of one-off high level exposures to anthrax (e.g. following a deliberate or accidental release of spores).

A 4-dose regimen is used for primary immunisation; a single booster dose should be given at 10-year intervals on up to 3 occasions to workers at potential continuous low level risk of exposure to anthrax. In those with potential intermittent high level exposure, a single booster dose should be offered just before entering situations with a specific high exposure risk. If such opportunities do not arise, a single booster dose should be given at 10-year intervals on up to 3 occasions to sustain protection.

In the event of proven or high probability of exposure to anthrax spores, a single booster dose should be given, in addition to antibacterial prophylaxis, except when a dose has been given in the preceding 12 months.

Advice on the treatment of previously unvaccinated individuals with a proven or high probability of exposure to anthrax spores can be found at: www.gov.uk/government/publications/chemical-biological-radiological-and-nuclear-incidents-recognise-and-respond.

Anthrax is a notifiable disease in the UK. For further information, see *Notifiable diseases* in Antibacterials, principles of therapy p. 531.

Useful Resources

Recommendations reflect Chapter 13, Anthrax, in *Immunisation against infectious disease*—‘The ‘Green Book’’. Public Health England. February 2017. www.gov.uk/government/publications/anthrax-the-green-book-chapter-13

Bacillus Calmette-Guérin vaccine

24-Oct-2019

Overview

The Bacillus Calmette-Guérin vaccine p. 1377 (BCG vaccine) contains a live attenuated strain derived from *Mycobacterium*

bovis which is indicated for the prevention of Tuberculosis p. 621.

BCG vaccine is recommended for the following individuals if immunisation has not previously been carried out and they are tuberculin-negative:

- all neonates and infants (aged 0–12 months) living in areas of the UK where the annual incidence of tuberculosis is 40 cases per 100 000 or greater;
- all neonates and infants (aged 0–12 months) with a parent or grandparent born in a country where the annual incidence of tuberculosis is 40 cases per 100 000 or greater;
- previously unvaccinated children (aged 1–5 years) with a parent or grandparent born in a country where the annual incidence of tuberculosis is 40 cases per 100 000 or greater (tuberculin testing is not usually required);
- previously unvaccinated children (aged 6–15 years) with a parent or grandparent born in a country where the annual incidence of tuberculosis is 40 cases per 100 000 or greater;
- previously unvaccinated children (aged under 16 years) with close contact to cases of sputum smear-positive pulmonary or laryngeal tuberculosis;
- previously unvaccinated children (aged under 16 years) who were born in, or lived for at least 3 months in a country where the annual incidence of tuberculosis is 40 cases per 100 000 or greater;
- previously unvaccinated individuals at occupational risk (irrespective of age). This includes healthcare workers or laboratory staff who have direct contact with patients with tuberculosis or potentially infectious clinical materials, and veterinary and abattoir staff handling animals or animal materials that could be infected with tuberculosis. BCG vaccination can also be considered for staff working with prisoners, homeless people, people with drug and alcohol misuse, and those who work with refugees and asylum seekers.

Although protection provided by BCG vaccine may decrease with time, there is no evidence that repeat vaccination offers significant additional protection and therefore repeat BCG vaccination is not recommended.

The *Bacillus Calmette-Guérin* vaccine is contra-indicated in all HIV-infected individuals. For advice on BCG vaccination in immunosuppressed individuals, consult Chapter 32: Tuberculosis - 'The Green Book', Public Health England (see *Useful resources*).

For advice on drug treatment, see Tuberculosis p. 621; for the treatment of infection following vaccination, see expert advice.

Travel

The risk of a traveller acquiring tuberculosis infection depends on several factors including the incidence of tuberculosis in that country, the duration of travel, the degree of contact with the local population, the work setting of the traveller (if any), the reason for travel, and the susceptibility and age of the traveller.

BCG vaccine is recommended for previously unvaccinated, tuberculin-negative individuals aged under 16 years, or for healthcare workers at high risk of exposure to patients with tuberculosis, who intend to travel for 3 months or more in a country where the annual incidence of tuberculosis is 40 cases per 100 000 or greater, or where the risk of multi-drug resistant tuberculosis is high. The risk of tourists acquiring tuberculosis infection is low and BCG vaccine is not required if no other factors are present.

A list of countries where the annual incidence of tuberculosis is 40 cases per 100 000 or greater, is available at www.gov.uk/government/publications/tuberculosis-tb-by-country-rates-per-100000-people.

Tuberculin skin testing

The tuberculin skin test (*Mantoux test*) is used to assess an individual's sensitivity to tuberculin protein when BCG vaccination is being considered or as an aid to diagnosis of

tuberculosis. A tuberculin skin test involves administration of tuberculin purified protein derivative p. 1350 by intradermal injection. It is necessary before BCG vaccination for:

- individuals aged 6 years and over;
- children aged under 6 years living in a country for more than 3 months with an annual tuberculosis incidence of 40 cases per 100 000 or greater;
- those who have had close contact with a person with known tuberculosis;
- those who have a family history of tuberculosis within the last 5 years.

BCG vaccination can be given up to three months following a negative tuberculin test.

The BCG vaccine should not be administered to an individual with a positive tuberculin test—it is unnecessary and may cause a more severe local reaction. Those with a *Mantoux test* induration of 5 mm and greater should be referred to a tuberculosis clinic for assessment of the need for further investigation and treatment.

All suspected cases of tuberculosis must be notified to the local health protection unit. Where there is a community level outbreak, specialist advice should be sought from Public Health England (tel. 020 8200 4400) or, in Scotland, Health Protection Scotland (tel. 0140 300 1191).

Useful Resources

Recommendations reflect Chapter 32, Tuberculosis, in *Immunisation against infectious disease*—'The Green Book'. Public Health England, August 2018.

www.gov.uk/government/publications/tuberculosis-the-green-book-chapter-32

Cholera vaccine

07-Nov-2018

Overview

Oral cholera vaccine p. 1378 contains inactivated Inaba (including El-Tor biotype) and Ogawa strains of *Vibrio cholerae*, serotype O1 together with recombinant B-subunit of the cholera toxin produced in Inaba strains of *V. cholerae*, serotype O1.

Oral cholera vaccine is licensed for adults and children from 2 years of age who are travelling to endemic or epidemic areas on the basis of current recommendations. Immunisation should be completed at least one week before potential exposure. However, there is no requirement for cholera vaccination for international travel. After a full risk assessment, immunisation can be considered for the following individuals:

- relief or disaster aid workers;
- persons with remote itineraries in areas where cholera epidemics are occurring and there is limited access to medical care;
- travellers to potential cholera risk areas, for whom vaccination is considered potentially beneficial;
- individuals at occupational risk, such as laboratory workers who may be regularly exposed to cholera.

For dosing schedule, see cholera vaccine.

Immunisation with cholera vaccine does not provide complete protection and all travellers to a country where cholera exists should be warned that scrupulous attention to food, water, and personal hygiene is essential.

All suspected cases of cholera must be notified to the local health protection unit. Where there is a community level outbreak, specialist advice should be sought from Public Health England (tel. 020 8200 4400) or, in Scotland, Health Protection Scotland (tel. 0140 300 1191).

Contacts

Contacts of patients with cholera should maintain high standards of personal hygiene to avoid becoming infected. Cholera vaccine should not be used in the management of contacts of cases or in controlling the spread of infection.

Useful Resources

Recommendations reflect Chapter 14, Cholera, in *Immunisation against infectious disease*—‘The Green Book’. Public Health England, December 2013.
www.gov.uk/government/publications/cholera-the-green-book-chapter-14

COVID-19 vaccine

17-Feb-2021

Overview

Currently, there are 3 COVID-19 vaccines authorised for use in the UK—the Pfizer/BioNTech (BNT162b2), Oxford/AstraZeneca (ChAdOx1-S [recombinant]), and Moderna vaccines. Only the Pfizer/BioNTech and Oxford/AstraZeneca vaccines are being offered through the COVID-19 national vaccination programme. The Pfizer/BioNTech vaccine is authorised for use in individuals aged 16 years and over, and the Oxford/AstraZeneca and Moderna vaccines are authorised for individuals aged 18 years and over. These vaccines target the SARS-CoV-2 spike (S) protein found on the virus surface to create neutralising antibodies. Both the Pfizer/BioNTech and Moderna vaccines, made *in vitro*, contain messenger RNA (mRNA) for the S protein formulated in lipid nanoparticles. The Oxford/AstraZeneca vaccine contains a live non-replicating chimpanzee adenovirus vector grown in a human cell-line. None of these vaccines can cause infection with COVID-19.

The COVID-19 vaccination programme aims to provide protection for individuals who are considered at highest risk of severe illness or death from COVID-19 infection, as well as protecting the frontline workforce from exposure. The Joint Committee on Vaccination and Immunisation (JCVI) have provided advice on priority groups for COVID-19 vaccination in Phase 1 and 2 of the programme according to COVID-19 mortality data. The risk of poorer outcomes from infection increases with age in both healthy adults and in adults with underlying health conditions. Older adults, particularly those aged over 65 years, are at highest risk, and residents in care homes for older adults have been disproportionately affected by the COVID-19 pandemic.

Based on JCVI advice, the following groups are eligible for immunisation in Phase 1 of the programme and are ranked in order of priority:

- residents of, and staff working in care homes for older adults;
- individuals aged 80 years and over, and frontline health and social care staff (see *Frontline health and social care staff* below);
- individuals aged 75 years and over;
- individuals aged 70 years and over, and clinically extremely vulnerable individuals (see *Individuals aged 16 years and over in at-risk groups* below);
- individuals aged 65 years and over;
- individuals aged 16–65 years in at-risk groups (see *Individuals aged 16 years and over in at-risk groups* below);
- individuals aged 60 years and over;
- individuals aged 55 years and over;
- individuals aged 50 years and over.

To further reduce mortality, morbidity and hospitalisations from COVID-19, the JCVI have provided advice on extending the national programme to the remainder of the adult population aged under 50 years. Based on interim JCVI

advice, the following groups are eligible for immunisation in Phase 2 of the programme and are ranked in order of priority:

- individuals aged 40 years and over;
- individuals aged 30 years and over;
- individuals aged 18 years and over.

For further information on priority groups for vaccination, see the JCVI’s **Advice on priority groups for COVID-19 vaccination** for phase 1 (available at: tinyurl.com/y3cocwvz) and **Interim statement on phase 2 of the COVID-19 vaccination programme** for phase 2 (available at: tinyurl.com/s5dnb5sb).

The Department of Health and Social Care have identified individuals working in roles such as manufacturing, fill and finish and batch testing, as crucial to the continuity of the COVID-19 vaccine supply chain. Eligible individuals (as identified by their employer) will be offered vaccination in order to reduce the risk of any immediate supply chain disruption should an outbreak occur.

Eligible individuals should receive 2 doses of COVID-19 vaccine p. 1383 at least 3 or 4 weeks apart depending on the vaccine used. However, during the roll out phase, the JCVI have recommended a routinely scheduled 4–12 week dosing interval to allow more individuals to benefit from the protection provided by the first dose. The same COVID-19 vaccine should ideally be used for the entire course as there is limited evidence on interchangeability, and research is still ongoing. If the course is delayed, it should be resumed, but the first dose should not be repeated. There is no available evidence to recommend booster doses of COVID-19 vaccines. Individuals presenting for vaccination who are part of a COVID-19 vaccine trial should be referred back to their investigators.

Co-administration of COVID-19 vaccines with other vaccines is not routinely recommended. To prevent incorrect attribution of adverse effects, administration of other vaccines should be separated by an interval of at least 7 days. However, if this will lead to a further delay in protection or risk of the patient not returning for a later appointment, vaccination should still proceed.

All vaccinated individuals should be advised to continue following the recommended social distancing precautions following immunisation, as it is not yet known if the COVID-19 vaccines prevent transmission from person to person.

COVID-19 vaccines are an area of ongoing research and recommendations may change as more data and other vaccines become available. For further information on the COVID-19 vaccination programme, see the Public Health England collection (available at: www.gov.uk/government/collections/covid-19-vaccination-programme).

Frontline health and social care staff

Occupational immunisation is recommended to protect staff at high risk of exposure to COVID-19 who work closely with vulnerable individuals. The following groups are considered at high risk of exposure:

- clinical and non-clinical staff in healthcare settings;
- laboratory and pathology staff who frequently collect or handle potentially infected specimens;
- frontline funeral operatives and those working in mortuaries;
- social workers who work in long-stay care facilities, or are directly involved with vulnerable individuals;
- individuals aged 16–18 years who are employed, training or studying in health or social care, alongside their colleagues listed above.

Individuals aged 16 years and over in at-risk groups

Individuals in at-risk groups include those considered to be at moderate risk (clinically vulnerable) and high risk (clinically extremely vulnerable—those individuals on the *Shielded Patient List*) of severe illness or fatality from COVID-19, and should be prioritised for immunisation in accordance

with the JCVI recommendations (see *Overview* above). At-risk groups include the following:

- individuals with:
 - ▶ chronic respiratory disease;
 - ▶ chronic heart and vascular disease;
 - ▶ chronic kidney disease;
 - ▶ chronic liver disease;
 - ▶ chronic neurological disease;
 - ▶ diabetes mellitus (any type);
 - ▶ immunosuppression;
 - ▶ asplenia or splenic dysfunction;
 - ▶ morbid obesity;
 - ▶ severe mental illness;
- adult carers;
- individuals in long-stay nursing and residential care settings.

Within the at-risk groups, individuals are further defined as being *clinically extremely vulnerable* if they fall into the following categories:

- solid organ transplant recipients;
- those with specific cancers;
- those with severe respiratory conditions;
- those with rare diseases that significantly increase the risk of infections;
- those on immunosuppression therapies sufficient to increase infection risk;
- those with splenic dysfunction or who have had a splenectomy;
- adults with Down's syndrome;
- adults on dialysis or with chronic (stage 5) kidney disease;
- pregnant females with significant heart disease (congenital or acquired).

Individuals may also be identified as being clinically extremely vulnerable through the COVID-19 Population Risk Assessment, which uses a risk prediction model (QCovid[®]) to identify those who may be potentially at high risk of serious illness from COVID-19 infection. For further information on clinically extremely vulnerable groups and the COVID-19 Population Risk Assessment, see tinyurl.com/y6lxvzud.

These lists are not exhaustive. Based on clinical judgement, a clinician may add to the *Shielded Patient List* any patient identified as being at very high risk of serious illness from COVID-19 infection.

Children aged under 16 years

Immunisation against COVID-19 is not routinely recommended in children aged under 16 years, as the risk of severe disease or death from COVID-19 infection is very low. Immunisation may be considered for children with serious neurological disabilities (including cerebral palsy, severe autism and Down's syndrome) who regularly spend time in specialised residential care settings [unlicensed]. There is currently no basis to recommend immunisation of children with other underlying health conditions; this will be reviewed when additional data on the use of vaccines in adults are available.

Pregnancy

Immunisation against COVID-19 is not routinely recommended during pregnancy, however a COVID-19 vaccine p. 1383 should be offered as soon as possible after pregnancy is completed. For pregnant women who are at high risk of exposure to COVID-19 that cannot be avoided, or who have an underlying condition which means they are at very high risk of serious complications, vaccination can be considered.

All exposure to COVID-19 vaccine from 1 month before conception to any time during pregnancy, should be reported to the Immunisation Department of Public Health England (PHE) who run UK-wide surveillance on the safety of vaccines given in pregnancy. For advice on the reporting,

risk assessment, and management of inadvertent vaccination in pregnancy, see PHE guidance: Vaccination in pregnancy (VIP) (available at: www.gov.uk/guidance/vaccination-in-pregnancy-vip). For further information on COVID-19 vaccination and disease in pregnancy, see www.gov.uk/government/publications/safety-of-covid-19-vaccines-when-given-in-pregnancy-the-safety-of-covid-19-vaccines-when-given-in-pregnancy.

Individuals with immunosuppression and HIV

Individuals with immunosuppression and HIV infection (regardless of CD4 count) are considered at-risk and should be vaccinated against COVID-19 in accordance with JCVI recommendations (see *Overview* above). There is limited evidence on response to immunisation in individuals with immunosuppression, therefore specialists may advise their patients on optimal timing of vaccine delivery based on the patient's immune status, likely response to vaccination, risk of COVID-19 and of exposure. Post-vaccination testing may be appropriate, and all vaccinated individuals with immunosuppression are advised to continue to reduce their risk of exposure until further information is available.

Refer to the British HIV Association for further information on the use of COVID-19 vaccine in HIV-positive individuals. See www.bhiva.org/SARS-CoV-2-vaccine-advice-for-adults-living-with-HIV-update for further information.

Post-exposure management

COVID-19 is a notifiable disease in the UK. For further information, see *Notifiable diseases* in Antibacterials, principles of therapy p. 531.

There is limited evidence on the use of COVID-19 vaccines as post-exposure prophylaxis or to prevent transmission during outbreaks. For vulnerable individuals who require direct protection during prolonged community outbreaks, advice on post-exposure management can be sought from local health protection teams.

For the management of COVID-19 infection and links to other resources, see COVID-19 p. 665.

Useful Resources

Recommendations reflect Chapter 14a, COVID-19 - SARS-CoV-2, in *Immunisation against infectious disease* - 'The Green Book'. Public Health England. February 2021. www.gov.uk/government/publications/covid-19-the-green-book-chapter-14a

Diphtheria vaccine

Overview

Diphtheria-containing vaccines are prepared from the toxin of *Corynebacterium diphtheriae* and adsorption on aluminium hydroxide or aluminium phosphate improves antigenicity. The vaccine stimulates the production of the protective antibody. The quantity of diphtheria toxoid in a preparation determines whether the vaccine is defined as 'high dose' or 'low dose'. Vaccines containing the higher dose of diphtheria toxoid are used for primary immunisation of children under 10 years of age. Vaccines containing the lower dose of diphtheria toxoid are used for primary immunisation in adults and children over 10 years. Single-antigen diphtheria vaccine is not available and adsorbed diphtheria vaccine is given as a combination product containing other vaccines.

For primary immunisation of children aged between 2 months and 10 years, vaccination is recommended usually in the form of 3 doses (separated by 1-month intervals) of diphtheria with tetanus, pertussis, hepatitis B, poliomyelitis and haemophilus influenzae type b vaccine p. 1377 (*Infanrix hexa*[®]) (see Immunisation schedule). In unimmunised individuals aged over 10 years the primary course comprises

of 3 doses of **adsorbed diphtheria** [low dose], **tetanus and poliomyelitis (inactivated) vaccine**.

A booster dose should be given 3 years after the primary course (this interval can be reduced to a minimum of 1 year if the primary course was delayed). Children *under 10 years* should receive **either adsorbed diphtheria, tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine or adsorbed diphtheria** [low dose], **tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine**. Individuals aged *over 10 years* should receive **adsorbed diphtheria** [low dose], **tetanus, and poliomyelitis (inactivated) vaccine**.

A second booster dose, of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine, should be given 10 years after the previous booster dose (this interval can be reduced to a minimum of 5 years if previous doses were delayed).

Diphtheria-containing vaccines for children over 10 years and adults

A **low dose** of diphtheria toxoid is sufficient to recall immunity in individuals previously immunised against diphtheria but whose immunity may have diminished with time; it is insufficient to cause serious reactions in an individual who is already immune. Preparations containing low dose diphtheria should be used for adults and children *over 10 years*, for both primary immunisation and booster doses.

Travel

Those intending to travel to areas with a risk of diphtheria infection should be fully immunised according to the UK schedule. If more than 10 years have lapsed since completion of the UK schedule, a dose of **adsorbed diphtheria** [low dose], **tetanus and poliomyelitis (inactivated) vaccine** should be administered.

Contacts

Staff in contact with diphtheria patients or with potentially pathogenic clinical specimens or working directly with *C. diphtheriae* or *C. ulcerans* should receive a booster dose if fully immunised (with 5 doses of diphtheria-containing vaccine given at appropriate intervals); further doses should be given at 10-year intervals if risk persists. Individuals at risk who are not fully immunised should complete the primary course; a booster dose should be given after 5 years and then at 10-year intervals. **Adsorbed diphtheria** [low dose], **tetanus and poliomyelitis (inactivated) vaccine** is used for this purpose; immunity should be checked by antibody testing at least 3 months after completion of immunisation.

Advice on the management of cases, carriers, contacts and outbreaks must be sought from health protection units. The immunisation history of infected individuals and their contacts should be determined; those who have been incompletely immunised should complete their immunisation and fully immunised individuals should receive a reinforcing dose. See advice on antibacterial treatment to prevent a secondary case of diphtheria in a non-immune individual.

Useful Resources

Advice reflects that in the handbook *Immunisation against Infectious Disease* (2013), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI). The advice also incorporates changes announced by the Chief Medical Officer and Health Department Updates. Chapters from the handbook (including updates since 2013) are available at:

www.gov.uk/government/collections/immunisation-against-infectious-disease-the-green-book

Haemophilus influenzae type b conjugate vaccine

25-Nov-2020

Overview

Haemophilus influenzae type b (Hib) containing vaccines are inactivated, and are made from capsular polysaccharide extracted from cultures of Hib bacteria. The polysaccharide is conjugated with a protein (such as tetanus toxoid) to increase immunogenicity, especially in young children. The Hib conjugate vaccine is only available as a combination preparation containing other vaccines.

Hib vaccination is given as a component of the routine childhood immunisation programme to provide protection against invasive Hib disease for children aged under 10 years (see Immunisation schedule p. 1353). If the child's routine immunisation is delayed, children aged under 10 years should be immunised at the earliest opportunity. Hib vaccination may also be given to individuals aged 10 years and over who are considered to be at increased risk of invasive Hib disease.

A primary course consists of 3 doses of the diphtheria with tetanus, pertussis, hepatitis B, poliomyelitis and haemophilus influenzae type b vaccine p. 1377, given at 4 weekly intervals.

Children aged under 1 year should be given a primary course, followed by a booster dose of the haemophilus influenzae type b with meningococcal group C vaccine p. 1379 at 1 year of age (usually on or after the child's first birthday). This should be given at least 4 weeks after the last dose of Hib-containing vaccine, and where there has been a delay, can be given up until 10 years of age. Early immunisation with a primary course may be considered for children from 6 weeks of age if required in certain circumstances, such as for travel reasons (immunisation may be given at an interval of 3 weeks for 1 dose only, with the other 2 doses completed at an interval of at least 4 weeks).

If the primary course was commenced with the pentavalent diphtheria with tetanus, pertussis, poliomyelitis and haemophilus influenzae type b vaccine p. 1377, it can be completed with the diphtheria with tetanus, pertussis, hepatitis B, poliomyelitis and haemophilus influenzae type b vaccine. If interrupted, the primary course should be resumed but not repeated, allowing a 4 week interval between doses.

Children aged 1 year to under 10 years who have not been immunised against Hib need to only receive 1 dose of the haemophilus influenzae type b with meningococcal group C vaccine. However, children who have not completed a primary course of diphtheria, tetanus, pertussis and polio, should be given 3 doses of the diphtheria with tetanus, pertussis, hepatitis B, poliomyelitis and haemophilus influenzae type b vaccine at 4 weekly intervals, in order to be fully protected against diphtheria, tetanus, pertussis and polio.

For further information on vaccination of children with uncertain or incomplete immunisation status, see Chapter 11, *The UK immunisation schedule, in Immunisation against infectious disease - 'The Green Book'*.

For information on immunisation of individuals with neurological conditions, see Chapter 16, *Haemophilus influenzae type b (Hib), in Immunisation against infectious disease - 'The Green Book'*.

Children with immunosuppression and HIV infection (regardless of CD4 count) should be given Hib-containing vaccines according to the routine immunisation schedule (see Immunisation schedule p. 1353). Consider re-immunisation after treatment completion—specialist advice may be required. Refer to the British HIV Association and Children's HIV Association for further information on the use of Hib-containing vaccines in individuals with HIV

infection. See www.bhiva.org/guidelines and www.chiva.org.uk/ for further information.

Post-exposure management of invasive *Haemophilus influenzae* type b disease

Acute meningitis caused by Hib is a notifiable disease in England, Northern Ireland and Wales. For further information, see *Notifiable diseases* in *Antibacterials, principles of therapy* p. 531.

To reduce the risk of secondary invasive Hib disease in the index case and their close contacts (such as contacts in a household, or a pre-school or primary school setting), antibacterial prophylaxis and vaccination may be required. Individual risk is determined by factors such as age, health status, and immunisation history. For information on antibacterial prophylaxis, see *Haemophilus influenzae type b infection: prevention of secondary disease* in *Antibacterials, use for prophylaxis* p. 533.

Children aged under 10 years who are unimmunised or partially immunised against Hib disease and are either the index case, a household contact of the index case, or a contact of the index case in a pre-school or primary school setting, should complete their primary immunisation. Vaccination of the index case should occur after recovery from invasive Hib infection. For further information on primary immunisation, see *Overview*. Children aged under 10 years who have completed their age-specific primary immunisation, and individuals of any age with asplenia or splenic dysfunction, may need an additional dose of a Hib-containing vaccine. For further information on vaccination following a case of invasive Hib disease, see *Public Health England guidance: Haemophilus influenzae type b* (see *Useful resources*).

Hepatitis A vaccine

22-Sep-2020

Overview

The hepatitis A vaccine p. 1384 is prepared from different strains of the virus grown in human diploid cells. The inactivated vaccine is available as a monovalent vaccine (different monovalent vaccines can be used interchangeably), or in combination with hepatitis B or typhoid—vaccine choice is dependent on which infection(s) the individual requires protection from. Immunisation with normal immunoglobulin p. 1346 can be used to provide immediate protection against hepatitis A.

Pre-exposure prophylaxis

Immunisation against hepatitis A is recommended for individuals at high risk of hepatitis A exposure, those with certain underlying medical conditions, and those at risk of complications, as listed:

- laboratory staff who may be exposed to the virus;
- staff and residents of homes for those with severe learning difficulties, or where personal hygiene among patients may be poor;

- workers at risk of repeated exposure to untreated sewage;
- individuals who work with primates;
- patients with haemophilia being treated with plasma-derived clotting factors;
- patients with severe liver disease regardless of the cause (consider for those with chronic hepatitis B or C infection and for patients with milder liver disease);
- individuals travelling to or going to reside in areas of intermediate or high prevalence, see *Travel* below;
- individuals who are at risk due to their sexual behaviour (such as men who have sex with men);
- parenteral drug misusers.

Immunisation may be considered under certain circumstances for:

- food packagers and handlers where a case or outbreak occurs—advice should be sought from the local Health Protection Team;
- staff in day-care facilities where there is a community outbreak—advice should be sought from the local Health Protection Team;
- healthcare workers.

Immunisation against hepatitis A infection requires a primary pre-exposure course. The immunisation regimens for monovalent hepatitis A vaccine and hepatitis A with typhoid vaccine p. 1385 consist of a single dose. For immunisation using the combined hepatitis A and B vaccine, the dosing regimen depends on the product used, see hepatitis A and B vaccine p. 1383 for dosing schedules (including accelerated course information).

Individuals with immunosuppression and HIV infection can be given hepatitis A-containing vaccines. Consider re-immunisation—specialist advice may be required. Refer to the British HIV Association or Children’s HIV Association for further information on the use of hepatitis A vaccine in HIV-positive individuals. See www.bhiva.org or www.chiva.org.uk/ for further information.

Boosters

A booster dose is usually given 6–12 months after the initial dose of hepatitis A-containing vaccine, and ensures immunity beyond 10 years; however, successful boosting can occur even if the second dose is delayed by several years. A further booster dose 25 years after full primary immunisation is only considered necessary if the risk of hepatitis A infection is still present.

Travel

Pre-exposure immunisation is recommended for individuals travelling to or going to reside in areas of high or intermediate prevalence. Immunisation should ideally be given 2 weeks prior to departure, but can be given up to the day of departure; the use of normal immunoglobulin for travel prophylaxis is no longer recommended. Care should also be taken to avoid hepatitis A exposure through food and water. Further information on country-specific hepatitis A risk is available from the National Travel Health Network and Centre (travelhealthpro.org.uk/) and Health Protection Scotland (www.travax.nhs.uk).

Post-exposure prophylaxis

Hepatitis A (acute infectious hepatitis) is a notifiable disease in the UK. For further information, see *Notifiable diseases* in *Antibacterials, principles of therapy* p. 531.

A risk assessment should be carried out for the index case (particularly if infection occurs in a non-household setting), and the national standard questionnaire also completed for all probable and confirmed cases. Verbal and written guidance on the importance of good hygiene practices (such as hand washing after using the toilet, changing nappies, and before preparing food) should be given to the index case, their family and other close contacts. If sexual transmission is the likely route (particularly between men who have sex with men), advice on prevention of hepatitis A spread during

sex should also be given. For further information on the management of index cases and link to the national standard questionnaire, see Public Health England (PHE) guidance: **Public Health control and management of hepatitis A** (see *Useful resources*).

Close contacts of the index case(s) should have a risk assessment as soon as possible within 14 days of exposure. Prophylactic treatment choice for close contacts depends on susceptibility (determined by age and health status) and time since exposure. There should be a low threshold for considering someone a close contact.

Close contacts should be considered immune if they have a documented history of either a completed primary course within the past 10 years, or a single dose of monovalent vaccine within the past year, or if they have previously had laboratory-confirmed hepatitis A.

Post-exposure prophylaxis is **not** required for healthy close contacts aged under 1 year not attending childcare; immunisation should be offered to all those who assist in the child's toileting to prevent tertiary infection. For close contacts aged 2–12 months attending childcare, a dose of monovalent hepatitis A vaccine (unlicensed use) should be given within 14 days of exposure. If the child contact cannot be immunised, appropriate advice should be given on enhanced hygiene in the childcare setting; if enhanced hygiene standards cannot be met, the child should be excluded from childcare for 30 days. If exclusion of the child is not possible, all carers and children aged 2 months and above in the childcare setting should be immunised. In these cases, any child that goes on to require long-term protection against hepatitis A after their first birthday, should be given the full course of 2 doses.

For healthy close contacts aged 1–59 years, a single dose of monovalent hepatitis A vaccine is recommended within 14 days of exposure. A risk assessment is required to determine any continued risk of hepatitis A infection. To ensure long term protection, a second dose should be given after 6–12 months.

For close contacts who have chronic liver disease (including chronic hepatitis B or C infection), HIV infection (with a CD4 count < 200 cells per microlitre), are immunosuppressed, or are aged 60 years or over, normal immunoglobulin in addition to monovalent hepatitis A vaccine is recommended within 14 days of exposure (up to 28 days in those with chronic liver disease). To provide long term protection, a second dose should be given after 6–12 months.

Refer to the British HIV Association or Children's HIV Association for further information on the use of hepatitis A vaccine p. 1384 in HIV-positive individuals. See www.bhiva.org or www.chiva.org.uk for further information.

In households with more than one close contact, all unvaccinated household contacts seen within 8 weeks of jaundice onset in the index case, should be given the monovalent hepatitis A vaccine to prevent tertiary spread within the household.

For further information on the management of susceptible close contacts and for information on outbreaks, see PHE guidance: **Public Health control and management of hepatitis A** (see *Useful resources*); and for further information on normal immunoglobulin, see Immunoglobulins p. 1342.

Useful Resources

Hepatitis B vaccine

28-Oct-2020

Overview

Hepatitis B vaccines contain inactivated hepatitis B surface antigen (HBsAg) prepared from yeast cells using recombinant DNA technology, which are adsorbed onto an adjuvant. The vaccine is available as a monovalent vaccine, a bivalent vaccine in combination with hepatitis A, and a hexavalent vaccine in combination with diphtheria, tetanus, acellular pertussis, inactivated poliomyelitis, and *Haemophilus influenzae* type b (Hib).

Pre-exposure prophylaxis

Hepatitis B vaccination is given as a component of the routine childhood immunisation programme to provide long-term protection against hepatitis B for children aged under 1 year. Children aged under 1 year should be given a primary course consisting of 3 doses of the diphtheria with tetanus, pertussis, hepatitis B, poliomyelitis and haemophilus influenzae type b vaccine p. 1377, given at 4 weekly intervals (see Immunisation schedule p. 1353). If interrupted, the primary course should be resumed but not repeated, allowing a 4 week interval between doses. Early immunisation with a primary course may be considered for children from 6 weeks of age if required in certain circumstances, such as for travel reasons (immunisation may be given at an interval of 3 weeks for 1 dose only, with the other 2 doses completed at an interval of at least 4 weeks).

If the child's routine immunisation is delayed, children aged under 10 years should be immunised at the earliest opportunity.

If the primary course was commenced with the pentavalent diphtheria with tetanus, pertussis, poliomyelitis and haemophilus influenzae type b vaccine p. 1377, it can be completed with the hexavalent diphtheria with tetanus, pertussis, hepatitis B, poliomyelitis and haemophilus influenzae type b vaccine.

Children aged 1 year to under 10 years who have completed a primary course with the pentavalent vaccine but have not received any hepatitis B-containing vaccines, do not require a hepatitis B-containing vaccine unless they are in a high risk group (see below) or are exposed to hepatitis B (see *Post-exposure management*).

Immunisation against hepatitis B is also recommended for individuals in high risk groups (those at high risk of exposure or those at risk of complications), as listed:

- parenteral drug misusers and their sexual partners, other household and close family contacts;
- non-parenteral drug misusers who are likely to 'progress' to parenteral drug misuse;
- individuals who change sexual partners frequently (such as commercial sex workers);
- men who have sex with men;
- individuals receiving regular blood transfusions or blood products (such as those with haemophilia), and carers responsible for the administration of such products;
- patients with chronic renal failure who are on haemodialysis or a renal transplantation programme, and those predicted to require these interventions—use vaccines specifically formulated for patients with renal insufficiency. Haemodialysis patients should be monitored for antibodies annually and re-immunised if necessary;
- patients with severe liver disease regardless of the cause, or those with milder liver disease who may share risk factors for acquiring hepatitis B infection (such as individuals with chronic hepatitis C);

- healthcare workers (including students and trainees) who may have direct contact with patients' blood, blood-stained body fluids or tissues;
- laboratory staff who handle material that may contain the virus;
- other occupational risk groups (such as morticians and embalmers);
- staff and residents of homes for those with learning difficulties (consideration may also be given for those in day care, schools and centres for those with severe learning disability);
- staff and inmates of custodial institutions;
- individuals travelling to or going to reside in areas of high or intermediate prevalence of hepatitis B, see *Travel* below;
- families adopting children from countries with a high or intermediate prevalence of hepatitis B;
- some foster carers and their families.

For immunisation of individuals in a high-risk group, the primary course dosing regimen depends on how rapidly protection is required, the likelihood of patient compliance, and the product used. For most individuals, an accelerated schedule should be given (particularly in individuals where compliance with immunisation is difficult). Alternative non-accelerated schedules are available, but should only be used when rapid protection is not required and there is a high likelihood of patient attendance for immunisation. In certain circumstances, a very rapid schedule may be given to individuals who are at immediate risk where a more rapid induction of protection is required. See hepatitis B vaccine p. 1386 and hepatitis A and B vaccine p. 1383 for information on dosing schedules.

During vaccination, advice should be provided on other preventative measures (such as condom use and needle exchange), and referral to specialist services arranged if appropriate.

Immunosuppressed individuals with HIV infection have higher rates of developing chronic infection; HIV-positive patients and those at risk of HIV infection should be offered vaccination. Refer to the British HIV Association and Children's HIV Association for further information on the use of hepatitis B-containing vaccines in individuals with HIV infection. See www.bhiva.org/guidelines and www.chiva.org.uk/ for further information.

Boosters

Following a primary course of immunisation, most individuals do not require a reinforcing dose of a hepatitis B-containing vaccine. For healthcare workers (including students and trainees) a single booster dose (once only) should be offered approximately 5 years after primary immunisation. For patients with renal failure and for individuals at the time of a subsequent significant exposure, a booster dose may be required. For further information, see Chapter 18: Hepatitis B, in *Immunisation against infectious disease* - 'The Green Book'.

Travel

Pre-exposure immunisation is recommended for individuals travelling to or going to reside in areas of high or intermediate prevalence of hepatitis B and who, through their behaviour/activities may put themselves at risk while abroad. These include sexual activity, parenteral drug use, undertaking relief aid work, and/or playing contact sports. Travellers are also at risk of acquiring infection as a result of medical or dental procedures carried out in countries where unsafe therapeutic injections (e.g. the re-use of contaminated needles and syringes without sterilisation) are a risk factor for hepatitis B. Individuals at high risk of requiring medical or dental procedures in such countries should therefore be immunised, including:

- those staying for lengthy periods;

- those with chronic medical conditions that may require hospitalisation;
- those travelling for medical or dental procedures.

Further information on country-specific hepatitis B risk is available from the National Travel Health Network and Centre (travelhealthpro.org.uk/) and Health Protection Scotland (www.travax.nhs.uk).

Post-exposure prophylaxis

Hepatitis B (acute infectious hepatitis) is a notifiable disease in the UK. For further information, see *Notifiable diseases in Antibacterials*, principles of therapy p. 531.

Post-exposure prophylaxis should be given immediately to neonates born to mothers infected with hepatitis B, see *Selective neonatal immunisation programme* below for further information. Immediate post-exposure prophylaxis should also be offered to any individual who has potentially been exposed to hepatitis B infected blood or bodily fluids, such as sexual partners/close contacts of an individual with acute hepatitis B or newly diagnosed chronic hepatitis B, or those exposed through a needle stick injury or bites from a known hepatitis B individual. Advice should be sought from the nearest public health laboratory, health protection team, or on-call virologist. The recommended vaccine course (including use of a booster dose) is dependent on the individual's vaccination history, source of exposure, and continued risk. For further information, see Chapter 18: Hepatitis B, in *Immunisation against infectious disease* - 'The Green Book'.

Hepatitis B immunoglobulin p. 1345 may also be given to individuals at the same time as the hepatitis B vaccine following accidental exposure to hepatitis B-infected blood or bodily fluids through percutaneous inoculation, contamination of mucous membranes or non-intact skin. It is also recommended for use with the vaccine in sexual partners/contacts of an individual with acute hepatitis B or newly diagnosed chronic hepatitis B, if seen within 1 week. Hepatitis B immunoglobulin is also recommended in some known non-responders to the hepatitis B vaccine. For further information, see Public Health England guidance:

Human hepatitis B immunoglobulin specific for hepatitis B post-exposure (see *Useful resources*).

Selective neonatal immunisation programme

Neonates born to mothers who have chronic hepatitis B infection or who had acute hepatitis B during pregnancy, should be vaccinated with a dose of the monovalent hepatitis B vaccine p. 1386 as soon as possible (ideally within 24 hours of birth), followed by a second dose at 4 weeks. Routine childhood immunisation with the hexavalent diphtheria with tetanus, pertussis, hepatitis B, poliomyelitis and haemophilus influenzae type b vaccine p. 1377 should then be given as scheduled (see Immunisation schedule p. 1353), followed by a further dose of the monovalent hepatitis B vaccine and blood test (to exclude infection) at 1 year of age. For further information on the selective immunisation programme, see Public Health England guidance:

Hexavalent combination vaccine: selective programme guidance (see *Useful resources*).

For neonates with a birth weight below 1.5 kg born to an infected mother, or neonates born to a highly infectious mother, hepatitis B immunoglobulin should be given at the same time as the first dose of monovalent hepatitis B vaccine (administered at different sites) in order to provide rapid protection until the vaccine becomes effective. For further information on the use of hepatitis B immunoglobulin, and which mothers are considered to be highly infectious, see Public Health England guidance: **Human hepatitis B immunoglobulin specific for hepatitis B post-exposure** (see *Useful resources*).

Human papillomavirus vaccine

24-Jul-2020

Overview

The human papillomavirus vaccines p. 1388 consist of virus-like particles prepared from the major protein of the viral coat or capsid and mimic the structure of the native virus, but do not contain any viral DNA. The vaccines are available as a bivalent vaccine (*Cervarix*[®], containing human papillomavirus (HPV) types 16 and 18), a quadrivalent vaccine (*Gardasil*[®], containing HPV types 6, 11, 16 and 18), and a nine-valent vaccine (*Gardasil 9*[®], containing HPV types 6, 11, 16, 18, 31, 33, 45, 52 and 58). All are adjuvanted and used for the prevention of cervical and anal cancers, and pre-cancerous genital (cervical, vulvar, and vaginal) and anal lesions associated with HPV types 16 and 18. *Gardasil*[®] and *Gardasil 9*[®] are also effective at preventing genital warts. The vaccines may also provide some cross-protection against infection caused by other high-risk HPV types.

Although there is emerging evidence on interchangeability of the HPV vaccines, the same vaccine product should be used for an entire course. Only *Gardasil*[®] is offered as part of the national HPV programme and is recommended for eligible individuals aged 11 to 25 years, and for men who have sex with men aged up to and including 45 years of age.

The Joint Committee on Vaccination and Immunisation have issued a statement on delivery of the routine HPV vaccination programme to eligible children during the COVID-19 pandemic, available at: tinyurl.com/yylafue.

As the vaccines do not protect against all strains of HPV, safe sex precautions should always be practiced; and for all females, routine cervical screening should continue at the scheduled age.

Children aged 9 to 14 years

The human papillomavirus vaccines are licensed for individuals from 9 years of age, however, vaccination in children aged 9 to 10 years is not offered as part of the national programme. A 2 dose schedule is recommended for children who receive the first dose before the age of 15 years. The first dose is usually given to children from 11 years, with the second dose given 6–24 months after the first dose. See Immunisation schedule p. 1353 for guidance on immunisation in different countries within the UK.

2 doses given less than 6 months apart should not be considered adequate to provide long term protection. A third dose should be given according to human papillomavirus vaccines dosing schedule.

Children and adults aged 15 to 25 years

Under the national programme in England, individuals remain eligible to receive the HPV vaccine up to the age of 25 years if they did not receive the vaccine when scheduled.

A 3 dose schedule is recommended, with the second and third dose given 1 month and 4–6 months after the first dose respectively. All 3 doses should be given within a 12-month period (see human papillomavirus vaccines).

In cases where the second dose is given late and there is a high likelihood that the individual will not return, or it is not practical for the third dose to be given after three months, then the third dose can be given at least one month after the second dose.

Where appropriate, immunisation with the HPV vaccine should be offered to individuals aged under 25 years coming into the UK, as they may not have been offered protection in their country of origin. If they are aged 25 years and over, and commenced, but did not complete their vaccination, it is reasonable to complete their vaccination in the UK.

Vaccination of men who have sex with men and other at risk individuals

Men aged 15 to 45 years, who have sex with other men and attend Specialist Sexual Health Services or HIV clinics are eligible for vaccination if they have not previously been vaccinated. Immunisation should still be offered to eligible men who have sex with men, regardless of CD4 cell count, antiretroviral therapy use, viral load, or if known to be immunocompromised at the time of immunisation. A 3 dose schedule of *Gardasil*[®] should be given, with administration of doses aligned with clinic appointments. All 3 doses should be given within a 24 month period, but if the course has not been completed before the age of 46, it can still be completed provided the first dose was given as part of the pilot or national programme.

There may be considerable benefit in offering the HPV vaccination to individuals who attend Sexual Health Services or HIV clinics, who are not eligible under the national programme and are deemed to have a similar risk profile to that seen in men who have sex with men. This includes some transgender individuals, sex workers, and men and women living with HIV infection. For these individuals a 3 dose schedule of *Gardasil*[®] is recommended.

Refer to the British HIV Association for further information on the use of human papillomavirus vaccines in individuals with HIV infection. See www.bhiva.org/guidelines for further information.

Booster doses

Protection from human papillomavirus vaccines is maintained for at least 10 years, although protection is expected to last longer. There is no recommendation for the need for booster doses.

Influenza vaccine

05-Jan-2021

Overview

While most viruses are antigenically stable, the influenza viruses A and B (especially A) are constantly altering their antigenic structure as indicated by changes in the haemagglutinins (H) and neuraminidases (N) on the surface of the viruses. It is essential that influenza vaccines in use contain the H and N components of the prevalent strain or

strains as recommended each year by the World Health Organization.

The influenza vaccines recommended for immunisation are the adjuvanted trivalent influenza vaccine (inactivated), high dose trivalent influenza vaccine (inactivated), cell-grown quadrivalent influenza vaccine (inactivated), egg-grown quadrivalent influenza vaccine (inactivated), recombinant quadrivalent influenza vaccine (inactivated) [unlicensed], and the live attenuated influenza vaccine. The choice of vaccine is dependent on the person's age and contra-indications.

The ideal time for immunisation is between September and early November.

Immunisation is recommended for *individuals at high risk* of serious complications from influenza, and to reduce transmission of infection. In the national flu immunisation programme 2020/2021, influenza vaccination is recommended for the following eligible groups:

- Individuals aged 6 months and over in a clinical risk group, such as those with:
 - ▶ chronic respiratory disease;
 - ▶ chronic heart disease;
 - ▶ chronic liver disease;
 - ▶ chronic renal disease at stage 3, 4, or 5;
 - ▶ chronic neurological disease;
 - ▶ diabetes mellitus;
 - ▶ splenic dysfunction or asplenia;
 - ▶ immunosuppression because of disease or treatment (including prolonged systemic corticosteroid treatment [for over 1 month at dose equivalents of prednisolone p. 721: *adult and child over 20 kg*, 20 mg or more daily; *child under 20 kg*, 1 mg/kg or more daily], and chemotherapy);
 - ▶ HIV infection (regardless of immune status);
 - ▶ morbid obesity (BMI of 40 kg/m² and above);
 - ▶ learning disability.
- All children aged 2–11 years on 31st August 2020 (including those in reception class and school years 1, 2, 3, 4, 5, 6, and 7).
- All pregnant females (including those who become pregnant during the flu season).
- All adults aged 50–64 years (including those who turn 50 by 31st March 2021).
- All adults aged 65 years and over (including those who turn 65 by 31st March 2021).
- Residents of long-stay residential homes or other specific long-stay facilities, where rapid spread is likely to follow introduction of infection and cause high morbidity and mortality (this does not include, for instance, prisons, young offender institutions, or university halls of residence).
- Individuals who receive a carer's allowance, or who are the main carer of an older or disabled individual whose welfare may be at risk if the carer falls ill.
- Household contacts of those on the *NHS Shielded Patient List* or of immunocompromised individuals.
- Frontline health and social care workers.

Children aged 6 months to less than 2 years who are in a clinical risk group should be offered the egg-grown quadrivalent inactivated influenza vaccine p. 1389.

Children aged 2–17 years (including those in a clinical risk group) should be offered the live attenuated influenza vaccine, administered as a nasal spray (*Fluenz tetra*[®]). The live attenuated vaccine is thought to provide broader protection than inactivated vaccines. Children aged 2–11 years *not* in a clinical risk group whose parent refuses the live attenuated vaccine for their child due to the porcine gelatine content, may be offered the egg-grown quadrivalent inactivated influenza vaccine as an alternative, subject to vaccine availability. For children *not* in a clinical risk group who have a severely immunocompromised household contact, the egg-grown or cell-grown quadrivalent inactivated influenza vaccine should be offered. For children

in a clinical risk group in whom the live attenuated vaccine is contra-indicated or otherwise unsuitable, offer the:

- egg-grown quadrivalent inactivated influenza vaccine in children aged less than 9 years;
- cell-grown quadrivalent inactivated influenza vaccine in children aged 9 years and over who are vaccinated in a GP practice—if unavailable, GPs should offer the egg-grown quadrivalent inactivated influenza vaccine;
- egg-grown quadrivalent inactivated influenza vaccine to the small number of children aged 9 years and over who are vaccinated in a primary school setting.

Children aged less than 9 years in a clinical risk group who have never had the influenza vaccine previously, should be offered 2 doses of the appropriate influenza vaccine, at least 4 weeks apart.

Children aged less than 9 years *not* in a clinical risk group should also be offered 2 doses (at least 4 weeks apart) if the inactivated influenza vaccine is required and they have never had the influenza vaccine previously, and they are household contacts of individuals who are immunocompromised or on the NHS shielded patients list.

Adults aged 18 to 64 years in a clinical risk group or other eligible groups should be offered either the cell-grown quadrivalent inactivated influenza vaccine, or the recombinant quadrivalent inactivated influenza vaccine [unlicensed]. If these options are unavailable, the egg-grown quadrivalent inactivated influenza vaccine may be offered.

Pregnant females should be offered either the cell-grown quadrivalent inactivated influenza vaccine, or the recombinant quadrivalent inactivated influenza vaccine [unlicensed] (if aged 18 years and over). If these options are unavailable, the egg-grown quadrivalent inactivated influenza vaccine may be offered.

Adults aged 65 years and over (including those who turn 65 by 31st March 2021) should be offered the adjuvanted trivalent inactivated influenza vaccine; if unavailable, the cell-grown quadrivalent inactivated influenza vaccine is a suitable alternative. The high dose trivalent inactivated influenza vaccine, and recombinant quadrivalent inactivated influenza vaccine [unlicensed] are also suitable, but are **not eligible for reimbursement under the NHS flu vaccination 2020/2021 programme**.

For further information on the annual influenza programme, see PHE collection: **Annual flu programme** (available at: www.gov.uk/government/collections/annual-flu-programme); and for information on pandemic influenza, avian influenza, and swine influenza, see www.gov.uk/government/collections/pandemic-flu-public-health-response, www.gov.uk/guidance/avian-influenza-bird-flu, and www.gov.uk/guidance/swine-influenza.

For the management of influenza, see Influenza p. 703.

Japanese encephalitis vaccine 14-Nov-2018

Overview

Japanese encephalitis is a mosquito-borne viral encephalitis caused by a *Flavivirus*.

Japanese encephalitis vaccine p. 1390 (*Ixiaro*)[®] is an inactivated vaccine adsorbed onto an adjuvant. It is recommended for individuals who are going to reside in an area where Japanese encephalitis is endemic or epidemic. Travellers to South and South-East Asia and the Far East should be immunised if staying for a month or longer in endemic areas during the transmission season. Other travellers with shorter exposure periods should also be immunised if the risk is considered sufficient. Immunisation is also recommended for laboratory staff at risk of exposure to the virus.

The primary immunisation course of 2 doses should be completed at least one week before potential exposure to Japanese encephalitis virus.

In adults (aged under 65 years) and children (aged 2 months and over) at ongoing risk (including laboratory staff and long-term travellers), a single booster dose should be given 12 months after the primary immunisation course. A booster dose can be considered in adults aged 65 years and over, but the immune response is lower than in younger adults. For other travellers, a single booster dose should be given within 12–24 months after primary immunisation, before potential re-exposure to the Japanese encephalitis virus. Travellers aged 18–64 years should be offered a second booster dose at 10 years if they remain at risk.

Cases of Japanese encephalitis should be managed with supportive treatment.

Up-to-date information on the risk of Japanese encephalitis in specific countries can be obtained from the National Travel Health Network and Centre.

Useful Resources

Recommendations reflect Chapter 20, Japanese encephalitis, in *Immunisation against infectious disease*— ‘The ‘Green book’’. Public Health England, June 2018.

Measles, Mumps and Rubella vaccine

Overview

Measles vaccine has been replaced by a combined measles, mumps and rubella vaccine, live (MMR vaccine) p. 1390.

Measles, mumps and rubella vaccine, live aims to eliminate measles, mumps, and rubella (German measles) and congenital rubella syndrome. Every child should receive two doses of measles, mumps and rubella vaccine, live by entry to primary school, unless there is a valid contra-indication. Measles, mumps and rubella vaccine, live should be given irrespective of previous measles, mumps, or rubella infection or vaccination.

The first dose of measles, mumps and rubella vaccine, live is given to children at 1 year of age, on or after their first birthday. A second dose is given before starting school at 3 years and 4 months of age, or soon after (see Immunisation Schedule).

Children presenting for pre-school booster who have not received the first dose of measles, mumps and rubella vaccine, live should be given a dose of measles, mumps and rubella vaccine, live followed 3 months later by a second dose.

At school-leaving age or at entry into further education, measles, mumps and rubella vaccine, live immunisation should be offered to individuals of both sexes who have not received 2 doses during childhood. In those who have received only a single dose of measles, mumps and rubella vaccine, live in childhood, a second dose is recommended to achieve full protection. If 2 doses of measles, mumps and rubella vaccine, live are required, the second dose should be given one month after the initial dose. The decision on whether to vaccinate adults should take into consideration their vaccination history, the likelihood of the individual remaining susceptible, and the future risk of exposure and disease.

Measles, mumps and rubella vaccine, live should be used to protect against rubella in *seronegative women of child-bearing age* (see Immunisation Schedule); unimmunised healthcare workers who might put pregnant women and other vulnerable groups at risk of rubella or measles should be vaccinated. Measles, mumps and rubella vaccine, live may also be offered to previously *unimmunised and seronegative post-partum women* (see measles, mumps and rubella vaccine, live)—vaccination a few days after delivery is important because about 60% of congenital abnormalities from rubella infection occur in babies of women who have borne more than one child. Immigrants arriving after the age of school immunisation are particularly likely to require immunisation.

Contacts

Measles, mumps and rubella vaccine, live may also be used in the control of outbreaks of measles and should be offered to susceptible children aged over 6 months who are contacts of a case, within 3 days of exposure to infection. Children immunised before 12 months of age should still receive two doses of measles, mumps and rubella vaccine, live at the recommended ages. If one dose of measles, mumps and rubella vaccine, live has already been given to a child, then the second dose may be brought forward to at least one month after the first, to ensure complete protection. If the child is under 18 months of age and the second dose is given within 3 months of the first, then the routine dose before starting school at 3 years and 4 months of age (or soon after) should still be given. Children aged under 9 months for whom avoidance of measles infection is particularly important (such as those with history of recent severe illness) can be given normal immunoglobulin after exposure to measles; routine measles, mumps and rubella vaccine, live immunisation should then be given after at least 3 months at the appropriate age.

Measles, mumps and rubella vaccine, live is **not suitable** for prophylaxis following exposure to mumps or rubella since the antibody response to the mumps and rubella components is too slow for effective prophylaxis.

Children and adults with impaired immune response should not receive live vaccines (see advice on HIV). If they have been exposed to measles infection they should be given normal immunoglobulin.

Travel

Unimmunised travellers, including children over 6 months, to areas where measles is endemic or epidemic should receive measles, mumps and rubella vaccine, live. Children immunised before 12 months of age should still receive two doses of measles, mumps and rubella vaccine, live at the recommended ages. If one dose of measles, mumps and rubella vaccine, live has already been given to a child, then the second dose should be brought forward to at least one month after the first, to ensure complete protection. If the child is under 18 months of age and the second dose is given within 3 months of the first, then the routine dose before starting school at 3 years and 4 months of age (or soon after) should still be given.

Useful Resources

Advice reflects that in the handbook *Immunisation against Infectious Disease* (2013), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI). The advice also incorporates changes announced by the Chief Medical Officer and Health Department Updates. Chapters from the handbook (including updates since 2013) are available at:

www.gov.uk/government/collections/immunisation-against-infectious-disease-the-green-book

Meningococcal vaccine

Overview

Almost all childhood meningococcal disease in the UK is caused by *Neisseria meningitidis* serogroups B and C. **Meningococcal group C conjugate vaccine** protects only against infection by serogroup C and **Meningococcal group B vaccine** protects only against infection by serogroup B. The risk of meningococcal disease declines with age—immunisation is not generally recommended after the age of 25 years.

Tetravalent meningococcal vaccines that cover serogroups A, C, W135, and Y are available. Although the duration of protection has not been established, the **meningococcal groups A, C, W135, and Y conjugate vaccine** is likely to provide longer-lasting protection than the unconjugated meningococcal polysaccharide vaccine. The antibody response to serogroup C in unconjugated meningococcal polysaccharide vaccines in young children may be suboptimal [not currently available in the UK].

Meningococcal group B vaccines, *Bexsero*[®], and *Trumenba*[®] are licensed in the UK against infection caused by *Neisseria meningitidis* serogroup B. The use of *Bexsero*[®] is recommended in the Immunisation Schedule. *Bexsero*[®] contains 3 recombinant *Neisseria meningitidis* serogroup B proteins and the outer membrane vesicles from the NZ 98/254 strain, in order to achieve broad protection against *Neisseria meningitidis* serogroup B. *Trumenba*[®] contains 2 recombinant *Neisseria meningitidis* serogroup B proteins. The proteins are adsorbed onto an aluminium compound to stimulate an enhanced immune response.

Childhood immunisation

Meningococcal group C conjugate vaccine provides long-term protection against infection by serogroup C of *Neisseria meningitidis*. Immunisation consists of 1 dose given at 12 months of age (as the haemophilus influenzae type b with meningococcal group C vaccine p. 1379) and a second dose given at 13–15 years of age (as the meningococcal groups A with C and W135 and Y vaccine p. 1380) (see Immunisation Schedule).

Meningococcal group B vaccine provides protection against infection by serogroup B of *Neisseria meningitidis*. Immunisation consists of 1 dose given at 2 months of age, a second dose at 4 months of age, and a booster dose at 12 months of age (see *Immunisation Schedule* above).

Unimmunised children aged under 12 months should be given 1 dose of meningococcal group B vaccine (rDNA, component, adsorbed) p. 1379 followed by a second dose of meningococcal group B vaccine (rDNA, component, adsorbed) two months later. They should then be vaccinated according to the Immunisation Schedule (ensuring at least a two month interval between doses of meningococcal group B vaccines). Unimmunised children aged 12–23 months should be given 2 doses of meningococcal group B vaccine (rDNA, component, adsorbed) separated by an interval of two months if they have received less than 2 doses in the first year of life. Unimmunised children aged 2–9 years should be given a single dose of meningococcal group C vaccine (as the haemophilus influenzae type b with meningococcal group C

vaccine) followed by a booster dose of meningococcal groups A with C and W135 and Y vaccine at 13–15 years of age.

From 2015, unimmunised individuals aged 10–25 years, including those aged under 25 years who are attending university for the first time, should be given a single dose of meningococcal groups A with C and W135 and Y vaccine; a booster dose is not required.

Patients under 25 years of age with confirmed serogroup C disease, who have previously been immunised with meningococcal group C vaccine, should be offered meningococcal group C conjugate vaccine before discharge from hospital.

Travel

Individuals travelling to countries of risk should be immunised with meningococcal groups A, C, W135, and Y conjugate vaccine, even if they have previously received meningococcal group C conjugate vaccine. If an individual has recently received meningococcal group C conjugate vaccine, an interval of at least 4 weeks should be allowed before administration of the tetravalent (meningococcal groups A, C, W135, and Y) vaccine.

Vaccination is particularly important for those living or working with local people or visiting an area of risk during outbreaks.

Immunisation recommendations and requirements for visa entry for individual countries should be checked before travelling, particularly to countries in Sub-Saharan Africa, Asia, and the Indian sub-continent where epidemics of meningococcal outbreaks and infection are reported. Country-by-country information is available from the National Travel Health Network and Centre (www.nathnac.org/).

Proof of vaccination with the tetravalent meningococcal groups A with C and W135 and Y vaccine is required for those travelling to Saudi Arabia during the Hajj and Umrah pilgrimages (where outbreaks of the W135 strain have occurred).

Contacts

For advice on the immunisation of *laboratory workers and close contacts* of cases of meningococcal disease in the UK and on the role of the vaccine in the control of *local outbreaks*, consult Guidance for Public Health Management of Meningococcal Disease in the UK at www.gov.uk/phe. Also see for antibacterial prophylaxis for prevention of secondary cases of meningococcal meningitis.

The need for immunisation of laboratory staff who work directly with *Neisseria meningitidis* should be considered.

Useful Resources

Advice reflects that in the handbook *Immunisation against Infectious Disease* (2013), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI). The advice also incorporates changes announced by the Chief Medical Officer and Health Department Updates. Chapters from the handbook (including updates since 2013) are available at:

www.gov.uk/government/collections/immunisation-against-infectious-disease-the-green-book

Pertussis vaccine

28-May-2020

Overview

Pertussis vaccine is given as a combination preparation containing other vaccines. Acellular vaccines are derived from highly purified components of *Bordetella pertussis*. Primary immunisation against pertussis (whooping cough) requires 3 doses of an acellular pertussis-containing vaccine (see Immunisation schedule), given at intervals of 1 month from the age of 2 months.

All children up to the age of 10 years should receive primary immunisation with a combination vaccine of diphtheria with tetanus, pertussis, hepatitis B, poliomyelitis and haemophilus influenzae type b vaccine p. 1377 (*Infanrix hexa*[®]).

A booster dose of an acellular pertussis-containing vaccine should ideally be given 3 years after the primary course, although, the interval can be reduced to 1 year if the primary course was delayed. Children aged 1–10 years who have not received a *pertussis-containing* vaccine as part of their primary immunisation should be offered 1 dose of a suitable pertussis-containing vaccine; after an interval of at least 1 year, a booster dose of a suitable pertussis-containing vaccine should be given. Immunisation against pertussis is not routinely recommended in individuals over 10 years of age.

Vaccination of pregnant women against pertussis

In response to the pertussis outbreak, the UK health departments introduced a temporary programme (October 2012) to vaccinate pregnant women against pertussis, and this programme will continue until further notice. The aim of the programme is to boost the levels of pertussis-specific antibodies that are transferred through the placenta, from the mother to the fetus, so that the newborn is protected before routine immunisation begins at 2 months of age.

Pregnant women should be offered a single dose of acellular pertussis-containing vaccine (as adsorbed diphtheria [low dose], tetanus, pertussis [acellular, component] and poliomyelitis [inactivated] vaccine; *Boostrix-IPV*[®] or *Repevac*[®]) between 16 and 32 weeks of pregnancy. Public Health England has advised (2016) that the vaccine is probably best offered after the fetal anomaly scan at around 18–20 weeks. Pregnant women should be offered a single dose of acellular pertussis-containing vaccine up to the onset of labour if they missed the opportunity for vaccination at 16–32 weeks of pregnancy. A single dose of acellular pertussis-containing vaccine may also be offered to new mothers, who have never previously been vaccinated against pertussis, until the child receives the first vaccination.

While this programme is in place, women who become pregnant again should be offered vaccination during each pregnancy to maximise transplacental transfer of antibody.

Contacts

Vaccination against pertussis should be considered for close contacts of cases with pertussis who have been offered antibacterial prophylaxis. Unimmunised or partially immunised contacts under 10 years of age should complete their vaccination against pertussis. A booster dose of an acellular pertussis-containing vaccine is recommended for contacts aged over 10 years who have not received a pertussis-containing vaccine in the last 5 years and who have not received adsorbed diphtheria [low dose], tetanus, and poliomyelitis (inactivated) vaccine in the last month.

Side-effects

Local reactions do not contra-indicate further doses.

The vaccine should not be withheld from children with a history to a preceding dose of:

- fever, irrespective of severity;
- persistent crying or screaming for more than 3 hours;
- severe local reaction, irrespective of extent.

Useful Resources

Advice reflects that in the handbook Immunisation against Infectious Disease (2013), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI). The advice also incorporates changes announced by the Chief Medical Officer and Health Department Updates. Chapters from the handbook (including updates since 2013) are available at:

www.gov.uk/government/collections/immunisation-against-infectious-disease-the-green-book

Pneumococcal vaccine

12-Apr-2021

Overview

The pneumococcal polysaccharide conjugate vaccine (adsorbed) p. 1381 and the pneumococcal polysaccharide vaccine p. 1382 protect against infection with *Streptococcus pneumoniae* (pneumococcus). Both vaccines contain polysaccharide from capsular pneumococci. The pneumococcal polysaccharide vaccine contains purified polysaccharide from **23 capsular types** of pneumococcus, whereas the pneumococcal polysaccharide conjugate vaccine (adsorbed) contains polysaccharide from either **10 capsular types** (*Synflorix*[®]) or **13 capsular types** (*Prevenar 13*[®]). Both vaccines are inactivated.

Prevenar 13[®] is the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) used for childhood immunisation. For children born on or before December 31st 2019, the schedule consists of 3 doses given at separate intervals. For children born on or after January 1st 2020, the schedule consists of 2 doses given at separate intervals. For more information on the schedule, see Immunisation schedule p. 1353. Children who present late for vaccination should be immunised according to *Children with unknown or incomplete vaccination histories*.

For further information on the use of *Prevenar 13*[®] pneumococcal polysaccharide conjugate vaccine (adsorbed) (including guidance on early immunisation, or shortened dosing intervals; and the management of children given the incorrect dosing schedule or pneumococcal vaccine, or if vaccinated overseas), see Public Health England (PHE) guidance: **Pneumococcal vaccination: guidance for health professionals** (available from: www.gov.uk/government/publications/pneumococcal-vaccination-guidance-for-health-professionals).

The 23-valent pneumococcal polysaccharide vaccine is recommended for all adults aged 65 years and over (including those immunised during the influenza season and who turn 65 by the 31st March), and for adults and children aged 2 years and over in the following at-risk groups:

- asplenia or splenic dysfunction (including homozygous sickle cell disease and coeliac syndrome which could lead to splenic dysfunction);
- chronic respiratory disease (including severe asthma treated with continuous or frequent use of a systemic corticosteroid);
- chronic heart disease;
- chronic renal disease;
- chronic liver disease;
- diabetes mellitus requiring insulin or anti-diabetic medication;
- immunosuppression because of disease (e.g. HIV infection, and genetic disorders affecting the immune system) or treatment (including prolonged systemic corticosteroid treatment for over 1 month at dose equivalents of prednisolone: *adult and child 20 kg and over*, 20 mg or more daily; *child under 20 kg*, 1 mg/kg or more daily, and chemotherapy);
- presence of cochlear implant;
- conditions where leakage of cerebrospinal fluid may occur.

The 23-valent pneumococcal polysaccharide vaccine should also be considered for those at risk of occupational exposure to metal fume (e.g. welders).

Due to a shortage of the 23-valent pneumococcal polysaccharide vaccine, stock should be prioritised for patients according to their level of risk. For further guidance on priority groups, see *Supply of pneumococcal polysaccharide vaccine (Pneumovax*[®] 23) in PHE: **Vaccine update: Issue 318**

(available at: www.gov.uk/government/publications/vaccine-update-issue-318-march-2021).

Where possible, the vaccine should be given at least 2 weeks (ideally 4–6 weeks) before splenectomy, chemotherapy or radiotherapy; patients should be given advice about the increased risk of pneumococcal infection. If it is not possible to vaccinate at least 2 weeks before splenectomy, chemotherapy or radiotherapy, the vaccine should be given at least 2 weeks after the splenectomy, and at least 3 months after completion of chemotherapy or radiotherapy. Vaccination advice for patients with leukaemia or those who have had a bone marrow transplant, and information on patient cards and leaflets for individuals with asplenia, are available in Chapter 25, *Pneumococcal, in Immunisation against infectious disease* - 'The Green Book'.

Vaccination regimens may differ depending on the individual's age, risk of pneumococcal disease, vaccination history, and immune status. Individuals in at-risk groups may require additional protection.

For information on revaccination with 23-valent pneumococcal polysaccharide vaccine for individuals in whom the antibody concentration is likely to decline rapidly, see *Revaccination*.

Children with unknown or incomplete vaccination histories

Individuals born on or before December 31st 2019

Unimmunised or partially immunised children who present late for vaccination and before the age of 1 year should receive 2 doses of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) 2 months apart, and a booster dose on or after their first birthday, at least 2 months after the previous dose (intervals can be reduced to 1 month to allow the immunisation schedule to be completed promptly).

Children aged 1 year to under 2 years who are unimmunised or partially immunised should receive a single dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed).

Individuals born on or after January 1st 2020

Unimmunised or partially immunised children who present late for vaccination and before the age of 1 year should receive a single dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed), and a booster dose on or after their first birthday, at least 4 weeks after the previous dose.

Children aged 1 year to under 2 years who are unimmunised or partially immunised should receive a single dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed).

For the management of children who received one or more doses of 10-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) in another country, refer to Chapter 25 (for infants born on or after 1 January 2020), *Pneumococcal, in Immunisation against infectious disease* - 'The Green Book'.

Individuals with an at-risk condition born on or before December 31st 2019

Children diagnosed with at-risk conditions aged under 2 years

Children diagnosed with an at-risk condition aged under 1 year should receive the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) according to the Immunisation schedule p. 1353. Those who present late for vaccination should be immunised according to *Children with unknown or incomplete vaccination histories*. A single dose of the 23-valent pneumococcal polysaccharide vaccine should then be given at 2 years of age, at least 2 months after the last dose of 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed).

Children aged under 2 years who are severely immunocompromised, or those with asplenia, splenic dysfunction or complement disorders, should have an

additional dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed), given at least 2 months after the booster dose due on or after their first birthday (the interval can be reduced to 1 month to allow the immunisation schedule to be completed promptly). A single dose of the 23-valent pneumococcal polysaccharide vaccine should then be given at 2 years of age, at least 2 months after the last dose of 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed).

For further information on vaccination in individuals with asplenia, splenic dysfunction, or complement disorders, see *Vaccination, general principles* p. 1351.

Children diagnosed with at-risk conditions aged 2 years to under 10 years

Children diagnosed or first presenting with an at-risk condition who have completed their routine immunisation schedule should receive a single dose of 23-valent pneumococcal polysaccharide vaccine, at least 2 months after the last dose of 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) p. 1381.

Children previously unvaccinated or partially vaccinated with the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) should receive a single dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed), followed by a single dose of the 23-valent pneumococcal polysaccharide vaccine p. 1382 at least 2 months later.

For further information on vaccination in individuals with asplenia, splenic dysfunction, or complement disorders, see *Vaccination, general principles* p. 1351.

Severely immunocompromised children may have a sub-optimal immunological response to the vaccine and should be given an additional dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed), even if they are fully vaccinated. This should be followed by a single dose of the 23-valent pneumococcal polysaccharide vaccine, at least 2 months after the last dose of 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed). If the 23-valent pneumococcal polysaccharide vaccine has already been given, the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) should be given at least 6 months after.

Individuals diagnosed with at-risk conditions aged 10 years and over

Individuals diagnosed or first presenting with an at-risk condition should be given a single dose of the 23-valent pneumococcal polysaccharide vaccine; no additional 23-valent pneumococcal polysaccharide vaccine is required at 65 years of age.

For further information on vaccination in individuals with asplenia, splenic dysfunction, or complement disorders, see *Vaccination, general principles* p. 1351.

Severely immunocompromised individuals should be given a single dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) followed by the 23-valent pneumococcal polysaccharide vaccine at least 2 months after, irrespective of their previous pneumococcal vaccinations. If the 23-valent pneumococcal polysaccharide vaccine has already been given, the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) should be given at least 6 months after.

Individuals with an at-risk condition born on or after January 1st 2020

Children diagnosed with at-risk conditions aged under 1 year

Children in an at-risk group (excluding those with asplenia, splenic dysfunction or complement disorder, or who are severely immunocompromised) should receive the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) according to the Immunisation schedule p. 1353. Those who present late for vaccination should be immunised according

to *Children with unknown or incomplete vaccination histories*. A single dose of the 23-valent pneumococcal polysaccharide vaccine should then be given at 2 years of age, at least 8 weeks after the last dose of 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed).

Children who are severely immunocompromised, or those with asplenia, splenic dysfunction or complement disorders, should receive 2 doses of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) at least 8 weeks apart (commencing no earlier than 6 weeks of age), followed by a single booster dose given on or after their first birthday. An additional dose of 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) should be given at least 8 weeks after the booster dose. A single dose of the 23-valent pneumococcal polysaccharide vaccine should then be given at 2 years of age, at least 8 weeks after the last dose of 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed).

For further information on vaccination in individuals with asplenia, splenic dysfunction, or complement disorders, see Vaccination, general principles p. 1351.

Children diagnosed with at-risk conditions aged 1 year to under 2 years

Children in an at-risk group (excluding those with asplenia, splenic dysfunction or complement disorder, or who are severely immunocompromised) should receive their 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) booster dose according to the Immunisation schedule p. 1353. Those who present late for vaccination should be immunised according to *Children with unknown or incomplete vaccination histories*. A single dose of the 23-valent pneumococcal polysaccharide vaccine should then be given at 2 years of age, at least 8 weeks after the last dose of 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed).

Children who are severely immunocompromised, or those with asplenia, splenic dysfunction or complement disorders, should receive their 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) booster dose according to the Immunisation schedule p. 1353. Those who present late for vaccination should be immunised according to *Children with unknown or incomplete vaccination histories*. An additional dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) should be given at least 8 weeks after the booster dose. A single dose of the 23-valent pneumococcal polysaccharide vaccine should then be given at 2 years of age, at least 8 weeks after the last dose of 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed).

For further information on vaccination in individuals with asplenia, splenic dysfunction, or complement disorders, see Vaccination, general principles p. 1351.

Children diagnosed with at-risk conditions aged 2 years to under 10 years

Children diagnosed or first presenting with an at-risk condition (excluding those severely immunocompromised) who have completed their routine immunisation schedule should receive a single dose of 23-valent pneumococcal polysaccharide vaccine, at least 8 weeks after the last dose of 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed).

Children diagnosed or first presenting with an at-risk condition (excluding those severely immunocompromised) who are previously unimmunised or partially immunised with the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed), should receive a single dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed), followed by a single dose of the 23-valent pneumococcal polysaccharide vaccine at least 8 weeks later.

For further information on vaccination in individuals with asplenia, splenic dysfunction, or complement disorders, see Vaccination, general principles p. 1351.

Severely immunocompromised children should be given a single dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed), regardless of immunisation status. This should be followed by a single dose of the 23-valent pneumococcal polysaccharide vaccine, at least 8 weeks after the last dose of 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed).

Individuals diagnosed with at-risk conditions aged 10 years and over

Individuals diagnosed or first presenting with an at-risk condition (excluding those who are severely immunocompromised) should be given a single dose of the 23-valent pneumococcal polysaccharide vaccine. The 23-valent pneumococcal polysaccharide vaccine is not required for individuals with asplenia, splenic dysfunction or complement disorders if they have already received a dose within the previous 2 years (due to a theoretical risk of pneumococcal serotype-specific hypo-responsiveness with revaccination).

For further information on vaccination in individuals with asplenia, splenic dysfunction, or complement disorders, see Vaccination, general principles p. 1351.

Severely immunocompromised individuals should be given a single dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed), followed by a single dose of the 23-valent pneumococcal polysaccharide vaccine at least 8 weeks after. The 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) or additional 23-valent pneumococcal polysaccharide vaccine are not required if a 23-valent pneumococcal polysaccharide vaccine has already been received within the previous 2 years, due to a theoretical risk of pneumococcal serotype-specific hypo-responsiveness with re-vaccination.

Revaccination

Revaccination is not recommended for any clinical risk groups or age groups, except for individuals in whom the antibody concentration is likely to decline rapidly (e.g. asplenia, splenic dysfunction, or chronic renal disease), where revaccination is recommended every 5 years.

Management of cases

For the management of cases, contacts and outbreaks, refer to Chapter 25, Pneumococcal, in *Immunisation against infectious disease*- 'The Green Book' (see *Useful resources*).

Useful Resources

Recommendations reflect Chapter 25 (for infants born up to and including 31 December 2019), Pneumococcal, in *Immunisation against infectious disease*- 'The Green Book'. Public Health England, January 2018.
www.gov.uk/government/publications/pneumococcal-the-green-book-chapter-25

Recommendations reflect Chapter 25 (for infants born on or after 1 January 2020), Pneumococcal, in *Immunisation against infectious disease*- 'The Green Book'. Public Health England, January 2020.
www.gov.uk/government/publications/pneumococcal-the-green-book-chapter-25

Poliomyelitis vaccine

Overview

Two types of poliomyelitis vaccines (containing strains of poliovirus types 1, 2, and 3) are available, inactivated poliomyelitis vaccine (for injection) and live (oral) poliomyelitis vaccine. **Inactivated** poliomyelitis vaccines, only available in combined preparation, is recommended for routine immunisation.

A course of primary immunisation consists of 3 doses of a combined preparation containing inactivated poliomyelitis vaccines, starting at 2 months of age with intervals of 1 month between doses (see Immunisation schedule). A course of 3 doses should also be given to all unimmunised adults; no adult should remain unimmunised against poliomyelitis.

Two booster doses of a preparation containing inactivated poliomyelitis vaccines are recommended, the first before school entry and the second before leaving school (see Immunisation schedule). Further booster doses are only necessary for adults at special risk, such as travellers to endemic areas, or laboratory staff likely to be exposed to the viruses, or healthcare workers in possible contact with cases; booster doses should be given to such individuals every 10 years.

Live (oral) poliomyelitis vaccine is no longer available for routine use; its use may be considered during large outbreaks, but advice should be sought from Public Health England. The live (oral) vaccine poses a very rare risk of vaccine-associated paralytic polio because the attenuated strain of the virus can revert to a virulent form. For this reason the live (oral) vaccine must **not** be used for immunosuppressed individuals or their household contacts. The use of inactivated poliomyelitis vaccines removes the risk of vaccine-associated paralytic polio altogether.

Travel

Unimmunised travellers to areas with a high incidence of poliomyelitis should receive a full 3-dose course of a preparation containing inactivated poliomyelitis vaccines. Those who have not been vaccinated in the last 10 years should receive a booster dose of **adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine**. Information about countries with a high incidence of poliomyelitis can be obtained from www.travax.nhs.uk/ or from the National Travel Health Network and Centre (www.nathnac.org/).

Useful Resources

Advice reflects that in the handbook Immunisation against Infectious Disease (2013), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI). The advice also incorporates changes announced by the Chief Medical Officer and Health Department Updates. Chapters from the handbook (including updates since 2013) are available at: www.gov.uk/government/collections/immunisation-against-infectious-disease-the-green-book

Rabies vaccine

13-Nov-2019

Overview

The rabies vaccine p. 1391 contains inactivated rabies virus cultured in either human diploid cells or purified chick embryo cells; vaccines may be used interchangeably to provide protection for pre-exposure prophylaxis and post-exposure treatment.

Pre-exposure prophylaxis

Immunisation with the rabies vaccine should be offered to those considered to be at risk of exposure to rabies within the UK, as listed:

- laboratory staff who routinely handle the rabies virus;
- workers at Defra-authorized quarantine premises and carriers;
- those who regularly handle bats, including on a voluntary basis;
- veterinary and technical staff who, by reason of their employment, encounter enhanced risk.

Immunisation is also recommended for those considered to be at risk of exposure to rabies travelling outside the UK, including:

- animal control and wildlife workers, veterinary staff or zoologists who regularly work in rabies enzootic (high risk) areas;
- travellers to rabies enzootic areas, especially if:
 - ▶ post-exposure medical care and rabies biologics at the destination are lacking or in short supply;
 - ▶ they are undertaking higher risk activities such as cycling or running;
 - ▶ they are living or staying there for more than 1 month.

Immunisation against rabies requires a primary pre-exposure course of 3 doses administered over 21 or 28 days (preferred schedule if time allows), or an accelerated course of 3 doses over 7 days with an additional dose at 1 year. For dosing schedules, see rabies vaccine.

For further information on pre-exposure prophylaxis in individuals with immunosuppression and/or HIV infection, see *Immunosuppression and HIV infection*.

Boosters

The requirement for booster doses is dependent on an individual's indication for pre-exposure prophylaxis and the likely frequency of ongoing exposures.

For laboratory workers who handle lyssavirus containing material (includes the rabies virus) a single booster dose of rabies vaccine should be given 1 year after the primary course has been completed. Further booster doses should be given based on 6-monthly antibody levels.

For individuals who may have frequent unrecognised exposures to the virus (such as bat handlers) a single booster dose of rabies vaccine should be given 1 year after the primary course has been completed. Further booster doses should then be given every 3–5 years or based on antibody levels.

For individuals at infrequent risk of exposure, but who are likely to have an unrecognised exposure (such as recreational cavers, veterinarians investigating suspect rabies cases and non-compliant imported pets, engineers maintaining rabies laboratory equipment or those entering rabies laboratories), should be given booster doses of rabies vaccine based on antibody levels from at least 1 year after the primary course has been completed.

For further information on antibody testing and booster doses, see PHE guidance: **Guidelines on timing of rabies boosters based on antibody levels** (see *Useful resources*).

Travel

Routine booster doses are not recommended for most travellers. A single booster dose of rabies vaccine can be considered, following a risk assessment, in those who have completed a primary course over 1 year ago and are travelling again to an enzootic area. Only 1 booster is needed in a traveller's lifetime.

Further information on country-specific rabies travel risk is available from the National Travel Health Network and Centre (travelhealthpro.org.uk/) and, in Scotland, from Health Protection Scotland (www.hps.scot.nhs.uk).

Post-exposure management

Medical practitioners must notify the proper officer at their local council or local health protection team of all suspected cases of rabies. For further information, see *Notifiable diseases in Antibacterials*, principles of therapy p. 531.

Following potential exposure to rabies, the wound or site of exposure (e.g. mucous membrane) should be cleansed under running water and washed for several minutes with soapy water as soon as possible. Disinfectant and a simple dressing can be applied, but suturing should be delayed until post-exposure treatment has begun otherwise it may increase the risk of introducing rabies virus into the nerves.

A full, rapid post-exposure risk assessment (based on detailed information about the circumstances of the potential exposure) is required so that post-exposure treatment, if indicated, can be started promptly. When post-exposure treatment is indicated, this should always be started without delay, even in the presence of other illness. If the exposure occurred many months or years previously, a full risk assessment should always be done and treatment considered as the incubation period for rabies can be prolonged.

The regimen used for post-exposure management depends on the composite rabies risk (assessed as a green, amber, or red rating using a combination of the country where the incident occurred and the type of animal involved, and the category of exposure), and the individual's past medical history (including immune status). For further information on risk assessment (including composite rabies risk) and the management of potential rabies exposure, see PHE guidance: **Guidelines on managing rabies post-exposure** (see *Useful resources*).

For individuals arriving in the UK who started post-exposure treatment via the intradermal route, the remaining doses should be given intramuscularly. If the regimen started was different to the UK regimen—seek specialist advice.

For post-exposure management in individuals with immunosuppression, see *Immunosuppression and HIV infection*; and for country-specific specialist contact details in England, Wales, Scotland and Northern Ireland, see Chapter 27: Rabies, in *Immunisation against infectious disease*—‘The Green Book’.

Post-exposure treatment of individuals who are fully immunised

Fully immunised individuals are those who have received at least 3 documented doses of rabies vaccine (on at least two separate days either as a primary pre-exposure prophylaxis course or as part of a previous post-exposure treatment course), or documented rabies virus neutralising antibody (VNA) titres of at least 0.5 IU/ml.

For *fully immunised* individuals with a *green* composite rabies risk or who have completed a rabies post-exposure treatment course in the last 3 months, no treatment is required.

For *fully immunised* individuals with an *amber* or *red* composite rabies risk, give 2 doses of rabies vaccine (first dose on day 0 and second dose between days 3–7). Rabies immunoglobulin is not needed for these individuals. If rabies immunoglobulin is inadvertently given, individuals will need to complete a 4 dose course of rabies vaccine (on days 0, 3, 7 and 21).

Post-exposure treatment of individuals who are partially immunised

Partially immunised individuals are those who have had an incomplete/inadequate primary pre-exposure prophylaxis course or documented rabies virus neutralising antibody titres consistently less than 0.5 IU/ml.

For *partially immunised* individuals with a *green* composite rabies risk, no treatment is required.

For *partially immunised* individuals with an *amber* or *red* composite rabies risk, give 4 doses in total of rabies vaccine p. 1391 (on days 0, 3, 7 and 21). If the 4th dose of rabies vaccine is given before day 21, a 5th dose of vaccine should be administered 2 weeks after the 4th dose. Rabies immunoglobulin is not needed for these individuals.

Post-exposure treatment of individuals who are non-immunised

Non-immunised individuals are those who have never received rabies pre- or post-exposure immunisation.

For *non-immunised* individuals with a *green* composite rabies risk, no treatment is required.

For *non-immunised* individuals, with an *amber* or *red* composite rabies risk, give 4 doses in total of rabies vaccine

(on days 0, 3, 7 and 21). If the 4th dose of rabies vaccine is given before day 21, a 5th dose of vaccine should be administered 2 weeks after the 4th dose.

Individuals with a *red* composite rabies risk should also be given rabies immunoglobulin p. 1348. This is not required if more than 7 days has passed since the first dose of rabies vaccine or more than 1 day since the second dose, or if the exposure was more than 12 months ago.

Immunosuppression and HIV infection

Refer to the British HIV Association for further information on the use of *rabies vaccine* and *rabies immunoglobulin* in individuals with HIV infection. See www.bhiva.org/guidelines for further information.

Pre-exposure prophylaxis

Pre-exposure prophylaxis may be given to individuals with immunosuppression and HIV infection (regardless of CD4 count). These individuals may not develop a full antibody response so re-immunisation should be considered upon completion of treatment and recovery has occurred, or in those with HIV when there has been immune recovery following commencement of antiretroviral treatment (such as a CD4 count >200 per mm³).

Individuals who become immunosuppressed after receiving a primary course of immunisation, or having an antibody test or booster should be advised to seek medical advice for review of testing/booster vaccination frequency. They may no longer be able to produce an effective immune response following a rabies virus exposure and should be informed about the potential risks of continuing with activities that might lead to rabies virus exposures.

Post-exposure management

For *immunosuppressed* individuals with a *green* composite rabies risk, no treatment is required.

For *immunosuppressed* individuals with an *amber* or *red* composite rabies risk, give 5 doses in total of rabies vaccine (on days 0, 3, 7, 14, and 28 or 30) and rabies immunoglobulin. Post-exposure treatment response should be confirmed using antibody testing at the same time as the 4th dose (day 14); further antibody tests may be required depending on the results. Rabies immunoglobulin is not indicated if more than 7 days have passed since the first dose of rabies vaccine or more than 1 day since the second dose, or if the exposure was more than 12 months previously.

Rotavirus vaccine

02-Aug-2019

Overview

Rotavirus vaccine p. 1392 is a live, oral vaccine that protects young children against gastro-enteritis caused by rotavirus infection. The recommended schedule consists of 2 doses, the first at 8 weeks of age, and the second at 12 weeks of age (see Immunisation schedule p. 1353). The first dose of rotavirus vaccine must be given between 6 weeks and under 15 weeks of age and the second dose should be given after an

interval of at least 4 weeks; the vaccine should not be started in children 15 weeks of age or older. Ideally, the full course should be completed before 16 weeks of age to provide protection before the main burden of disease, and to avoid a temporal association between vaccination and intussusception; the course must be completed before 24 weeks of age.

Children who inadvertently receive the first dose of rotavirus vaccine at 15 weeks of age or older should still receive a second dose after at least 4 weeks, providing that they will still be under 24 weeks of age at the time.

The rotavirus vaccine virus is excreted in the stool and may be transmitted to close contacts; however, vaccination of children with *immunosuppressed* close contacts may protect the contacts from wild-type rotavirus disease and outweigh any risk from transmission of vaccine virus. Carers of a recently vaccinated child should be advised of the need to wash their hands after changing the child's nappies.

Useful Resources

Recommendations reflect Chapter 27b, Rotavirus, in *Immunisation against infectious disease*— 'The Green book'. Public Health England, August 2015.
www.gov.uk/government/publications/rotavirus-the-green-book-chapter-27b

Smallpox vaccine

25-Jun-2020

Overview

The smallpox vaccine is prepared from the live vaccinia virus (a pox virus similar to smallpox, but less harmful). Routine immunisation against smallpox is not indicated, but should be considered for workers in laboratories where pox viruses (such as monkeypox or genetically modified vaccinia) are handled, and for others whose work involves an identifiable risk of exposure to pox viruses. For further information on the need for smallpox immunisation and for information on contra-indications and supply, contact the Public Health England Virus Reference Department (contact details available at: www.gov.uk/government/collections/virus-reference-department-vrd). In Scotland, information can be obtained from Health Protection Scotland (contact details available at: www.hps.scot.nhs.uk/about-us/contact-us/).

Refer to the British HIV Association for information on the use of smallpox vaccine in individuals with HIV. See www.bhiva.org/guidelines for further information.

A 24 hour on-call service for urgent diagnosis of smallpox is available; contact the Colindale Duty Doctor (Tel: 020 8200 4400). Medical practitioners must notify the proper officer at their local council or local health protection team of all suspected cases of smallpox. For further information, see *Notifiable diseases* in *Antibacterials, principles of therapy* p. 531.

Useful Resources

Recommendations reflect Chapter 29, Smallpox and vaccinia, in *Immunisation against infectious disease* - 'The Green Book', Public Health England, March 2013.
www.gov.uk/government/publications/smallpox-and-vaccinia-the-green-book-chapter-29

Tetanus vaccine

Overview

Tetanus vaccine contains a cell-free purified toxin of *Clostridium tetani* adsorbed on aluminium hydroxide or aluminium phosphate to improve antigenicity.

Primary immunisation for children under 10 years consists of 3 doses of a combined preparation containing adsorbed

tetanus vaccine, with an interval of 1 month between doses (see *Routine immunisation schedule*). Following routine childhood vaccination, 2 booster doses of a preparation containing adsorbed tetanus vaccine are recommended, the first before school entry and the second before leaving school.

The recommended schedule of tetanus vaccination not only gives protection against tetanus in childhood but also gives the basic immunity for subsequent booster doses. In most circumstances, a total of 5 doses of tetanus vaccine is considered sufficient for long term protection.

For primary immunisation of adults and children over 10 years previously unimmunised against tetanus, 3 doses of **adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine** are given with an interval of 1 month between doses (see *Diphtheria-containing vaccines for children over 10 years and adults*).

When an individual presents for a booster dose but has been vaccinated following a tetanus-prone wound, the vaccine preparation administered at the time of injury should be determined. If this is not possible, the booster should still be given to ensure adequate protection against all antigens in the booster vaccine.

Very rarely, tetanus has developed after abdominal surgery; patients awaiting elective surgery should be asked about tetanus immunisation and immunised if necessary.

Parenteral drug abuse is also associated with tetanus; those abusing drugs by injection should be vaccinated if unimmunised—booster doses should be given if there is any doubt about their immunisation status.

All laboratory staff should be offered a primary course if unimmunised.

Wounds

Wounds are considered to be tetanus-prone if they are sustained more than 6 hours before surgical treatment or at any interval after injury and are puncture-type (particularly if contaminated with soil or manure) or show much devitalised tissue or are septic or are compound fractures or contain foreign bodies. All wounds should receive thorough cleansing.

- For *clean wounds*: fully immunised individuals (those who have received a total of 5 doses of a tetanus-containing vaccine at appropriate intervals) and those whose primary immunisation is complete (with boosters up to date), do not require tetanus vaccine; individuals whose primary immunisation is incomplete or whose boosters are not up to date require a reinforcing dose of a tetanus-containing vaccine (followed by further doses as required to complete the schedule); non-immunised individuals (or those whose immunisation status is not known or who have been fully immunised but are now immunocompromised) should be given a dose of the appropriate tetanus-containing vaccine immediately (followed by completion of the full course of the vaccine if records confirm the need)
- For *tetanus-prone wounds*: management is as for clean wounds with the addition of a dose of tetanus immunoglobulin given at a different site; in fully immunised individuals and those whose primary immunisation is complete (with boosters up to date) the immunoglobulin is needed only if the risk of infection is especially high (e.g. contamination with manure). Antibacterial prophylaxis (with benzylpenicillin, co-amoxiclav, or metronidazole) may also be required for tetanus-prone wounds.

Useful Resources

Advice reflects that in the handbook *Immunisation against Infectious Disease* (2013), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI). The advice also incorporates changes announced by the Chief Medical Officer and Health Department Updates.

Chapters from the handbook (including updates since 2013) are available at:

www.gov.uk/government/collections/immunisation-against-infectious-disease-the-green-book

Tick-borne encephalitis vaccine

08-Jul-2020

Overview

The tick-borne encephalitis (TBE) vaccine contains inactivated TBE virus (Neudörfel strain) grown in chick embryo cells. It is recommended for the protection of individuals at high risk of exposure to the TBE virus through their work or travel.

Immunisation with the tick-borne encephalitis vaccine, inactivated p. 1393 is therefore recommended for:

- individuals who travel, particularly in spring and summer, to endemic forested areas where ticks are most prevalent (including those who hike, camp, hunt, and undertake fieldwork);
- individuals who will be residing in an area where TBE is endemic or epidemic, especially those working in forestry, woodcutting, farming, and the military;
- laboratory workers who may be exposed to the TBE virus.

A 3 dose schedule of the tick-borne encephalitis vaccine, inactivated is recommended for children aged 1 year and over, and for adults. Sufficient protection can be expected for the ongoing tick season after the first 2 doses, and for at least 3 years after the 3rd dose. Booster doses are required every 3–5 years for those still at risk of TBE exposure. For dosing schedules, see tick-borne encephalitis vaccine, inactivated.

Refer to the British HIV Association for information on the use of tick-borne encephalitis vaccine, inactivated in individuals with HIV infection. See www.bhiva.org/guidelines for further information.

Further information on preventing or reducing the risk of TBE is available from the National Travel Health Network and Centre (nathnac.net/) and Health Protection Scotland (www.travax.nhs.uk/).

Post-exposure management

Unvaccinated individuals bitten by ticks in endemic areas should seek local medical advice. No specific therapy is available following exposure to tick-borne encephalitis; supportive treatment can significantly reduce morbidity and mortality. If tick-borne encephalitis is suspected, the referring clinician should discuss the case with a clinician at the Public Health England Rare and Imported Pathogens Laboratory (contact details are available at: www.gov.uk/guidance/tick-borne-encephalitis-epidemiology-diagnosis-and-prevention).

Medical practitioners must notify the proper officer at their local council or local health protection team of all suspected cases of acute encephalitis of any cause. For further information, see *Notifiable diseases* in *Antibacterials*, principles of therapy p. 531.

Useful Resources

Recommendations reflect Chapter 31, Tick-borne encephalitis, in *Immunisation against infectious disease*– 'The Green Book'. Public Health England, April 2013. www.gov.uk/government/publications/tick-borne-encephalitis-the-green-book-chapter-31

Typhoid vaccine

29-Jul-2019

Overview

Typhoid vaccine p. 1382 is available as a Vi capsular polysaccharide (from *Salmonella typhi*) vaccine for injection and a live, attenuated *Salmonella typhi* vaccine for oral use.

Typhoid immunisation is advised for:

- travellers to areas where typhoid is endemic and whose planned activities put them at higher risk (country-by-country information is available from the National Travel Health Network and Centre);
- travellers to endemic areas where frequent or prolonged exposure to poor sanitation and poor food hygiene is likely;
- laboratory personnel who, in the course of their work, may be exposed to *Salmonella typhi*.

Capsular polysaccharide typhoid vaccine is given as a single dose, usually by intramuscular injection. Children under 2 years [unlicensed] may respond suboptimally to the vaccine, but children aged between 1–2 years should be immunised if the risk of typhoid fever is considered high (immunisation is not recommended for infants under 12 months). A single booster dose should be given at 3-year intervals in adults and children over 2 years of age who remain at risk from typhoid fever.

Oral typhoid vaccine is a live, attenuated vaccine contained in an enteric-coated capsule recommended in individuals aged 5 years and over. One capsule taken on alternate days for a total of 3 doses, provides protection 7–10 days after the last dose. If travelling from a non-endemic area to an area where typhoid is endemic, a booster consisting of 3 doses is recommended every 3 years. The oral typhoid vaccine should be avoided in immunosuppressed and HIV-infected individuals.

Prevention of typhoid primarily depends on improving sanitation and water supplies in endemic areas and on scrupulous personal, food and water hygiene.

All suspected cases of typhoid fever must be notified to the local health protection unit. Where there is a community level outbreak, specialist advice should be sought from Public Health England (tel. 020 8200 4400) or, in Scotland, Health Protection Scotland (tel. 0140 300 1191).

Useful Resources

Recommendations reflect Chapter 33, Typhoid, in *Immunisation against infectious disease*– 'The Green Book'. Public Health England, May 2019.

www.gov.uk/government/publications/typhoid-the-green-book-chapter-33

National Travel Health Network and Centre nathnac.net

Varicella-zoster vaccine

11-May-2021

Overview

The varicella-zoster vaccine p. 1393 preparations contain live, attenuated virus derived from the Oka strain of varicella-zoster virus. The *Varilrix*[®] and *Varivax*[®] vaccines provide protection against varicella (chickenpox)—there is no data on interchangeability between these 2 vaccines, but it is likely that a course can be completed effectively with the different vaccine. The *Zostavax*[®] vaccine has a significantly higher antigen content than the chickenpox vaccines and is used to provide protection against herpes zoster (shingles).

Pre-exposure prophylaxis against varicella (chickenpox)

Varicella immunisation aims to protect individuals who are at most risk of serious illness from exposure to the varicella-

zoster virus, by vaccinating specific individuals who are in regular or close contact with those at risk. Individuals with a definite history of chickenpox or shingles can be considered immune. However, for individuals born and raised overseas a history of chickenpox is a less reliable predictor of immunity and routine testing should be considered.

Vaccination with the chickenpox varicella-zoster vaccine (*Varilrix*[®] or *Varivax*[®]) is recommended for:

- non-immune or varicella-zoster antibody-negative healthcare workers who have patient contact (including cleaners, catering staff, and receptionists);
- non-immune laboratory staff who may be exposed to varicella-zoster virus in the course of their work in virology laboratories and clinical infectious disease units;
- non-immune healthy susceptible contacts of immunocompromised patients where continuing close contact is unavoidable.

Children aged 1 year and over and adults, should receive 2 doses of the chickenpox varicella-zoster vaccine at least 4–8 weeks apart. Vaccination should be postponed in acutely unwell individuals until they have fully recovered, unless protection is urgently required.

Within 1 month of vaccination, some individuals may develop a localised rash at the injection site or a generalised rash (papular or vesicular). Healthcare workers who develop a post-vaccine rash should consult their occupational health department for assessment before commencing work. The vaccine virus strain can also establish latent infection and reactivate to cause shingles in some individuals (the risk is substantially lower than with wild chickenpox infection)—cases of shingles should be investigated. For further information on vaccine-related cutaneous rashes, see *Cautions, further information in varicella-zoster vaccine*, and Chapter 34, *Varicella*, in *Immunisation against infectious disease*- ‘The Green Book’ (see *Useful resources*).

The chickenpox vaccines are not recommended for individuals with immunosuppression—seek specialist advice for those who require protection against chickenpox. Refer to the British HIV Association or Children’s HIV Association for information on the use of varicella-zoster vaccines in individuals with HIV infection (available at: www.bhiva.org/guidelines and www.chiva.org.uk).

For information on post-exposure management, see *Varicella-zoster immunoglobulin* in *Immunoglobulins* p. 1342. Chickenpox is only a notifiable disease in Northern Ireland. For further information, see *Notifiable diseases in Antibacterials, principles of therapy* p. 531.

Immunisation against herpes zoster (shingles)

The national shingles vaccination programme (launched on 1st September 2013) aims to lower the incidence and severity of shingles in older people, in whom the risk and severity of disease, and of subsequent post herpetic neuralgia (PHN) is higher.

Although the shingles varicella-zoster vaccine is licensed for use in individuals aged 50 years and over, immunisation should only be offered to individuals aged 70–79 years as part of the national immunisation program. This is because the burden of shingles disease is generally not as severe in individuals aged 50–69 years, and because of the limited vaccine effectiveness in older individuals. Inadvertent vaccination with the shingles vaccine in individuals aged under 50 years is unlikely to result in serious adverse effects as they are likely to be immune to chickenpox.

Eligible individuals who missed the opportunity to be vaccinated (as a result of lockdown or when shielding was recommended) during the COVID-19 pandemic and who turned 80 years during that period, can still be offered the shingles varicella-zoster vaccine temporarily. For further information, see PHE: **Shingles vaccination: eligibility information** (available at: www.gov.uk/government/

[publications/shingles-vaccination-eligibility-poster/whos-eligible-for-shingles-vaccination](http://www.gov.uk/government/publications/shingles-vaccination-eligibility-poster/whos-eligible-for-shingles-vaccination)).

Individuals should be offered a single dose of the shingles varicella-zoster vaccine. This aims to boost immunity in individuals with pre-existing varicella-zoster virus immunity to prevent the development of shingles in later years and significantly reduce the incidence of PHN. Administration of the shingles vaccine should be delayed in individuals who are being treated with oral or intravenous antivirals (such as aciclovir) until 48 hours after cessation of treatment. The need for a booster dose has not been established.

The shingles vaccine is not recommended for the treatment of shingles or PHN, but it can be given to those with a previous history of shingles. For further information see, Chapter 28a, *Shingles (herpes zoster)*, in *Immunisation against infectious disease*- ‘The Green Book’ (see *Useful resources*).

There is a theoretical risk that individuals who develop a rash following shingles vaccination could transmit the attenuated vaccine virus to a susceptible individual. Individuals who develop a vesicular rash or varicella-zoster virus-like rash after shingles vaccination, should take precautionary measures and be tested. For further information, see Public Health England guidance: **Shingles vaccination: guidance for healthcare professionals** (available at: www.gov.uk/government/publications/shingles-vaccination-guidance-for-healthcare-professionals), and Chapter 28a, *Shingles (herpes zoster)*, in *Immunisation against infectious disease*- ‘The Green Book’ (see *Useful resources*).

Immunisation against shingles for individuals with immunosuppression should be based on clinical risk assessment—seek specialist advice for those who require protection against shingles. For further information, see Chapter 28a, *Shingles (herpes zoster)*, in *Immunisation against infectious disease*- ‘The Green Book’ (see *Useful resources*). Refer to the British HIV Association for information on the use of varicella-zoster vaccines in individuals with HIV infection (available at: www.bhiva.org/guidelines).

For information on post-exposure management, see *Varicella-zoster immunoglobulin* in *Immunoglobulins* p. 1342.

Pregnancy

The varicella-zoster vaccines are not recommended during pregnancy, and pregnancy should be avoided for 1 month after the last dose of the chickenpox varicella-zoster vaccine.

All exposure to varicella-zoster vaccine from 3 months before conception to any time during pregnancy, should be reported to the Immunisation Department of Public Health England (PHE) who run UK-wide surveillance on the safety of vaccines given in pregnancy. For advice on the reporting, risk assessment, and management of inadvertent vaccination in pregnancy, see PHE guidance: **Vaccination in pregnancy (VIP)** (available at: www.gov.uk/guidance/vaccination-in-pregnancy-vip). Pregnant women should be advised to seek prompt medical advice if they develop a vesicular rash following inadvertent vaccination with a varicella-zoster vaccine p. 1393.

Useful Resources

Recommendations reflect Chapter 28a, *Shingles (herpes zoster)*, in *Immunisation against infectious disease*- ‘The Green Book’. Public Health England, February 2016. www.gov.uk/government/publications/shingles-herpes-zoster-the-green-book-chapter-28a

Recommendations reflect Chapter 34, *Varicella*, in *Immunisation against infectious disease*- ‘The Green Book’. Public Health England, August 2015. www.gov.uk/government/publications/varicella-the-green-book-chapter-34

Yellow fever vaccine

23-Jan-2020

MHRA/CHM advice: stronger precautions in people with weakened immunity and in those aged 60 years or older

The MHRA and CHM have released important safety information regarding the use of the live yellow fever vaccine in those with weakened immunity, and in those aged 60 years or older. For further information, see *Important safety information for yellow fever vaccine*, live p. 1394.

Overview

Yellow fever vaccine, live is an attenuated preparation of yellow fever virus grown in chick eggs. Yellow fever vaccine, live is recommended for:

- laboratory workers handling infected material;
- individuals aged 9 months or older who are travelling to, or living in areas or countries with a risk of yellow fever transmission;
- individuals aged 9 months or older who are travelling to, or living in countries that require an International Certificate of Vaccination or Prophylaxis (ICVP) for entry (information about countries at risk of yellow fever is available from the National Travel Health Network and Centre).

Children aged under 9 months are at higher risk of vaccine-associated encephalitis, with the risk being inversely proportional to age. Children aged under 6 months should **not** be vaccinated. Children aged 6–9 months should only be vaccinated following a detailed risk assessment, and vaccination is generally only recommended if the risk of yellow fever transmission is high (such as during epidemics/outbreaks). If travel is unavoidable, seek expert advice on whether to vaccinate.

Yellow fever vaccine, live should be avoided in individuals with primary or acquired immunodeficiency due to a congenital condition or disease process, and in individuals who are immunosuppressed as a result of treatment.

If the yellow fever risk is unavoidable in HIV-infected individuals, consult the British HIV Association (bhiva.org/vaccination-guidelines) or other specialist advice.

For additional guidance on the suitability of immunisation against yellow fever, standardised checklists are available from: National Travel Health Network and Centre (see *Useful resources*) or Health Protection Scotland (www.Travax.nhs.uk).

A single-dose of yellow fever vaccine, live confers life-long immunity against yellow fever disease. Immunisation should be performed at least 10 days before travelling to an endemic area to allow protective immunity to develop and for the ICVP (if required) to become valid.

Reinforcing immunisation is not needed, except for a small subset of individuals at continued risk who may not have developed long-term protection from their initial yellow fever vaccine, live vaccination—seek expert advice.

All suspected cases of yellow fever must be notified to the local health protection unit. Where there is a community level outbreak, specialist advice should be sought from Public Health England (tel. 020 8200 4400) or, in Scotland, Health Protection Scotland (tel. 0140 300 1191).

Useful Resources

Recommendations reflect Chapter 35, Yellow fever, in *Immunisation against infectious disease*—‘The Green Book’. Public Health England, January 2020.

Travel vaccinations and precautions

28-Oct-2020

Immunisation for travel

The National Travel Health Network and Centre have issued guidance on how to manage interrupted vaccination schedules which includes general principles for consideration, such as keeping to the recommended schedules, lengthening and shortening schedules, off-label administration and re-starting courses. For further information, see travelhealthpro.org.uk/news/517/interrupted-vaccination-schedules-general-principles-for-travel-health-professionals.

No special immunisation is required for travellers to the United States, Europe, Australia, or New Zealand, although all travellers should have immunity to tetanus and poliomyelitis (and childhood immunisations should be up to date); the tick-borne encephalitis vaccine is recommended for immunisation of those working in, or visiting, high-risk areas. Certain special precautions are required in non-European areas surrounding the Mediterranean, in Africa, the Middle East, Asia, and South America.

Travellers to areas that have a high incidence of **poliomyelitis** should be immunised with the appropriate vaccine; previously immunised travellers may be given a booster dose of a preparation containing inactivated poliomyelitis vaccine.

Immunisation against **meningococcal meningitis** is recommended for a number of areas of the world.

Travellers who have not had a tetanus booster in the last 10 years and are visiting areas where medical attention may not be accessible should receive a booster dose of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine, even if they have received 5 doses of a tetanus-containing vaccine previously.

There is no requirement for cholera vaccination as a condition for entry into any country, but **oral cholera vaccine** should be considered for backpackers and those travelling to situations where the risk is greatest (e.g. refugee camps). Regardless of vaccination, travellers to areas where cholera is endemic should take special care with food hygiene.

Advice on **diphtheria** is available from the National Travel Health Network and Centre (see *Useful resources*).

For guidance on immunisation against the following infectious diseases, refer to the individual treatment summaries listed:

- Hepatitis A (see Hepatitis A vaccine p. 1359).
- Hepatitis B (see hepatitis B vaccine p. 1360).
- Japanese encephalitis (see Japanese encephalitis vaccine p. 1364).
- Rabies (see Rabies vaccine p. 1369).
- Tick-borne encephalitis (see Tick-borne encephalitis vaccine p. 1372).
- Tuberculosis (see Bacillus Calmette–Guérin vaccine p. 1354).
- Typhoid (see Typhoid vaccine p. 1372).
- Yellow fever (see Yellow fever vaccine above).

Immunisation requirements change from time to time, and information on the current requirements for any particular country may be obtained from the embassy or legation of the appropriate country; or the National Travel Health Network and Centre, Health Protection Scotland, the Welsh Government, or the Department of Health Northern Ireland (see *Useful resources*).

Precautions for avoiding infectious disease

In areas where sanitation is poor, good food hygiene is important to help prevent hepatitis A, typhoid, cholera, and other diarrhoeal diseases (including travellers' diarrhoea). Food should be freshly prepared and hot, and uncooked

vegetables (including green salads) should be avoided; only fruits which can be peeled should be eaten. Only suitable bottled water, or tap water that has been boiled or treated with sterilising tablets, should be used for drinking.

For guidance on malaria precautions, see Malaria, prophylaxis p. 651 and Malaria, treatment p. 657.

Further information on preventing or reducing the risk of infectious diseases when travelling, visiting, working, or living in high risk areas is available from the National Travel Health Network and Centre and Health Protection Scotland (see *Useful resources*).

VACCINES

Vaccines

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (UPDATED NOVEMBER 2017)

Following reports of death in neonates who received a live attenuated vaccine after exposure to a tumor necrosis factor alpha (TNF- α) inhibitor in utero, the MHRA has issued the following advice:

- any infant who has been exposed to immunosuppressive treatment from the mother either in utero during pregnancy or via breastfeeding should have any live attenuated vaccination deferred for as long as a postnatal influence on the immune status of the infant remains possible;
- in the case of infants who have been exposed to TNF- α inhibitors and other immunosuppressive biological medicines in utero, PHE advise that any live attenuated vaccination (e.g. BCG vaccine) should be deferred until the infant is age 6 months;
- PHE advise if there is any doubt as to whether an infant due to receive a live attenuated vaccine may be immunosuppressed due to the mother's therapy, including exposure through breast-feeding, specialist advice should be sought.

CONTRA-INDICATIONS

- **impaired immune response** Public Health England advises severely immunosuppressed patients should not be given live vaccines (including those with severe primary immunodeficiency).

CAUTIONS

- **Acute illness** • minor illnesses
- **CAUTIONS, FURTHER INFORMATION** PHE advises vaccination may be postponed if the individual is suffering from an acute illness; however, it is not necessary to postpone immunisation in patients with minor illnesses without fever or systemic upset.

- **impaired immune response and drugs affecting immune response** Immune response to vaccines may be reduced in immunosuppressed patients and there is also a risk of generalised infection with live vaccines.

PHE advises:

- specialist advice should be sought for immunosuppressed patients, or those being treated with high doses of corticosteroids (dose equivalents of

prednisolone: **adults**, at least 40 mg daily for more than 1 week or at least 20 mg daily for more than 14 days; **children**, 2 mg/kg (or more than 40 mg) daily for more than 1 week or 1 mg/kg (or more than 20 mg) daily for more than 14 days) or other immunosuppressive drugs, or those being treated for malignant or non-malignant conditions with chemotherapy or generalised radiotherapy. Live vaccines should be postponed until at least 3 months after stopping high-dose systemic corticosteroids or non-biological oral immune modulating drugs, and at least 6 months after stopping other immunosuppressive drugs or generalised radiotherapy (at least 12 months after discontinuing immunosuppressive biological therapy).

- ▶ **Predisposition to neurological problems** PHE advises:

- when there is a personal or family history of *febrile convulsions*, there is an increased risk of these occurring during fever from any cause including immunisation, but this is not a contra-indication to immunisation. In children who have had a seizure associated with fever without neurological deterioration, immunisation is *recommended*; advice on the *management of fever* should be given before immunisation. When a child has had a convulsion not associated with fever, and the neurological condition is not deteriorating, immunisation is *recommended*;
- children with stable neurological disorders (e.g. spina bifida, congenital brain abnormality, and peri-natal hypoxic-ischaemic encephalopathy) should be immunised according to the recommended schedule;
- when there is a *still evolving neurological problem*, including poorly controlled epilepsy, immunisation should be deferred and the child referred to a specialist. Immunisation is recommended if a cause for the neurological disorder is identified. If a cause is not identified, immunisation should be deferred until the condition is stable.

SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain • appetite decreased • arthralgia • diarrhoea • dizziness • fatigue • fever • headache • irritability • lymphadenopathy • malaise • myalgia • nausea • skin reactions • vomiting
- ▶ **Uncommon** Hypersensitivity
- **ALLERGY AND CROSS-SENSITIVITY** PHE advises contra-indicated in patients with a confirmed anaphylactic reaction to a preceding dose of a vaccine containing the same antigens or vaccine component (such as antibacterials in viral vaccines).
- **PREGNANCY** Live vaccines should not be administered routinely to pregnant women because of the theoretical risk of fetal infection but where there is a significant risk of exposure to disease, the need for vaccination usually outweighs any possible risk to the fetus. Termination of pregnancy following inadvertent immunisation is not recommended. There is no evidence of risk from vaccinating pregnant women with inactivated viral or bacterial vaccines or toxins.
- **BREAST FEEDING** Although there is a theoretical risk of live vaccine being present in breast milk, vaccination is not contra-indicated for women who are breast-feeding when there is significant risk of exposure to disease. There is no evidence of risk from vaccinating women who are breast-feeding, with inactivated viral or bacterial vaccines or toxins.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises if alcohol or disinfectant is used for cleansing the skin it should be allowed to evaporate before vaccination to prevent possible inactivation of live vaccines. Public Health England advises when 2 or more live vaccines are required (and are not available as a combined preparation), they can be administered at any time before

or after each other at different sites, preferably in a different limb; if more than one injection is to be given in the same limb, they should be administered at least 2.5 cm apart. See also Cautions, further information in Bacillus Calmette–Guérin vaccine p. 1377 and in measles, mumps and rubella vaccine, live p. 1390.

Vaccines should not be given intravenously. Most vaccines are given by the intramuscular route, although some are given by either the intradermal, deep subcutaneous, or oral route. Public Health England advises the intramuscular route is usually avoided in patients with **bleeding disorders** such as haemophilia or thrombocytopenia; vaccines usually given by the intramuscular route can be given by deep subcutaneous injection instead.

Particular attention must be paid to instructions on the use of diluents. Vaccines which are liquid suspensions or are reconstituted before use should be adequately mixed to ensure uniformity of the material to be injected.

- **HANDLING AND STORAGE** Care must be taken to store all vaccines under the conditions recommended in the product literature, otherwise the preparation may become ineffective. **Refrigerated storage** is usually necessary; many vaccines need to be stored at 2–8°C and not allowed to freeze. Vaccines should be protected from light. Reconstituted vaccines and opened multidose vials must be used within the period recommended in the product literature. Unused vaccines should be disposed of by incineration at a registered disposal contractor.

VACCINES > BACTERIAL AND VIRAL VACCINES, COMBINED

F 1375

Diphtheria with tetanus and poliomyelitis vaccine

● INDICATIONS AND DOSE

Primary immunisation

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 10–17 years: 0.5 mL every month for 3 doses
- ▶ Adult: 0.5 mL every month for 3 doses

Booster doses

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 10–17 years: 0.5 mL for 1 dose, first booster dose—should be given 3 years after primary course (this interval can be reduced to a minimum of 1 year if the primary course was delayed), then 0.5 mL for 1 dose, second booster dose—should be given 10 years after first booster dose (this interval can be reduced to a minimum of 5 years if previous doses were delayed), second booster dose may also be used as first booster dose in those over 10 years who have received only 3 previous doses of a diphtheria-containing vaccine
- ▶ Adult: 0.5 mL for 1 dose, first booster dose—should be given 3 years after primary course (this interval can be reduced to a minimum of 1 year if the primary course was delayed), then 0.5 mL for 1 dose, second booster dose—should be given 10 years after first booster dose (this interval can be reduced to a minimum of 5 years if previous doses were delayed), second booster dose may also be used as first booster dose in those over 10 years who have received only 3 previous doses of a diphtheria-containing vaccine

● SIDE-EFFECTS

- ▶ **Common or very common** Vertigo
- ▶ **Frequency not known** Asthenia · chills · face oedema · influenza like illness · nerve disorders · pallor · seizure · shock · syncope · vaccination reactions

- **PRESCRIBING AND DISPENSING INFORMATION** Available as part of childhood schedule from health organisations or ImmForm.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

EXCIPIENTS: May contain Neomycin, polymyxin b, streptomycin

- ▶ **Revaxis** (Sanofi Pasteur)

Revaxis vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £7.80 DT = £7.80

F 1375

Diphtheria with tetanus, pertussis and poliomyelitis vaccine

29-Jul-2020

● INDICATIONS AND DOSE

First booster dose

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 3–9 years: 0.5 mL, to be given 3 years after primary immunisation

Vaccination of pregnant women against pertussis (using low dose vaccines)

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Females of childbearing potential: 0.5 mL for 1 dose

● SIDE-EFFECTS

- ▶ **Uncommon** Apathy (in children) · asthma · chills · drowsiness (very common in children) · dry throat (in children) · extensive swelling of vaccinated limb (very common in children) · oral herpes · pain · paraesthesia · sleep disorder (in children)
- ▶ **Frequency not known** Angioedema · asthenia · hypotonic-hyporesponsive episode · seizure

SIDE-EFFECTS, FURTHER INFORMATION The incidence of local and systemic reactions is lower with acellular pertussis vaccines than with whole-cell pertussis vaccines used previously.

Compared with primary vaccination, injection site reactions are more common with booster doses of vaccines containing acellular pertussis.

Public Health England has advised (2016) that the vaccine should not be withheld from children with a history to a preceding dose of: fever, irrespective of severity; hypotonic-hyporesponsive episodes; persistent crying or screaming for more than 3 hours; severe local reaction, irrespective of extent.

- **PREGNANCY** Contra-indicated in pregnant women with a history of encephalopathy of unknown origin within 7 days of previous immunisation with a pertussis-containing vaccine. Contra-indicated in pregnant women with a history of transient thrombocytopenia or neurological complications following previous immunisation against diphtheria or tetanus.
- **PRESCRIBING AND DISPENSING INFORMATION** Pregnant women should be vaccinated using low dose vaccines (brands may include *Boostrix-IPV*[®] or *Repevax*[®]). Available as part of childhood immunisation schedule from health organisations or ImmForm. Available for vaccination of pregnant women from ImmForm.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

EXCIPIENTS: May contain Neomycin, polymyxin b, streptomycin

- ▶ **Boostrix-IPV** (GlaxoSmithKline UK Ltd)

Boostrix-IPV suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £22.74 DT = £20.00

- ▶ **Repevax** (Sanofi Pasteur)

Repevax vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £20.00 DT = £20.00

F 1375

Diphtheria with tetanus, pertussis, hepatitis B, poliomyelitis and haemophilus influenzae type b vaccine

12-Oct-2017

● INDICATIONS AND DOSE

Primary immunisation (first dose)

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Child 2 months: 0.5 mL for 1 dose

Primary immunisation (second dose)

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Child 3 months: 0.5 mL for 1 dose, preferably administer at a different injection site to that of first dose

Primary immunisation (third dose)

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Child 4 months: 0.5 mL for 1 dose, preferably administer at a different injection site to that of second dose

● SIDE-EFFECTS

- ▶ **Common or very common** Anxiety · crying abnormal · drowsiness
- ▶ **Uncommon** Cough · extensive swelling of vaccinated limb · increased risk of infection
- ▶ **Rare or very rare** Angioedema · apnoea · hypotonic-hyporesponsiveness episode · seizure · swelling · thrombocytopenia

- **PRESCRIBING AND DISPENSING INFORMATION** Available as part of childhood schedule from health organisations or ImmForm.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder and suspension for suspension for injection

- EXCIPIENTS: May contain Neomycin, polymyxin b
- ▶ **Infanrix Hexa** (GlaxoSmithKline UK Ltd)
Infanrix Hexa vaccine powder and suspension for suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [PoM] 

F 1375

Diphtheria with tetanus, pertussis, poliomyelitis and haemophilus influenzae type b vaccine

● INDICATIONS AND DOSE

Primary immunisation

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 2 months-9 years: 0.5 mL every month for 3 doses

- **UNLICENSED USE** *Infanrix-IPV+ Hib*[®] not licensed for use in children over 36 months; *Pediacel*[®] not licensed in children over 4 years. However, the Department of Health recommends that these be used for children up to 10 years.

● SIDE-EFFECTS

- ▶ **Common or very common** Crying abnormal · drowsiness · restlessness
- ▶ **Uncommon** Cough · extensive swelling of vaccinated limb · increased risk of infection · rhinorrhoea
- ▶ **Frequency not known** Angioedema · apnoea · hypotonic-hyporesponsiveness episode · seizure

SIDE-EFFECTS, FURTHER INFORMATION The incidence of local and systemic reactions is lower with acellular pertussis vaccines than with whole-cell pertussis vaccines used previously.

Compared with primary vaccination, injection site reactions are more common with booster doses of vaccines containing acellular pertussis.

Public Health England has advised (2016) that the vaccine should not be withheld from children with a history to a preceding dose of: fever, irrespective of severity; hypotonic-hyporesponsive episodes; persistent crying or screaming for more than 3 hours; severe local reaction, irrespective of extent.

- **PRESCRIBING AND DISPENSING INFORMATION** Available as part of childhood schedule from health organisations or ImmForm.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder and suspension for suspension for injection

- ▶ **Infanrix-IPV + Hib** (GlaxoSmithKline UK Ltd)
Infanrix-IPV + Hib vaccine powder and suspension for suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £27.86

VACCINES > BACTERIAL VACCINES

F 1375

Anthrax vaccine

31-Jan-2019

● INDICATIONS AND DOSE

Immunisation against anthrax

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ **Adult:** Initially 0.5 mL every 3 weeks for 3 doses, followed by 0.5 mL after 6 months, to be administered in the deltoid region

Booster

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ **Adult:** 0.5 mL every 10 years for up to 3 doses, to be administered in deltoid region

● SIDE-EFFECTS

- ▶ **Common or very common** Febrile disorders · influenza like illness
- ▶ **Rare or very rare** Angioedema · asthenia · hyperhidrosis · paraesthesia
- ▶ **Frequency not known** Bronchospasm · circulatory collapse · hypotension
- **PRESCRIBING AND DISPENSING INFORMATION** Available from Public Health England's Centre for Emergency Preparedness and Response (Porton Down).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

- EXCIPIENTS: May contain Thiomersal
- ▶ **Anthrax vaccine (Non-proprietary)**
Anthrax vaccine (alum precipitated sterile filtrate) suspension for injection 0.5ml ampoules | 5 ampoule [PoM] 
- ▶ **BioThrax** (Secretary of State for Health) ▼
BioThrax suspension for injection 5ml multidose vials | 1 vial [PoM] £751.71 | 300 vial [PoM] £225,513.09

F 1375

Bacillus Calmette-Guérin vaccine

24-Sep-2020

(BCG Vaccine)

- **DRUG ACTION** BCG (Bacillus Calmette-Guérin) is a live attenuated strain derived from *Mycobacterium bovis* which stimulates the development of immunity to *M. tuberculosis*.

● INDICATIONS AND DOSE

Immunisation against tuberculosis

- ▶ BY INTRADERMAL INJECTION
- ▶ **Child 1-11 months:** 0.05 mL, to be injected at insertion of deltoid muscle onto humerus (keloid formation more likely with sites higher on arm); tip of shoulder should be **avoided**

continued →

- ▶ Child 1-17 years: 0.1 mL, to be injected at insertion of deltoid muscle onto humerus (keloid formation more likely with sites higher on arm); tip of shoulder should be **avoided**
- ▶ Adult: 0.1 mL, to be injected at insertion of deltoid muscle onto humerus (keloid formation more likely with sites higher on arm); tip of shoulder should be **avoided**

● **CONTRA-INDICATIONS** Children less than 2 years of age in household contact with known or suspected case of active tuberculosis · generalised septic skin conditions

CONTRA-INDICATIONS, FURTHER INFORMATION

Manufacturer advises using a lesion-free site to administer BCG vaccine to patients with eczema.

● **CAUTIONS** When BCG is given to infants, there is no need to delay routine primary immunisations. No further vaccination should be given in the arm used for BCG vaccination for at least 3 months because of the risk of regional lymphadenitis.

● **INTERACTIONS** → Appendix 1: live vaccines

● **SIDE-EFFECTS**

▶ **Uncommon** Lymphadenitis suppurative

▶ **Rare or very rare** Osteitis · osteomyelitis

▶ **Frequency not known** Seizure · syncope

● **PRE-TREATMENT SCREENING** Apart from children under 6 years, any person being considered for BCG immunisation must first be given a skin test for hypersensitivity to tuberculin protein (see tuberculin purified protein derivative p. 1350). A skin test is not necessary for a child under 6 years provided that the child has not stayed for longer than 3 months in a country with an incidence of tuberculosis greater than 40 per 100 000, the child has not had contact with a person with tuberculosis, and there is no family history of tuberculosis within the last 5 years.

● **DIRECTIONS FOR ADMINISTRATION**

Intradermal injection technique Public Health England advises skin is stretched between thumb and forefinger and needle (size 26G) inserted (bevel upwards) for about 3 mm into superficial layers of dermis (almost parallel with surface). Needle should be short with short bevel (can usually be seen through epidermis during insertion). Tense raised blanched bleb is sign of correct injection; 7 mm bleb ≡ 0.1 mL injection, 3 mm bleb ≡ 0.05 mL injection; if considerable resistance not felt, needle too deep and should be removed and reinserted before giving more vaccine. Jet injectors and multiple puncture devices should not be used.

● **PRESCRIBING AND DISPENSING INFORMATION** Available from health organisations or direct from ImmForm portal. immform.phe.gov.uk (SSI brand, multidose vial with diluent).

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for injection

▶ **Bacillus calmette-guérin vaccine (Non-proprietary)**

BCG Vaccine AUV powder for suspension for injection 1ml vials | 10 vial  

Cholera vaccine

● **INDICATIONS AND DOSE**

Immunisation against cholera (for travellers to endemic or epidemic areas on the basis of current recommendations)

▶ **BY MOUTH**

▶ Child 2-5 years: 1 dose every 1-6 weeks for 3 doses, if more than 6 weeks have elapsed between doses, the primary course should be restarted, immunisation should be completed at least one week before potential exposure

▶ Child 6-17 years: 1 dose every 1-6 weeks for 2 doses, if more than 6 weeks have elapsed between doses, the primary course should be restarted, immunisation should be completed at least one week before potential exposure

▶ Adult: 1 dose every 1-6 weeks for 2 doses, if more than 6 weeks have elapsed between doses, the primary course should be restarted, immunisation should be completed at least one week before potential exposure

Booster

▶ **BY MOUTH**

▶ Child 2-5 years: A single booster dose can be given within 6 months after primary course, if more than 6 months have elapsed since the last vaccination, the primary course should be repeated

▶ Child 6-17 years: A single booster dose can be given within 2 years after primary course, if more than 2 years have elapsed since the last vaccination, the primary course should be repeated

▶ Adult: A single booster dose can be given within 2 years after primary course, if more than 2 years have elapsed since the last vaccination, the primary course should be repeated

● **CONTRA-INDICATIONS** Acute gastro-intestinal illness

● **INTERACTIONS** → Appendix 1: cholera vaccine

● **SIDE-EFFECTS**

▶ **Uncommon** Gastrointestinal discomfort · gastrointestinal disorders

▶ **Rare or very rare** Chills · cough · dehydration · drowsiness · hyperhidrosis · increased risk of infection · insomnia · pulmonary reaction · syncope · taste altered · throat pain

▶ **Frequency not known** Angioedema · asthenia · dyspnoea · hypertension · influenza like illness · lymphadenitis · pain · paraesthesia · sputum increased

● **DIRECTIONS FOR ADMINISTRATION**

▶ In children Manufacturer advises dissolve effervescent sodium bicarbonate granules in a glassful of water or chlorinated water (approximately 150 mL). For children over 6 years, add vaccine suspension to make one dose. For child 2-5 years, discard half (approximately 75 mL) of the solution, then add vaccine suspension to make one dose. Drink within 2 hours. Food, drink, and other oral medicines should be avoided for 1 hour before and after vaccination.

▶ In adults Manufacturer advises dissolve effervescent sodium bicarbonate granules in a glassful of water or chlorinated water (approximately 150 mL). Add vaccine suspension to make one dose. Drink within 2 hours. Food, drink, and other oral medicines should be avoided for 1 hour before and after vaccination.

● **PATIENT AND CARER ADVICE** Counselling on administration advised. Immunisation with cholera vaccine does not provide complete protection and all travellers to a country where cholera exists should be warned that scrupulous attention to food, water, and personal hygiene is **essential**.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Oral suspension

- ▶ **Dukoral** (Valveva UK Ltd)
Dukoral cholera vaccine oral suspension | 2 dose [PoM] £26.35 DT = £26.35

F 1375

Haemophilus influenzae type b with meningococcal group C vaccine

● INDICATIONS AND DOSE

Booster dose (for infants who have received primary immunisation with a vaccine containing *Haemophilus influenzae* type b component) and primary immunisation against *Neisseria meningitidis*

▶ BY INTRAMUSCULAR INJECTION

- ▶ Child 12–13 months: 0.5 mL for 1 dose

Immunisation against *Neisseria meningitidis* in an unimmunised patient

▶ BY INTRAMUSCULAR INJECTION

- ▶ Child 1–9 years: 0.5 mL for 1 dose

Booster dose (for children who have not been immunised against *Haemophilus influenzae* type b) | Booster dose after recovery from *Haemophilus influenzae* type b disease (for index cases previously vaccinated, with low Hib antibody concentration or if it is not possible to measure antibody concentration)

▶ BY INTRAMUSCULAR INJECTION

- ▶ Child 1–9 years: 0.5 mL for 1 dose

Booster dose after recovery from *Haemophilus influenzae* type b disease (for fully vaccinated index cases with asplenia or splenic dysfunction, if previous dose received over 1 year ago)

▶ BY INTRAMUSCULAR INJECTION

- ▶ Child 1–17 years: 0.5 mL for 1 dose
- ▶ Adult: 0.5 mL for 1 dose

Booster dose (for patients diagnosed with asplenia, splenic dysfunction or complement deficiency at under 2 years of age)

▶ BY INTRAMUSCULAR INJECTION

- ▶ Child 2–17 years: 0.5 mL for 1 dose, this booster dose should be given after the second birthday, this is the second dose of haemophilus influenzae type B vaccine combined with meningococcal group C conjugate vaccine (the first dose is given during the routine immunisation schedule)

Booster dose (for patients diagnosed with asplenia, splenic dysfunction or complement deficiency at over 2 years of age)

▶ BY INTRAMUSCULAR INJECTION

- ▶ Child 2–17 years: 0.5 mL for 1 dose, this booster dose should be followed 2 months later by one dose of meningococcal A, C, W135, and Y conjugate vaccine (in patients from 11 years of age, this interval can be reduced to one month)
- ▶ Adult: 0.5 mL for 1 dose, this booster dose should be followed 1 month later by one dose of meningococcal A, C, W135, and Y conjugate vaccine

- **UNLICENSED USE** Not licensed for use in patients over 2 years.

● SIDE-EFFECTS

- ▶ **Common or very common** Drowsiness
- ▶ **Uncommon** Crying
- ▶ **Rare or very rare** Insomnia
- ▶ **Frequency not known** Febrile seizure · meningism (but no evidence that vaccine causes meningococcal C meningitis) · muscle tone decreased

- **PRESCRIBING AND DISPENSING INFORMATION** Available as part of the childhood immunisation schedule from ImmForm.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

- ▶ **Menitorix** (GlaxoSmithKline UK Ltd)
Menitorix vaccine powder and solvent for solution for injection 0.5mL vials | 1 vial [PoM] £37.76 DT = £37.76

F 1375

Meningococcal group B vaccine (rDNA, component, adsorbed)

19-Oct-2017

● INDICATIONS AND DOSE

BEXSERO®

Immunisation against *Neisseria meningitidis*, primary immunisation

▶ BY DEEP INTRAMUSCULAR INJECTION

- ▶ Child 2 months: 0.5 mL for 1 dose, injected preferably into deltoid region (or anterolateral thigh in infants), for information about the use of paracetamol for prophylaxis of post-immunisation pyrexia, see paracetamol p. 468.
- ▶ Child 4 months: 0.5 mL for 1 dose, injected preferably into deltoid region (or anterolateral thigh in infants), for information about the use of paracetamol for prophylaxis of post-immunisation pyrexia, see paracetamol p. 468.

Immunisation against *Neisseria meningitidis*, primary immunisation booster dose

▶ BY DEEP INTRAMUSCULAR INJECTION

- ▶ Child 12–23 months: 0.5 mL for 1 dose, injected preferably into deltoid region (or anterolateral thigh in infants)

Immunisation against *Neisseria meningitidis*, primary immunisation (in unimmunised patients)

▶ BY DEEP INTRAMUSCULAR INJECTION

- ▶ Child 6–11 months: 0.5 mL for 2 doses, separated by an interval of at least 2 months; booster dose of 0.5 mL given between 1–2 years of age and at least 2 months after completion of primary immunisation, injected preferably into deltoid region (or anterolateral thigh in infants)
- ▶ Child 12–23 months: 0.5 mL for 2 doses, separated by an interval of at least 2 months; booster dose of 0.5 mL given 12–24 months after completion of primary immunisation, injected preferably into deltoid region (or anterolateral thigh in infants)
- ▶ Child 2–10 years: 0.5 mL for 2 doses, separated by an interval of at least 2 months. Injected preferably into deltoid region (or anterolateral thigh in infants)
- ▶ Child 11–17 years: 0.5 mL for 2 doses, separated by an interval of at least 1 month. Injected preferably into deltoid region
- ▶ Adult: 0.5 mL for 2 doses, separated by an interval of at least 1 month. Injected preferably into deltoid region

TRUMENBA®

Immunisation against *Neisseria meningitidis*, primary immunisation

▶ BY INTRAMUSCULAR INJECTION

- ▶ Child 10–17 years: 0.5 mL for 2 doses, separated by an interval of 6 months, alternatively 0.5 mL for 2 doses, separated by an interval of at least 1 month, followed by 0.5 mL as a third dose, given at least 4 months after the second dose, injected preferably into deltoid region, a booster dose should be considered for individuals at continued risk—consult product literature

continued →

- ▶ **Adult:** 0.5 mL for 2 doses, separated by an interval of 6 months, alternatively 0.5 mL for 2 doses, separated by an interval of at least 1 month, followed by 0.5 mL as a third dose, given at least 4 months after the second dose, injected preferably into deltoid region, a booster dose should be considered for individuals at continued risk—consult product literature

● SIDE-EFFECTS

- ▶ **Common or very common** Crying abnormal (in children) · drowsiness (in children) · eating disorder (in children)
- ▶ **Uncommon** Seizures (in children) · vascular disorders (in children)
- ▶ **Frequency not known** Extensive swelling of vaccinated limb · hypotonic-hyporesponsiveness episode (in children)

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

EXCIPIENTS: May contain Kanamycin

- ▶ **Bexsero** (GlaxoSmithKline UK Ltd)
Bexsero vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £75.00
- ▶ **Trumenba** (Pfizer Ltd) ▼
Trumenba vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £75.00

F 1375

Meningococcal group C vaccine

24-Sep-2020

● INDICATIONS AND DOSE

Patients with confirmed serogroup C disease (who have previously been immunised)

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 1-17 years: 0.5 mL for 1 dose, dose to be given before discharge from hospital
- ▶ Adult 18-24 years: 0.5 mL for 1 dose, dose to be given before discharge from hospital

● SIDE-EFFECTS

- ▶ **Common or very common** Anxiety (in children) · cough (in children) · crying (in children) · drowsiness (in children) · hyperhidrosis (in children) · increased risk of infection (in children)
- ▶ **Uncommon** Chills · dyspepsia (in children) · eyelid oedema (in children) · flushing (in children) · influenza like illness (rare in children) · joint stiffness (in children)
- ▶ **Rare or very rare** Circulatory collapse (in children)
- ▶ **Frequency not known** Angioedema · apnoea · asthenia (uncommon in children) · dyspnoea · hypotonic-hyporesponsiveness episode · immune thrombocytopenic purpura · meningism (but no evidence that vaccine causes meningococcal C meningitis) · musculoskeletal stiffness (uncommon in children) · nasal congestion (uncommon in children) · oedema (uncommon in children) · pain (very common in children) · respiratory disorders (uncommon in children) · seizures (uncommon in children) · sensation abnormal (uncommon in children) · sleep disorders (very common in children) · Stevens-Johnson syndrome · syncope (uncommon in children)

- **PRESCRIBING AND DISPENSING INFORMATION** Available as part of childhood immunisation schedule from ImmForm portal. immform.phe.gov.uk.

- **MEDICINAL FORMS** No licensed medicines listed.

F 1375

Meningococcal groups A with C and W135 and Y vaccine

● INDICATIONS AND DOSE

MENVEO®

Primary immunisation against *Neisseria meningitidis*

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 13-15 years: 0.5 mL for 1 dose, dose preferably injected into deltoid region

Immunisation against *Neisseria meningitidis* in an unimmunised patient

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 10-17 years: 0.5 mL for 1 dose, booster dose is not required
- ▶ Adult 18-24 years: 0.5 mL for 1 dose, booster dose is not required

Immunisation against *Neisseria meningitidis* in those at risk of exposure to prevent invasive disease

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 3-11 months: 0.5 mL every month for 2 doses, dose preferably injected into deltoid region
- ▶ Child 1-17 years: 0.5 mL for 1 dose, dose preferably injected into deltoid region
- ▶ Adult: 0.5 mL for 1 dose, dose preferably injected into deltoid region

Patients attending university for the first time (who have not received the routine meningococcal groups A with C and W135 and Y conjugate vaccine over the age of 10 years)

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult 18-24 years: 0.5 mL for 1 dose

NIMENRIX®

Primary immunisation against *Neisseria meningitidis*

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 13-15 years: 0.5 mL for 1 dose, to be injected preferably into deltoid region

Immunisation against *Neisseria meningitidis* in an unimmunised patient

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 10-17 years: 0.5 mL for 1 dose, booster dose is not required
- ▶ Adult 18-24 years: 0.5 mL for 1 dose, booster dose is not required

Immunisation against *Neisseria meningitidis* in those at risk of exposure

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 1-17 years: 0.5 mL for 1 dose, to be injected preferably into deltoid region (or anterolateral thigh in child 12-23 months), then 0.5 mL after 1 year if required for 1 dose, second dose should be considered in those who continue to be at risk of *Neisseria meningitidis* serogroup A infection
- ▶ Adult: 0.5 mL for 1 dose, to be injected preferably into deltoid region, then 0.5 mL after 1 year if required for 1 dose, second dose should be considered in those who continue to be at risk of *Neisseria meningitidis* serogroup A infection

Patients attending university for the first time (who have not received the routine meningococcal groups A with C and W135 and Y conjugate vaccine over the age of 10 years)

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult 18-24 years: 0.5 mL for 1 dose

● UNLICENSED USE

MENVEO®

- ▶ In children *Menveo*® is not licensed for use in children under 2 years.

● SIDE-EFFECTS

- ▶ **Common or very common** Drowsiness
- ▶ **Uncommon** Crying · insomnia · numbness · pain in extremity
- ▶ **Frequency not known** Extensive swelling of vaccinated limb

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

- ▶ **Menveo** (GlaxoSmithKline UK Ltd)
Menveo vaccine powder and solvent for solution for injection 0.5ml vials | 1 vial [PoM] £30.00 DT = £30.00
- ▶ **Nimenrix** (Pfizer Ltd)
Nimenrix vaccine powder and solvent for solution for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £30.00 DT = £30.00

F 1375

Pneumococcal polysaccharide conjugate vaccine (adsorbed)

24-Sep-2020

● INDICATIONS AND DOSE

PREVENAR 13[®]

Primary immunisation against pneumococcal infection—first dose [infants born on or after 1 January 2020]

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 12 weeks: 0.5 mL for 1 dose, anterolateral thigh is preferred site of injection in infants under 1 year

Primary immunisation against pneumococcal infection—booster dose [infants born on or after 1 January 2020]

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 1 year: 0.5 mL for 1 dose, anterolateral thigh is preferred site of injection in infants under 1 year; deltoid muscle is preferred in older children

Primary immunisation against pneumococcal infection—in those with asplenia, splenic dysfunction, complement disorder or severe immunocompromise [infants born on or after 1 January 2020]

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 6 weeks–11 months: 0.5 mL for 4 doses, the first two doses to be given at least 8 weeks apart, the third dose to be given on or after their first birthday, and the fourth dose to be given at least 8 weeks later. Anterolateral thigh is preferred site of injection in infants under 1 year; deltoid muscle is preferred in children

Immunisation against pneumococcal infection—unimmunised or partially immunised patients [infants born on or after 1 January 2020]

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 3–11 months: 0.5 mL for 1 dose, followed by 0.5 mL for 1 dose on or after their first birthday, given at least 4 weeks after the first dose. Anterolateral thigh is preferred site of injection in infants under 1 year
- ▶ Child 12–23 months: 0.5 mL for 1 dose, deltoid muscle is preferred site of injection in children

Immunisation against pneumococcal infection—unimmunised or partially immunised patients at increased risk [born on or after 1 January 2020]

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 2–9 years: 0.5 mL for 1 dose, deltoid muscle is preferred site of injection in children

Immunisation against pneumococcal infection—immunised patients with severe immunocompromise [born on or after 1 January 2020]

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 2–17 years: 0.5 mL for 1 dose, deltoid muscle is preferred site of injection in children
- ▶ Adult: 0.5 mL for 1 dose, deltoid muscle is preferred site of injection in adults

Primary immunisation against pneumococcal infection—first dose [infants born on or before 31 December 2019]

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 8 weeks: 0.5 mL for 1 dose, anterolateral thigh is preferred site of injection in infants under 1 year

Primary immunisation against pneumococcal infection—second dose [infants born on or before 31 December 2019]

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 16 weeks: 0.5 mL for 1 dose, anterolateral thigh is preferred site of injection in infants under 1 year

Primary immunisation against pneumococcal infection—booster dose [infants born on or before 31 December 2019]

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 1 year: 0.5 mL for 1 dose, anterolateral thigh is preferred site of injection in infants under 1 year; deltoid muscle is preferred in older children

Immunisation against pneumococcal infection—unimmunised or partially immunised patients [infants born on or before 31 December 2019]

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 3–11 months: 0.5 mL for 2 doses, given 2 months apart (interval may be reduced to 1 month to ensure immunisation schedule is completed), followed by 0.5 mL for 1 dose on their first birthday, given at least 2 months after the last dose. Anterolateral thigh is preferred site of injection in infants under 1 year
- ▶ Child 12–23 months: 0.5 mL for 1 dose, deltoid muscle is preferred site of injection in children

Immunisation against pneumococcal infection—immunised patients at increased risk [born on or before 31 December 2019]

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 14 months–17 years: 0.5 mL for 1 dose, given at least 2 months after primary immunisation booster dose, deltoid muscle is preferred site of injection in children
- ▶ Adult: 0.5 mL for 1 dose, deltoid muscle is preferred site of injection in adults

Immunisation against pneumococcal infection—unimmunised or partially immunised patients at increased risk [born on or before 31 December 2019]

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 3–11 months: 0.5 mL for 2 doses, given 2 months apart (interval may be reduced to 1 month to ensure immunisation schedule is completed), followed by 0.5 mL for 1 dose on their first birthday, given at least 2 months after the last dose, followed by 0.5 mL for 1 dose, given at least 2 months after the last dose. Anterolateral thigh is preferred site of injection in infants under 1 year
- ▶ Adult: 0.5 mL for 1 dose, deltoid muscle is preferred site of injection in adults

SYNFLORIX[®]

Immunisation against pneumococcal infection

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 6 weeks–4 years: Deltoid muscle is preferred site of injection in young children; anterolateral thigh is preferred site in infants (consult product literature)

● UNLICENSED USE

- ▶ **PREVENAR 13[®]** The dose in BNF publications may differ from that in product literature.

● SIDE-EFFECTS

- ▶ **Common or very common** Drowsiness
- ▶ **Uncommon** Apnoea · crying abnormal · extensive swelling of vaccinated limb
- ▶ **Rare or very rare** Angioedema · hypotonic-hyporesponsiveness episode · Kawasaki disease · seizure

● **PRESCRIBING AND DISPENSING INFORMATION**

PREVENAR 13® Available as part of childhood immunisation schedule from ImmForm portal.immform.phe.gov.uk.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection▶ **Prevenar** (Pfizer Ltd)

Prevenar 13 vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £49.10 DT = £49.10 | 10 pre-filled disposable injection [PoM] £491.00

F 1375

Pneumococcal polysaccharide vaccine

01-May-2019

● **INDICATIONS AND DOSE****Primary immunisation against pneumococcal infection**▶ **BY INTRAMUSCULAR INJECTION**

- ▶ Elderly: 0.5 mL for 1 dose, deltoid muscle is preferred site of injection in adults

Immunisation against pneumococcal infection [in patients at increased risk]▶ **BY INTRAMUSCULAR INJECTION**

- ▶ Child 2-17 years: 0.5 mL for 1 dose, dose should be administered at least 2 months after the last dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed), deltoid muscle is preferred site of injection in children and adults
- ▶ Adult: 0.5 mL for 1 dose, deltoid muscle is preferred site of injection in adults, primary immunisation with the pneumococcal polysaccharide vaccine is not required when these patients reach 65 years of age

Immunisation against pneumococcal infection [re vaccination; booster dose in patients with no spleen, splenic dysfunction or chronic kidney disease]▶ **BY INTRAMUSCULAR INJECTION**

- ▶ Child 7-17 years: 0.5 mL every 5 years, deltoid muscle is preferred site of injection in children and adults
- ▶ Adult: 0.5 mL every 5 years, deltoid muscle is preferred site of injection in adults

- **SIDE-EFFECTS** Angioedema · arthritis · asthenia · chills · febrile seizure · haemolytic anaemia · injected limb mobility decreased · leucocytosis · lymphadenitis · nerve disorders · paraesthesia · peripheral oedema · thrombocytopenia

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection▶ **Pneumococcal polysaccharide vaccine (Non-proprietary)**

Pneumococcal polysaccharide vaccine solution for injection 0.5ml vials | 1 vial [PoM] £8.32

▶ **Pneumovax 23** (Merck Sharp & Dohme (UK) Ltd)

Pneumovax 23 solution for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £16.80 DT = £16.80

Typhoid vaccine

23-Sep-2020

F 1375

- **DRUG ACTION** Typhoid vaccine protects against typhoid fever caused by *Salmonella typhi* infection; it is available as an oral live attenuated vaccine and an injectable polysaccharide vaccine.

● **INDICATIONS AND DOSE****Immunisation against typhoid fever [in children at high risk of typhoid fever]**▶ **BY INTRAMUSCULAR INJECTION**

- ▶ Child 12-23 months: 0.5 mL for 1 dose, dose should be given at least 2 weeks before potential exposure to typhoid infection, response may be suboptimal

Immunisation against typhoid fever▶ **BY INTRAMUSCULAR INJECTION**

- ▶ Child 2-17 years: 0.5 mL for 1 dose, dose should be given at least 2 weeks before potential exposure to typhoid infection
 - ▶ Adult: 0.5 mL for 1 dose, dose should be given at least 2 weeks before potential exposure to typhoid infection
- ▶ **BY MOUTH**
- ▶ Child 5-17 years: 1 capsule every 2 days for 3 doses (on days 1, 3, and 5), course should be completed at least 1 week before potential exposure to typhoid infection
 - ▶ Adult: 1 capsule every 2 days for 3 doses (on days 1, 3, and 5), course should be completed at least 1 week before potential exposure to typhoid infection

Booster▶ **BY INTRAMUSCULAR INJECTION**

- ▶ Child 2-17 years: 0.5 mL for 1 dose every 3 years
 - ▶ Adult: 0.5 mL for 1 dose every 3 years
- ▶ **BY MOUTH**
- ▶ Child 5-17 years: 1 capsule every 2 days for 3 doses (on days 1, 3, and 5) every 3 years
 - ▶ Adult: 1 capsule every 2 days for 3 doses (on days 1, 3, and 5) every 3 years

● **UNLICENSED USE**

- ▶ With intramuscular use in children Not licensed for use in children under 2 years.

● **CONTRA-INDICATIONS**

- ▶ With oral use Acute gastro-intestinal illness

- ▶ **INTERACTIONS** → Appendix 1: live vaccines

● **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS Shock

SPECIFIC SIDE-EFFECTS

- ▶ With oral use Abdominal distension · asthenia · back pain · chills · flatulence · influenza like illness · paraesthesia
 - ▶ With parenteral use Asthma · syncope
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises capsule should be taken one hour before a meal. Swallow as soon as possible after placing in mouth with a cold or lukewarm drink.

● **HANDLING AND STORAGE**

- ▶ With oral use It is important to store capsules in a refrigerator.

● **PATIENT AND CARER ADVICE**

- ▶ With oral use Patients or carers should be given advice on how to administer and store typhoid vaccine capsules.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection▶ **Typhim Vi** (Sanofi Pasteur)

Salmonella typhi Vi capsular polysaccharide 50 microgram per 1 ml Typhim Vi 25micrograms/0.5ml vaccine solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £11.16 DT = £11.16 | 10 pre-filled disposable injection [PoM] £111.60 DT = £111.60

Gastro-resistant capsule

CAUTIONARY AND ADVISORY LABELS 25

- ▶ **Vivotif** (Emergent BioSolutions UK Ltd)
Vivotif vaccine gastro-resistant capsules | 3 capsule [PoM] £14.77 DT
= £14.77

Combinations available: *Hepatitis A with typhoid vaccine*, p. 1385

VACCINES > VIRAL VACCINES

F 1375

24-May-2021

COVID-19 vaccine● **INDICATIONS AND DOSE****Immunisation against COVID-19**

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: (consult local protocol)

- **CONTRA-INDICATIONS** History of heparin-induced thrombocytopenia and thrombosis (AstraZeneca vaccine) · major arterial thrombosis with thrombocytopenia (AstraZeneca vaccine) · major venous thrombosis with thrombocytopenia (AstraZeneca vaccine)

- **CAUTIONS** Patients under 40 years (higher risk of thrombotic side-effects with AstraZeneca vaccine; Pfizer/BioNTech and Moderna vaccines preferred)

CAUTIONS, FURTHER INFORMATION

- ▶ Medical conditions predisposing to blood clots The MHRA advises that administration of the AstraZeneca vaccine in individuals of any age who are at higher risk of blood clots because of a medical condition (such as cerebral venous sinus thrombosis or antiphospholipid syndrome) should only be considered if the benefits outweigh the risks.

● **SIDE-EFFECTS**

- ▶ **Common or very common** Axillary lymph node tenderness · chills · influenza like illness
- ▶ **Uncommon** Hyperhidrosis
- ▶ **Rare or very rare** Facial paralysis · facial swelling
- ▶ **Frequency not known** Arterial thrombosis (following AstraZeneca vaccine) · cerebral venous sinus thrombosis (following AstraZeneca vaccine) · thrombocytopenia (following AstraZeneca vaccine) · thromboembolism (following AstraZeneca vaccine) · venous thrombosis (following AstraZeneca vaccine) · visceral venous thrombosis (following AstraZeneca vaccine)

- **ALLERGY AND CROSS-SENSITIVITY** The MHRA advises individuals with a history of anaphylaxis to food, an identified drug or vaccine, or an insect sting can receive any COVID-19 vaccine, as long as they are not allergic to any of its ingredients.

PHE advises individuals with a history of immediate onset anaphylaxis to multiple classes of drugs, or unexplained anaphylaxis, should not be vaccinated with the Pfizer/BioNTech or Moderna vaccine except on advice of an allergy specialist; the AstraZeneca vaccine can be used as an alternative (if not otherwise contra-indicated). The vaccine should be administered in a setting with full resuscitation facilities, followed by an observation period of 30 minutes.

PHE advises that individuals are observed for 15 minutes following vaccination with the Pfizer/BioNTech or Moderna vaccine. Individuals with a localised allergic reaction (without systemic symptoms) to the first dose of a COVID-19 vaccine can receive the second dose with an observation period of 30 minutes. If the reaction was delayed and self-limiting or was resolved with an oral antihistamine, consider pre-treatment with a non-sedating antihistamine 30 minutes before giving the second dose. Seek advice from an allergy specialist if the reaction presented with systemic symptoms or required medical attention.

- **PREGNANCY** [EVGR] Use only if potential benefit outweighs risk. (M) The MHRA and PHE advise that patients should be informed about the risks and benefits of vaccination, and that safety data in pregnancy is limited.

- **BREAST FEEDING** PHE advises that COVID-19 vaccines may be given during breast-feeding. Patients should be informed about the absence of safety data in breast-feeding.

- **DIRECTIONS FOR ADMINISTRATION** Public Health England advises that individuals with **bleeding disorders** may be vaccinated by the intramuscular route, on the advice of a doctor familiar with their bleeding risk. Patients treated with medicines to reduce bleeding (e.g. for haemophilia) are advised to administer their medicine shortly prior to intramuscular vaccination.

- **PRESCRIBING AND DISPENSING INFORMATION** The available preparations are licensed for use in specific age-groups—further information can be found in the product literature of the individual vaccines. For choice of vaccine, see COVID-19 vaccine p. 1356.

- **HANDLING AND STORAGE** [EVGR] The Pfizer/BioNTech vaccine should be stored in a freezer at -80°C to -60°C; the Moderna vaccine should be stored in a freezer at -25°C to -15°C. (M) For information about thawing and storage after thawing—consult product literature.

- **PATIENT AND CARER ADVICE** Healthcare professionals are advised to inform all patients to seek immediate medical advice if symptoms of thromboembolism and/or thrombocytopenia develop 4 days or more after vaccination.

Leaflet for patients The leaflet *COVID-19 vaccination and blood clotting* is available from PHE (www.gov.uk/government/publications/covid-19-vaccination-and-blood-clotting).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Hepatitis A and B vaccine

16-Nov-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, hepatitis A vaccine p. 1384, hepatitis B vaccine p. 1386.

● **INDICATIONS AND DOSE**

AMBIRIX®

Immunisation against hepatitis A and hepatitis B infection [primary course]

▶ BY INTRAMUSCULAR INJECTION

- ▶ Child 1-15 years: Initially 1 mL for 1 dose, then 1 mL after 6–12 months for 1 dose, the deltoid region is the preferred site of injection in older children; anterolateral thigh may be used in infants; not to be injected into the buttock (vaccine efficacy reduced),

continued →

subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)

Post-exposure prophylaxis against hepatitis A infection [for rapid protection]

► BY INTRAMUSCULAR INJECTION

- Child 1-15 years: 1 mL for 1 dose, the deltoid region is the preferred site of injection in older children; anterolateral thigh may be used in infants; not to be injected into the buttock (vaccine efficacy reduced), subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)

TWINRIX® ADULT

Immunisation against hepatitis A and hepatitis B infection [primary course]

► BY INTRAMUSCULAR INJECTION

- Child 16-17 years: Initially 1 mL every month for 2 doses, then 1 mL after 5 months for 1 dose, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced), subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)
- Adult: Initially 1 mL every month for 2 doses, then 1 mL after 5 months for 1 dose, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced), subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)

Immunisation against hepatitis A and hepatitis B infection [accelerated schedule for travellers departing within 1 month]

► BY INTRAMUSCULAR INJECTION

- Child 16-17 years: Initially 1 mL for 1 dose, then 1 mL after 7 days for 1 dose, then 1 mL after 14 days for 1 dose, then 1 mL for 1 dose given 12 months after the first dose, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced), subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)
- Adult: Initially 1 mL for 1 dose, then 1 mL after 7 days for 1 dose, then 1 mL after 14 days for 1 dose, then 1 mL for 1 dose given 12 months after the first dose, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced), subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)

TWINRIX® PAEDIATRIC

Immunisation against hepatitis A and hepatitis B infection [primary course]

► BY INTRAMUSCULAR INJECTION

- Child 1-15 years: Initially 0.5 mL every month for 2 doses, then 0.5 mL after 5 months for 1 dose, the deltoid region is the preferred site of injection in older children; anterolateral thigh is the preferred site in infants; not to be injected into the buttock (vaccine efficacy reduced), subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)

• UNLICENSED USE

AMBIRIX® Public Health England advises that *Ambirix*® may be used for post-exposure prophylaxis against hepatitis A infection where rapid protection is required, but is not licensed for this indication.

IMPORTANT SAFETY INFORMATION

Ambirix® and *Twinrix*® are not recommended for post-exposure prophylaxis following percutaneous (needle-stick), ocular, or mucous membrane exposure to hepatitis B virus.

• PRESCRIBING AND DISPENSING INFORMATION

TWINRIX® PAEDIATRIC Primary course should be completed with *Twinrix*® (single component vaccines given at appropriate intervals may be used for booster dose).

TWINRIX® ADULT Primary course should be completed with *Twinrix*® (single component vaccines given at appropriate intervals may be used for booster dose).

AMBIRIX® Primary course should be completed with *Ambirix*® (single component vaccines given at appropriate intervals may be used for booster dose).

• MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

EXCIPIENTS: May contain Neomycin

† 1375

Hepatitis A vaccine

17-Nov-2020

• INDICATIONS AND DOSE

AVAXIM®

Immunisation against hepatitis A infection

► BY INTRAMUSCULAR INJECTION

- Child 16-17 years: Initially 0.5 mL for 1 dose, then 0.5 mL after 6-12 months, dose given as booster; booster dose may be delayed by up to 3 years if not given after recommended interval following primary dose, the deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders; not to be injected into the buttock (vaccine efficacy reduced)
- Adult: Initially 0.5 mL for 1 dose, then 0.5 mL after 6-12 months, dose given as booster; booster dose may be delayed by up to 3 years if not given after recommended interval following primary dose, the deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders; not to be injected into the buttock (vaccine efficacy reduced)

HAVRIX JUNIOR MONODOSE®

Immunisation against hepatitis A infection

► BY INTRAMUSCULAR INJECTION

- Child 1-15 years: Initially 0.5 mL for 1 dose, then 0.5 mL after 6-12 months, dose given as booster; booster dose may be delayed by up to 3 years if not given after recommended interval following primary dose, deltoid muscle is preferred site of injection in older children; anterolateral thigh is preferred site in infants and young children; not to be injected into the gluteal region. The subcutaneous route may be used for patients with bleeding disorders

HAVRIX MONODOSE®

Immunisation against hepatitis A infection

► BY INTRAMUSCULAR INJECTION

- Child 16-17 years: Initially 1 mL for 1 dose, then 1 mL after 6-12 months, dose given as booster; booster dose may be delayed by up to 3 years if not given after recommended interval following primary dose, the deltoid region is the preferred site of injection; not to be injected into the gluteal region. The subcutaneous route may be used for patients with bleeding disorders

- **Adult:** Initially 1 mL for 1 dose, then 1 mL after 6–12 months, dose given as booster; booster dose may be delayed by up to 3 years if not given after recommended interval following primary dose, the deltoid region is the preferred site of injection; not to be injected into the gluteal region. The subcutaneous route may be used for patients with bleeding disorders

VAQTA® ADULT**Immunisation against hepatitis A infection**

▶ BY INTRAMUSCULAR INJECTION

- **Adult:** Initially 1 mL for 1 dose, then 1 mL after 6–18 months, dose given as booster, the deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders (but immune response may be delayed)

VAQTA® PAEDIATRIC**Immunisation against hepatitis A infection**

▶ BY INTRAMUSCULAR INJECTION

- **Child 1–17 years:** Initially 0.5 mL for 1 dose, then 0.5 mL after 6–18 months, dose given as booster, the deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders (but immune response may be reduced)

• SIDE-EFFECTS

- ▶ **Common or very common** Asthenia (uncommon in children) · pain (uncommon in children)
- ▶ **Uncommon** Anxiety (in children) · chills (in adults) · cough · crying (in children) · ear pain (rare in children) · gastrointestinal disorders (rare in children) · increased risk of infection (in adults) · influenza like illness (rare in children) · muscle weakness (in adults) · musculoskeletal stiffness (rare in children) · nasal complaints · paraesthesia (rare in children) · respiratory disorders (rare in children) · sensation of tightness (rare in children) · temperature sensation altered (rare in children) · vasodilation (rare in children)
- ▶ **Rare or very rare** Allergic rhinitis (in children) · apathy (in adults) · asthma (in children) · ataxia (in children) · burping (in children) · chest pain · constipation (in children) · dehydration (in children) · drowsiness (uncommon in children) · dry mouth (in adults) · eye discomfort · gait abnormal (in children) · gastrointestinal discomfort · infantile spitting up (in children) · menstrual disorder (in adults) · migraine (in adults) · muscle complaints (in adults) · oral ulceration (in adults) · oropharyngeal pain (in children) · photophobia (in adults) · screaming (in children) · sleep disorders (uncommon in children) · sweat changes · synovitis (in children) · throat oedema (in adults) · tremor (in adults) · vertigo (in adults) · watering eye (in adults)
- ▶ **Frequency not known** Guillain-Barre syndrome · thrombocytopenia

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

EXCIPIENTS: May contain Neomycin

▶ **Avaxim** (Sanofi Pasteur)

Avaxim vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £21.72 | 10 pre-filled disposable injection [PoM] £217.20

16-Nov-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, hepatitis A vaccine p. 1384, typhoid vaccine p. 1382.

• INDICATIONS AND DOSE**VIATIM®****Immunisation against hepatitis A and typhoid infection [primary course]**

▶ BY INTRAMUSCULAR INJECTION

- ▶ **Child 16–17 years:** 1 mL for 1 dose, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced). The subcutaneous route may be used for patients with bleeding disorders, booster dose may be given using single or multicomponent vaccines
- ▶ **Adult:** 1 mL for 1 dose, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced). The subcutaneous route may be used for patients with bleeding disorders, booster dose may be given using single or multicomponent vaccines

Immunisation against hepatitis A [booster dose for individuals who have received primary immunisation with monovalent hepatitis A vaccine, where protection against typhoid is also required]

▶ BY INTRAMUSCULAR INJECTION

- ▶ **Child 16–17 years:** 1 mL for 1 dose, within 36 months (preferably 6–12 months) of primary immunisation, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced). The subcutaneous route may be used for patients with bleeding disorders
- ▶ **Adult:** 1 mL for 1 dose, within 36 months (preferably 6–12 months) of primary immunisation, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced). The subcutaneous route may be used for patients with bleeding disorders

Immunisation against typhoid [booster dose for individuals who have received primary immunisation with hepatitis A and typhoid vaccine, where continued protection against typhoid is required]

▶ BY INTRAMUSCULAR INJECTION

- ▶ **Child 16–17 years:** 1 mL for 1 dose, 36 months after primary immunisation, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced). The subcutaneous route may be used for patients with bleeding disorders
- ▶ **Adult:** 1 mL for 1 dose, 36 months after primary immunisation, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced). The subcutaneous route may be used for patients with bleeding disorders

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Hepatitis B vaccine

● INDICATIONS AND DOSE

ENGERIX B®

Immunisation against hepatitis B infection

► BY INTRAMUSCULAR INJECTION

- Child 1 month-15 years: 10 micrograms for 1 dose, then 10 micrograms after 1 month for 1 dose, followed by 10 micrograms after 5 months for 1 dose, deltoid muscle is preferred site of injection in older children; anterolateral thigh is preferred site in infants and young children; not to be injected into the buttock (vaccine efficacy reduced)
- Child 16-17 years: 20 micrograms for 1 dose, then 20 micrograms after 1 month for 1 dose, followed by 20 micrograms after 5 months for 1 dose, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)
- Adult: 20 micrograms for 1 dose, then 20 micrograms after 1 month for 1 dose, followed by 20 micrograms after 5 months for 1 dose, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

Immunisation against hepatitis B infection (accelerated schedule for pre- and post-exposure prophylaxis)

► BY INTRAMUSCULAR INJECTION

- Neonate: 10 micrograms every month for 3 doses, followed by 10 micrograms after 10 months for 1 dose, for post-exposure prophylaxis, PHE advises dose at 12 months not required if patient is at low risk, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced), this dose should not be given to neonates born to hepatitis B surface antigen-positive mothers.
- Child 1 month-15 years: 10 micrograms every month for 3 doses, followed by 10 micrograms after 10 months for 1 dose, for post-exposure prophylaxis, PHE advises dose at 12 months not required if patient is at low risk, deltoid muscle is preferred site of injection in older children; anterolateral thigh is preferred site in infants and young children; not to be injected into the buttock (vaccine efficacy reduced)
- Child 16-17 years: 20 micrograms every month for 3 doses, followed by 20 micrograms after 10 months for 1 dose, for post-exposure prophylaxis, PHE advises dose at 12 months not required if patient is at low risk, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)
- Adult: 20 micrograms every month for 3 doses, followed by 20 micrograms after 10 months for 1 dose, for post-exposure prophylaxis, PHE advises dose at 12 months not required if patient is at low risk, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

Immunisation against hepatitis B infection (alternative accelerated schedule)

► BY INTRAMUSCULAR INJECTION

- Child 11-15 years: 20 micrograms for 1 dose, followed by 20 micrograms after 6 months for 1 dose, this schedule is not suitable if high risk of infection between doses or if compliance with second dose uncertain, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

Immunisation against hepatitis B infection (very rapid schedule)

► BY INTRAMUSCULAR INJECTION

- Child 16-17 years: 20 micrograms for 1 dose, then 20 micrograms after 7 days for 1 dose, followed by

20 micrograms after 14 days for 1 dose, followed by 20 micrograms for 1 dose, to be given 12 months after the first dose, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

- Adult: 20 micrograms for 1 dose, then 20 micrograms after 7 days for 1 dose, followed by 20 micrograms after 14 days for 1 dose, followed by 20 micrograms for 1 dose, to be given 12 months after the first dose, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

Immunisation against hepatitis B infection (in renal insufficiency, including haemodialysis patients)

► BY INTRAMUSCULAR INJECTION

- Child 1 month-15 years: 10 micrograms every month for 2 doses, followed by 10 micrograms after 5 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection in older children; anterolateral thigh is preferred site in infants and young children; not to be injected into the buttock (vaccine efficacy reduced)
- Child 16-17 years: 40 micrograms every month for 3 doses, followed by 40 micrograms after 4 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)
- Adult: 40 micrograms every month for 3 doses, followed by 40 micrograms after 4 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

Immunisation against hepatitis B infection (accelerated schedule for pre- and post-exposure prophylaxis in renal insufficiency, including haemodialysis patients)

► BY INTRAMUSCULAR INJECTION

- Child 1 month-15 years: 10 micrograms every month for 3 doses, followed by 10 micrograms after 10 months for 1 dose, for post-exposure prophylaxis, PHE advises dose at 12 months not required if patient is at low risk, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection in older children; anterolateral thigh is preferred site in infants and young children; not to be injected into the buttock (vaccine efficacy reduced)

FENDRIX®

Immunisation against hepatitis B infection in renal insufficiency (including pre-haemodialysis and haemodialysis patients)

► BY INTRAMUSCULAR INJECTION

- Child 15-17 years: 20 micrograms every month for 3 doses, followed by 20 micrograms after 4 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)
- Adult: 20 micrograms every month for 3 doses, followed by 20 micrograms after 4 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

HBVAXPRO®**Immunisation against hepatitis B infection**

▶ BY INTRAMUSCULAR INJECTION

- ▶ Neonate: 5 micrograms for 1 dose, followed by 5 micrograms after 1 month for 1 dose, then 5 micrograms after 5 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced), dose not to be used in neonates born to hepatitis B surface antigen-positive mothers.
- ▶ Child 1 month–15 years: 5 micrograms for 1 dose, followed by 5 micrograms after 1 month for 1 dose, then 5 micrograms after 5 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection in adults and older children; anterolateral thigh is preferred site in infants; not to be injected into the buttock (vaccine efficacy reduced)
- ▶ Child 16–17 years: 10 micrograms for 1 dose, followed by 10 micrograms after 1 month for 1 dose, followed by 10 micrograms after 5 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection in adults and older children; not to be injected into the buttock (vaccine efficacy reduced)
- ▶ Adult: 10 micrograms for 1 dose, followed by 10 micrograms after 1 month for 1 dose, followed by 10 micrograms after 5 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection in adults and older children; not to be injected into the buttock (vaccine efficacy reduced)

Immunisation against hepatitis B infection (accelerated schedule for pre- and post-exposure prophylaxis)

▶ BY INTRAMUSCULAR INJECTION

- ▶ Neonate: 5 micrograms every month for 3 doses, followed by 5 micrograms every 10 months for 1 dose, for post-exposure prophylaxis, PHE advises dose at 12 months not required if patient is at low risk, booster doses may be required in immunocompromised patients with low antibody concentration, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced), dose not to be used in neonates born to hepatitis B surface antigen-positive mothers.
- ▶ Child 1 month–15 years: 5 micrograms every month for 3 doses, followed by 5 micrograms after 10 months for 1 dose, for post-exposure prophylaxis, PHE advises dose at 12 months not required if patient is at low risk, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection in older children; anterolateral thigh is preferred site in infants; not to be injected into the buttock (vaccine efficacy reduced)
- ▶ Child 16–17 years: 10 micrograms every month for 3 doses, followed by 10 micrograms after 10 months for 1 dose, for post-exposure prophylaxis, PHE advises dose at 12 months not required if patient is at low risk, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection in older children; not to be injected into the buttock (vaccine efficacy reduced)
- ▶ Adult: 10 micrograms every month for 3 doses, followed by 10 micrograms after 10 months for 1 dose, for post-exposure prophylaxis, PHE advises dose at

12 months not required if patient is at low risk, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

Immunisation against hepatitis B infection (in chronic haemodialysis patients)

▶ BY INTRAMUSCULAR INJECTION

- ▶ Child 16–17 years: 40 micrograms every month for 2 doses, followed by 40 micrograms after 5 months for 1 dose, booster doses may be required in those with low antibody concentration, deltoid muscle is preferred site of injection in older children; not to be injected into the buttock (vaccine efficacy reduced)
- ▶ Adult: 40 micrograms every month for 2 doses, followed by 40 micrograms after 5 months for 1 dose, booster doses may be required in those with low antibody concentration, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

• UNLICENSED USE**ENGERIX B®**

- ▶ In children PHE advises *Engerix B®* is used in the doses provided in the BNF for immunisation against hepatitis B infection (very rapid schedule) in children aged 16–17 years, but these are considered unlicensed.

• SIDE-EFFECTS

- ▶ **Common or very common** Drowsiness · gastrointestinal disorder
- ▶ **Uncommon** Influenza like illness
- ▶ **Rare or very rare** Sensation abnormal
- ▶ **Frequency not known** Angioedema · apnoea · arthritis · encephalitis · encephalopathy · hypotension · meningitis · multiple sclerosis · muscle weakness · nerve disorders · paralysis · seizure · thrombocytopenia · vasculitis
- **PRESCRIBING AND DISPENSING INFORMATION** PHE advises different hepatitis B vaccine preparations can be used to complete a primary immunisation course, or to administer a booster dose.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

EXCIPIENTS: May contain Thiomersal

▶ **Engerix B** (GlaxoSmithKline UK Ltd)

Hepatitis B virus surface antigen 20 microgram per 1 ml Engerix B 10micrograms/0.5ml vaccine suspension for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £9.67 DT = £9.67
 Engerix B 20micrograms/1ml vaccine suspension for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £12.99 DT = £12.99 | 10 pre-filled disposable injection [PoM] £129.92

Human papillomavirus vaccines

29-Oct-2019

● INDICATIONS AND DOSE

CERVARIX®

Immunisation against HPV-related premalignant lesions and cancer (cervical, vulvar, vaginal, and anal) [2 dose schedule]

► BY INTRAMUSCULAR INJECTION

- Child 9-14 years: 0.5 mL for 1 dose, followed by 0.5 mL after 5–24 months for 1 dose, if second dose administered earlier than 5 months after the first, a third dose should be administered, to be administered into deltoid region, if the 2 dose schedule is interrupted, it should be resumed (using the same vaccine) but not repeated, even if more than 24 months have elapsed since the first dose or if the patient is now older than 14 years

Immunisation against HPV-related premalignant lesions and cancer (cervical, vulvar, vaginal, and anal) [3 dose schedule]

► BY INTRAMUSCULAR INJECTION

- Child 15-17 years: 0.5 mL for 1 dose, followed by 0.5 mL after 1–2.5 months for 1 dose, then 0.5 mL after 5–12 months from the first dose for 1 dose, to be administered into deltoid region, if the 3 dose schedule is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses
- Adult: 0.5 mL for 1 dose, followed by 0.5 mL after 1–2.5 months for 1 dose, then 0.5 mL after 5–12 months from the first dose for 1 dose, to be administered into deltoid region, if the 3 dose schedule is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses

GARDASIL 9®

Immunisation against HPV-related premalignant lesions and cancer (cervical, vulvar, vaginal, and anal) and genital warts [2 dose schedule]

► BY INTRAMUSCULAR INJECTION

- Child 9-14 years: 0.5 mL for 1 dose, followed by 0.5 mL after 5–24 months for 1 dose, to be administered preferably into deltoid region or higher anterolateral thigh, if the 2 dose schedule is interrupted, it should be resumed (using the same vaccine) but not repeated, even if more than 24 months have elapsed since the first dose or if the patient is now older than 14 years

Immunisation against HPV-related premalignant lesions and cancer (cervical, vulvar, vaginal, and anal) and genital warts [3 dose schedule]

► BY INTRAMUSCULAR INJECTION

- Child 9-17 years: 0.5 mL for 1 dose, followed by 0.5 mL for 1 dose, second dose to be given at least 1 month after the first dose, then 0.5 mL for 1 dose, third dose to be given at least 3 months after the second dose, to be administered preferably into deltoid region or higher anterolateral thigh, the 3 dose schedule should be completed within 12 months of the first dose. If the schedule is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses
- Adult: 0.5 mL for 1 dose, followed by 0.5 mL for 1 dose, second dose to be given at least 1 month after the first dose, then 0.5 mL for 1 dose, third dose to be given at least 3 months after the second dose, to be administered preferably into deltoid region or higher anterolateral thigh, the 3 dose schedule should be completed within 12 months of the first dose. If the

schedule is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses

GARDASIL®

Immunisation against HPV-related premalignant lesions and cancer (cervical, vulvar, vaginal, and anal) and genital warts [2 dose schedule]

► BY INTRAMUSCULAR INJECTION

- Child 9-14 years: 0.5 mL for 1 dose, followed by 0.5 mL after 6–24 months for 1 dose, to be administered preferably into deltoid region or higher anterolateral thigh, if the 2 dose schedule is interrupted, it should be resumed (using the same vaccine) but not repeated, even if more than 24 months have elapsed since the first dose or if the patient is now older than 14 years

Immunisation against HPV-related premalignant lesions and cancer (cervical, vulvar, vaginal, and anal) and genital warts [3 dose schedule]

► BY INTRAMUSCULAR INJECTION

- Child 9-17 years: 0.5 mL for 1 dose, followed by 0.5 mL for 1 dose, second dose to be given at least 1 month after the first dose, then 0.5 mL for 1 dose, third dose to be given at least 3 months after the second dose, to be administered preferably into deltoid region or higher anterolateral thigh, the 3 dose schedule should be completed within 12 months of the first dose, if the schedule is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses
- Adult: 0.5 mL for 1 dose, followed by 0.5 mL for 1 dose, second dose to be given at least 1 month after the first dose, then 0.5 mL for 1 dose, third dose to be given at least 3 months after the second dose, to be administered preferably into deltoid region or higher anterolateral thigh, the 3 dose schedule should be completed within 12 months of the first dose, if the schedule is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses

- **UNLICENSED USE** [\[EwGr\]](#) Human papillomavirus vaccines are used in a 2 dose immunisation schedule, [↕](#) but the interval between doses may differ from licensing.

GARDASIL® [\[EwGr\]](#) The 2 dose schedule is not licensed for use in children aged 14 years. [↕](#)

● SIDE-EFFECTS

- **Common or very common** Gastrointestinal disorder · pain in extremity
- **Uncommon** Upper respiratory tract infection
- **Frequency not known** Acute disseminated encephalomyelitis · angioedema · asthenia · bronchospasm · chills · Guillain-Barre syndrome · immune thrombocytopenic purpura · syncope
- **PREGNANCY** Not known to be harmful, but vaccination should be postponed until completion of pregnancy.
- **PRESCRIBING AND DISPENSING INFORMATION** To avoid confusion, prescribers should specify the brand to be dispensed.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

► Gardasil (Merck Sharp & Dohme (UK) Ltd)

Gardasil vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [\[PoM\]](#) £86.50 DT = £86.50

► Gardasil 9 (Merck Sharp & Dohme (UK) Ltd)

Gardasil 9 vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [\[PoM\]](#) £105.00 DT = £105.00

27-Jan-2021

Influenza vaccine

- **DRUG ACTION** Influenza vaccines protect people at high risk from influenza and reduce transmission of infection; the nasal spray contains live attenuated strains, all other vaccines are inactivated.

● INDICATIONS AND DOSE

Annual immunisation against seasonal influenza

► BY INTRAMUSCULAR INJECTION

- Child 6 months–8 years: 0.5 mL for 1 dose, for children who have not received seasonal influenza vaccine previously, repeat dose after at least 4 weeks
- Child 9–17 years: 0.5 mL for 1 dose
- Adult: 0.5 mL for 1 dose

► BY INTRANASAL ADMINISTRATION

- Child 2–17 years: 0.2 mL for 1 dose, to be administered as 0.1 mL into each nostril

Annual immunisation against seasonal influenza (for children in clinical risk groups, or who are household contacts of others in clinical risk groups, and who have not received seasonal influenza vaccine previously)

► BY INTRAMUSCULAR INJECTION

- Child 6 months–8 years: 0.5 mL for 1 dose, followed by 0.5 mL for 1 dose, after at least 4 weeks

► BY INTRANASAL ADMINISTRATION

- Child 2–8 years: 0.2 mL for 1 dose, followed by 0.2 mL for 1 dose, after at least 4 weeks. Dose to be administered as 0.1 mL into each nostril

● UNLICENSED USE

- With intranasal use in children The Joint Committee on Vaccination and Immunisation advises offering a second dose of vaccine for annual immunisation against seasonal influenza to children in clinical risk groups only, but this differs from licensed advice.

- **CONTRA-INDICATIONS** Preparations marketed by Pfizer, or CSL Biotherapies in child under 5 years—increased risk of febrile convulsions

FLUENZ TETRA® Active wheezing · concomitant use with antiviral therapy for influenza · severe asthma

CONTRA-INDICATIONS, FURTHER INFORMATION

- Concomitant use with antiviral therapy for influenza Public Health England advises avoid immunisation for at least 48 hours after stopping the influenza antiviral agent. Administration of influenza antiviral agents within two weeks of Fluenz Tetra® administration may reduce the effectiveness of the vaccine.

- **INTERACTIONS** → Appendix 1: live vaccines

● SIDE-EFFECTS

► Common or very common

- With intramuscular use Chills · hyperhidrosis · induration · local reactions · pain

- With intranasal use Nasal complaints

► Uncommon

- With intranasal use Epistaxis · face oedema

► Frequency not known

- With intramuscular use Angioedema · encephalomyelitis · extensive swelling of vaccinated limb · febrile seizure · nerve disorders · nervous system disorder · paraesthesia · shock · syncope · thrombocytopenia · vasculitis
- With intranasal use Guillain-Barre syndrome

SIDE-EFFECTS, FURTHER INFORMATION Elderly patients might be more susceptible to side-effects.

- **ALLERGY AND CROSS-SENSITIVITY** PHE advises individuals with a history of egg allergy can be immunised with either an egg free influenza vaccine, if available, or an influenza vaccine with an ovalbumin content less than 120 nanograms/mL (facilities should be available to treat anaphylaxis). If an influenza vaccine containing

ovalbumin is being considered in those with a history of severe anaphylaxis to egg which has previously required intensive care, these individuals should be referred to a specialist in hospital.

- **PREGNANCY** Inactivated vaccines not known to be harmful.

FLUENZ TETRA® Avoid in pregnancy.

- **BREAST FEEDING** Inactivated vaccines not known to be harmful.

FLUENZ TETRA® Avoid in breast-feeding.

- **DIRECTIONS FOR ADMINISTRATION** Public Health England advises that individuals with **bleeding disorders** may be vaccinated by the intramuscular route, on the advice of a doctor familiar with their bleeding risk. Patients treated with medicines to reduce bleeding (e.g. for haemophilia) are advised to administer their medicine shortly prior to intramuscular vaccination.

- **PRESCRIBING AND DISPENSING INFORMATION** The available preparations are not licensed for use in all age-groups—further information can be found in the product literature for the individual vaccines. **Flublok**®, a recombinant quadrivalent inactivated influenza vaccine preparation licensed in the USA, is authorised by the MHRA for temporary supply for the 2020/21 influenza season. For choice of vaccine, see Influenza vaccine p. 1362.

FLUARIX TETRA® Ovalbumin content less than 100 nanograms/mL.

- **PATIENT AND CARER ADVICE**

FLUENZ TETRA® Avoid close contact with severely immunocompromised patients for 1–2 weeks after vaccination.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

F 1375

Japanese encephalitis vaccine

22-Feb-2019

● INDICATIONS AND DOSE

Immunisation against Japanese encephalitis

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 2-35 months: 0.25 mL every 28 days for 2 doses, alternatively 0.25 mL every 7 days for 2 doses, anterolateral thigh may be used as the injection site in infants; deltoid muscle is preferred site in older children, immunisation should be completed at least 1 week before potential exposure
- ▶ Child 3-17 years: 0.5 mL every 28 days for 2 doses, alternatively 0.5 mL every 7 days for 2 doses, deltoid muscle is preferred site in older children, immunisation should be completed at least 1 week before potential exposure
- ▶ Adult: 0.5 mL every 28 days for 2 doses, alternatively 0.5 mL every 7 days for 2 doses, deltoid muscle is preferred site of injection, immunisation should be completed at least 1 week before potential exposure

First booster

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: 0.5 mL after 1-2 years, deltoid muscle is preferred site of injection, for those at continued risk, the booster dose should be given 1 year after completing the primary course
- ▶ Elderly: 0.5 mL after 1 year, for those at continued risk, deltoid muscle is preferred site of injection

Second booster

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: 0.5 mL after 10 years, for those at continued risk, deltoid muscle is preferred site of injection

● UNLICENSED USE

- ▶ When used for immunisation against Japanese encephalitis The rapid schedule administered at days 0 and 7 is not licensed in children or the elderly.

● SIDE-EFFECTS

- ▶ **Common or very common** Influenza like illness (frequency not known in children)
- ▶ **Uncommon** Asthenia (in adults) · chills (in adults) · hyperhidrosis (in adults) · migraine (in adults) · musculoskeletal stiffness (in adults) · vertigo (in adults)
- ▶ **Rare or very rare** Dyspnoea (in adults) · eyelid oedema (in adults) · neuritis (in adults) · pain in extremity (in adults) · palpitations (in adults) · paraesthesia (in adults) · peripheral oedema (in adults) · tachycardia (in adults) · taste altered (in adults) · thrombocytopenia (in adults)
- ▶ **Frequency not known** Cough (in children)

- **PREGNANCY** Although manufacturer advises avoid because of limited information, miscarriage has been associated with Japanese encephalitis virus infection acquired during the first 2 trimesters of pregnancy.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ Japanese encephalitis vaccine (Non-proprietary)

- ▶ Japanese encephalitis GCVC vaccine solution for injection 1ml vials | 1 vial [X]
- ▶ Japanese encephalitis GCVC vaccine solution for injection 20ml vials | 1 vial [X]
- ▶ Japanese encephalitis GCVC vaccine solution for injection 10ml vials | 1 vial [X]

Suspension for injection

▶ Ixiaro (Valneva UK Ltd)

- ▶ Ixiaro vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £59.50 DT = £59.50

F 1375

Measles, mumps and rubella vaccine, live

27-Jan-2021

● INDICATIONS AND DOSE

Primary immunisation against measles, mumps, and rubella (first dose)

- ▶ BY INTRAMUSCULAR INJECTION, OR BY DEEP SUBCUTANEOUS INJECTION
- ▶ Child 12-13 months: 0.5 mL for 1 dose

Primary immunisation against measles, mumps, and rubella (second dose)

- ▶ BY INTRAMUSCULAR INJECTION, OR BY DEEP SUBCUTANEOUS INJECTION
- ▶ Child 40 months-5 years: 0.5 mL for 1 dose

Rubella immunisation (in seronegative women, susceptible to rubella and in unimmunised, seronegative women, post-partum)

- ▶ BY INTRAMUSCULAR INJECTION, OR BY DEEP SUBCUTANEOUS INJECTION
- ▶ Females of childbearing potential: (consult product literature or local protocols)

Children presenting for pre-school booster, who have not received the primary immunisation (first dose) |

Immunisation for patients at school-leaving age or at entry into further education, who have not completed the primary immunisation course | Control of measles outbreak | Immunisation for patients travelling to areas where measles is endemic or epidemic, who have not completed the primary immunisation

- ▶ BY INTRAMUSCULAR INJECTION, OR BY DEEP SUBCUTANEOUS INJECTION
- ▶ Child 6 months-17 years: (consult product literature or local protocols)
- ▶ Adult: (consult product literature or local protocols)

- **UNLICENSED USE** Not licensed for use in children under 9 months.

IMPORTANT SAFETY INFORMATION

MMR VACCINATION AND BOWEL DISEASE OR AUTISM

Reviews undertaken on behalf of the CSM, the Medical Research Council, and the Cochrane Collaboration, have not found any evidence of a link between MMR vaccination and bowel disease or autism. Information (including fact sheets and a list of references) may be obtained from www.dh.gov.uk/immunisation.

- **CAUTIONS** Antibody response to measles component may be reduced after immunoglobulin administration or blood transfusion—leave an interval of at least 3 months before MMR immunisation

CAUTIONS, FURTHER INFORMATION

- ▶ Administration with other vaccines Public Health England advises MMR and yellow fever vaccines should not be administered on the same day; there should be a 4-week minimum interval between the vaccines. When protection is rapidly required, the vaccines can be given at any interval; an additional dose of MMR should be considered and re-vaccination with the yellow fever vaccine can also be considered in those at on-going risk.

Public Health England advises MMR and varicella-zoster vaccines can be given on the same day or separated by a 4-week minimum interval. When protection is rapidly required, the vaccines can be given at any interval and an

additional dose of the vaccine given second may be considered.

- **INTERACTIONS** → Appendix 1: live vaccines
- **SIDE-EFFECTS**
- ▶ **Uncommon** Increased risk of infection · rhinorrhoea
- ▶ **Frequency not known** Angioedema · arthritis · ataxia · cough · encephalopathy · eye inflammation · meningitis aseptic · nerve deafness · nerve disorders · oculomotor nerve paralysis · oedema · panniculitis · papillitis · paraesthesia · regional lymphadenopathy · respiratory disorders · seizures · Stevens-Johnson syndrome · subacute sclerosing panencephalitis · syncope · throat pain · thrombocytopenia · vasculitis

SIDE-EFFECTS, FURTHER INFORMATION Malaise, fever, or a rash can occur after the first dose of MMR vaccine—most commonly about a week after vaccination and lasting about 2 to 3 days.

Febrile seizures occur rarely 6 to 11 days after MMR vaccination (the incidence is lower than that following measles infection).

Idiopathic thrombocytopenic purpura Idiopathic thrombocytopenic purpura has occurred rarely following MMR vaccination, usually within 6 weeks of the first dose. The risk of idiopathic thrombocytopenic purpura after MMR vaccine is much less than the risk after infection with wild measles or rubella virus. Children who develop idiopathic thrombocytopenic purpura within 6 weeks of the first dose of MMR should undergo serological testing before the second dose is due; if the results suggest incomplete immunity against measles, mumps or rubella then a second dose of MMR is recommended. Samples should be sent to the Virus Reference Laboratory of the Health Protection Agency.

Frequency of side effects Adverse reactions are considerably less frequent after the second dose of MMR vaccine than after the first.

- **ALLERGY AND CROSS-SENSITIVITY** PHE advises MMR vaccine can be given safely even when the child has had an anaphylactic reaction to food containing egg. Children with a confirmed anaphylactic reaction to the MMR vaccine should be assessed by a specialist. Dislike of eggs, refusal to eat egg, or confirmed anaphylactic reactions to egg-containing food is not a contra-indication to MMR vaccination.
- **CONCEPTION AND CONTRACEPTION** Exclude pregnancy before immunisation. Avoid pregnancy for at least 1 month after vaccination.
- **PRESCRIBING AND DISPENSING INFORMATION** Available as part of childhood immunisation schedule from health organisations or ImmForm portal.immform.phe.gov.uk.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Rabies vaccine

F 1375

17-Jun-2020

● INDICATIONS AND DOSE

Primary pre-exposure immunisation against rabies infection

▶ BY INTRAMUSCULAR INJECTION

- ▶ Child: 1 mL for 3 doses (on days 0, 7, and 28), to be administered into deltoid region; in infants anterolateral thigh is recommended, final dose may be given from day 21 if insufficient time before travel
- ▶ Adult: 1 mL for 3 doses (on days 0, 7, and 28), to be administered into deltoid region, final dose may be given from day 21 if insufficient time before travel

Primary pre-exposure immunisation against rabies infection [accelerated course]

▶ BY INTRAMUSCULAR INJECTION

- ▶ Child: 1 mL for 3 doses (on days 0, 3, and 7), followed by 1 mL for 1 dose at 1 year if continued travel to high-risk areas, to be administered into deltoid region; in infants anterolateral thigh is recommended
- ▶ Adult: 1 mL for 3 doses (on days 0, 3, and 7), followed by 1 mL for 1 dose at 1 year if continued travel to high-risk areas, to be administered into deltoid region

Pre-exposure immunisation booster dose [patients at frequent risk of exposure e.g. laboratory workers who handle lyssavirus-containing material]

▶ BY INTRAMUSCULAR INJECTION

- ▶ Child: 1 mL for 1 dose, to be given 1 year after primary course is completed, then 1 mL, repeated if necessary, based on six-monthly antibody levels. To be administered into deltoid region; in infants anterolateral thigh is recommended
- ▶ Adult: 1 mL for 1 dose, to be given 1 year after primary course is completed, then 1 mL, repeated if necessary, based on six-monthly antibody levels. To be administered into deltoid region

Pre-exposure immunisation booster dose [patients who may have frequent, unrecognised exposures e.g. bat handlers]

▶ BY INTRAMUSCULAR INJECTION

- ▶ Child: 1 mL for 1 dose, to be given 1 year after primary course is completed, then 1 mL every 3–5 years, to be administered into deltoid region; in infants anterolateral thigh is recommended, the frequency of booster doses may alternatively be based on antibody levels
- ▶ Adult: 1 mL for 1 dose, to be given 1 year after primary course is completed, then 1 mL every 3–5 years, repeated if necessary, to be administered into deltoid region, the frequency of booster doses may alternatively be based on antibody levels

Pre-exposure immunisation booster dose [patients at frequent risk of exposure]

▶ BY INTRAMUSCULAR INJECTION

- ▶ Child: 1 mL for 1 dose, to be given at least 1 year after primary course is completed based on antibody levels, to be administered into deltoid region; in infants anterolateral thigh is recommended
- ▶ Adult: 1 mL for 1 dose, to be given at least 1 year after primary course is completed based on antibody levels, to be administered into deltoid region

Post-exposure treatment [fully immunised patients with amber or red composite rabies risk] (administered on expert advice)

▶ BY INTRAMUSCULAR INJECTION

- ▶ Child: 1 mL for 1 dose, followed by 1 mL after 3–7 days for 1 dose, to be administered into deltoid region; in infants anterolateral thigh is recommended, rabies immunoglobulin is not necessary

continued →

- ▶ Adult: 1 mL for 1 dose, followed by 1 mL after 3–7 days for 1 dose, to be administered into deltoid region, rabies immunoglobulin is not necessary

Post-exposure treatment [partially immunised patients with amber or red composite rabies risk] (administered on expert advice)

▶ BY INTRAMUSCULAR INJECTION

- ▶ Child: 1 mL for 4 doses (on days 0, 3, 7, and 21), to be administered into deltoid region; in infants anterolateral thigh is recommended, rabies immunoglobulin is not necessary
- ▶ Adult: 1 mL for 4 doses (on days 0, 3, 7, and 21), to be administered into deltoid region, rabies immunoglobulin is not necessary

Post-exposure treatment [non-immunised patients with amber or red composite rabies risk] (administered on expert advice)

▶ BY INTRAMUSCULAR INJECTION

- ▶ Child: 1 mL for 4 doses (on days 0, 3, 7, and 21), to be administered into deltoid region; in infants anterolateral thigh is recommended, rabies immunoglobulin also to be given to patients with red composite rabies risk (but is not required if more than 7 days have elapsed after the first dose of vaccine, or more than 1 day after the second dose of vaccine)
- ▶ Adult: 1 mL for 4 doses (on days 0, 3, 7, and 21), to be administered into deltoid region, rabies immunoglobulin also to be given to patients with red composite rabies risk (but is not required if more than 7 days have elapsed after the first dose of vaccine, or more than 1 day after the second dose of vaccine)

Post-exposure treatment [immunosuppressed patients with amber or red composite rabies risk, regardless of immunisation status] (administered on expert advice)

▶ BY INTRAMUSCULAR INJECTION

- ▶ Child: 1 mL for 5 doses (on days 0, 3, 7, 14, and 28 or 30), to be administered into deltoid region; in infants anterolateral thigh is recommended, rabies immunoglobulin also to be given (but is not required if more than 7 days have elapsed after the first dose of vaccine, or more than 1 day after the second dose of vaccine)
- ▶ Adult: 1 mL for 5 doses (on days 0, 3, 7, 14, and 28 or 30), to be administered into deltoid region, rabies immunoglobulin also to be given (but is not required if more than 7 days have elapsed after the first dose of vaccine, or more than 1 day after the second dose of vaccine)

- **UNLICENSED USE** Public Health England advises rabies vaccine may be used as detailed below, although these situations are considered unlicensed:

- dosing regimens for post-exposure treatment.

- **INTERACTIONS** → Appendix 1: rabies vaccine

● **SIDE-EFFECTS**

- ▶ **Common or very common** Abdominal discomfort · asthenia
- ▶ **Rare or very rare** Angioedema · chills · encephalitis · Guillain-Barre syndrome · hyperhidrosis · paraesthesia · syncope · vertigo

- **PREGNANCY** Because of the potential consequences of untreated rabies exposure and because rabies vaccination has not been associated with fetal abnormalities, pregnancy is not considered a contra-indication to post-exposure prophylaxis. Immunisation against rabies is indicated during pregnancy if there is substantial risk of exposure to rabies and rapid access to post-exposure prophylaxis is likely to be limited.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for suspension for injection

F 1375

Rotavirus vaccine

27-Jul-2020

- **DRUG ACTION** Rotavirus vaccine is a live, oral vaccine that protects young children against gastro-enteritis caused by rotavirus infection.

● **INDICATIONS AND DOSE**

Immunisation against gastro-enteritis caused by rotavirus

▶ BY MOUTH

- ▶ Child 6–23 weeks: 1.5 mL for 2 doses separated by an interval of at least 4 weeks, first dose must be given between 6–14 weeks of age; course should be completed before 24 weeks of age (preferably before 16 weeks)

IMPORTANT SAFETY INFORMATION

PUBLIC HEALTH ENGLAND: UPDATE TO GREEN BOOK (OCTOBER 2017)

Public Health England advises that immunisation with live vaccines should be delayed until 6 months of age in children born to mothers who received immunosuppressive biological therapy during pregnancy. In practice, this means that children born to mothers who were on immunosuppressive biological therapy during pregnancy will not be eligible to receive rotavirus vaccine.

- **CONTRA-INDICATIONS** History of intussusception · predisposition to intussusception · severe combined immunodeficiency disorder
- ▶ **CONTRA-INDICATIONS, FURTHER INFORMATION**
- ▶ **Immunosuppression** With the exception of severe combined immunodeficiency disorder (and children born to mothers who received immunosuppressive biological therapy during pregnancy, see *Important safety information*), rotavirus vaccine is not contra-indicated in immunosuppressed patients—benefit from vaccination is likely to outweigh the risk, if there is any doubt, Public Health England recommends seek specialist advice.
- **CAUTIONS** Diarrhoea (postpone vaccination) · immunosuppressed close contacts · vomiting (postpone vaccination)
- ▶ **CAUTIONS, FURTHER INFORMATION** The rotavirus vaccine virus is excreted in the stool and may be transmitted to close contacts; however, Public Health England advises vaccination of those with immunosuppressed close contacts may protect the contacts from wild-type rotavirus disease and outweigh any risk from transmission of vaccine virus.
- **INTERACTIONS** → Appendix 1: live vaccines
- **SIDE-EFFECTS**
- ▶ **Uncommon** Gastrointestinal disorders
- ▶ **Frequency not known** Apnoea · haematochezia
- **PATIENT AND CARER ADVICE** The rotavirus vaccine virus is excreted in the stool and may be transmitted to close contacts; carers of a recently vaccinated baby should be advised of the need to wash their hands after changing the baby's nappies.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Oral suspension

- ▶ **Rotarix** (GlaxoSmithKline UK Ltd)
Rotarix vaccine live oral suspension 1.5mL tube | 1 tube [PoM] £34.76
DT = £34.76

F 1375

Tick-borne encephalitis vaccine, inactivated

27-Jan-2021

● INDICATIONS AND DOSE

Initial immunisation against tick-borne encephalitis

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 1-15 years: 0.25 mL for 1 dose, followed by 0.25 mL after 1-3 months for 1 dose, then 0.25 mL after further 5-12 months for 1 dose, to achieve more rapid protection, second dose may be given 14 days after first dose, dose to be administered in deltoid region or anterolateral thigh in infants, in immunocompromised patients (including those receiving immunosuppressants), antibody concentration may be measured 4 weeks after second dose and dose repeated if protective levels not achieved
- ▶ Child 16-17 years: 0.5 mL for 1 dose, followed by 0.5 mL after 1-3 months for 1 dose, then 0.5 mL after further 5-12 months for 1 dose, to achieve more rapid protection, second dose may be given 14 days after first dose, dose to be administered in deltoid region, in immunocompromised patients (including those receiving immunosuppressants), antibody concentration may be measured 4 weeks after second dose and dose repeated if protective levels not achieved
- ▶ Adult: 0.5 mL for 1 dose, followed by 0.5 mL after 1-3 months for 1 dose, then 0.5 mL after further 5-12 months for 1 dose, to achieve more rapid protection, second dose may be given 14 days after first dose, dose to be administered in deltoid region, in immunocompromised patients (including those receiving immunosuppressants), antibody concentration may be measured 4 weeks after second dose and dose repeated if protective levels not achieved
- ▶ Elderly: 0.5 mL for 1 dose, followed by 0.5 mL after 1-3 months for 1 dose, then 0.5 mL after further 5-12 months for 1 dose, to achieve more rapid protection, second dose may be given 14 days after first dose, dose to be administered in deltoid region, antibody concentration may be measured 4 weeks after second dose and dose repeated if protective levels not achieved

Immunisation against tick-borne encephalitis, booster doses

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 1-17 years: First dose to be given within 3 years after initial course completed and then every 3-5 years, dose to be administered in deltoid region or anterolateral thigh in infants (consult product literature)
- ▶ Adult: First dose to be given within 3 years after initial course completed and then every 3-5 years, dose to be administered in deltoid region (consult product literature)

● SIDE-EFFECTS

- ▶ **Common or very common** Restlessness (in children) · sleep disorder (in children)
- ▶ **Rare or very rare** Asthenia · autoimmune disorder (in adults) · chills (uncommon in children) · demyelination (in adults) · drowsiness (in adults) · dyspepsia (in children) · dyspnoea · eye pain · gait abnormal · hyperhidrosis ·

- increased risk of infection · influenza like illness · joint swelling (in adults) · meningism · meningitis aseptic (in adults) · motor dysfunction · musculoskeletal stiffness · nerve disorders · oedema · pain · seizures · sensory disorder · tachycardia (in adults) · tinnitus · vertigo · vision disorders
- **ALLERGY AND CROSS-SENSITIVITY** PHE advises individuals with evidence of previous anaphylactic reaction to egg should not be given tick-borne encephalitis vaccine.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

EXCIPIENTS: May contain Gentamicin, neomycin

- ▶ **TicoVac** (Pfizer Ltd)
TicoVac Junior vaccine suspension for injection 0.25mL pre-filled syringes | 1 pre-filled disposable injection [PoM] £28.00
TicoVac vaccine suspension for injection 0.5mL pre-filled syringes | 1 pre-filled disposable injection [PoM] £32.00

F 1375

Varicella-zoster vaccine

16-Oct-2020

- **DRUG ACTION** *Varilrix*® and *Varivax*® are live attenuated vaccines that protect against varicella (chickenpox) caused by varicella-zoster virus infection. *Zostavax*® is a live attenuated vaccine that protects against herpes zoster (shingles) caused by varicella-zoster virus infection.

● INDICATIONS AND DOSE

VARILRIX®

Prevention of varicella infection (chickenpox)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child 1-17 years: 0.5 mL every 4-6 weeks for 2 doses, to be administered into the deltoid region or anterolateral thigh
- ▶ Adult: 0.5 mL every 4-6 weeks for 2 doses, to be administered into the deltoid region or anterolateral thigh

VARIVAX®

Prevention of varicella infection (chickenpox)

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Child 1-12 years: 0.5 mL for 2 doses, interval of at least 4 weeks between each dose, to be administered into the deltoid region (or higher anterolateral thigh in young children)
- ▶ Child 13-17 years: 0.5 mL for 2 doses, interval of 4-8 weeks between each dose, to be administered preferably into the deltoid region
- ▶ Adult: 0.5 mL for 2 doses, interval of 4-8 weeks between each dose, to be administered preferably into the deltoid region

Prevention of varicella infection (chickenpox) in children with asymptomatic HIV infection

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Child 1-12 years: 0.5 mL for 2 doses, interval of 12 weeks between each dose, to be administered into the deltoid region (or higher anterolateral thigh in young children)

ZOSTAVAX®

Prevention of herpes zoster (shingles)

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Adult 70-79 years: 0.65 mL for 1 dose, intramuscular route preferred, to be administered preferably into the deltoid region

- **CAUTIONS** Post-vaccination close contact with susceptible individuals

CAUTIONS, FURTHER INFORMATION Rarely, the varicella-zoster vaccine virus has been transmitted from the vaccinated individual to close contacts. Therefore,

manufacturer advises contact with the following should be avoided if a vaccine-related cutaneous rash develops within 4–6 weeks of the first or second dose:

- varicella-susceptible pregnant women;
- individuals at high risk of severe varicella, including those with immunodeficiency or those receiving immunosuppressive therapy.

Public Health England advises healthcare workers who develop a generalised papular or vesicular rash on vaccination should avoid contact with patients until the lesions have crusted. Those who develop a localised rash after vaccination should cover the lesions and be allowed to continue working unless in contact with patients at high risk of severe varicella.

- ▶ Administration with MMR vaccine Public Health England advises varicella-zoster and MMR vaccines can be given on the same day or separated by a 4-week minimum interval. When protection is rapidly required, the vaccines can be given at any interval and an additional dose of the vaccine given second may be considered.

● **INTERACTIONS** → Appendix 1: live vaccines

● **SIDE-EFFECTS**

- ▶ **Uncommon** Cough · drowsiness · increased risk of infection
- ▶ **Rare or very rare** Conjunctivitis · Kawasaki disease · seizure · stroke · thrombocytopenia · vasculitis

● **CONCEPTION AND CONTRACEPTION** Manufacturer advises avoid pregnancy for 1 month after vaccination.

● **PRESCRIBING AND DISPENSING INFORMATION**

ZOSTAVAX® Advice in the BNF may differ from that in product literature.

VARIVAX®

- ▶ In children Advice in the BNF may differ from that in product literature.

VARILRIX®

- ▶ In children Advice in the BNF may differ from that in product literature.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

† 1375

Yellow fever vaccine, live

29-Jul-2020

● **INDICATIONS AND DOSE**

Immunisation against yellow fever

- ▶ BY DEEP SUBCUTANEOUS INJECTION
- ▶ Child 6–8 months (administered on expert advice): Infants under 9 months should be vaccinated only if the risk of yellow fever is high and unavoidable (consult product literature or local protocols)
- ▶ Child 9 months–17 years: 0.5 mL for 1 dose
- ▶ Adult: 0.5 mL for 1 dose

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (UPDATED NOVEMBER 2019): YELLOW FEVER VACCINE: STRONGER PRECAUTIONS IN PEOPLE WITH WEAKENED IMMUNITY AND IN THOSE AGED 60 YEARS OR OLDER

The yellow fever vaccine (*Stamaril*®) has been associated with the very rare, life-threatening reactions viscerotropic disease (YEL-AVD) and neurotropic disease (YEL-AND), which both resemble yellow fever infection. It must not be given to patients who have had a thymectomy, who are taking immunosuppressive or immunomodulating biological drugs, or who have a first-degree family history of YEL-AVD or YEL-AND following vaccination that was unrelated to a known medical risk factor. In patients aged 60 years and older, the vaccine should only be administered when there is a significant and unavoidable risk of acquiring yellow fever infection. It must only be administered by healthcare professionals specifically trained in the benefit-risk evaluation of yellow fever vaccine. Healthcare professionals must inform patients and carers about the early signs and symptoms of YEL-AVD and YEL-AND, and advise them to seek urgent medical attention if they occur; the manufacturer's patient information leaflet should also be provided. Healthcare professionals administering vaccines should consult information in the YF Vaccine Centre code of practice and strengthen protocols and checklists to avoid inappropriate administration.

- **CONTRA-INDICATIONS** Children under 6 months · history of thymus dysfunction

- **CAUTIONS** Individuals over 60 years—greater risk of vaccine-associated adverse effects

CAUTIONS, FURTHER INFORMATION

- ▶ Administration with MMR vaccine Public Health England advises yellow fever and MMR vaccines should not be administered on the same day; there should be a 4-week minimum interval between the vaccines. When protection is rapidly required, the vaccines can be given at any interval; an additional dose of MMR should be considered and re-vaccination with the yellow fever vaccine can also be considered in those at on-going risk.

- **INTERACTIONS** → Appendix 1: live vaccines

● **SIDE-EFFECTS**

- ▶ **Common or very common** Asthenia · crying (in children) · drowsiness (in children)
- ▶ **Rare or very rare** Rhinitis · yellow fever vaccine-associated neurotropic disease · yellow fever vaccine-associated viscerotropic disease
- ▶ **Frequency not known** Angioedema · influenza like illness · paraesthesia

SIDE-EFFECTS, FURTHER INFORMATION Very rare vaccine-associated adverse effects may occur, such as viscerotropic disease (yellow-fever vaccine-associated viscerotropic disease, YEL-AVD), a syndrome which may include metabolic acidosis, muscle and liver cirrhosis, and multi-organ failure. Neurological disorders (yellow fever vaccine-associated neurotropic disease, YEL-AND) such as encephalitis have also been reported. These very rare adverse effects usually occur after the first dose of yellow fever vaccine in those with no previous immunity. Increased risk of fatal reactions reported in patients aged 60 years and older and those who are immunosuppressed.

- **ALLERGY AND CROSS-SENSITIVITY** Yellow fever vaccine should only be considered under the guidance of a specialist in individuals with evidence of previous anaphylactic reaction to egg.
- **PREGNANCY** Live yellow fever vaccine should not be given during pregnancy because there is a theoretical risk of fetal infection. Pregnant women should be advised not to travel to areas at high risk of yellow fever. If exposure cannot be avoided during pregnancy, then the vaccine should be

given if the risk from disease in the mother outweighs the risk to the fetus from vaccination.

- **BREAST FEEDING** Avoid; seek specialist advice if exposure to virus cannot be avoided.

-
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Anaesthesia (general)

Overview

Several different types of drug are given together during general anaesthesia. Anaesthesia is induced with either a volatile drug given by inhalation or with an intravenously administered drug; anaesthesia is maintained with an intravenous or inhalational anaesthetic. Analgesics, usually short-acting opioids, are also used. The use of neuromuscular blocking drugs necessitates intermittent positive-pressure ventilation. Following surgery, anticholinesterases can be given to reverse the effects of neuromuscular blocking drugs; specific antagonists can be used to reverse central and respiratory depression caused by some drugs used in surgery. A local topical anaesthetic can be used to reduce pain at the injection site.

Individual requirements vary considerably and the recommended doses are only a guide. Smaller doses are indicated in ill, shocked, or debilitated patients and in significant hepatic impairment, while robust individuals may require larger doses. The required dose of induction agent may be less if the patient has been premedicated with a sedative agent or if an opioid analgesic has been used.

Intravenous anaesthetics

Intravenous anaesthetics may be used either to induce anaesthesia or for maintenance of anaesthesia throughout surgery. Intravenous anaesthetics nearly all produce their effect in one arm-brain circulation time. Extreme care is required in surgery of the mouth, pharynx, or larynx where the airway may be difficult to maintain (e.g. in the presence of a tumour in the pharynx or larynx).

To facilitate tracheal intubation, induction is usually followed by a neuromuscular blocking drug or a short-acting opioid.

The doses of all intravenous anaesthetic drugs should be titrated to effect (except when using 'rapid sequence induction'); lower doses may be required in premedicated patients.

Total intravenous anaesthesia

This is a technique in which major surgery is carried out with all drugs given intravenously. Respiration can be spontaneous, or controlled with oxygen-enriched air. Neuromuscular blocking drugs can be used to provide relaxation and prevent reflex muscle movements. The main problem to be overcome is the assessment of depth of anaesthesia. Target Controlled Infusion (TCI) systems can be used to titrate intravenous anaesthetic infusions to

predicted plasma-drug concentrations in ventilated adult patients.

Drugs used for intravenous anaesthesia

Propofol p. 1398, the most widely used intravenous anaesthetic, can be used for induction or maintenance of anaesthesia in adults and children, but it is not commonly used in neonates. Propofol is associated with rapid recovery and less hangover effect than other intravenous anaesthetics. Propofol can also be used for sedation during diagnostic procedures and sedation in adults in intensive care.

Thiopental sodium p. 361 is a barbiturate that is used for induction of anaesthesia, but has no analgesic properties. Induction is generally smooth and rapid, but dose-related cardiovascular and respiratory depression can occur. Awakening from a moderate dose of thiopental sodium is rapid because the drug redistributes into other tissues, particularly fat. However, metabolism is slow and sedative effects can persist for 24 hours. Repeated doses have a cumulative effect and recovery is much slower.

Etomidate p. 1398 is an intravenous agent associated with rapid recovery without a hangover effect. Etomidate causes less hypotension than thiopental sodium and propofol during induction. It produces a high incidence of extraneous muscle movements, which can be minimised by an opioid analgesic or a short-acting benzodiazepine given just before induction.

Ketamine p. 1415 is used rarely. Ketamine causes less hypotension than thiopental sodium and propofol during induction. It is used mainly for paediatric anaesthesia, particularly when repeated administration is required (such as for serial burns dressings); recovery is relatively slow and there is a high incidence of extraneous muscle movements. The main disadvantage of ketamine is the high incidence of hallucinations, nightmares, and other transient psychotic effects; these can be reduced by a benzodiazepine such as diazepam p. 366 or midazolam p. 362.

Inhalational anaesthetics

Inhalational anaesthetics include gases and volatile liquids. *Gaseous anaesthetics* require suitable equipment for storage and administration. *Volatile liquid anaesthetics* are administered using calibrated vaporisers, using air, oxygen, or nitrous oxide-oxygen mixtures as the carrier gas. To prevent hypoxia, the inspired gas mixture should contain a minimum of 25% oxygen at all times. Higher concentrations of oxygen (greater than 30%) are usually required during inhalational anaesthesia when nitrous oxide p. 1401 is being administered.

Volatile liquid anaesthetics

Volatile liquid anaesthetics can be used for induction and maintenance of anaesthesia, and following induction with an intravenous anaesthetic.

Isflurane p. 1400 is a volatile liquid anaesthetic. Heart rhythm is generally stable during isflurane anaesthesia, but heart-rate can rise, particularly in younger patients. Systemic arterial pressure and cardiac output can fall, owing to a decrease in systemic vascular resistance. Muscle relaxation occurs and the effects of muscle relaxant drugs are potentiated. Isflurane is the preferred inhalational anaesthetic for use in obstetrics.

Desflurane p. 1400 is a rapid acting volatile liquid anaesthetic; it is reported to have about one-fifth the potency of isoflurane. Emergence and recovery from anaesthesia are particularly rapid because of its low solubility. Desflurane is not recommended for induction of anaesthesia as it is irritant to the upper respiratory tract.

Sevoflurane p. 1401 is a rapid acting volatile liquid anaesthetic and is more potent than desflurane. Emergence and recovery are particularly rapid, but slower than desflurane. Sevoflurane is non-irritant and is therefore often used for inhalational induction of anaesthesia; it has little effect on heart rhythm compared with other volatile liquid anaesthetics.

Nitrous oxide

Nitrous oxide is used for maintenance of anaesthesia and, in sub-anaesthetic concentrations, for analgesia. For anaesthesia, nitrous oxide is commonly used in a concentration of 50 to 66% in oxygen as part of a balanced technique in association with other inhalational or intravenous agents. Nitrous oxide is unsatisfactory as a sole anaesthetic owing to lack of potency, but is useful as part of a combination of drugs since it allows a significant reduction in dosage.

For analgesia (without loss of consciousness), a mixture of nitrous oxide and oxygen containing 50% of each gas (Entonox[®], Equanox[®]) is used. Self-administration using a demand valve is popular in obstetric practice, for changing painful dressings, as an aid to postoperative physiotherapy, and in emergency ambulances.

Nitrous oxide may have a deleterious effect if used in patients with an air-containing closed space since nitrous oxide diffuses into such a space with a resulting increase in pressure. This effect may be dangerous in conditions such as pneumothorax, which may enlarge to compromise respiration, or in the presence of intracranial air after head injury, entrapped air following recent underwater dive, or recent intra-ocular gas injection.

Malignant hyperthermia

Malignant hyperthermia is a rare but potentially lethal complication of anaesthesia. It is characterised by a rapid rise in temperature, increased muscle rigidity, tachycardia, and acidosis. The most common triggers of malignant hyperthermia are the volatile anaesthetics. Suxamethonium chloride p. 1405 has also been implicated, but malignant hyperthermia is more likely if it is given following a volatile anaesthetic. Volatile anaesthetics and suxamethonium chloride should be avoided during anaesthesia in patients at high risk of malignant hyperthermia.

Dantrolene sodium p. 1416 is used in the treatment of malignant hyperthermia.

Sedation, anaesthesia, and resuscitation in dental practice

Overview

Sedation for dental procedures should be limited to conscious sedation. Diazepam p. 366 and temazepam p. 512 are effective anxiolytics for dental treatment in adults.

For details of sedation, anaesthesia, and resuscitation in dental practice see *A Conscious Decision: A review of the use of general anaesthesia and conscious sedation in primary dental care*; report by a group chaired by the Chief Medical Officer and Chief Dental Officer, July 2000 and associated documents. Further details can also be found in *Standards for Conscious Sedation in the Provision of Dental Care*; report of an Intercollegiate Advisory Committee for Sedation in Dentistry, 2020 www.rcseg.ac.uk/dental-facilities/fds/publications-guidelines/standards-for-conscious-sedation-in-the-provision-of-dental-care-and-accreditation/.

Surgery and long-term medication

02-Mar-2021

Overview

The risk of losing disease control on stopping long-term medication before surgery is often greater than the risk posed by continuing it during surgery. It is vital that the anaesthetist knows about **all** drugs that a patient is (or has been) taking.

Patients with adrenal atrophy resulting from long-term corticosteroid use may suffer a precipitous fall in blood pressure unless corticosteroid cover is provided during anaesthesia and in the immediate postoperative period. Anaesthetists must therefore know whether a patient is, or has been, receiving corticosteroids (including high-dose inhaled corticosteroids).

Other drugs that should normally not be stopped before surgery include antiepileptics, antiparkinsonian drugs, antipsychotics, anxiolytics, bronchodilators, cardiovascular drugs (but see potassium-sparing diuretics, angiotensin-converting enzyme inhibitors, and angiotensin-II receptor antagonists), glaucoma drugs, immunosuppressants, drugs of dependence, and thyroid or antithyroid drugs. Expert advice is required for patients receiving antivirals for HIV infection. See general advice on surgery in diabetic patients in Diabetes, surgery and medical illness p. 732.

Patients taking antiplatelet medication or an oral anticoagulant present an increased risk for surgery. In these circumstances, the anaesthetist and surgeon should assess the relative risks and decide jointly whether the antiplatelet or the anticoagulant drug should be stopped or replaced with heparin (unfractionated) p. 147 or low molecular weight heparin therapy. [EvG](#) In patients with stable angina, perioperative aspirin p. 133 should be only continued where there is a high thrombotic risk (e.g. patients with a recent acute coronary syndrome, coronary artery stents, or an ischaemic stroke). [A](#)

Drugs that should be stopped before surgery include combined hormonal contraceptives, see Contraceptives, hormonal p. 838; for advice on hormone replacement therapy, see Sex hormones p. 793. MAOIs can have important interactions with some drugs used during surgery, such as pethidine hydrochloride p. 493. Tricyclic antidepressants need not be stopped, but there may be an increased risk of arrhythmias and hypotension (and dangerous interactions with vasopressor drugs); therefore, the anaesthetist should be informed if they are not stopped. Lithium should be stopped 24 hours before major surgery but the normal dose can be continued for minor surgery (with careful monitoring of fluids and electrolytes). Potassium-

sparing diuretics may need to be withheld on the morning of surgery because hyperkalaemia may develop if renal perfusion is impaired or if there is tissue damage. Angiotensin-converting enzyme (ACE) inhibitors and angiotensin-II receptor antagonists can be associated with severe hypotension after induction of anaesthesia; these drugs may need to be discontinued 24 hours before surgery. Herbal medicines may be associated with adverse effects when given with anaesthetic drugs and consideration should be given to stopping them before surgery.

ANAESTHETICS, GENERAL > INTRAVENOUS ANAESTHETICS

Etomidate

04-Sep-2020

● INDICATIONS AND DOSE

Induction of anaesthesia

- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: 150–300 micrograms/kg (max. per dose 60 mg), to be administered over 30–60 seconds (60 seconds in patients in whom hypotension might be hazardous)
- ▶ Elderly: 150–200 micrograms/kg (max. per dose 60 mg), to be administered over 30–60 seconds (60 seconds in patients in whom hypotension might be hazardous)

IMPORTANT SAFETY INFORMATION

Etomidate should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

- **CAUTIONS** Acute circulatory failure (shock) · adrenal insufficiency · avoid in Acute porphyrias p. 1114 · cardiovascular disease · elderly · fixed cardiac output · hypovolaemia
- **CAUTIONS, FURTHER INFORMATION**
 - ▶ Adrenal insufficiency Etomidate suppresses adrenocortical function, particularly during continuous administration, and it should not be used for maintenance of anaesthesia. It should be used with caution in patients with underlying adrenal insufficiency, for example, those with sepsis.
- **INTERACTIONS** → Appendix 1: etomidate
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Apnoea · hypotension · movement disorders · nausea · respiratory disorders · skin reactions · vascular pain · vomiting
 - ▶ **Uncommon** Arrhythmias · cough · hiccups · hypersalivation · hypertension · muscle rigidity · neuromuscular dysfunction · nystagmus · procedural complications
 - ▶ **Frequency not known** Adrenal insufficiency · atriocentric block · cardiac arrest · embolism and thrombosis · seizures · shock · Stevens-Johnson syndrome · trismus
- **SIDE-EFFECTS, FURTHER INFORMATION** **Pain on injection** Can be reduced by injecting into a larger vein or by giving an opioid analgesic just before induction.
 - ▶ **Extraneous muscle movements** Extraneous muscle movements can be minimised by an opioid analgesic or a short-acting benzodiazepine given just before induction.
- **PREGNANCY** May depress neonatal respiration if used during delivery.
- **BREAST FEEDING** Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.
- **HEPATIC IMPAIRMENT**
 - ▶ **Dose adjustments** Manufacturer advises reduce dose in liver cirrhosis.

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises give over 30–60 seconds (60 seconds in patients in whom hypotension might be hazardous).

● PATIENT AND CARER ADVICE

Driving and skilled tasks Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risk of driving or undertaking skilled tasks afterwards. For a short general anaesthetic the risk extends to **at least 24 hours** after administration. Responsible persons should be available to take patients home. The dangers of taking **alcohol** should also be emphasised.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Propylene glycol

▶ **Hypnomidate** (Piramal Critical Care Ltd)

Etomidate 2 mg per 1 ml Hypnomidate 20mg/10ml solution for injection ampoules | 5 ampoule [POM] £6.90

Emulsion for injection

▶ **Etomidate-Lipuro** (B.Braun Medical Ltd)

Etomidate 2 mg per 1 ml Etomidate-Lipuro 20mg/10ml emulsion for injection ampoules | 10 ampoule [POM] £16.09

Propofol

13-Aug-2020

● INDICATIONS AND DOSE

Induction of anaesthesia using 0.5% or 1% injection

- ▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult 18–54 years: Usual dose 1.5–2.5 mg/kg, to be administered at a rate of 20–40 mg every 10 seconds until response, for debilitated patients use dose for 55 years and over
- ▶ Adult 55 years and over: Usual dose 1–1.5 mg/kg, to be administered at a rate of 20 mg every 10 seconds until response

Induction of anaesthesia using 2% injection

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult 18–54 years: Usual dose 1.5–2.5 mg/kg, to be administered at a rate of 20–40 mg every 10 seconds until response. For debilitated patients use dose for 55 years and over
- ▶ Adult 55 years and over: Usual dose 1–1.5 mg/kg, to be administered at a rate of 20 mg every 10 seconds until response

Maintenance of anaesthesia using 1% injection

- ▶ INITIALLY BY INTRAVENOUS INFUSION
- ▶ Adult: Usual dose 4–12 mg/kg/hour, alternatively (by slow intravenous injection) 25–50 mg, dose may be repeated according to response, for debilitated patients use dose for elderly
- ▶ Elderly: Usual dose 3–6 mg/kg/hour, alternatively (by slow intravenous injection) 25–50 mg, dose may be repeated according to response

Maintenance of anaesthesia using 2% injection

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: Usual dose 4–12 mg/kg/hour, for debilitated patients use dose for elderly
- ▶ Elderly: Usual dose 3–6 mg/kg/hour

Sedation of ventilated patients in intensive care using 1% or 2% injection

- ▶ BY CONTINUOUS INTRAVENOUS INFUSION
- ▶ Adult: Usual dose 0.3–4 mg/kg/hour, adjusted according to response

Induction of sedation for surgical and diagnostic procedures using 0.5% or 1% injection

- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: Initially 0.5–1 mg/kg, to be administered over 1–5 minutes, dose and rate of administration adjusted according to desired level of sedation and response

Maintenance of sedation for surgical and diagnostic procedures using 0.5% injection

- ▶ INITIALLY BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 1.5–4.5 mg/kg/hour, dose and rate of administration adjusted according to desired level of sedation and response, followed by (by slow intravenous injection) 10–20 mg, (if rapid increase in sedation required), patients over 55 years or debilitated may require lower initial dose and rate of administration

Maintenance of sedation for surgical and diagnostic procedures using 1% injection

- ▶ INITIALLY BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 1.5–4.5 mg/kg/hour, dose and rate of administration adjusted according to desired level of sedation and response, followed by (by slow intravenous injection) 10–20 mg, (if rapid increase in sedation required), patients over 55 years or debilitated may require lower initial dose and rate of administration

Maintenance of sedation for surgical and diagnostic procedures using 2% injection

- ▶ INITIALLY BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 1.5–4.5 mg/kg/hour, dose and rate of administration adjusted according to desired level of sedation and response, followed by (by slow intravenous injection) 10–20 mg, using 0.5% or 1% injection (if rapid increase in sedation required), patients over 55 years or debilitated may require lower initial dose and rate of administration

IMPORTANT SAFETY INFORMATION

Propofol should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

- **CAUTIONS** Acute circulatory failure (shock) · cardiac impairment · cardiovascular disease · elderly · epilepsy · fixed cardiac output · hypotension · hypovolaemia · raised intracranial pressure · respiratory impairment
 - **INTERACTIONS** → Appendix 1: propofol
 - **SIDE-EFFECTS**
 - ▶ **Common or very common** Apnoea · arrhythmias · headache · hypotension · localised pain · nausea · vomiting
 - ▶ **Uncommon** Thrombosis
 - ▶ **Rare or very rare** Epileptiform seizure (may be delayed) · pancreatitis · post procedural complications · pulmonary oedema · sexual disinhibition · soft tissue necrosis · urinary discoloration
 - ▶ **Frequency not known** Drug use disorders · dyskinesia · euphoric mood · heart failure · hepatomegaly · hyperkalaemia · hyperlipidaemia · metabolic acidosis · renal failure · respiratory depression · rhabdomyolysis
- SIDE-EFFECTS, FURTHER INFORMATION Bradycardia**
Bradycardia may be profound and may be treated with intravenous administration of an antimuscarinic drug.
- Pain on injection** Pain on injection can be reduced by intravenous lidocaine.
- Propofol infusion syndrome** Prolonged infusion of propofol doses exceeding 4mg/kg/hour may result in potentially fatal effects, including metabolic acidosis, arrhythmias, cardiac failure, rhabdomyolysis,

hyperlipidaemia, hyperkalaemia, hepatomegaly, and renal failure.

- **PREGNANCY** May depress neonatal respiration if used during delivery.
- **Dose adjustments** Max. dose for maintenance of anaesthesia 6 mg/kg/hour.
- **BREAST FEEDING** Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **RENAL IMPAIRMENT** Use with caution.
- **MONITORING REQUIREMENTS** Monitor blood-lipid concentration if risk of fat overload or if sedation longer than 3 days.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises shake before use; microbiological filter not recommended; may be administered via a Y-piece close to injection site co-administered with Glucose 5% or Sodium chloride 0.9%. 0.5% **emulsion** for injection or intermittent infusion; manufacturer advises may be administered undiluted, or diluted with Glucose 5% or Sodium chloride 0.9%; dilute to a concentration not less than 1 mg/mL. 1% **emulsion** for injection or infusion; manufacturer advises may be administered undiluted, or diluted with Glucose 5% (*Diprivan*[®]) or (*Propofol-Lipuro*[®]) or Sodium chloride 0.9% (*Propofol-Lipuro*[®] only); dilute to a concentration not less than 2 mg/mL; use within 6 hours of preparation. 2% **emulsion** for infusion; manufacturer advises do not dilute.
- **PATIENT AND CARER ADVICE**

Driving and skilled tasks Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risk of driving or undertaking skilled tasks afterwards. For a short general anaesthetic the risk extends to **at least 24 hours** after administration. Responsible persons should be available to take patients home. The dangers of taking **alcohol** should also be emphasised.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Emulsion for infusion▶ **Propofol (Non-proprietary)**

Propofol 10 mg per 1 ml Propofol 500mg/50ml emulsion for infusion vials | 1 vial [PoM](#) £5.00 (Hospital only)

ANAESTHETICS, GENERAL > VOLATILE LIQUID ANAESTHETICS

Volatile halogenated anaesthetics

IMPORTANT SAFETY INFORMATION

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

- **CONTRA-INDICATIONS** Susceptibility to malignant hyperthermia
- **CAUTIONS** Can trigger malignant hyperthermia · raised intracranial pressure (can increase cerebrospinal pressure)
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Agitation · apnoea · arrhythmias · chills · cough · dizziness · headache · hypersalivation · hypertension · hypotension · nausea · respiratory disorders · vomiting
 - ▶ **Uncommon** Hypoxia
 - ▶ **Frequency not known** Breath holding · cardiac arrest · haemorrhage · hepatic disorders · hyperkalaemia · malignant hyperthermia · QT interval prolongation · rhabdomyolysis · seizure
- **ALLERGY AND CROSS-SENSITIVITY** Can cause hepatotoxicity in those sensitised to halogenated anaesthetics.
- **DIRECTIONS FOR ADMINISTRATION** Volatile liquid anaesthetics are administered using calibrated vaporisers, using oxygen, oxygen-enriched air, or nitrous oxide-oxygen mixtures as the carrier gas (consult product literature).
- **PATIENT AND CARER ADVICE**

Driving and skilled tasks Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risks of driving or undertaking skilled tasks afterwards. For a short general anaesthetic, the risk extends to **at least 24 hours** after administration. Responsible persons should be available to take patients home. The dangers of taking **alcohol** should also be emphasised.

Desflurane

● INDICATIONS AND DOSE

Induction of anaesthesia (but not recommended)

- ▶ **BY INHALATION**
- ▶ **Adult:** 4–11 %, to be inhaled through specifically calibrated vaporiser

Maintenance of anaesthesia (in nitrous oxide-oxygen)

- ▶ **BY INHALATION**
- ▶ **Adult:** 2–6 %, to be inhaled through a specifically calibrated vaporiser

Maintenance of anaesthesia (in oxygen or oxygen-enriched air)

- ▶ **BY INHALATION**
- ▶ **Adult:** 2.5–8.5 %, to be inhaled through a specifically calibrated vaporiser

- **INTERACTIONS** → Appendix 1: volatile halogenated anaesthetics
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Coagulation disorder · conjunctivitis
 - ▶ **Uncommon** Myalgia · myocardial infarction · myocardial ischaemia · vasodilation
 - ▶ **Frequency not known** Abdominal pain · asthenia · heart failure · hypokalaemia · malaise · metabolic acidosis · pancreatitis acute · shock · skin reactions · ventricular dysfunction · visual acuity decreased
- **PREGNANCY** May depress neonatal respiration if used during delivery.
- **BREAST FEEDING** Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Inhalation vapour

▶ Desflurane (Non-proprietary)

Desflurane 1 ml per 1 ml Desflurane volatile liquid | 240 ml [PoM]  (Hospital only)

above

12-Dec-2019

Isoflurane

● INDICATIONS AND DOSE

Induction of anaesthesia (in oxygen or nitrous oxide-oxygen)

- ▶ **BY INHALATION**
- ▶ **Adult:** Initially 0.5 %, increased to 3 %, adjusted according to response, administered using specifically calibrated vaporiser

Maintenance of anaesthesia (in nitrous oxide-oxygen)

- ▶ **BY INHALATION**
- ▶ **Adult:** 1–2.5 %, to be administered using specifically calibrated vaporiser; an additional 0.5–1% may be required when given with oxygen alone

Maintenance of anaesthesia in caesarean section (in nitrous oxide-oxygen)

- ▶ **BY INHALATION**
- ▶ **Adult:** 0.5–0.75 %, to be administered using specifically calibrated vaporiser

- **INTERACTIONS** → Appendix 1: volatile halogenated anaesthetics
- **SIDE-EFFECTS** Carboxyhaemoglobinaemia · chest discomfort · cognitive impairment · delirium · dyspnoea · ileus · mood altered (that can last several days) · myoglobinuria · skin reactions
- **PREGNANCY** May depress neonatal respiration if used during delivery.
- **BREAST FEEDING** Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Inhalation vapour

▶ Isoflurane (Non-proprietary)

Isoflurane 1 ml per 1 ml Isoflurane inhalation vapour | 250 ml [PoM] £35.29 (Hospital only)

▶ AErrane (Baxter Healthcare Ltd)

Isoflurane 1 ml per 1 ml AErrane volatile liquid | 250 ml [PoM]  (Hospital only)

Nitrous oxide

12-Aug-2020

● INDICATIONS AND DOSE

Maintenance of anaesthesia in conjunction with other anaesthetic agents

► BY INHALATION

- Adult: 50–66 %, to be administered using suitable anaesthetic apparatus in oxygen

Analgesia

► BY INHALATION

- Adult: Up to 50 %, to be administered using suitable anaesthetic apparatus in oxygen, adjusted according to the patient's needs

IMPORTANT SAFETY INFORMATION

Nitrous oxide should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

- **CAUTIONS** Entrapped air following recent underwater dive · pneumothorax · presence of intracranial air after head injury · recent intra-ocular gas injection

CAUTIONS, FURTHER INFORMATION Nitrous oxide may have a deleterious effect if used in patients with an air-containing closed space since nitrous oxide diffuses into such a space with a resulting increase in pressure. This effect may be dangerous in conditions such as pneumothorax, which may enlarge to compromise respiration, or in the presence of intracranial air after head injury, entrapped air following recent underwater dive, or recent intra-ocular gas injection.

- **INTERACTIONS** → Appendix 1: nitrous oxide
- **SIDE-EFFECTS** Abdominal distension · addiction · agranulocytosis · disorientation · dizziness · euphoric mood · megaloblastic anaemia · middle ear damage · myeloneuropathy · nausea · paraesthesia · sedation · subacute combined cord degeneration · tympanic membrane perforation · vomiting

SIDE-EFFECTS, FURTHER INFORMATION Exposure of patients to nitrous oxide for prolonged periods, either by continuous or by intermittent administration, may result in megaloblastic anaemia owing to interference with the action of vitamin B₁₂; neurological toxic effects can occur without preceding overt haematological changes. Depression of white cell formation may also occur.

- **PREGNANCY** May depress neonatal respiration if used during delivery.
- **BREAST FEEDING** Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.
- **MONITORING REQUIREMENTS**
 - Assessment of plasma-vitamin B₁₂ concentration should be considered in those at risk of deficiency, including the elderly, those who have a poor, vegetarian, or vegan diet, and those with a history of anaemia.
 - Nitrous oxide should **not** be given continuously for longer than 24 hours or more frequently than every 4 days without close supervision and haematological monitoring.
- **DIRECTIONS FOR ADMINISTRATION** For analgesia (without loss of consciousness), manufacturer advises a mixture of nitrous oxide and oxygen containing 50% of each gas (*Entonox*[®]) is used.
- **HANDLING AND STORAGE** Exposure of theatre staff to nitrous oxide should be minimised (risk of serious side-effects).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Inhalation gas

 Medical Nitrous Oxide cylinders size E | 1800 litre [P] [X]

F 1400

Sevoflurane

● INDICATIONS AND DOSE

Induction of anaesthesia (in oxygen or nitrous oxide-oxygen)

► BY INHALATION

- Adult: Initially 0.5–1 %, then increased to up to 8 %, increased gradually, according to response, to be administered using specifically calibrated vaporiser

Maintenance of anaesthesia (in oxygen or nitrous oxide-oxygen)

► BY INHALATION

- Adult: 0.5–3 %, adjusted according to response, to be administered using specifically calibrated vaporiser

- **CAUTIONS** Susceptibility to QT-interval prolongation
 - **INTERACTIONS** → Appendix 1: volatile halogenated anaesthetics
 - **SIDE-EFFECTS**
 - **Common or very common** Drowsiness · fever · hypothermia
 - **Uncommon** Asthma · atrioventricular block · confusion

1 Anaesthesia adjuvants

Pre-medication and peri-operative drugs

01-Sep-2020

Drugs that affect gastric pH

Regurgitation and aspiration of gastric contents (Mendelson's syndrome) can be an important complication of general anaesthesia, particularly in obstetrics and during emergency surgery, and requires prophylaxis against acid aspiration. Prophylaxis is also needed in those with gastro-oesophageal reflux disease and in circumstances where gastric emptying may be delayed.

An **H₂-receptor antagonist** can be used before surgery to increase the pH and reduce the volume of gastric fluid. It does not affect the pH of fluid already in the stomach and

this limits its value in emergency procedures; an oral H₂-receptor antagonist can be given 1–2 hours before the procedure. Antacids are frequently used to neutralise the acidity of the fluid already in the stomach; 'clear' (non-particulate) antacids such as sodium citrate p. 836 are preferred.

Antimuscarinic drugs

Antimuscarinic drugs are used (less commonly nowadays) as premedicants to dry bronchial and salivary secretions which are increased by intubation, upper airway surgery, or some inhalational anaesthetics. They are also used before or with neostigmine p. 1180 to prevent bradycardia, excessive salivation, and other muscarinic actions of neostigmine. They also prevent bradycardia and hypotension associated with drugs such as propofol p. 1398 and suxamethonium chloride p. 1405.

Atropine sulfate p. 1218 is now rarely used for premedication but still has an emergency role in the treatment of vagotonic side-effects. Atropine sulfate may have a role in acute arrhythmias after myocardial infarction.

Hyoscine hydrobromide p. 461 reduces secretions and also provides a degree of amnesia, sedation, and anti-emesis. Unlike atropine sulfate it may produce bradycardia rather than tachycardia.

Glycopyrronium bromide p. 263 reduces salivary secretions. When given intravenously it produces less tachycardia than atropine sulfate. It is widely used with neostigmine for reversal of non-depolarising neuromuscular blocking drugs.

Phenothiazines do not effectively reduce secretions when used alone.

Sedative drugs

Fear and anxiety before a procedure (including the night before) can be minimised by using a sedative drug, usually a **benzodiazepine**. Premedication may also augment the action of anaesthetics and provide some degree of pre-operative amnesia. The choice of drug depends on the individual, the nature of the procedure, the anaesthetic to be used, and other prevailing circumstances such as outpatients, obstetrics, and availability of recovery facilities. The choice also varies between elective and emergency procedures.

Premedicants can be given the night before major surgery; a further, smaller dose may be required before surgery. Alternatively, the first dose may be given on the day of the procedure.

Benzodiazepines

Benzodiazepines possess useful properties for premedication including relief of anxiety, sedation, and amnesia; short-acting benzodiazepines taken by mouth are the most common premedicants. Benzodiazepines are also used in intensive care units for sedation, particularly in those receiving assisted ventilation. Flumazenil p. 1440 is used to antagonise the effects of benzodiazepines.

Diazepam p. 366 is used to produce mild sedation with amnesia. It is a long-acting drug with active metabolites and a second period of drowsiness can occur several hours after its administration. Peri-operative use of diazepam in children is not recommended; its effect and timing of response are unreliable and paradoxical effects may occur.

Diazepam is relatively insoluble in water and preparations formulated in organic solvents are painful on intravenous injection and give rise to a high incidence of venous thrombosis (which may not be noticed for several days after the injection). Intramuscular injection of diazepam is painful and absorption is erratic. An emulsion formulated for intravenous injection is less irritant and reduces the risk of venous thrombosis; it is not suitable for intramuscular injection.

Temazepam p. 512 is given by mouth for premedication and has a shorter duration of action and a more rapid onset than oral diazepam; anxiolytic and sedative effects last about 90 minutes although there may be residual drowsiness.

Lorazepam p. 361 produces more prolonged sedation than temazepam and it has marked amnesic effects.

Midazolam p. 362 is a water-soluble benzodiazepine that is often used in preference to intravenous diazepam; recovery is faster than from diazepam, but may be significantly longer in the elderly, in patients with a low cardiac output, or after repeated dosing. Midazolam is associated with profound sedation when high doses are given intravenously or when it is used with certain other drugs.

Other drugs for sedation

Dexmedetomidine p. 1416 and clonidine hydrochloride p. 160 are alpha₂-adrenergic agonists with sedative properties. Dexmedetomidine is licensed for the sedation of patients receiving intensive care who need to remain responsive to verbal stimulation. Clonidine hydrochloride [unlicensed indication] can be used by mouth or by intravenous injection as a sedative agent when adequate sedation cannot be achieved with standard treatment.

Analgesia

For guidance on the use of analgesics before, during, or after surgery, see Peri-operative analgesia p. 1409.

Antagonists for central and respiratory depression

Respiratory depression is a major concern with opioid analgesics and it may be treated by artificial ventilation or be reversed by naloxone hydrochloride p. 1441. Naloxone hydrochloride will immediately reverse opioid-induced respiratory depression but the dose may have to be repeated because of the short duration of action of naloxone hydrochloride; however, naloxone hydrochloride will also antagonise the analgesic effect.

Flumazenil is a benzodiazepine antagonist for the reversal of the central sedative effects of benzodiazepines after anaesthetic and similar procedures. Flumazenil has a shorter half-life and duration of action than diazepam or midazolam so patients may become resedated.

Doxapram hydrochloride p. 318 is a central and respiratory stimulant but is of limited value in anaesthesia.

ANTIMUSCARINICS

F 823

Atropine sulfate

22-Jan-2012

• INDICATIONS AND DOSE

Symptomatic bradycardia due to acute overdose of beta-blockers

- ▶ BY INTRAVENOUS INJECTION
- ▶ Child: 0.02 mg/kg (max. per dose 1.2 mg), repeat doses may be necessary
- ▶ Adult: 0.5–1.2 mg, repeat doses may be necessary

Treatment of poisoning by organophosphorus insecticide or nerve agent (in combination with pralidoxime chloride)

- ▶ BY INTRAVENOUS INJECTION
- ▶ Child: 20 micrograms/kg every 5–10 minutes (max. per dose 2 mg) until the skin becomes flushed and dry, the pupils dilate, and bradycardia is abolished, frequency of administration dependent on the severity of poisoning
- ▶ Adult: 2 mg every 5–10 minutes until the skin becomes flushed and dry, the pupils dilate, and bradycardia is abolished, frequency of administration dependent on the severity of poisoning

Symptomatic relief of gastro-intestinal disorders characterised by smooth muscle spasm

▶ BY MOUTH

- Adult: 0.6–1.2 mg daily, dose to be taken at night

Premedication

▶ BY INTRAVENOUS INJECTION

- Child 12–17 years: 300–600 micrograms, to be administered immediately before induction of anaesthesia
- Adult: 300–600 micrograms, to be administered immediately before induction of anaesthesia
- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- Child 12–17 years: 300–600 micrograms, to be administered 30–60 minutes before induction of anaesthesia
- Adult: 300–600 micrograms, to be administered 30–60 minutes before induction of anaesthesia

Intra-operative bradycardia

▶ BY INTRAVENOUS INJECTION

- Child 12–17 years: 300–600 micrograms, larger doses may be used in emergencies
- Adult: 300–600 micrograms, larger doses may be used in emergencies

Control of muscarinic side-effects of neostigmine in reversal of competitive neuromuscular block

▶ BY INTRAVENOUS INJECTION

- Child 12–17 years: 0.6–1.2 mg
- Adult: 0.6–1.2 mg

Excessive bradycardia associated with beta-blocker use

▶ BY INTRAVENOUS INJECTION

- Adult: 0.6–2.4 mg in divided doses (max. per dose 600 micrograms)

Bradycardia following myocardial infarction (particularly if complicated by hypotension)

▶ BY INTRAVENOUS INJECTION

- Adult: 500 micrograms every 3–5 minutes; maximum 3 mg per course

● UNLICENSED USE

- With intravenous use TOXBASE advises atropine sulfate is used in the doses provided for the treatment of symptomatic bradycardia due to acute overdosage of beta-blockers, but these may vary from those licensed.

IMPORTANT SAFETY INFORMATION

Antimuscarinic drugs used for premedication to general anaesthesia should only be administered by, or under the direct supervision of, personnel experienced in their use.

● INTERACTIONS → Appendix 1: atropine**● SIDE-EFFECTS**▶ **Common or very common**

- With intravenous use Abdominal distension · anhidrosis · anxiety · arrhythmias · bronchial secretion decreased · dysphagia · gastrointestinal disorders · hallucination · hyperthermia · movement disorders · mydriasis · speech disorder · taste loss · thirst

▶ **Uncommon**

- With intravenous use Psychotic disorder

▶ **Rare or very rare**

- With intravenous use Angina pectoris · hypertensive crisis · seizure
- ▶ **Frequency not known**
- With intravenous use Insomnia
- With oral use Angle closure glaucoma · arrhythmias · bronchial secretion altered · chest pain · dysphagia · fever · gastrointestinal disorders · mydriasis · staggering · thirst

● PREGNANCY Not known to be harmful; manufacturer advises caution.

- **BREAST FEEDING** May suppress lactation; small amount present in milk—manufacturer advises caution.

● MONITORING REQUIREMENTS

- ▶ Control of muscarinic side-effects of neostigmine in reversal of competitive neuromuscular block Since atropine has a shorter duration of action than neostigmine, late unopposed bradycardia may result; close monitoring of the patient is necessary.

● LESS SUITABLE FOR PRESCRIBING

- ▶ With oral use Atropine tablets less suitable for prescribing. Any clinical benefit as a gastro-intestinal antispasmodic is outweighed by atropinic side-effects.

● EXCEPTIONS TO LEGAL CATEGORY

- ▶ With intramuscular use or intravenous use or subcutaneous use Prescription only medicine restriction does not apply where administration is for saving life in emergency.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution for injection, solution for infusion

Solution for injection▶ **Atropine sulfate (Non-proprietary)**

Atropine sulfate 100 microgram per 1 ml Atropine 500micrograms/5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection (POM) £13.00 | 10 pre-filled disposable injection (POM) £130.00

Atropine sulfate 200 microgram per 1 ml Atropine 1mg/5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection (POM) £13.00 | 10 pre-filled disposable injection (POM) £130.00

F 823

Glycopyrronium bromide (Glycopyrrolate)

06-Nov-2020

● INDICATIONS AND DOSE**Premedication at induction**

▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION

- ▶ Adult: 200–400 micrograms, alternatively 4–5 micrograms/kg (max. per dose 400 micrograms)

Intra-operative bradycardia

▶ BY INTRAVENOUS INJECTION

- ▶ Adult: 200–400 micrograms, alternatively 4–5 micrograms/kg (max. per dose 400 micrograms), repeated if necessary

Control of muscarinic side-effects of neostigmine in reversal of non-depolarising neuromuscular block

▶ BY INTRAVENOUS INJECTION

- ▶ Adult: 10–15 micrograms/kg, alternatively, 200 micrograms per 1 mg of neostigmine to be administered

Bowel colic in palliative care | Excessive respiratory secretions in palliative care

▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: 200 micrograms every 4 hours and when required, hourly use is occasionally necessary, particularly in excessive respiratory secretions

continued →

- ▶ BY SUBCUTANEOUS INFUSION
- ▶ Adult: 0.6–1.2 mg/24 hours

IMPORTANT SAFETY INFORMATION

Antimuscarinic drugs used for premedication to general anaesthesia should only be administered by, or under the direct supervision of, personnel experienced in their use.

- **INTERACTIONS** → Appendix 1: glycopyrronium
- **SIDE-EFFECTS** Anhidrosis · bronchial secretion decreased · mydriasis
- **PRESCRIBING AND DISPENSING INFORMATION**

Palliative care For further information on the use of glycopyrronium bromide in palliative care, see www.medicinescomplete.com/#/content/palliative/glycopyrronium.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

 - ▶ **Glycopyrronium bromide (Non-proprietary)**
 - Glycopyrronium bromide 200 microgram per 1 ml** Glycopyrronium bromide 200micrograms/1ml solution for injection ampoules | 10 ampoule (PoM) £14.00 DT = £9.95 | 10 ampoule (PoM) £5.72 DT = £9.95 (Hospital only)

1.1 Neuromuscular blockade

Neuromuscular blockade

Neuromuscular blocking drugs

Neuromuscular blocking drugs used in anaesthesia are also known as **muscle relaxants**. By specific blockade of the neuromuscular junction they enable light anaesthesia to be used with adequate relaxation of the muscles of the abdomen and diaphragm. They also relax the vocal cords and allow the passage of a tracheal tube. Their action differs from the muscle relaxants used in musculoskeletal disorders that act on the spinal cord or brain.

Patients who have received a neuromuscular blocking drug should **always** have their respiration assisted or controlled until the drug has been inactivated or antagonised. They should also receive sufficient concomitant inhalational or intravenous anaesthetic or sedative drugs to prevent awareness.

Non-depolarising neuromuscular blocking drugs

Non-depolarising neuromuscular blocking drugs (also known as competitive muscle relaxants) compete with acetylcholine for receptor sites at the neuromuscular junction and their action can be reversed with anticholinesterases such as neostigmine p. 1180. Non-depolarising neuromuscular blocking drugs can be divided into the **aminosteroid** group, comprising pancuronium bromide p. 1407, rocuronium bromide p. 1407, and vecuronium bromide p. 1407, and the **benzylisoquinolinium** group, comprising atracurium besilate p. 1405, cisatracurium p. 1406, and mivacurium p. 1406.

Non-depolarising neuromuscular blocking drugs have a slower onset of action than suxamethonium chloride p. 1405. These drugs can be classified by their duration of action as short-acting (15–30 minutes), intermediate-acting (30–40 minutes), and long-acting (60–120 minutes), although duration of action is dose-dependent. Drugs with a shorter or intermediate duration of action, such as

atracurium besilate and vecuronium bromide p. 1407, are more widely used than those with a longer duration of action, such as pancuronium bromide.

Non-depolarising neuromuscular blocking drugs have no sedative or analgesic effects and are not considered to trigger malignant hyperthermia.

For patients receiving intensive care and who require tracheal intubation and mechanical ventilation, a non-depolarising neuromuscular blocking drug is chosen according to its onset of effect, duration of action, and side-effects. Rocuronium bromide, with a rapid onset of effect, may facilitate intubation. Atracurium besilate or cisatracurium may be suitable for long-term neuromuscular blockade since their duration of action is not dependent on elimination by the liver or the kidneys.

Atracurium besilate, a mixture of 10 isomers, is a benzylisoquinolinium neuromuscular blocking drug with an intermediate duration of action. It undergoes non-enzymatic metabolism which is independent of liver and kidney function, thus allowing its use in patients with hepatic or renal impairment. Cardiovascular effects are associated with significant histamine release; histamine release can be minimised by administering slowly or in divided doses over at least 1 minute.

Cisatracurium is a single isomer of atracurium besilate. It is more potent and has a slightly longer duration of action than atracurium besilate and provides greater cardiovascular stability because cisatracurium lacks histamine-releasing effects.

Mivacurium, a benzylisoquinolinium neuromuscular blocking drug, has a short duration of action. It is metabolised by plasma cholinesterase and muscle paralysis is prolonged in individuals deficient in this enzyme. It is not associated with vagolytic activity or ganglionic blockade although histamine release can occur, particularly with rapid injection.

Pancuronium bromide, an aminosteroid neuromuscular blocking drug, has a long duration of action and is often used in patients receiving long-term mechanical ventilation in intensive care units. It lacks a histamine-releasing effect, but vagolytic and sympathomimetic effects can cause tachycardia and hypertension.

Rocuronium bromide exerts an effect within 2 minutes and has the most rapid onset of any of the non-depolarising neuromuscular blocking drugs. It is an aminosteroid neuromuscular blocking drug with an intermediate duration of action. It is reported to have minimal cardiovascular effects; high doses produce mild vagolytic activity.

Vecuronium bromide p. 1407, an aminosteroid neuromuscular blocking drug, has an intermediate duration of action. It does not generally produce histamine release and lacks cardiovascular effects.

Depolarising neuromuscular blocking drugs

Suxamethonium chloride has the most rapid onset of action of any of the neuromuscular blocking drugs and is ideal if fast onset and brief duration of action are required, e.g. with tracheal intubation. Unlike the non-depolarising neuromuscular blocking drugs, its action cannot be reversed and recovery is spontaneous; anticholinesterases such as neostigmine potentiate the neuromuscular block.

Suxamethonium chloride should be given after anaesthetic induction because paralysis is usually preceded by painful muscle fasciculations. While tachycardia occurs with single use, bradycardia may occur with repeated doses in adults and with the first dose in children. Premedication with atropine reduces bradycardia as well as the excessive salivation associated with suxamethonium chloride use.

Prolonged paralysis may occur in **dual block**, which occurs with high or repeated doses of suxamethonium chloride and is caused by the development of a non-depolarising block following the initial depolarising block. Individuals with myasthenia gravis are resistant to suxamethonium chloride

but can develop dual block resulting in delayed recovery. Prolonged paralysis may also occur in those with low or atypical plasma cholinesterase. Assisted ventilation should be continued until muscle function is restored.

NEUROMUSCULAR BLOCKING DRUGS > DEPOLARISING

Suxamethonium chloride

02-Dec-2020

(Succinylcholine chloride)

- **DRUG ACTION** Suxamethonium acts by mimicking acetylcholine at the neuromuscular junction but hydrolysis is much slower than for acetylcholine; depolarisation is therefore prolonged, resulting in neuromuscular blockade.

● INDICATIONS AND DOSE

Neuromuscular blockade (short duration) during surgery and intubation

- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: 1–1.5 mg/kg

- **UNLICENSED USE** Doses of suxamethonium in BNF may differ from those in product literature.

IMPORTANT SAFETY INFORMATION

Should only be administered by, or under the direct supervision of, personnel experienced in its use.

- **CONTRA-INDICATIONS** Hyperkalaemia · low plasma-cholinesterase activity (including severe liver disease) · major trauma · neurological disease involving acute wasting of major muscle · personal or family history of congenital myotonic disease · personal or family history of malignant hyperthermia · prolonged immobilisation (risk of hyperkalaemia) · severe burns · skeletal muscle myopathies (e.g. Duchenne muscular dystrophy)
- **CAUTIONS** Cardiac disease · neuromuscular disease · raised intra-ocular pressure (avoid in penetrating eye injury) · respiratory disease · severe sepsis (risk of hyperkalaemia)
- **INTERACTIONS** → Appendix 1: suxamethonium
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Arrhythmias · bradycardia (may occur with repeated doses) · flushing · muscle contractions involuntary · myoglobinuria · myoglobinuria · post procedural muscle pain · rash
 - ▶ **Rare or very rare** Apnoea · cardiac arrest · hypersensitivity · malignant hyperthermia · respiratory disorders · trismus
- **ALLERGY AND CROSS-SENSITIVITY**  Allergic cross-reactivity between neuromuscular blocking drugs has been reported; caution is advised in cases of hypersensitivity to these drugs. 

- **PREGNANCY** Mildly prolonged maternal neuromuscular blockade may occur.
- **BREAST FEEDING** Unlikely to be present in breast milk in significant amounts (ionised at physiological pH). Breast-feeding may be resumed once the mother recovered from neuromuscular block.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution, particularly in end stage hepatic failure (increased risk of prolonged apnoea due to reduced hepatic synthesis of plasma cholinesterase).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection

▶ Suxamethonium chloride (Non-proprietary)

Suxamethonium chloride 50 mg per 1 ml Suxamethonium chloride 100mg/2ml solution for injection ampoules | 10 ampoule  £28.80–£50.00

▶ Anectine (Aspen Pharma Trading Ltd)

Suxamethonium chloride 50 mg per 1 ml Anectine 100mg/2ml solution for injection ampoules | 5 ampoule  £3.57 (Hospital only)

NEUROMUSCULAR BLOCKING DRUGS > NON-DEPOLARISING

Non-depolarising neuromuscular blocking drugs

IMPORTANT SAFETY INFORMATION

Non-depolarising neuromuscular blocking drugs should only be administered by, or under direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management.

- **CAUTIONS** Burns (resistance can develop, increased doses may be required) · cardiovascular disease (reduce rate of administration) · electrolyte disturbances (response unpredictable) · fluid disturbances (response unpredictable) · hypothermia (activity prolonged, lower doses required) · myasthenia gravis (activity prolonged, lower doses required) · neuromuscular disorders (response unpredictable)
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Flushing · hypotension
 - ▶ **Uncommon** Bronchospasm · hypersensitivity · skin reactions · tachycardia
 - ▶ **Rare or very rare** Circulatory collapse · muscle weakness (after prolonged use in intensive care) · myopathy (after prolonged use in intensive care) · shock
- **ALLERGY AND CROSS-SENSITIVITY** Allergic cross-reactivity between neuromuscular blocking drugs has been reported; caution is advised in cases of hypersensitivity to these drugs.
- **PREGNANCY** Non-depolarising neuromuscular blocking drugs are highly ionised at physiological pH and are therefore unlikely to cross the placenta in significant amounts.
- **BREAST FEEDING** Non-depolarising neuromuscular blocking drugs are ionised at physiological pH and are unlikely to be present in milk in significant amounts. Breast-feeding may be resumed once the mother has recovered from neuromuscular block.

 above

Atracurium besilate (Atracurium besylate)

● INDICATIONS AND DOSE

Neuromuscular blockade (short to intermediate duration) for surgery and intubation

▶ INITIALLY BY INTRAVENOUS INJECTION

- ▶ Adult: Initially 300–600 micrograms/kg, then (by intravenous injection) 100–200 micrograms/kg as required, alternatively (by intravenous injection) initially 300–600 micrograms/kg, followed by (by intravenous infusion) 300–600 micrograms/kg/hour

continued →

Neuromuscular blockade during intensive care

- ▶ INITIALLY BY INTRAVENOUS INJECTION
- ▶ Adult: Initially 300–600 micrograms/kg, initial dose is optional, then (by intravenous infusion) 270–1770 micrograms/kg/hour; (by intravenous infusion) usual dose 650–780 micrograms/kg/hour

DOSES AT EXTREMES OF BODY-WEIGHT

- ▶ To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

- **INTERACTIONS** → Appendix 1: neuromuscular blocking drugs, non-depolarising

● SIDE-EFFECTS

- ▶ Rare or very rare Cardiac arrest
- ▶ Frequency not known Seizure

SIDE-EFFECTS, FURTHER INFORMATION Hypotension, skin flushing, and bronchospasm is associated with histamine release. Manufacturer advises minimising effects of histamine release by administering over 1 minute in patients with cardiovascular disease or sensitivity to hypotension.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (*Tracrium*®; Atracurium besilate injection, Hospira; Atracurium injection/infusion, Genus), give continuously in Glucose 5% or Sodium Chloride 0.9%; stability varies with diluent; dilute requisite dose with infusion fluid to a concentration of 0.5–5 mg/mL.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection▶ **Atracurium besilate (Non-proprietary)**

F 1405

Mivacurium**● INDICATIONS AND DOSE****Neuromuscular blockade (short duration) during surgery and intubation**

- ▶ INITIALLY BY INTRAVENOUS INJECTION
- ▶ Adult: 70–250 micrograms/kg; (by intravenous injection) maintenance 100 micrograms/kg every 15 minutes, alternatively (by intravenous infusion) maintenance 8–10 micrograms/kg/minute, (by intravenous infusion) adjusted in steps of 1 microgram/kg/minute every 3 minutes if required; (by intravenous infusion) usual dose 6–7 micrograms/kg/minute

DOSES AT EXTREMES OF BODY-WEIGHT

- ▶ To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

- **CAUTIONS** Burns (low plasma cholinesterase activity; dose titration required) · elderly

- **INTERACTIONS** → Appendix 1: neuromuscular blocking drugs, non-depolarising

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in hepatic failure (increased duration of action).

Dose adjustments Manufacturer advises dose reduction in hepatic failure.

● RENAL IMPAIRMENT

Dose adjustments Clinical effect prolonged in renal failure—reduce dose according to response.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion, give continuously in Glucose 5% or Sodium chloride 0.9%. Dilute to a concentration of 500 micrograms/mL; may also be given undiluted. Doses up to 150 micrograms/kg may be given over 5–15 seconds,

higher doses should be given over 30 seconds. In asthma, cardiovascular disease or in those sensitive to reduced arterial blood pressure, give over 60 seconds.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Mivacron** (Aspen Pharma Trading Ltd)
Mivacurium (as Mivacurium chloride) 2 mg per 1 ml Mivacron 10mg/5ml solution for injection ampoules | 5 ampoule (PoM) £13.95 (Hospital only)
Mivacron 20mg/10ml solution for injection ampoules | 5 ampoule (PoM) £22.57 (Hospital only)

F 1405

Pancuronium bromide

10-May-2021

● INDICATIONS AND DOSE

Neuromuscular blockade (long duration) during surgery and intubation

- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: Initially 100 micrograms/kg, then 20 micrograms/kg as required

Neuromuscular blockade (long duration) during intensive care

- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: Initially 100 micrograms/kg, initial dose is optional, then 60 micrograms/kg every 60–90 minutes

DOSES AT EXTREMES OF BODY-WEIGHT

- ▶ To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

- **INTERACTIONS** → Appendix 1: neuromuscular blocking drugs, non-depolarising
- **SIDE-EFFECTS** Apnoea · arrhythmia · hypersalivation · increased cardiac output · miosis

SIDE-EFFECTS, FURTHER INFORMATION Pancuronium lacks histamine-releasing effect, but vagolytic and sympathomimetic effects can cause tachycardia.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution (possibly slower onset and higher dose requirements due to resistance to neuromuscular blocking action which may lead to a prolonged recovery time).
- **RENAL IMPAIRMENT** (EvGr) Use with caution (may prolong duration of block). ⚠

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Pancuronium bromide (Non-proprietary)**
Pancuronium bromide 2 mg per 1 ml Pancuronium bromide 4mg/2ml solution for injection ampoules | 10 ampoule (PoM) £50.00 (Hospital only)

F 1405

Rocuronium bromide

05-Nov-2020

● INDICATIONS AND DOSE

Neuromuscular blockade (intermediate duration) during surgery and intubation

- ▶ INITIALLY BY INTRAVENOUS INJECTION
- ▶ Adult: Initially 600 micrograms/kg; (by intravenous injection) maintenance 150 micrograms/kg, alternatively (by intravenous infusion) maintenance 300–600 micrograms/kg/hour, adjusted according to response
- ▶ Elderly: Initially 600 micrograms/kg; (by intravenous injection) maintenance 75–100 micrograms/kg, alternatively (by intravenous infusion) maintenance up to 400 micrograms/kg/hour, adjusted according to response

Neuromuscular blockade (intermediate duration) during intensive care

- ▶ INITIALLY BY INTRAVENOUS INJECTION
- ▶ Adult: Initially 600 micrograms/kg, initial dose is optional; (by intravenous infusion) maintenance 300–600 micrograms/kg/hour for first hour, then (by intravenous infusion), adjusted according to response

DOSES AT EXTREMES OF BODY-WEIGHT

- ▶ To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

- **INTERACTIONS** → Appendix 1: neuromuscular blocking drugs, non-depolarising
- **SIDE-EFFECTS**
- ▶ **Uncommon** Procedural complications
- ▶ **Rare or very rare** Angioedema · face oedema · malignant hyperthermia · paralysis
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (may prolong duration of action).
- Dose adjustments** Manufacturer advises consider dose reduction—consult product literature.
- **RENAL IMPAIRMENT**
Dose adjustments Reduce maintenance dose; prolonged paralysis.
- **DIRECTIONS FOR ADMINISTRATION** (EvGr) For *continuous intravenous infusion* or via drip tubing, may be diluted with Glucose 5% or Sodium Chloride 0.9%. ⚠

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Rocuronium bromide (Non-proprietary)**
Rocuronium bromide 10 mg per 1 ml Rocuronium bromide 50mg/5ml solution for injection ampoules | 10 ampoule (PoM) £24.00–£28.00
Rocuronium bromide 50mg/5ml solution for injection vials | 10 vial (PoM) £28.00–£40.20 (Hospital only)
Rocuronium bromide 100mg/10ml solution for injection vials | 10 vial (PoM) £57.00–£80.50 (Hospital only)
Rocuronium bromide 100mg/10ml solution for injection ampoules | 10 ampoule (PoM) £57.00
- ▶ **Esmeron** (Merck Sharp & Dohme (UK) Ltd)
Rocuronium bromide 10 mg per 1 ml Esmeron 50mg/5ml solution for injection vials | 10 vial (PoM) £28.92 (Hospital only)

F 1405

Vecuronium bromide

10-May-2021

● INDICATIONS AND DOSE

Neuromuscular blockade (intermediate duration) during surgery and intubation

- ▶ INITIALLY BY INTRAVENOUS INJECTION
- ▶ Adult: 80–100 micrograms/kg; (by intravenous injection) maintenance 20–30 micrograms/kg, adjusted according to response, max. 100 micrograms/kg in caesarean section, alternatively (by intravenous infusion) maintenance 0.8–1.4 micrograms/kg/minute, adjusted according to response

DOSES AT EXTREMES OF BODY-WEIGHT

- ▶ To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

- **INTERACTIONS** → Appendix 1: neuromuscular blocking drugs, non-depolarising
- **SIDE-EFFECTS**
- ▶ **Uncommon** Procedural complications
- ▶ **Rare or very rare** Angioedema · face oedema · paralysis
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in significant impairment.
- **RENAL IMPAIRMENT** (EvGr) Use with caution. ⚠
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises reconstitute each vial with 5 mL Water for Injections to

give 2 mg/mL solution; *alternatively* reconstitute with up to 10 mL Glucose 5% or Sodium Chloride 0.9% or Water for Injections—unsuitable for further dilution if not reconstituted with Water for Injections. For *continuous intravenous infusion*, manufacturer advises dilute reconstituted solution to a concentration up to 40 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%; reconstituted solution can also be given via drip tubing.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

- ▶ **Vecuronium bromide (Non-proprietary)**

Vecuronium bromide 10 mg Vecuronium bromide 10mg powder for solution for injection vials | 10 vial (PoM) £57.85 (Hospital only)

1.2 Neuromuscular blockade reversal

Neuromuscular blockade reversal

Neuromuscular blockade reversal

Anticholinesterases

Anticholinesterases reverse the effects of the non-depolarising (competitive) neuromuscular blocking drugs such as pancuronium bromide p. 1407 but they prolong the action of the depolarising neuromuscular blocking drug suxamethonium chloride p. 1405.

Neostigmine p. 1180 is used specifically for reversal of non-depolarising (competitive) blockade. It acts within one minute of intravenous injection and its effects last for 20 to 30 minutes; a second dose may then be necessary. Glycopyrronium bromide p. 263 or alternatively atropine sulfate p. 1218, given before or with neostigmine, prevent bradycardia, excessive salivation, and other muscarinic effects of neostigmine.

Other drugs for reversal of neuromuscular blockade

Sugammadex below is a modified gamma cyclodextrin that can be used for rapid reversal of neuromuscular blockade induced by rocuronium bromide p. 1407 or vecuronium bromide p. 1407. In practice, sugammadex is used mainly for rapid reversal of neuromuscular blockade in an emergency.

ANTICHOLINESTERASES

Neostigmine with glycopyrronium bromide

17-Jul-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, neostigmine p. 1180, glycopyrronium bromide p. 263.

● INDICATIONS AND DOSE

Reversal of non-depolarising neuromuscular blockade

▶ BY INTRAVENOUS INJECTION

- ▶ Adult: 1–2 mL, repeated if necessary, alternatively 0.02 mL/kg, repeated if necessary; maximum 2 mL per course

- **INTERACTIONS** → Appendix 1: glycopyrronium · neostigmine

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous injection*, manufacturer advises give over 10–30 seconds.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Neostigmine with glycopyrronium bromide (Non-proprietary)**

Glycopyrronium bromide 500 microgram per 1 mL, Neostigmine metilsulfate 2.5 mg per 1 mL Neostigmine 2.5mg/1ml / Glycopyrronium bromide 500micrograms/1ml solution for injection ampoules | 10 ampoule (PoM) £11.50

ANTIDOTES AND CHELATORS

Sugammadex

06-Aug-2020

● INDICATIONS AND DOSE

Routine reversal of neuromuscular blockade induced by rocuronium or vecuronium

▶ BY INTRAVENOUS INJECTION

- ▶ Adult: Initially 2–4 mg/kg, then 4 mg/kg if required, administered if recurrence of neuromuscular blockade occurs; consult product literature for further details

Immediate reversal of neuromuscular blockade induced by rocuronium

▶ BY INTRAVENOUS INJECTION

- ▶ Adult: 16 mg/kg (consult product literature)

IMPORTANT SAFETY INFORMATION

Should only be administered by, or under the direct supervision of, personnel experienced in its use.

- **CAUTIONS** Cardiovascular disease (recovery may be delayed) · elderly (recovery may be delayed) · pre-existing coagulation disorders · recurrence of neuromuscular blockade—monitor respiratory function until fully recovered · use of anticoagulants (unrelated to surgery) · wait 24 hours before re-administering rocuronium · wait 24 hours before re-administering vecuronium

- **INTERACTIONS** → Appendix 1: sugammadex

● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · arrhythmias · cough · dizziness · headache · nausea · procedural complications · skin reactions · taste altered · vomiting
- ▶ **Uncommon** Hypersensitivity
- ▶ **Frequency not known** Bronchospasm

- **PREGNANCY** Use with caution—no information available.

- **RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m².

● NATIONAL FUNDING/ACCESS DECISIONS

For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

- ▶ Sugammadex (*Bridion*®) for the routine reversal of neuromuscular blockade induced by rocuronium or vecuronium in adults and rocuronium in paediatric patients (March 2013) SMC No. 527/09 Recommended with restrictions

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

ELECTROLYTES: May contain Sodium

▶ **Bridion** (Merck Sharp & Dohme (UK) Ltd)

Sugammadex (as Sugammadex sodium) 100 mg per 1 mL Bridion 500mg/5ml solution for injection vials | 10 vial (PoM) £1,491.00 (Hospital only)
Bridion 200mg/2ml solution for injection vials | 10 vial (PoM) £596.40 (Hospital only)

1.3 Peri-operative analgesia

Peri-operative analgesia

01-Sep-2020

Overview

EvGr Postoperative pain management options should be discussed with patients prior to surgery. Take into account the patient's clinical features and the type of surgery, and discuss the patient's pain history, preferences and expectations, likely impact of the procedure on their pain, potential benefits and risks of treatment, and discharge plan. A multimodal approach using a combination of analgesics from different classes to manage postoperative pain should be offered.

Consider prescribing pre-emptive analgesia to ensure that the patient's pain is managed when the effects of local anaesthesia wears off. **▲**

Non-opioid analgesics

EvGr Oral paracetamol p. 468 should be offered before and after surgery irrespective of pain severity, with intravenous paracetamol reserved for patients unable to take oral medication.

Offer oral ibuprofen p. 1195 to manage immediate postoperative pain (pain during the first 24 hours after surgery) of all severities, except for patients who have had surgery for a hip fracture—see NICE guideline: **Hip fractures: management for guidance**, available at: www.nice.org.uk/guidance/cg124. Intravenous NSAIDs should be reserved for patients unable to take oral medication; if offering intravenous NSAIDs, choose a traditional NSAID rather than a COX-2 (cyclo-oxygenase-2) inhibitor. **▲**

Intramuscular injections of diclofenac sodium p. 1190 and ketoprofen p. 1199 are rarely used; they are given deep into the gluteal muscle to minimise pain and tissue damage. Ketorolac trometamol p. 1231 is less irritant on intramuscular injection but pain has been reported; it can also be given by intravenous injection. Suppositories of diclofenac sodium and ketoprofen may be effective alternatives to the parenteral use of these drugs.

Since non-steroidal anti-inflammatory drugs (NSAIDs) do not depress respiration, do not impair gastro-intestinal motility, and do not cause dependence, they may be useful alternatives or adjuncts to opioids for the relief of postoperative pain.

Opioid analgesics

Opioid analgesics are now rarely used as premedicants; they are more likely to be administered at induction. Pre-operative use of opioid analgesics is generally limited to those patients who require control of existing pain.

EvGr An oral opioid should only be offered if immediate postoperative pain is expected to be moderate to severe. It should be given as soon as the patient can eat and drink after surgery, and the dose adjusted to help achieve functional recovery (such as coughing and mobilising) as soon as possible. Patients unable to take oral opioids should be offered either a patient-controlled analgesia (PCA) or continuous epidural. The benefit of a continuous epidural should be taken into consideration for patients who are having major or complex open-torso surgery, are expected to have severe pain, or those who have cognitive impairment. If opioids are used, see NICE guideline: **Controlled drugs: safe use and management** (available at: www.nice.org.uk/guidance/ng46) for information on prescribing controlled drugs. **▲**

For guidance on the management of opioid-induced respiratory depression, see Pre-medication and peri-operative drugs p. 1401.

Intra-operative analgesia

Opioid analgesics given in small doses before or with induction reduce the dose requirement of some drugs used during anaesthesia.

Alfentanil p. 1413, fentanyl p. 482, and remifentanyl p. 1414 are particularly useful because they act within 1–2 minutes and have short durations of action. The initial doses of alfentanil or fentanyl are followed either by successive intravenous injections or by an intravenous infusion; prolonged infusions increase the duration of effect. Repeated intra-operative doses of alfentanil or fentanyl should be given with care since the resulting respiratory depression can persist postoperatively and occasionally it may become apparent for the first time postoperatively when monitoring of the patient might be less intensive. Alfentanil, fentanyl, and remifentanyl can cause muscle rigidity, particularly of the chest wall or jaw; this can be managed by the use of neuromuscular blocking drugs.

In contrast to other opioids which are metabolised in the liver, remifentanyl undergoes rapid metabolism by nonspecific blood and tissue esterases; its short duration of action allows prolonged administration at high dosage, without accumulation, and with little risk of residual postoperative respiratory depression. Remifentanyl should not be given by intravenous injection intraoperatively, but it is well suited to continuous infusion; a supplementary analgesic is given before stopping the infusion of remifentanyl.

EvGr A single dose of intravenous ketamine p. 1415 [unlicensed] should be considered either during or immediately after surgery to supplement other types of pain relief if, the patient's pain is expected to be moderate to severe and an intravenous opioid alone does not provide adequate pain relief, or the patient has opioid sensitivity. **▲**

Perioperative care in adults. National Institute for Health and Care Excellence. NICE guideline 180. August 2020. www.nice.org.uk/guidance/ng180

ANAESTHETICS, GENERAL > NMDA RECEPTOR ANTAGONISTS

Esketamine

05-Nov-2020

- **DRUG ACTION** Esketamine is an isomer of ketamine that blocks N-methyl-D-aspartate (NMDA) receptors and interrupts the association pathways of the brain, resulting in dissociative anaesthesia and analgesia and in restoration of neural pathways regulating mood and emotional behaviour.

● INDICATIONS AND DOSE

Induction and maintenance of anaesthesia (specialist use only)

- ▶ BY SLOW INTRAVENOUS INJECTION
 - Adult: 0.5–1 mg/kg, then maintenance 0.25–0.5 mg/kg every 10–15 minutes, adjusted according to response
- ▶ BY INTRAMUSCULAR INJECTION
 - Adult: 2–4 mg/kg, then maintenance 1–2 mg/kg every 10–15 minutes, adjusted according to response
- ▶ BY CONTINUOUS INTRAVENOUS INFUSION
 - Adult: 0.5–3 mg/kg/hour, adjusted according to response

Analgesic supplementation of regional and local anaesthesia (specialist use only)

- ▶ BY CONTINUOUS INTRAVENOUS INFUSION
 - Adult: 0.125–0.25 mg/kg/hour, adjusted according to response

continued →

Analgesia in emergency medicine (specialist use only)

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: 0.25–0.5 mg/kg, adjusted according to response
- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: 0.125–0.25 mg/kg, adjusted according to response

Major depressive disorder (specialist use only)

- ▶ BY INTRANASAL ADMINISTRATION
- ▶ Adult: Initially 56 mg on day 1, then 56–84 mg twice weekly for weeks 1–4, then 56–84 mg once weekly for weeks 5–8, then 56–84 mg every 1–2 weeks from week 9 onwards, review continued treatment periodically, treatment is recommended for at least 6 months after depressive symptoms improve, all dose adjustments to be made in 28 mg increments
- ▶ BY INTRANASAL ADMINISTRATION
- ▶ Elderly: Initially 28 mg on day 1, then 28–84 mg twice weekly for weeks 1–4, then 28–84 mg once weekly for weeks 5–8, then 28–84 mg every 1–2 weeks from week 9 onwards, review continued treatment periodically, treatment is recommended for at least 6 months after depressive symptoms improve, all dose adjustments to be made in 28 mg increments

Major depressive disorder (patients of Japanese origin) (specialist use only)

- ▶ BY INTRANASAL ADMINISTRATION
- ▶ Adult: Initially 28 mg on day 1, then 28–84 mg twice weekly for weeks 1–4, then 28–84 mg once weekly for weeks 5–8, then 28–84 mg every 1–2 weeks from week 9 onwards, review continued treatment periodically, treatment is recommended for at least 6 months after depressive symptoms improve, all dose adjustments to be made in 28 mg increments

DOSE EQUIVALENCE AND CONVERSION

- ▶ With intranasal use
- ▶ 28 mg equivalent to 2 sprays (1 spray administered into each nostril).

IMPORTANT SAFETY INFORMATION

Esketamine should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

● CONTRA-INDICATIONS

GENERAL CONTRA-INDICATIONS Acute porphyrias p. 1114 - patients in whom hypertension or raised intracranial pressure forms a serious risk

SPECIFIC CONTRA-INDICATIONS

- ▶ When used for Induction and maintenance of anaesthesia or Analgesic supplementation of regional and local anaesthesia or Analgesia in emergency medicine Eclampsia · ischaemic cardiac disorders (when used as sole anaesthetic agent) · pre-eclampsia
- ▶ When used for Major depressive disorder Aneurysmal vascular disease · cardiovascular events, including myocardial infarction (within 6 weeks) · intracerebral haemorrhage

● CAUTIONS

GENERAL CAUTIONS Hypertension · raised intracranial pressure · thyroid dysfunction

SPECIFIC CAUTIONS

- ▶ When used for Induction and maintenance of anaesthesia or Analgesic supplementation of regional and local anaesthesia or Analgesia in emergency medicine Chronic or acute alcohol consumption · decompensated cardiac failure · increased cerebrospinal fluid pressure · patients with multiple injuries or in poor condition—consult product literature · prolapsed umbilical cord · raised intra-ocular pressure ·

severe psychotic disorders · unstable angina pectoris · uterine rupture

- ▶ When used for Major depressive disorder Bipolar disorder (active or previous history) · cardiovascular conditions (clinically significant or unstable) · mania (active or previous history) · psychosis (active or previous history) · respiratory conditions (clinically significant or unstable)

CAUTIONS, FURTHER INFORMATION

- ▶ Cardiovascular or respiratory conditions
- ▶ When used for Major depressive disorder Esketamine should be administered where appropriately trained staff and resuscitation facilities are available.

- **INTERACTIONS** → Appendix 1: esketamine

● SIDE-EFFECTS**GENERAL SIDE-EFFECTS**

- ▶ Common or very common Anxiety · dizziness · nausea · vomiting

SPECIFIC SIDE-EFFECTS

- ▶ Common or very common
- ▶ With intranasal use Drowsiness · dry mouth · dysarthria · feeling abnormal · feeling of body temperature change · hallucinations · headache · hyperacusia · hyperhidrosis · hypertension · mood altered · nasal complaints · oral disorders · perception altered · psychiatric disorders · sensation abnormal · tachycardia · taste altered · tinnitus · tremor · urinary disorders · vertigo · vision blurred
- ▶ With parenteral use Arrhythmias · hypersalivation · movement disorders · respiratory disorders · respiratory secretion increased · sleep disorders · vision disorders
- ▶ Uncommon
- ▶ With parenteral use Muscle tone increased · nystagmus · skin reactions
- ▶ Rare or very rare
- ▶ With parenteral use Hypotension
- ▶ Frequency not known
- ▶ With intranasal use Cystitis
- ▶ With parenteral use Disorientation · drug-induced liver injury · dysphoria · hallucination

● PREGNANCY

- ▶ When used for Induction and maintenance of anaesthesia or Analgesic supplementation of regional and local anaesthesia or Analgesia in emergency medicine Manufacturer advises use only if potential benefit outweighs risk—may depress neonatal respiration if used during delivery.
- ▶ When used for Major depressive disorder Manufacturer advises avoid—no information available.

● BREAST FEEDING

- ▶ When used for Induction and maintenance of anaesthesia or Analgesic supplementation of regional and local anaesthesia or Analgesia in emergency medicine Manufacturer advises present in milk—not thought to be harmful at therapeutic doses.
- ▶ When used for Major depressive disorder Manufacturer advises avoid—present in milk in *animal* studies.

● HEPATIC IMPAIRMENT

- ▶ When used for Induction and maintenance of anaesthesia or Analgesic supplementation of regional and local anaesthesia or Analgesia in emergency medicine Manufacturer advises caution (risk of prolonged action).
- ▶ When used for Major depressive disorder Manufacturer advises caution in moderate impairment when using maximum dose (84 mg); avoid in severe impairment—no information available.

Dose adjustments ▶ When used for Induction and maintenance of anaesthesia or Analgesic supplementation of regional and local anaesthesia or Analgesia in emergency medicine Manufacturer advises consider dose reduction.

● MONITORING REQUIREMENTS

- ▶ When used for Major depressive disorder Manufacturer advises monitor blood pressure at baseline, approximately 40 minutes after treatment, and as clinically indicated

thereafter. Manufacturer advises monitor for urinary tract and bladder symptoms during treatment and refer to an appropriate healthcare provider if symptoms persist.

● DIRECTIONS FOR ADMINISTRATION

- ▶ With intramuscular use or intravenous use Manufacturer advises solution can be diluted with Glucose 5% or Sodium Chloride 0.9%.
- ▶ With intranasal use Manufacturer advises dose is administered via a single-use device delivering 28 mg as 2 sprays (1 spray per nostril). A second device is required for a 56 mg dose, and a third device is required for an 84 mg dose. Allow a break of 5 minutes between use of each device.

● PRESCRIBING AND DISPENSING INFORMATION

- ▶ When used for Major depressive disorder The manufacturer of *Spravato*® has provided the following materials: *Guide for Healthcare Professionals, Checklist for Healthcare Professionals and Patient Guide*.

● PATIENT AND CARER ADVICE

- ▶ When used for Major depressive disorder Manufacturer advises patients should be informed not to eat for at least 2 hours before and not to drink liquids for at least 30 minutes before treatment. Manufacturer advises patients who require a nasal corticosteroid or nasal decongestant on a dosing day should be informed not to administer these within 1 hour prior to treatment. Manufacturer advises patients and carers should seek immediate medical advice if symptoms worsen, or if suicidal behaviour or thoughts and unusual changes in behaviour occur.
- ▶ When used for Major depressive disorder A patient guide should be provided.

Missed doses

- ▶ When used for Major depressive disorder Manufacturer advises if more than 2 treatment sessions are missed, adjustment of the dose or frequency of treatment may be clinically appropriate.

Driving and skilled tasks

- ▶ When used for Induction and maintenance of anaesthesia or Analgesic supplementation of regional and local anaesthesia or Analgesia in emergency medicine Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risk of driving or undertaking skilled tasks afterwards. For a short general anaesthetic the risk extends to **at least 24 hours** after administration. Responsible persons should be available to take patients home. The dangers of taking **alcohol** should also be emphasised. For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including ketamine which has similar pharmacokinetic properties to esketamine, see *Drugs and driving* under Guidance on prescribing p. 1.

- ▶ When used for Major depressive disorder Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of somnolence, sedation, dissociative symptoms, perception disturbances, dizziness, vertigo and anxiety. For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including ketamine which has similar pharmacokinetic properties to esketamine, see *Drugs and driving* under Guidance on prescribing p. 1.

● NATIONAL FUNDING/ACCESS DECISIONS

For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

- ▶ Esketamine nasal spray (*Spravato*®) in combination with a selective serotonin reuptake inhibitor (SSRI) or serotonin-norepinephrine reuptake inhibitor (SNRI), for adults with treatment-resistant Major Depressive Disorder, who have not responded to at least two different treatments with antidepressants in the current moderate to severe depressive episode (September 2020) SMC No. SMC2258 Recommended

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

ANALGESICS > NON-STEROIDAL ANTI-INFLAMMATORY DRUGS

Ketorolac trometamol

07-Dec-2020

● INDICATIONS AND DOSE

Short-term management of moderate to severe acute postoperative pain only

▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION

- ▶ Adult (body-weight up to 50 kg): Initially 10 mg, then 10–30 mg every 4–6 hours as required for maximum duration of treatment 2 days, frequency may be increased to up to every 2 hours during initial postoperative period; maximum 60 mg per day
- ▶ Adult (body-weight 50 kg and above): Initially 10 mg, then 10–30 mg every 4–6 hours as required for maximum duration of treatment 2 days, frequency may be increased to up to every 2 hours during initial postoperative period; maximum 90 mg per day
- ▶ Elderly: Initially 10 mg, then 10–30 mg every 4–6 hours as required for maximum duration of treatment 2 days, frequency may be increased to up to every 2 hours during initial postoperative period; maximum 60 mg per day

- **CONTRA-INDICATIONS** Active or history of gastrointestinal bleeding · active or history of gastro-intestinal ulceration · coagulation disorders · complete or partial syndrome of nasal polyps · confirmed or suspected cerebrovascular bleeding · dehydration · following operations with high risk of haemorrhage or incomplete haemostasis · haemorrhagic diatheses · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · hypovolaemia · severe heart failure
- **CAUTIONS** Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · connective-tissue disorders · elderly (risk of serious side-effects and fatalities) · heart failure · history of gastro-intestinal disorders (e.g. ulcerative colitis, Crohn's disease) · ischaemic heart disease · may mask symptoms of infection · peripheral arterial disease · risk factors for cardiovascular events · uncontrolled hypertension

- **INTERACTIONS** → Appendix 1: NSAIDs

● **SIDE-EFFECTS**

- ▶ **Frequency not known** Agranulocytosis · angioedema · anxiety · aplastic anaemia · appetite decreased · asthenia · asthma · azotaemia · bradycardia · burping · chest pain · concentration impaired · confusion · constipation · Crohn's disease aggravated · depression · diarrhoea · dizziness · drowsiness · dry mouth · dyspnoea · electrolyte imbalance · embolism and thrombosis · euphoric mood · fever · flank pain · fluid retention · flushing · gastrointestinal discomfort · gastrointestinal disorders · haemolytic anaemia · haemorrhage · hallucination · headache · hearing loss · heart failure · hepatic disorders · hyperhidrosis · hyperkinesia · hypersensitivity · hypertension · hypotension · infertility female · malaise · meningitis aseptic (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · musculoskeletal disorder · myalgia · myocardial infarction · nausea · nephritis tubulointerstitial · nephropathy · neutropenia · oedema · optic neuritis · oral disorders · pallor · palpitations · pancreatitis · paraesthesia · perforation · photosensitivity reaction · platelet aggregation inhibition · psychotic disorder · pulmonary oedema · renal impairment · respiratory disorders · seizure · severe cutaneous adverse reactions (SCARs) · skin reactions · sleep disorders · stroke · taste altered · thinking abnormal · thirst · thrombocytopenia · tinnitus · ulcer ·

urinary disorders · vertigo · visual impairment · vomiting · weight increased · wound haemorrhage

SIDE-EFFECTS, FURTHER INFORMATION For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs. p. 1185

- **ALLERGY AND CROSS-SENSITIVITY** ^{EvgR} Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID. [⚠]
- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- **BREAST FEEDING** Amount too small to be harmful.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution—may increase risk of renal impairment; avoid in hepatic failure.
- **RENAL IMPAIRMENT** Avoid if possible or use with caution. Avoid if serum creatinine greater than 160 micromol/litre. **Dose adjustments** The lowest effective dose should be used for the shortest possible duration. Max. 60 mg daily by intramuscular injection or intravenous injection. **Monitoring** In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With intravenous use For *intravenous injection*, manufacturer advises give over at least 15 seconds.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection▶ **Ketorolac trometamol (Non-proprietary)**

Ketorolac trometamol 30 mg per 1 ml Ketorolac 30mg/1ml solution for injection ampoules | 5 ampoule ^[PoM] £6.80 DT = £5.36 (Hospital only)

▶ **Toradol** (Atrnas Pharma UK Ltd)

Ketorolac trometamol 30 mg per 1 ml Toradol 30mg/1ml solution for injection ampoules | 5 ampoule ^[PoM] £5.36 DT = £5.36 (Hospital only)

Parecoxib

17-Nov-2020

- **DRUG ACTION** Parecoxib is a selective inhibitor of cyclooxygenase-2.

● **INDICATIONS AND DOSE****Short-term management of acute postoperative pain**

▶ BY DEEP INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION

- ▶ Adult: Initially 40 mg, then 20–40 mg every 6–12 hours as required for up to 3 days; maximum 80 mg per day
- ▶ Elderly (body-weight up to 50 kg): Initially 20 mg; maximum 40 mg per day

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · cerebrovascular disease · following coronary artery bypass graft surgery · inflammatory bowel disease · ischaemic heart disease · mild to severe heart failure · peripheral arterial disease
- **CAUTIONS** Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · coagulation defects · connective-tissue disorders · dehydration (risk of renal impairment) · elderly (risk of serious side-effects and fatalities) · history of cardiac failure · history of gastro-intestinal disorders · hypertension · may mask symptoms

of infection · oedema · risk factors for cardiovascular events

● **INTERACTIONS** → Appendix 1: NSAIDs

● **SIDE-EFFECTS**

- ▶ **Common or very common** Agitation · back pain · constipation · dizziness · gastrointestinal discomfort · gastrointestinal disorders · hyperhidrosis · hypertension · hypokalaemia · hypotension · increased risk of infection · insomnia · nausea · numbness · peripheral oedema · post procedural complications · renal impairment · respiratory disorders · skin reactions · vomiting
- ▶ **Uncommon** Appetite decreased · arrhythmias · arthralgia · asthenia · cerebrovascular insufficiency · dry mouth · ear pain · embolism and thrombosis · hyperglycaemia · myocardial infarction · thrombocytopenia
- ▶ **Rare or very rare** Hypersensitivity · pancreatitis · perioral swelling
- ▶ **Frequency not known** Angioedema · cardiovascular event · circulatory collapse · congestive heart failure · dyspnoea · fluid retention · hepatitis · renal failure (more common in patients with pre-existing renal impairment) · severe cutaneous adverse reactions (SCARs)

SIDE-EFFECTS, FURTHER INFORMATION For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs, p. 1185

- **ALLERGY AND CROSS-SENSITIVITY** EVGr Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID. Contra-indicated in patients with a history of allergic drug reactions including sulfonamide hypersensitivity. ⚠

- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

- **BREAST FEEDING** Avoid—present in milk.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment (risk of increased exposure); avoid in severe impairment (no information available).

Dose adjustments Manufacturer advises dose reduction to half the usual recommended dose in moderate impairment; maximum 40 mg daily.

- **RENAL IMPAIRMENT** Avoid if possible or use with caution. **Dose adjustments** The lowest effective dose should be used for the shortest possible duration.

Monitoring In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

● **NATIONAL FUNDING/ACCESS DECISIONS**

For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

- ▶ Parecoxib (*Dynastat*[®]) for the short-term treatment of postoperative pain (January 2003) SMC No. 27/02 Not recommended

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

▶ **Dynastat** (Pfizer Ltd)

Parecoxib (as Parecoxib sodium) 40 mg Dynastat 40mg powder and solvent for solution for injection vials | 5 vial PoM £28.34 DT = £28.34

Powder for solution for injection

▶ **Parecoxib (Non-proprietary)**

Parecoxib (as Parecoxib sodium) 40 mg Parecoxib 40mg powder for solution for injection vials | 10 vial PoM £49.60 DT = £49.60 (Hospital only)

▶ **Dynastat** (Pfizer Ltd)

Parecoxib (as Parecoxib sodium) 40 mg Dynastat 40mg powder for solution for injection vials | 10 vial PoM £49.60 DT = £49.60

ANALGESICS > OPIOIDS

F 470

Alfentanil

13-Nov-2020

● **INDICATIONS AND DOSE**

Spontaneous respiration: analgesia and enhancement of anaesthesia for short procedures

▶ **BY INTRAVENOUS INJECTION**

- ▶ **Adult:** Initially up to 500 micrograms, dose to be administered over 30 seconds; supplemental doses 250 micrograms

Assisted ventilation: analgesia and enhancement of anaesthesia for short procedures

▶ **BY INTRAVENOUS INJECTION**

- ▶ **Adult:** Initially 30–50 micrograms/kg, supplemental doses 15 micrograms/kg

Assisted ventilation: analgesia and enhancement of anaesthesia during maintenance of anaesthesia for longer procedures

▶ **BY INTRAVENOUS INFUSION**

- ▶ **Adult:** Initially 50–100 micrograms/kg, dose to be administered over 10 minutes or as a bolus, followed by maintenance 30–60 micrograms/kg/hour

Assisted ventilation: analgesia and suppression of respiratory activity during intensive care for up to 4 days

▶ **BY INTRAVENOUS INFUSION**

- ▶ **Adult:** Initially 2 mg/hour, adjusted according to response; usual dose 0.5–10 mg/hour, alternatively initially 5 mg in divided doses, to be administered over 10 minutes; dose used for more rapid initial control, reduce rate of administration if hypotension or bradycardia occur; additional doses of 0.5–1 mg may be given by intravenous injection during short painful procedures

DOSES AT EXTREMES OF BODY-WEIGHT

- ▶ To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

● **CAUTIONS**

- ▶ Repeated intra-operative doses EVGr Repeated intra-operative doses of alfentanil should be given with care since the resulting respiratory depression can persist postoperatively and occasionally it may become apparent for the first time postoperatively when monitoring of the patient might be less intensive. ⚠

● **INTERACTIONS** → Appendix 1: opioids

● **SIDE-EFFECTS**

- ▶ **Common or very common** Apnoea · chills · fatigue · hypertension · movement disorders · muscle rigidity · procedural complications
- ▶ **Uncommon** Coma · hiccups · hypercapnia · pain · post procedural complications · respiratory disorders
- ▶ **Rare or very rare** Agitation · crying · epistaxis · vascular pain
- ▶ **Frequency not known** Cardiac arrest · cough · fever · loss of consciousness · seizure

SIDE-EFFECTS, FURTHER INFORMATION Alfentanil can cause muscle rigidity, particularly of the chest wall or jaw; this can be managed by the use of neuromuscular blocking drugs.

- **BREAST FEEDING** Present in milk—withhold breast-feeding for 24 hours.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution. **Dose adjustments** Manufacturer advises dose reduction and cautious titration.
- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises 5 mg/mL injection should be diluted in Glucose 5% or Sodium Chloride 0.9% before use.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection

▶ Alfentanil (Non-proprietary)

Alfentanil (as Alfentanil hydrochloride) 500 microgram per 1 ml Alfentanil 1mg/2ml solution for injection ampoules |

10 ampoule [PoM] £27.80 DT = £6.34 (Hospital only) [CD2] |

10 ampoule [PoM] £5.95 DT = £6.34 [CD2]

Alfentanil 25mg/50ml solution for injection vials | 1 vial [PoM]

£14.90 [CD2]

Alfentanil 5mg/10ml solution for injection ampoules |

5 ampoule [PoM] £16.00 DT = £16.00 (Hospital only) [CD2] |

10 ampoule [PoM] £27.80 DT = £27.80 [CD2]

Alfentanil (as Alfentanil hydrochloride) 5 mg per 1 ml Alfentanil

5mg/1ml solution for injection ampoules | 10 ampoule [PoM] £21.95

DT = £23.19 (Hospital only) [CD2]

▶ Rapifen (Piramal Critical Care Ltd)

Alfentanil (as Alfentanil hydrochloride) 500 microgram per 1 ml Rapifen 5mg/10ml solution for injection ampoules |

5 ampoule [PoM] £16.00 DT = £16.00 [CD2]

Rapifen 1mg/2ml solution for injection ampoules | 10 ampoule [PoM]

£6.34 DT = £6.34 [CD2]

Alfentanil (as Alfentanil hydrochloride) 5 mg per 1 ml Rapifen

Intensive Care 5mg/1ml solution for injection ampoules |

10 ampoule [PoM] £23.19 DT = £23.19 (Hospital only) [CD2]

additional doses can be given *by intravenous injection* every 2–5 minutes during the intravenous infusion

Spontaneous respiration: analgesia and enhancement of anaesthesia during maintenance of anaesthesia

▶ BY INTRAVENOUS INFUSION

- ▶ **Adult:** Initially 2.4 micrograms/kg/hour, adjusted according to response; usual dose 1.5–6 micrograms/kg/hour

Assisted ventilation: analgesia and sedation in intensive-care patients (for max 3 days)

▶ BY INTRAVENOUS INFUSION

- ▶ **Adult:** Initially 6–9 micrograms/kg/hour, then adjusted in steps of 1.5 micrograms/kg/hour, allow at least 5 minutes between dose adjustments; usual dose 0.36–44.4 micrograms/kg/hour, if an infusion rate of 12 micrograms/kg/hour does not produce adequate sedation add another sedative (consult product literature for details)

Assisted ventilation: additional analgesia during stimulating or painful procedures in intensive-care patients

▶ BY INTRAVENOUS INFUSION

- ▶ **Adult:** Usual dose 15–45 micrograms/kg/hour, maintain infusion rate of at least 6 micrograms/kg/hour for at least 5 minutes before procedure and adjust every 2–5 minutes according to requirements

Cardiac surgery

- ▶ **Adult:** (consult product literature)

DOSES AT EXTREMES OF BODY-WEIGHT

- ▶ To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

- **UNLICENSED USE** Remifentanil doses in BNF may differ from those in product literature.
- **CONTRA-INDICATIONS** Analgesia in conscious patients
- **INTERACTIONS** → Appendix 1: opioids
- **SIDE-EFFECTS**

- ▶ **Common or very common** Apnoea · muscle rigidity · post procedural complications
- ▶ **Uncommon** Hypoxia
- ▶ **Rare or very rare** Cardiac arrest
- ▶ **Frequency not known** Agitation · atrioventricular block · hypertension · seizure

SIDE-EFFECTS, FURTHER INFORMATION In contrast to other opioids which are metabolised in the liver, remifentanil undergoes rapid metabolism by plasma esterases; it has short duration of action which is independent of dose and duration of infusion.

Muscle rigidity Remifentanil can cause muscle rigidity that can be managed by the use of neuromuscular blocking drugs.

- **PREGNANCY** No information available.
- **BREAST FEEDING** Avoid breast-feeding for 24 hours after administration—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (limited information available).
- **RENAL IMPAIRMENT** **Dose adjustments** [EvGr] No dose adjustment necessary in renal impairment. ⚠
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With intravenous use For *intravenous infusion (Ultiva®)*, manufacturer advises give continuously in Glucose 5% or Sodium Chloride 0.9% or Water for Injections; reconstitute with infusion fluid to a concentration of 1 mg/mL then dilute further to a concentration of 20–250 micrograms/mL (50 micrograms/mL recommended for general anaesthesia, 20–50 micrograms/mL recommended when used with target controlled infusion (TCI) device).

Remifentanil

• INDICATIONS AND DOSE

Analgesia and enhancement of anaesthesia at induction (initial bolus injection)

▶ BY INTRAVENOUS INJECTION

- ▶ **Adult:** Initially 0.25–1 microgram/kg, dose to be administered over at least 30 seconds, if patient is to be intubated more than 8 minutes after start of intravenous infusion, initial bolus intravenous injection dose is not necessary

Analgesia and enhancement of anaesthesia at induction with or without initial bolus dose

▶ BY INTRAVENOUS INFUSION

- ▶ **Adult:** 30–60 micrograms/kg/hour, if patient is to be intubated more than 8 minutes after start of intravenous infusion, initial bolus intravenous injection dose is not necessary

Assisted ventilation: analgesia and enhancement of anaesthesia during maintenance of anaesthesia (initial bolus injection)

▶ BY INTRAVENOUS INJECTION

- ▶ **Adult:** Initially 0.25–1 microgram/kg, dose to be administered over at least 30 seconds

Assisted ventilation: analgesia and enhancement of anaesthesia during maintenance of anaesthesia with or without initial bolus dose

▶ BY INTRAVENOUS INFUSION

- ▶ **Adult:** 3–120 micrograms/kg/hour, dose to be administered according to anaesthetic technique and adjusted according to response, in light anaesthesia

● PRESCRIBING AND DISPENSING INFORMATION

Remifentanyl should not be given by intravenous injection intra-operatively, but it is well suited to continuous infusion; a supplementary analgesic is given before stopping the infusion of remifentanyl.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

▶ Remifentanyl (Non-proprietary)

Remifentanyl (as Remifentanyl hydrochloride) 1 mg Remifentanyl 1mg powder for concentrate for solution for injection vials | 5 vial [PoM] £25.60 (Hospital only) [CD2]

Remifentanyl (as Remifentanyl hydrochloride) 2 mg Remifentanyl 2mg powder for concentrate for solution for injection vials | 5 vial [PoM] £51.13 (Hospital only) [CD2]

Remifentanyl (as Remifentanyl hydrochloride) 5 mg Remifentanyl 5mg powder for concentrate for solution for injection vials | 5 vial [PoM] £127.90-£147.80 (Hospital only) [CD2]

▶ Ultiva (Aspen Pharma Trading Ltd)

Remifentanyl (as Remifentanyl hydrochloride) 1 mg Ultiva 1mg powder for solution for injection vials | 5 vial [PoM] £25.58 (Hospital only) [CD2]

Remifentanyl (as Remifentanyl hydrochloride) 2 mg Ultiva 2mg powder for solution for injection vials | 5 vial [PoM] £51.15 (Hospital only) [CD2]

Remifentanyl (as Remifentanyl hydrochloride) 5 mg Ultiva 5mg powder for solution for injection vials | 5 vial [PoM] £127.88 (Hospital only) [CD2]

1.4 Peri-operative sedation

Conscious sedation for clinical procedures

Overview

Sedation of patients during diagnostic and therapeutic procedures is used to reduce fear and anxiety, to control pain, and to minimise excessive movement. The choice of sedative drug will depend upon the intended procedure; some procedures are safer and more successful under anaesthesia. The patient should be *monitored carefully*; monitoring should begin as soon as the sedative is given or when the patient becomes drowsy, and should be continued until the patient wakes up.

ANAESTHETICS, GENERAL > NMDA RECEPTOR ANTAGONISTS

Ketamine

04-Dec-2019

● INDICATIONS AND DOSE

Induction and maintenance of anaesthesia for short procedures

▶ BY INTRAMUSCULAR INJECTION

▶ **Adult:** Initially 6.5–13 mg/kg, adjusted according to response, a dose of 10 mg/kg usually produces 12–25 minutes of surgical anaesthesia

▶ BY INTRAVENOUS INJECTION

▶ **Adult:** Initially 1–4.5 mg/kg, adjusted according to response, to be administered over at least 60 seconds, a dose of 2 mg/kg usually produces 5–10 minutes of surgical anaesthesia

Diagnostic manoeuvres and procedures not involving intense pain

▶ BY INTRAMUSCULAR INJECTION

▶ **Adult:** Initially 4 mg/kg

Induction and maintenance of anaesthesia for long procedures

▶ BY INTRAVENOUS INFUSION

▶ **Adult:** Initially 0.5–2 mg/kg, using an infusion solution containing 1 mg/ml; maintenance 10–45 micrograms/kg/minute, adjusted according to response

IMPORTANT SAFETY INFORMATION

Ketamine should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

● **CONTRA-INDICATIONS** Acute porphyrias p. 1114 · eclampsia · head trauma · hypertension · pre-eclampsia · raised intracranial pressure · severe cardiac disease · stroke

● **CAUTIONS** Acute circulatory failure (shock) · cardiovascular disease · dehydration · elderly · fixed cardiac output · hallucinations · head injury · hypertension · hypovolaemia · increased cerebrospinal fluid pressure · intracranial mass lesions · nightmares · predisposition to seizures · psychotic disorders · raised intra-ocular pressure · respiratory tract infection · thyroid dysfunction

● **INTERACTIONS** → Appendix 1: ketamine

● SIDE-EFFECTS

▶ **Common or very common** Anxiety · behaviour abnormal · confusion · diplopia · hallucination · muscle tone increased · nausea · nystagmus · skin reactions · sleep disorders · tonic clonic movements · vomiting

▶ **Uncommon** Appetite decreased · arrhythmias · hypotension · respiratory disorders

▶ **Rare or very rare** Apnoea · cystitis · cystitis haemorrhagic · delirium · dysphoria · flashback · hypersalivation

▶ **Frequency not known** Drug-induced liver injury

SIDE-EFFECTS, FURTHER INFORMATION Incidence of hallucinations can be reduced by premedication with a benzodiazepine (such as midazolam).

● **PREGNANCY** May depress neonatal respiration if used during delivery.

● **BREAST FEEDING** Avoid for at least 12 hours after last dose.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of prolonged duration of action).

Dose adjustments Manufacturer advises consider dose reduction.

● **DIRECTIONS FOR ADMINISTRATION** For *continuous intravenous infusion*, dilute to a concentration of 1 mg/mL with Glucose 5% or Sodium Chloride 0.9%; use microdrip infusion for maintenance of anaesthesia. For *intravenous injection*, dilute 100 mg/mL strength to a concentration of not more than 50 mg/mL with Glucose 5% or Sodium Chloride 0.9% or Water for Injections.

● PATIENT AND CARER ADVICE

Driving and skilled tasks Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risk of driving or undertaking skilled tasks afterwards. For a short general anaesthetic the risk extends to **at least 24 hours** after administration. Responsible persons should be available to take patients home. The dangers of taking **alcohol** should also be emphasised.

For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including ketamine, see *Drugs and driving* under Guidance on prescribing p. 1.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection

▶ Ketamine (Non-proprietary)

Ketamine (as Ketamine hydrochloride) 10 mg per 1 ml Ketamin 10 Curamed 50mg/5ml solution for injection ampoules | 10 ampoule [PoM] [S] [CD2]

Ketamine (as Ketamine hydrochloride) 50 mg per 1 ml Ketamine 500mg/10ml solution for injection vials | 10 vial [PoM] £70.00 (Hospital only) [CD2]

Ketamin 100mg/2ml solution for injection ampoules | 10 ampoule [PoM] [S] [CD2]

HYPNOTICS, SEDATIVES AND ANXIOLYTICS > NON-BENZODIAZEPINE HYPNOTICS AND SEDATIVES

Dexmedetomidine

07-Aug-2020

● INDICATIONS AND DOSE

Maintenance of sedation during intensive care

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 0.7 microgram/kg/hour, adjusted according to response; usual dose 0.2–1.4 micrograms/kg/hour

IMPORTANT SAFETY INFORMATION

Dexmedetomidine should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management.

- **CONTRA-INDICATIONS** Acute cerebrovascular disorders · second- or third-degree AV block (unless pacemaker fitted) · uncontrolled hypotension
- **CAUTIONS** Abrupt withdrawal after prolonged use · bradycardia · elderly (risk of hypotension) · ischaemic heart disease (especially at higher doses) · malignant hyperthermia · severe cerebrovascular disease (especially at higher doses) · severe neurological disorders · spinal cord injury
- **INTERACTIONS** → Appendix 1: dexmedetomidine
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Agitation · arrhythmias · dry mouth · hyperglycaemia · hypertension · hyperthermia · hypoglycaemia · hypotension · myocardial infarction · myocardial ischaemia · nausea · respiratory depression · vomiting
 - ▶ **Uncommon** Abdominal distension · apnoea · atrioventricular block · dyspnoea · hallucination · hypoalbuminaemia · metabolic acidosis · thirst
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—*toxicity in animal studies.*
- **BREAST FEEDING** Manufacturer advises avoid unless potential benefit outweighs risk—*present in milk in animal studies.*
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (increased risk of toxicity due to decreased clearance). **Dose adjustments** Manufacturer advises consider dose reduction.

● MONITORING REQUIREMENTS

- ▶ Monitor cardiac function.
- ▶ Monitor respiratory function in non-intubated patients.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises to be diluted before use. For *intravenous infusion* given continuously in Glucose 5% or Sodium Chloride 0.9%, dilute to a concentration of 4 micrograms/mL.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

▶ Dexmedetomidine (Non-proprietary)

Dexmedetomidine (as Dexmedetomidine hydrochloride)

100 microgram per 1 ml Dexmedetomidine 1mg/10ml concentrate for solution for infusion vials | 4 vial [PoM] £313.10–£313.20 (Hospital only) | 5 vial [PoM] £391.50 (Hospital only)

Dexmedetomidine 400micrograms/4ml concentrate for solution for infusion vials | 4 vial [PoM] £125.30 (Hospital only)

Dexmedetomidine 200micrograms/2ml concentrate for solution for infusion ampoules | 5 ampoule [PoM] £78.30 (Hospital only)

▶ Dextor (Orion Pharma (UK) Ltd)

Dexmedetomidine (as Dexmedetomidine hydrochloride)

100 microgram per 1 ml Dextor 1mg/10ml concentrate for solution for infusion vials | 4 vial [PoM] £313.20 (Hospital only) Dextor 400micrograms/4ml concentrate for solution for infusion vials | 4 vial [PoM] £125.28 (Hospital only)

Dextor 200micrograms/2ml concentrate for solution for infusion ampoules | 5 ampoule [PoM] £78.30 (Hospital only)

2 Malignant hyperthermia

MUSCLE RELAXANTS > DIRECTLY ACTING

Dantrolene sodium

08-Mar-2021

- **DRUG ACTION** Acts on skeletal muscle cells by interfering with calcium efflux, thereby stopping the contractile process.

● INDICATIONS AND DOSE

Malignant hyperthermia

▶ BY RAPID INTRAVENOUS INJECTION

- ▶ Adult: Initially 2–3 mg/kg, then 1 mg/kg, repeated if necessary; maximum 10 mg/kg per course

Chronic severe spasticity of voluntary muscle

▶ BY MOUTH

- ▶ Adult: Initially 25 mg daily, then increased to up to 100 mg 4 times a day, dose increased at weekly intervals; usual dose 75 mg 3 times a day

Muscle cramps in motor neurone disease (specialist use only)

▶ BY MOUTH

- ▶ Adult: Initially 25 mg daily, then increased to up to 100 mg 4 times a day, dose increased at weekly intervals

● UNLICENSED USE

- ▶ With oral use [EvGr] Dantrolene sodium is used for the treatment of muscle cramps in motor neurone disease, but is not licensed for this indication.

IMPORTANT SAFETY INFORMATION

Should only be administered by, or under the direct supervision of, personnel experienced in the use of dantrolene when used for malignant hyperthermia.

● CONTRA-INDICATIONS

- ▶ With oral use Acute muscle spasm · avoid when spasticity is useful, for example, locomotion
- **CAUTIONS**
 - ▶ With intravenous use Avoid extravasation (risk of tissue necrosis)

- ▶ With oral use Females (hepatotoxicity) · history of liver disorders (hepatotoxicity) · if doses greater than 400 mg daily (hepatotoxicity) · impaired cardiac function · impaired pulmonary function · patients over 30 years (hepatotoxicity) · therapeutic effect may take a few weeks to develop—discontinue if no response within 6–8 weeks

● **INTERACTIONS** → Appendix 1: dantrolene

● **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · hepatic disorders · nausea · respiratory disorders · skin reactions · speech disorder · vomiting
- ▶ **Uncommon** Crystalluria · hyperhidrosis
- ▶ **Frequency not known** Arrhythmias · dizziness · drowsiness

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
 - ▶ With oral use Appetite decreased · chills · confusion · depression · eosinophilia · fever · headache · insomnia · nervousness · pericarditis · visual impairment
- ▶ **Uncommon**
 - ▶ With oral use Constipation · dysphagia · haemorrhage · heart failure aggravated · urinary disorders
- ▶ **Frequency not known**
 - ▶ With intravenous use Gastrointestinal haemorrhage · heart failure · localised pain · pulmonary oedema · seizure · thrombophlebitis
- ▶ With oral use Asthenia · diarrhoea · dyspnoea · hypertension · malaise

● **PREGNANCY**

- ▶ With intravenous use Use only if potential benefit outweighs risk.
- ▶ With oral use Although teratological studies in *animals* have proved satisfactory, dantrolene sodium does cross the placenta, therefore manufacturer advises avoid.

● **BREAST FEEDING**

- ▶ With intravenous use Present in milk—use only if potential benefit outweighs risk.
- ▶ With oral use Present in milk—manufacturer advises avoid.

● **HEPATIC IMPAIRMENT**

- ▶ With oral use Manufacturer advises avoid in hepatic impairment.

● **MONITORING REQUIREMENTS**

- ▶ With oral use Test liver function before and at intervals during therapy.

● **PATIENT AND CARER ADVICE**

Hepatotoxicity ▶ With oral use Patients should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain, dark urine, or pruritus develop.

Driving and skilled tasks ▶ With oral use Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Powder for solution for injection

- ▶ **Dantrium** (Forum Health Products Ltd)

Local anaesthesia

Anaesthesia (local)

Local anaesthetic drugs

The use of local anaesthetics by injection or by application to mucous membranes to produce local analgesia is discussed in this section.

Local anaesthetic drugs act by causing a reversible block to conduction along nerve fibres. They vary widely in their potency, toxicity, duration of action, stability, solubility in water, and ability to penetrate mucous membranes. These factors determine their application, e.g. topical (surface), infiltration, peripheral nerve block, intravenous regional anaesthesia (Bier's block), plexus, epidural (extradural), or spinal (intrathecal or subarachnoid) block. Local anaesthetics may also be used for postoperative pain relief, thereby reducing the need for analgesics such as opioids.

Bupivacaine hydrochloride p. 1419 has a longer duration of action than other local anaesthetics. It has a slow onset of action, taking up to 30 minutes for full effect. It is often used in lumbar epidural blockade and is particularly suitable for continuous epidural analgesia in labour, or for postoperative pain relief. It is the principal drug used for spinal anaesthesia. Hyperbaric solutions containing glucose may be used for spinal block.

Levobupivacaine p. 1421, an isomer of bupivacaine, has anaesthetic and analgesic properties similar to bupivacaine hydrochloride, but is thought to have fewer adverse effects.

Lidocaine hydrochloride p. 1422 is effectively absorbed from mucous membranes and is a useful surface anaesthetic in concentrations up to 10%. Except for surface anaesthesia and dental anaesthesia, solutions should **not** usually exceed 1% in strength. The duration of the block (with adrenaline/epinephrine p. 239) is about 90 minutes.

Prilocaine hydrochloride p. 1426 is a local anaesthetic of low toxicity which is similar to lidocaine hydrochloride. A hyperbaric solution of prilocaine hydrochloride (containing glucose) may be used for spinal anaesthesia.

Ropivacaine hydrochloride p. 1427 is an amide-type local anaesthetic agent similar to bupivacaine hydrochloride. It is less cardiotoxic than bupivacaine hydrochloride, but also less potent.

Tetracaine p. 1428, a para-aminobenzoic acid ester, is an effective local anaesthetic for topical application; a 4% gel is indicated for anaesthesia before venepuncture or venous cannulation. It is rapidly absorbed from mucous membranes and should **never** be applied to inflamed, traumatised, or highly vascular surfaces. It should never be used to provide anaesthesia for bronchoscopy or cystoscopy because lidocaine hydrochloride is a safer alternative.

Administration by injection

The dose of local anaesthetic depends on the injection site and the procedure used. In determining the safe dosage, it is important to take account of the rate of absorption and excretion, and of the potency. The patient's age, weight, physique, and clinical condition, and the vascularity of the administration site and the duration of administration, must also be considered.

Uptake of local anaesthetics into the systemic circulation determines their duration of action and produces toxicity.

NHS Improvement has advised (September 2016) that, prior to administration, all injectable medicines must be drawn directly from their original ampoule or container into a syringe and should **never** be decanted into gallipots or open containers. This is to avoid the risk of medicines being confused with other substances, e.g. skin disinfectants, and to reduce the risk of contamination.

Great care must be taken to avoid accidental intravascular injection; local anaesthetic injections should be given slowly in order to detect inadvertent intravascular administration. When prolonged analgesia is required, a long-acting local anaesthetic is preferred to minimise the likelihood of cumulative systemic toxicity. Local anaesthesia around the oral cavity may impair swallowing and therefore increases the risk of aspiration.

Epidural anaesthesia is commonly used during surgery, often combined with general anaesthesia, because of its protective effect against the stress response of surgery. It is often used when good postoperative pain relief is essential.

Vasoconstrictors in combination with local anaesthetics

Local anaesthetics cause dilatation of blood vessels. The addition of a vasoconstrictor such as adrenaline/epinephrine to the local anaesthetic preparation diminishes local blood flow, slowing the rate of absorption and thereby prolonging the anaesthetic effect. Great care should be taken to avoid inadvertent intravenous administration of a preparation containing adrenaline/epinephrine, and it is **not** advisable to give adrenaline/epinephrine with a local anaesthetic injection in digits or appendages because of the risk of ischaemic necrosis.

Adrenaline/epinephrine must be used in a low concentration when administered with a local anaesthetic. Care must also be taken to calculate a safe maximum dose of local anaesthetic when using combination products.

In patients with severe hypertension or unstable cardiac rhythm, the use of adrenaline/epinephrine with a local anaesthetic may be hazardous. For these patients an anaesthetic without adrenaline/epinephrine should be used.

Dental anaesthesia

Lidocaine hydrochloride is widely used in dental procedures; it is most often used in combination with adrenaline/epinephrine. Lidocaine hydrochloride 2% combined with adrenaline/epinephrine 1 in 80 000 (12.5 micrograms/mL) is a safe and effective preparation; there is no justification for using higher concentrations of adrenaline/epinephrine.

The amide-type local anaesthetics **articaine** and mepivacaine hydrochloride p. 1425 are also used in dentistry; they are available in cartridges suitable for dental use. Mepivacaine hydrochloride is available with or without adrenaline/epinephrine and articaine is available with adrenaline.

In patients with severe hypertension or unstable cardiac rhythm, mepivacaine hydrochloride without adrenaline/epinephrine may be used. Alternatively, prilocaine hydrochloride with or without felypressin can be used but there is no evidence that it is any safer. Felypressin can cause coronary vasoconstriction when used at high doses; limit dose in patients with coronary artery disease.

Toxicity induced by local anaesthesia

For management of toxicity see Severe local anaesthetic-induced cardiovascular toxicity see below.

Severe local anaesthetic-induced cardiovascular toxicity

Overview

After injection of a bolus of local anaesthetic, toxicity may develop at any time in the following hour. In the event of signs of toxicity during injection, the administration of the local anaesthetic must be stopped immediately.

Cardiovascular status must be assessed and cardiopulmonary resuscitation procedures must be followed.

In the event of local anaesthetic-induced cardiac arrest, standard cardiopulmonary resuscitation should be initiated immediately. Lidocaine must not be used as anti-arrhythmic therapy.

If the patient does not respond rapidly to standard procedures, 20% lipid emulsion such as *Intralipid*[®] [unlicensed indication] should be given intravenously at an initial bolus dose of 1.5 mL/kg over 1 minute, followed by an infusion of 15 mL/kg/hour. After 5 minutes, if cardiovascular stability has not been restored or circulation deteriorates, give a maximum of two further bolus doses of 1.5 mL/kg over 1 minute, 5 minutes apart, and increase the infusion rate to 30 mL/kg/hour. Continue infusion until cardiovascular stability and adequate circulation are restored or maximum cumulative dose of 12 mL/kg is given.

Standard cardiopulmonary resuscitation must be maintained throughout lipid emulsion treatment.

Propofol is not a suitable alternative to lipid emulsion.

Further advice on ongoing treatment should be obtained from the National Poisons Information Service.

Detailed treatment algorithms and accompanying notes are available at www.toxbase.org or can be found in the Association of Anaesthetists of Great Britain and Ireland safety guideline, Management of Severe Local Anaesthetic Toxicity and Management of Severe Local Anaesthetic Toxicity – Accompanying notes.

ANAESTHETICS, LOCAL

Adrenaline with articaine hydrochloride

19-Dec-2019

(Carticaine hydrochloride with epinephrine)

• INDICATIONS AND DOSE

Infiltration anaesthesia in dentistry

- ▶ BY REGIONAL ADMINISTRATION
- ▶ Adult: Consult expert dental sources

DOSES AT EXTREMES OF BODY-WEIGHT

- ▶ To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

IMPORTANT SAFETY INFORMATION

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

- **CONTRA-INDICATIONS** Injection into infected tissues · injection into inflamed tissues · preparations containing preservatives should not be used for caudal, epidural, or spinal block

CONTRA-INDICATIONS, FURTHER INFORMATION

- ▶ Injection site Manufacturer advises the local anaesthetic effect may be reduced when injected into an inflamed or infected area, due to altered local pH. Increased absorption into the blood also increases the possibility of systemic side-effects.
- **CAUTIONS** Arrhythmias · arteriosclerosis · cardiovascular disease · cerebrovascular disease · cor pulmonale · debilitated patients (consider dose reduction) · diabetes mellitus · elderly (consider dose reduction) · epilepsy · hypercalcaemia · hyperreflexia · hypertension · hyperthyroidism · hypokalaemia · hypovolaemia · impaired cardiac conduction · impaired respiratory function · ischaemic heart disease · myasthenia gravis · obstructive cardiomyopathy · occlusive vascular disease · organic brain damage · phaeochromocytoma · prostate disorders ·

psychoneurosis · severe angina · shock · susceptibility to angle-closure glaucoma

CAUTIONS, FURTHER INFORMATION

- Use of vasoconstrictors In patients with severe hypertension or unstable cardiac rhythm, the use of adrenaline with a local anaesthetic may be hazardous. For these patients an anaesthetic without adrenaline should be used.

- INTERACTIONS** → Appendix 1: articaine · sympathomimetics, vasoconstrictor

- SIDE-EFFECTS** Face oedema · gingivitis · headache · nausea · sensation abnormal

SIDE-EFFECTS, FURTHER INFORMATION Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection. The toxicity mainly involves the central nervous and cardiovascular systems. The onset of toxicity can be unpredictable and delayed. Monitor as per local protocol for at least 30 minutes after administration.

ALLERGY AND CROSS-SENSITIVITY

- Hypersensitivity and cross-sensitivity** Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.
- PREGNANCY** Use only if potential benefit outweighs risk—no information available.
- BREAST FEEDING** Avoid breast-feeding for 48 hours after administration.
- HEPATIC IMPAIRMENT** Manufacturer advises caution (increased risk of toxicity in severe impairment).
- RENAL IMPAIRMENT** Manufacturers advise use with caution in severe impairment.
- MONITORING REQUIREMENTS** Consider monitoring blood pressure and ECG (advised with systemic adrenaline/epinephrine).

- MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Sulfit

- ▶ **Septanest** (Septodont Ltd)

Adrenaline (as Adrenaline acid tartrate) 10 microgram per 1 ml, Articaine hydrochloride 40 mg per 1 ml Septanest 1 in 100,000 solution for injection cartridges | 50 cartridge [PoM](#) £24.95

Adrenaline (as Adrenaline acid tartrate) 5 microgram per 1 ml, Articaine hydrochloride 40 mg per 1 ml Septanest 1 in 200,000 solution for injection cartridges | 50 cartridge [PoM](#) £24.95

Bupivacaine hydrochloride

09-Dec-2019

INDICATIONS AND DOSE

Surgical anaesthesia, lumbar epidural block

▶ BY REGIONAL ADMINISTRATION

- ▶ Adult: 75–150 mg, dose administered using a 5 mg/mL (0.5%) solution

Surgical anaesthesia, field block

▶ BY REGIONAL ADMINISTRATION

- ▶ Adult: Up to 150 mg, dose administered using a 2.5 mg/mL (0.25%) or 5 mg/mL (0.5%) solution

Surgical anaesthesia, thoracic epidural block

▶ BY THORACIC EPIDURAL

- ▶ Adult: 12.5–50 mg, dose administered using a 2.5 mg/mL (0.25%) or 5 mg/mL (0.5%) solution

Surgical anaesthesia, caudal epidural block

▶ BY REGIONAL ADMINISTRATION

- ▶ Adult: 50–150 mg, dose administered using a 2.5 mg/mL (0.25%) or 5 mg/mL (0.5%) solution

Surgical anaesthesia, major nerve block

▶ BY REGIONAL ADMINISTRATION

- ▶ Adult: 50–175 mg, dose administered using 5 mg/mL (0.5%) solution

Acute pain, intra-articular block

▶ BY INTRA-ARTICULAR INJECTION

- ▶ Adult: Up to 100 mg, dose administered using a 2.5 mg/mL (0.25%) solution; when co-administered with bupivacaine by another route, total max. 150 mg

Acute pain, thoracic epidural block

▶ BY CONTINUOUS EPIDURAL INFUSION

- ▶ Adult: 6.3–18.8 mg/hour, dose administered using a 1.25 mg/mL (0.125%) or 2.5 mg/mL (0.25%) solution; maximum 400 mg per day

Acute pain, labour

▶ BY CONTINUOUS EPIDURAL INFUSION

- ▶ Adult: 6.25–12.5 mg/hour, dose administered using a 1.25 mg/mL (0.125%) solution; maximum 400 mg per day

Acute pain, lumbar epidural block

▶ INITIALLY BY LUMBAR EPIDURAL

- ▶ Adult: 15–37.5 mg, then (by lumbar epidural) 15–37.5 mg, repeated when required at intervals of at least 30 minutes, dose administered by intermittent injection using a 2.5 mg/mL (0.25%) solution, alternatively (by continuous epidural infusion) 12.5–18.8 mg/hour, dose administered using a 1.25 mg/mL (0.125%) or 2.5 mg/mL (0.25%) solution; maximum 400 mg per day

Acute pain, field block

▶ BY REGIONAL ADMINISTRATION

- ▶ Adult: Up to 150 mg, dose administered using a 2.5 mg/mL (0.25%) solution

DOSES AT EXTREMES OF BODY-WEIGHT

- ▶ To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

MARCAIN HEAVY®

Intrathecal anaesthesia for surgery

▶ BY INTRATHECAL INJECTION

- ▶ Adult: 10–20 mg

IMPORTANT SAFETY INFORMATION

The licensed doses stated may not be appropriate in some settings and expert advice should be sought.

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

- CONTRA-INDICATIONS** Avoid injection into infected tissues · avoid injection into inflamed tissues · intravenous regional anaesthesia (Bier's block) · preparations containing preservatives should not be used for caudal, epidural, or spinal block

CONTRA-INDICATIONS, FURTHER INFORMATION

- ▶ Injection site Manufacturer advises local anaesthetics should not be injected into inflamed or infected tissues. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.
- ▶ **CAUTIONS** Cardiovascular disease · cerebral atheroma · complete heart block · debilitated patients (consider dose reduction) · elderly (consider dose reduction) · epilepsy ·

hypertension · hypotension · hypovolaemia · impaired cardiac conduction · impaired respiratory function · myasthenia gravis · myocardial depression may be more severe and more resistant to treatment · shock

● **INTERACTIONS** → Appendix 1: anaesthetics, local

● **SIDE-EFFECTS**

▶ **Common or very common** Arrhythmias · dizziness · hypertension · hypotension · nausea · paraesthesia · urinary retention · vomiting

▶ **Uncommon** Neurotoxicity

▶ **Rare or very rare** Arachnoiditis · cardiac arrest · diplopia · nerve disorders · paraplegia · paresis · respiratory depression

SIDE-EFFECTS, FURTHER INFORMATION Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection. The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems. The onset of toxicity can be unpredictable and delayed. Monitor as per local protocol for at least 30 minutes after administration.

● **ALLERGY AND CROSS-SENSITIVITY**

▶ Hypersensitivity and cross-sensitivity Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by the alternative chemical type.

● **PREGNANCY** Large doses during delivery can cause neonatal respiratory depression, hypotonia, and bradycardia after epidural block.

Dose adjustments Use lower doses for intrathecal use during late pregnancy.

● **BREAST FEEDING** Amount too small to be harmful.

● **HEPATIC IMPAIRMENT** Manufacturer advises use with caution in advanced liver dysfunction.

● **RENAL IMPAIRMENT** Use with caution in severe impairment.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, infusion, solution for infusion

Solution for injection

▶ **Bupivacaine hydrochloride (Non-proprietary)**

Chloroprocaine hydrochloride

21-May-2020

● **DRUG ACTION** Chloroprocaine is an ester-type local anaesthetic that blocks the generation and conduction of nerve impulses.

● **INDICATIONS AND DOSE**

Spinal anaesthesia for surgical procedures lasting 40 minutes or less (using 10 mg/ml solution) (specialist use only)

▶ BY SLOW INTRATHECAL INJECTION

▶ **Adult:** 40–50 mg (max. per dose 50 mg), dose depends on desired length of block

Surgical anaesthesia for procedures lasting 60 minutes or less, peripheral nerve block (using 20 mg/ml solution) (specialist use only)

- ▶ BY REGIONAL ADMINISTRATION
- ▶ Adult: (consult product literature)

IMPORTANT SAFETY INFORMATION

The licensed doses stated above may not be appropriate in some settings and expert advice should be sought.

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

- **CONTRA-INDICATIONS** Avoid injection into infected tissues
 - avoid injection into inflamed tissues · hypovolaemia · impaired cardiac conduction · intravenous regional anaesthesia (Bier's block) · severe anaemia

CONTRA-INDICATIONS, FURTHER INFORMATION

- ▶ Injection site Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.

- **CAUTIONS** Acute porphyrias p. 1114 · cardiovascular disease · complete heart block · debilitated patients (consider dose reduction) · elderly (consider dose reduction) · low plasma-cholinesterase activity (including severe liver disease) · neurological disorders · neuromuscular disorders · partial heart block

- **INTERACTIONS** → Appendix 1: chloroprocaine

● **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Anxiety · dizziness · hypotension · nausea · vomiting
- ▶ **Uncommon** Arrhythmias · hearing impairment · hypertension · loss of consciousness · neurotoxicity · oral disorders · seizure · speech disorder · tinnitus · tremor · vision disorders
- ▶ **Rare or very rare** Cardiac arrest · drowsiness · faecal incontinence · myocardial contractility decreased · nerve disorders · neurological injury · perineal numbness · sexual dysfunction · urinary incontinence

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
- ▶ With intrathecal use Sensation abnormal
- ▶ When used by regional administration Anaesthetic complication · paraesthesia
- ▶ **Uncommon**
- ▶ With intrathecal use Headache · pain
- ▶ **Rare or very rare**
- ▶ With intrathecal use Motor dysfunction · respiratory disorders · spinal block
- ▶ When used by regional administration Dyspnoea · respiratory arrest

SIDE-EFFECTS, FURTHER INFORMATION Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection. The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems. The onset of toxicity can be unpredictable and delayed. Monitor as per local protocol for at least 30 minutes after administration.

● **ALLERGY AND CROSS-SENSITIVITY**

- ▶ Hypersensitivity and cross-sensitivity Hypersensitivity reactions occur mainly with the ester-type local

anaesthetics, such as tetracaine and chloroprocaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk (limited information available); this does not preclude use at term for obstetrical anaesthesia.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment.
- **RENAL IMPAIRMENT** Manufacturer advises use with caution.
- **HANDLING AND STORAGE** Manufacturer advises protect from light.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Ampres** (Sintetica Ltd)

Levobupivacaine

08-Sep-2020

● **INDICATIONS AND DOSE**

Acute postoperative pain

- ▶ BY CONTINUOUS EPIDURAL INFUSION

- ▶ Adult: 12.5–18.75 mg/hour, dose administered using a 1.25 mg/mL (0.125%) or 2.5 mg/mL (0.25%) solution; maximum 400 mg per day

Acute labour pain

- ▶ BY LUMBAR EPIDURAL

- ▶ Adult: 15–25 mg, repeated at intervals of at least 15 minutes, dose administered using a 2.5 mg/mL (0.25%) solution; maximum 400 mg per day

- ▶ BY CONTINUOUS EPIDURAL INFUSION

- ▶ Adult: 5–12.5 mg/hour, dose administered using a 1.25 mg/mL (0.125%) solution; maximum 400 mg per day

Surgical anaesthesia, peripheral nerve block

- ▶ BY REGIONAL ADMINISTRATION

- ▶ Adult: 2.5–150 mg, dose administered using a 2.5 mg/mL (0.25%) or 5 mg/mL (0.5%) solution

Surgical anaesthesia, peribulbar nerve block

- ▶ BY REGIONAL ADMINISTRATION

- ▶ Adult: 37.5–112.5 mg, dose administered using a 7.5 mg/mL (0.75%) solution

Surgical anaesthesia for caesarean section

- ▶ BY LUMBAR EPIDURAL

- ▶ Adult: 75–150 mg, to be given over 15–20 minutes, dose administered using a 5 mg/mL (0.5%) solution

Surgical anaesthesia

- ▶ BY LUMBAR EPIDURAL

- ▶ Adult: 50–150 mg, to be given over 5 minutes, dose administered using a 5 mg/mL (0.5%) or 7.5 mg/mL (0.75%) solution

- ▶ BY INTRATHECAL INJECTION

- ▶ Adult: 15 mg, dose administered using a 5 mg/mL (0.5%) solution

- ▶ BY LOCAL INFILTRATION

- ▶ Adult: 2.5–150 mg, dose administered using a 2.5 mg/mL (0.25%) solution

DOSES AT EXTREMES OF BODY-WEIGHT

- ▶ To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

IMPORTANT SAFETY INFORMATION

The licensed doses stated may not be appropriate in some settings and expert advice should be sought.

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

- **CONTRA-INDICATIONS** Avoid injection into infected tissues · avoid injection into inflamed tissues · intravenous regional anaesthesia (Bier's block) · preparations containing preservatives should not be used for caudal, epidural, or spinal block

CONTRA-INDICATIONS, FURTHER INFORMATION

- ▶ **Injection site** Manufacturer advises local anaesthetics should not be injected into inflamed or infected tissues. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.
- **CAUTIONS** Cardiovascular disease · complete heart block · debilitated patients (consider dose reduction) · elderly (consider dose reduction) · epilepsy · hypovolaemia · impaired cardiac conduction · impaired respiratory function · myasthenia gravis · shock
- **INTERACTIONS** → Appendix 1: anaesthetics, local

SIDE-EFFECTS

- ▶ **Common or very common** Anaemia · back pain · dizziness · fever · headache · hypotension · nausea · procedural pain · vomiting
- ▶ **Frequency not known** Angioedema · apnoea · arrhythmias · asthma · atrioventricular block · bladder disorder · cardiac arrest · drowsiness · eye disorders · faecal incontinence · flushing · loss of consciousness · muscle twitching · muscle weakness · nerve disorders · neurological injury · oral hypoesthesia · paralysis · priapism · respiratory disorders · seizure · sensation abnormal · skin reactions · sneezing · sweat changes · syncope · vision blurred

SIDE-EFFECTS, FURTHER INFORMATION The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems. Systemic toxicity can occur due to inadvertent intravascular injection. The onset of toxicity can be unpredictable and delayed. Monitor as per local protocol for at least 30 minutes after administration.

ALLERGY AND CROSS-SENSITIVITY

- ▶ Hypersensitivity and cross-sensitivity Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.
- **PREGNANCY** Large doses during delivery can cause neonatal respiratory depression, hypotonia, and bradycardia after epidural block. Avoid if possible in the first trimester—toxicity in *animal* studies. May cause fetal distress syndrome. Do not use for paracervical block in obstetrics. Do not use 7.5 mg/mL strength in obstetrics.
- **BREAST FEEDING** Amount too small to be harmful.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in impairment or patients with reduced hepatic blood flow (no information available).
- **PRESCRIBING AND DISPENSING INFORMATION** Levobupivacaine is an isomer of bupivacaine.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection▶ **Levobupivacaine (Non-proprietary)**

Levobupivacaine (as Levobupivacaine hydrochloride) 2.5 mg per 1 ml Levobupivacaine 25mg/10ml solution for injection ampoules | 5 ampoule [PoM] £9.45-£9.90 (Hospital only)

Levobupivacaine (as Levobupivacaine hydrochloride) 5 mg per 1 ml Levobupivacaine 50mg/10ml solution for injection ampoules | 5 ampoule [PoM] £11.40 (Hospital only)

Levobupivacaine (as Levobupivacaine hydrochloride) 7.5 mg per 1 ml Levobupivacaine 75mg/10ml solution for injection ampoules | 5 ampoule [PoM] £17.00 (Hospital only)

▶ **Chirocaine (AbbVie Ltd)**

Levobupivacaine (as Levobupivacaine hydrochloride) 2.5 mg per 1 ml Chirocaine 25mg/10ml solution for injection ampoules | 10 ampoule [PoM] £14.11 (Hospital only)

Levobupivacaine (as Levobupivacaine hydrochloride) 5 mg per 1 ml Chirocaine 50mg/10ml solution for injection ampoules | 10 ampoule [PoM] £16.15 (Hospital only)

Levobupivacaine (as Levobupivacaine hydrochloride) 7.5 mg per 1 ml Chirocaine 75mg/10ml solution for injection ampoules | 10 ampoule [PoM] £24.23 (Hospital only)

Infusion▶ **Levobupivacaine (Non-proprietary)**

Levobupivacaine (as Levobupivacaine hydrochloride) 625 mg per 1 ml Levobupivacaine 62.5mg/100ml infusion bags | 5 bag [PoM] [X] Levobupivacaine 125mg/200ml infusion bags | 5 bag [PoM] [X]

Levobupivacaine (as Levobupivacaine hydrochloride) 1.25 mg per 1 ml Levobupivacaine 125mg/100ml infusion bags | 5 bag [PoM] [X]

▶ **Chirocaine (AbbVie Ltd)**

Levobupivacaine (as Levobupivacaine hydrochloride) 1.25 mg per 1 ml Chirocaine 125mg/100ml infusion bags | 24 bag [PoM] £174.22 Chirocaine 250mg/200ml infusion bags | 12 bag [PoM] £124.44

Lidocaine hydrochloride

10-Nov-2020

(Lignocaine hydrochloride)**● INDICATIONS AND DOSE****Infiltration anaesthesia**▶ **BY LOCAL INFILTRATION**

- ▶ **Adult:** Dose to be given according to patient's weight and nature of procedure; max. 200 mg, maximum dose 500 mg if given in solutions containing adrenaline

DOSES AT EXTREMES OF BODY-WEIGHT

- ▶ When used by local infiltration To avoid excessive dosage in obese patients, weight-based doses for non-emergency indications may need to be calculated on the basis of ideal body-weight.

Intravenous regional anaesthesia and nerve block▶ **BY REGIONAL ADMINISTRATION**

- ▶ **Adult:** Seek expert advice

Pain relief (in anal fissures, haemorrhoids, pruritus ani, pruritus vulvae, herpes zoster, or herpes labialis) | Lubricant in cystoscopy | Lubricant in proctoscopy▶ **TO THE SKIN USING OINTMENT**

- ▶ **Adult:** Apply 1–2 mL as required, avoid long-term use

Sore nipples from breast-feeding▶ **TO THE SKIN USING OINTMENT**

- ▶ **Adult:** Apply using gauze and wash off immediately before next feed

LMX 4[®]**Anaesthesia before venous cannulation or venepuncture**▶ **TO THE SKIN**

- ▶ **Child 1-2 months:** Apply up to 1 g, apply thick layer to small area (2.5 cm × 2.5 cm) of non-irritated skin at least 30 minutes before procedure; may be applied under an occlusive dressing; max. application time 60 minutes, remove cream with gauze and perform procedure after approximately 5 minutes

- Child 3-11 months: Apply up to 1 g, apply thick layer to small area (2.5 cm × 2.5 cm) of non-irritated skin at least 30 minutes before procedure; may be applied under an occlusive dressing; max. application time 4 hours, remove cream with gauze and perform procedure after approximately 5 minutes
- Child 1-17 years: Apply 1-2.5 g, apply thick layer to small area (2.5 cm × 2.5 cm) of non-irritated skin at least 30 minutes before procedure; may be applied under an occlusive dressing; max. application time 5 hours, remove cream with gauze and perform procedure after approximately 5 minutes
- Adult: Apply 1-2.5 g, apply thick layer to small area (2.5 cm × 2.5 cm) of non-irritated skin at least 30 minutes before procedure; may be applied under an occlusive dressing; max. application time 5 hours, remove cream with gauze and perform procedure after approximately 5 minutes

VERSATIS®**Postherpetic neuralgia**

▶ TO THE SKIN

- Adult: Apply once daily for up to 12 hours, followed by a 12-hour plaster-free period; discontinue if no response after 4 weeks, to be applied to intact, dry, non-hairy, non-irritated skin, up to 3 plasters may be used to cover large areas; plasters may be cut

XYLOCAINE®**During delivery in obstetrics**

▶ TO THE SKIN

- Adult: Up to 20 doses

IMPORTANT SAFETY INFORMATION

▶ When used by local infiltration

The licensed doses stated may not be appropriate in some settings and expert advice should be sought. Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

• CONTRA-INDICATIONS

- When used by regional administration Avoid injection into infected tissues · avoid injection into inflamed tissues · complete heart block · preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier's block)
- With topical use Application to the middle ear (can cause ototoxicity) · should not be applied to damaged skin

CONTRA-INDICATIONS, FURTHER INFORMATION

- With topical use or when used by regional administration Manufacturer advises local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.

• CAUTIONS

- When used by regional administration Acute porphyrias p. 1114 (consider infusion with glucose for its anti-porphyrinogenic effects) · congestive cardiac failure (consider lower dose) · debilitated patients (consider dose reduction) · elderly (consider dose reduction) · epilepsy · hypovolaemia · impaired cardiac conduction · impaired respiratory function · myasthenia gravis · post cardiac surgery (consider lower dose) · shock

- **INTERACTIONS** → Appendix 1: antiarrhythmics

• SIDE-EFFECTS

- With parenteral use Anxiety · arrhythmias · atrioventricular block · cardiac arrest · circulatory collapse · confusion · dizziness · drowsiness · euphoric mood · headache · hypotension (may lead to cardiac arrest) · loss of consciousness · methaemoglobinemia · muscle twitching · myocardial contractility decreased · nausea · neurological effects · nystagmus · pain · psychosis · respiratory disorders · seizure · sensation abnormal · temperature sensation altered · tinnitus · tremor · vision blurred · vomiting

SIDE-EFFECTS, FURTHER INFORMATION **Toxic effects** The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems.

Methaemoglobinemia Methylthionium chloride is licensed for the acute symptomatic treatment of drug-induced methaemoglobinemia.

• ALLERGY AND CROSS-SENSITIVITY

- Hypersensitivity and cross-sensitivity Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.
- **PREGNANCY** Crosses the placenta but not known to be harmful in *animal* studies—use if benefit outweighs risk. When used as a local anaesthetic, large doses can cause fetal bradycardia; if given during delivery can also cause neonatal respiratory depression, hypotonia, or bradycardia after paracervical or epidural block.

- **BREAST FEEDING** Present in milk but amount too small to be harmful.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of increased exposure).

- **RENAL IMPAIRMENT** Possible accumulation of lidocaine and active metabolite; caution in severe impairment.

• MONITORING REQUIREMENTS

- With systemic use Monitor ECG and have resuscitation facilities available.

• NATIONAL FUNDING/ACCESS DECISIONS

VERSATIS® For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

- ▶ Lidocaine hydrochloride (*Versatis®*) for the treatment of neuropathic pain associated with previous herpes zoster infection (post-herpetic neuralgia, PHN) (August 2008) SMC No. 334/06 Recommended with restrictions

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, liquid, ointment

Solution for injection

▶ Lidocaine hydrochloride (Non-proprietary)

Lidocaine hydrochloride 5 mg per 1 ml Lidocaine 50mg/10ml (0.5%) solution for injection ampoules | 10 ampoule **[PoM]** £10.00 DT = £10.00

Lidocaine hydrochloride 10 mg per 1 ml Lidocaine 100mg/10ml (1%) solution for injection Mini-Plasco ampoules | 20 ampoule **[PoM]** £1.15-£11.21

Lidocaine 100mg/10ml (1%) solution for injection ampoules | 10 ampoule **[PoM]** £5.00 DT = £5.00

Lidocaine 200mg/20ml (1%) solution for injection vials | 10 vial **[PoM]** £22.00 DT = £22.00

Lidocaine 200mg/20ml (1%) solution for injection ampoules | 10 ampoule **[PoM]** £10.00-£11.00 DT = £11.00

Lidocaine 50mg/5ml (1%) solution for injection ampoules | 10 ampoule **[PoM]** £3.00-£3.10 DT = £3.00

Lidocaine 200mg/20ml (1%) solution for injection Mini-Plasco ampoules | 20 ampoule **[PoM]** **[X]**

Lidocaine 20mg/2ml (1%) solution for injection ampoules | 10 ampoule **[PoM]** £3.50 DT = £2.50

Lidocaine 50mg/5ml (1%) solution for injection Mini-Plasco ampoules | 20 ampoule **[PoM]** £6.50

Lidocaine 50mg/5ml (1%) solution for injection Sure-Amp ampoules | 20 ampoule [PoM] £6.00

Lidocaine hydrochloride 20 mg per 1 ml Lidocaine 100mg/5ml (2%) solution for injection ampoules | 10 ampoule [PoM] £3.20-£3.80 DT = £3.20

Lidocaine 400mg/20ml (2%) solution for injection vials | 10 vial [PoM] £23.00 DT = £23.00

Lidocaine 200mg/10ml (2%) solution for injection Mini-Plasco ampoules | 20 ampoule [PoM] £14.95 DT = £14.95

Lidocaine 400mg/20ml (2%) solution for injection Mini-Plasco ampoules | 20 ampoule [PoM] £

Lidocaine 40mg/2ml (2%) solution for injection ampoules | 10 ampoule [PoM] £4.00 DT = £2.70

Lidocaine 100mg/5ml (2%) solution for injection Mini-Plasco ampoules | 20 ampoule [PoM] £7.50

Lidocaine 400mg/20ml (2%) solution for injection ampoules | 10 ampoule [PoM] £11.00-£11.40 DT = £11.40

Medicated plaster

EXCIPIENTS: May contain Hydroxybenzoates (parabens), propylene glycol

▶ **Versatis** (Grünenthal Ltd)

Lidocaine 50 mg per 1 gram Versatis 700mg medicated plasters | 30 plaster [PoM] £72.40 DT = £72.40

Cream

EXCIPIENTS: May contain Benzyl alcohol, propylene glycol

▶ **LMX 4** (Ferndale Pharmaceuticals Ltd)

Lidocaine 40 mg per 1 gram LMX 4 cream | 5 gram [P] £2.98 DT = £2.98 | 30 gram [P] £14.90 DT = £14.90

Ointment

▶ **Lidocaine hydrochloride (Non-proprietary)**

Lidocaine hydrochloride 50 mg per 1 gram Lidocaine 5% ointment | 15 gram [P] £9.00 DT = £8.28

Adrenaline (as Adrenaline acid tartrate) 5 microgram per 1 ml, Lidocaine hydrochloride 20 mg per 1 ml Xyllocaine 2% with Adrenaline 100micrograms/20ml (1 in 200,000) solution for injection vials | 5 vial [PoM] £8.85 DT = £8.85 (Hospital only)

Lidocaine with cetrimide

27-Apr-2018

The properties listed below are those particular to the combination only. For the properties of the components please consider, lidocaine hydrochloride p. 1422.

● INDICATIONS AND DOSE

Anaesthesia and disinfection in dental practice

▶ TO MUCOUS MEMBRANES USING OROMUCOSAL SPRAY

▶ Adult: 10–20 mg, no more than 30 mg should be applied to the same quadrant of the buccal cavity—consult product literature, dose expressed as lidocaine

Anaesthesia in dental practice

▶ TO MUCOUS MEMBRANES USING DENTAL GEL

▶ Adult: Apply 100–500 mg, use cotton pellet for application to dried mucosa, dose expressed as weight of gel

DOSE EQUIVALENCE AND CONVERSION

▶ 1 metered dose of Xylonor[®] spray is equivalent to 10 mg of lidocaine.

▶ 2 millimetres of Xylonor[®] gel is approximately equivalent to 100 mg of gel (approximately equivalent to 5 mg of lidocaine).

- **CAUTIONS** Sepsis (risk of rapid systemic absorption) - traumatised mucosa (risk of rapid systemic absorption)
- **INTERACTIONS** → Appendix 1: antiarrhythmics

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Oromucosal gel

▶ **Xylonor** (Septodont Ltd)

Cetrimide 1.5 mg per 1 gram, Lidocaine 50 mg per 1 gram Xylonor 50mg/g / 1.5mg/g gel sugar-free | 15 gram [PoM] £4.00

Spray

▶ **Xylonor** (Septodont Ltd)

Cetrimide 100 microgram per 1 gram, Lidocaine 10 mg per 1 gram Xylonor 150mg/g / 1.5mg/g oromucosal spray sugar-free | 36 gram [PoM] £20.15

Lidocaine with phenylephrine

The properties listed below are those particular to the combination only. For the properties of the components please consider, lidocaine hydrochloride p. 1422, phenylephrine hydrochloride p. 204.

● INDICATIONS AND DOSE

Anaesthesia before nasal surgery, endoscopy, laryngoscopy, or removal of foreign bodies from the nose

▶ BY INTRANASAL ADMINISTRATION

▶ Adult: Up to 8 sprays

- **INTERACTIONS** → Appendix 1: antiarrhythmics - sympathomimetics, vasoconstrictor

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Spray

▶ **Lidocaine with phenylephrine (Non-proprietary)**

Phenylephrine hydrochloride 5 mg per 1 ml, Lidocaine hydrochloride 50 mg per 1 ml Lidocaine 5% / Phenylephrine 0.5% nasal spray | 2.5 ml [PoM] £14.90 DT = £14.88

Lidocaine with adrenaline

19-Dec-2019

The properties listed below are those particular to the combination only. For the properties of the components please consider, lidocaine hydrochloride p. 1422, adrenaline/epinephrine p. 239.

● INDICATIONS AND DOSE

Local anaesthesia

▶ BY LOCAL INFILTRATION

▶ Adult: Dosed according to the type of nerve block required (consult product literature)

- **INTERACTIONS** → Appendix 1: antiarrhythmics - sympathomimetics, vasoconstrictor

● PROFESSION SPECIFIC INFORMATION

Dental information

A variety of lidocaine injections with adrenaline is available in dental cartridges.

Consult expert dental sources for specific advice in relation to dose of lidocaine for dental anaesthesia.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection

EXCIPIENTS: May contain Sulfites

▶ **Lignospan Special** (Septodont Ltd)

Adrenaline (as Adrenaline acid tartrate) 12.5 microgram per 1 ml, Lidocaine hydrochloride 20 mg per 1 ml Lignospan Special

20mg/ml / 12.5micrograms/ml solution for injection 2.2ml cartridges | 50 cartridge [PoM] £21.95 DT = £21.95

Lignospan Special 20mg/ml / 12.5micrograms/ml solution for injection 1.8ml cartridges | 50 cartridge [PoM] £21.95 DT = £21.95

▶ **Rexocaine** (Henry Schein Ltd)

Adrenaline (as Adrenaline acid tartrate) 12.5 microgram per 1 ml, Lidocaine hydrochloride 20 mg per 1 ml Rexocaine 2% injection

2.2ml cartridges | 50 cartridge [PoM] £23.29 DT = £21.95

▶ **Xylocaine with Adrenaline** (Aspen Pharma Trading Ltd)

Adrenaline (as Adrenaline acid tartrate) 5 microgram per 1 ml, Lidocaine hydrochloride 10 mg per 1 ml Xylocaine 1% with

Adrenaline 100micrograms/20ml (1 in 200,000) solution for injection vials | 5 vial [PoM] £9.66 DT = £9.66

Lidocaine with prilocaine

10-Mar-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, lidocaine hydrochloride p. 1422, prilocaine hydrochloride p. 1426.

● INDICATIONS AND DOSE

Anaesthesia before minor skin procedures including venepuncture

- ▶ TO THE SKIN
- ▶ Child 1-2 months: Apply up to 1 g for maximum 1 hour before procedure, to be applied under occlusive dressing, shorter application time of 15-30 minutes is recommended for children with atopic dermatitis (30 minutes before removal of mollusca); maximum 1 dose per day
- ▶ Child 3-11 months: Apply up to 2 g for maximum 1 hour before procedure, to be applied under occlusive dressing, shorter application time of 15-30 minutes is recommended for children with atopic dermatitis (30 minutes before removal of mollusca); maximum 2 doses per day
- ▶ Child 1-11 years: Apply 1-5 hours before procedure, a thick layer should be applied under occlusive dressing, shorter application time of 15-30 minutes is recommended for children with atopic dermatitis (30 minutes before removal of mollusca); maximum 2 doses per day
- ▶ Child 12-17 years: Apply 1-5 hours before procedure (2-5 hours before procedures on large areas e.g. split skin grafting), a thick layer should be applied under occlusive dressing, shorter application time of 15-30 minutes is recommended for children with atopic dermatitis (30 minutes before removal of mollusca)
- ▶ Adult: Apply 1-5 hours before procedure (2-5 hours before procedures on large areas e.g. split skin grafting), a thick layer should be applied under occlusive dressing

Anaesthesia on genital skin before injection of local anaesthetics

- ▶ TO THE SKIN
- ▶ Adult: Apply under occlusive dressing for 15 minutes (males) or 60 minutes (females) before procedure

Anaesthesia before surgical treatment of lesions on genital mucosa

- ▶ TO THE SKIN
- ▶ Adult: Apply up to 10 g, to be applied 5-10 minutes before procedure

Anaesthesia before cervical curettage

- ▶ TO THE SKIN
- ▶ Adult: Apply 10 g in lateral vaginal fornices for 10 minutes

Anaesthesia before mechanical cleansing or debridement of leg ulcer

- ▶ TO THE SKIN
- ▶ Adult: Apply up to 10 g for 30-60 minutes, to be applied under occlusive dressing

FORTACIN[®]

Primary premature ejaculation

- ▶ TO THE SKIN
- ▶ Adult: 3 sprays every 4 hours as required, to be applied to cover the glans penis (excess spray should be removed after 5 minutes and before intercourse); maximum 9 sprays per day

DOSE EQUIVALENCE AND CONVERSION

- ▶ For Fortacin[®], each dose of 3 sprays is equivalent to lidocaine 22.5 mg and prilocaine 7.5 mg.

- **CONTRA-INDICATIONS** Use in child less than 37 weeks corrected gestational age
- **CAUTIONS**
FORTACIN[®] Acquired methaemoglobinaemia · anaemia · congenital methaemoglobinaemia
- **INTERACTIONS** → Appendix 1: anaesthetics, local · antiarrhythmics
- **SIDE-EFFECTS**
 ▶ **Common or very common** Sexual dysfunction (in adults)
 ▶ **Uncommon** Fever (in adults) · headache (in adults) · penis disorder (in adults)
 ▶ **Rare or very rare** Methaemoglobinaemia · skin reactions
- **SIDE-EFFECTS, FURTHER INFORMATION** When applied to the glans penis, side-effects for sexual partners should be considered. Side-effects reported in female partners include vaginal candidiasis and dysuria.
- **CONCEPTION AND CONTRACEPTION**
FORTACIN[®] Deterioration of polyurethane-based female and male condoms has been observed. Manufacturer advises avoid in patients planning to conceive, or if it is essential to achieve penetration, then the glans penis should be washed thoroughly 5 minutes after application but before intercourse.
- **PREGNANCY**
FORTACIN[®] Manufacturer advises preferably avoid unless an effective male barrier contraceptive is used—limited information available.
- **HEPATIC IMPAIRMENT**
FORTACIN[®] Manufacturer advises caution in severe impairment (no information available).
- **DIRECTIONS FOR ADMINISTRATION**
FORTACIN[®] Manufacturer advises when using the spray for the first time, shake and prime the unit with 3 sprays, and before each subsequent use, shake and prime the unit with 1 spray.
- **PATIENT AND CARER ADVICE**
 Medicines for Children leaflet: EMLA cream for local anaesthesia www.medicinesforchildren.org.uk/emla-cream-local-anaesthesia
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
Cream
 ▶ **Denela** (Teva UK Ltd)
 Lidocaine 25 mg per 1 gram, Prilocaine 25 mg per 1 gram Denela 5% cream | 5 gram [P] £3.29 | 25 gram [P] £12.99 | 30 gram [P] £14.75 DT = £12.30
 ▶ **Emla** (Aspen Pharma Trading Ltd)
 Lidocaine 25 mg per 1 gram, Prilocaine 25 mg per 1 gram Emla 5% cream | 5 gram [P] £2.25-£2.99 | 25 gram [P] £11.70 | 30 gram [P] £12.30 DT = £12.30
 ▶ **Nulbia** (Glenmark Pharmaceuticals Europe Ltd)
 Lidocaine 25 mg per 1 gram, Prilocaine 25 mg per 1 gram Nulbia 5% cream | 5 gram [P] £1.58 | 25 gram [P] £7.88 | 30 gram [P] £8.61 DT = £12.30
- **Cutaneous spray solution**
 ▶ **Fortacin** (Recordati Pharmaceuticals Ltd)
 Prilocaine 50 mg per 1 ml, Lidocaine 150 mg per 1 ml Fortacin 150mg/ml / 50mg/ml cutaneous spray | 5 ml [PoM] £59.99 DT = £59.99

Mepivacaine hydrochloride

04-Dec-2019

● INDICATIONS AND DOSE

Infiltration anaesthesia and nerve block in dentistry

- ▶ Child 3-17 years: Consult expert dental sources
- ▶ Adult: Consult expert dental sources continued →

DOSES AT EXTREMES OF BODY-WEIGHT

- ▶ To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

IMPORTANT SAFETY INFORMATION

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

- **CONTRA-INDICATIONS** Avoid injection into infected tissues · avoid injection into inflamed tissues · intravenous regional anaesthesia (Bier's block) · preparations containing preservatives should not be used for caudal, epidural, or spinal block · severe atrio-ventricular conduction disorders not controlled by a pacemaker

CONTRA-INDICATIONS, FURTHER INFORMATION

- ▶ **Injection site** Manufacturer advises the local anaesthetic effect may be reduced when injected into an inflamed or infected area, due to altered local pH. Increased absorption into the blood also increases the possibility of systemic side-effects.
- **CAUTIONS** Cardiovascular disease · children (consider dose reduction) · debilitated patients (consider dose reduction) · elderly (consider dose reduction) · epilepsy · hypovolaemia · impaired cardiac conduction · impaired respiratory function · myasthenia gravis · shock

- **INTERACTIONS** → Appendix 1: anaesthetics, local

SIDE-EFFECTS

- ▶ **Common or very common** Arrhythmias · dizziness · hypertension · hypotension · nausea · paraesthesia · vomiting
- ▶ **Uncommon** Neurotoxicity
- ▶ **Rare or very rare** Arachnoiditis · cardiac arrest · diplopia · nerve disorders · respiratory depression

SIDE-EFFECTS, FURTHER INFORMATION Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection. The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems. The onset of toxicity can be unpredictable and delayed. Monitor as per local protocol for at least 30 minutes after administration.

ALLERGY AND CROSS-SENSITIVITY

- ▶ **Hypersensitivity and cross-sensitivity** Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

- **PREGNANCY** Use with caution in early pregnancy.

- **BREAST FEEDING** Use with caution.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution; increased risk of toxic plasma concentrations in severe impairment.

- **RENAL IMPAIRMENT** Use with caution; increased risk of side-effects.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Scandonest plain** (Septodont Ltd)
Mepivacaine hydrochloride 30 mg per 1 ml Scandonest plain 3% solution for injection 2.2ml cartridges | 50 cartridge (PoM) £21.95

Mepivacaine with adrenaline

19-Dec-2019

The properties listed below are those particular to the combination only. For the properties of the components please consider, mepivacaine hydrochloride p. 1425, adrenaline/epinephrine p. 239.

INDICATIONS AND DOSE**Infiltration anaesthesia and nerve block in dentistry**

- ▶ **BY LOCAL INFILTRATION**
- ▶ **Adult:** (consult product literature)

- **INTERACTIONS** → Appendix 1: anaesthetics, local · sympathomimetics, vasoconstrictor

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Sulfites

- ▶ **Scandonest special** (Septodont Ltd)
Adrenaline 10 microgram per 1 ml, Mepivacaine hydrochloride 20 mg per 1 ml Scandonest special 2% solution for injection 2.2ml cartridges | 50 cartridge (PoM) £21.95

Prilocaine hydrochloride

12-Nov-2020

INDICATIONS AND DOSE**CITANEST 1%®****Infiltration anaesthesia | Nerve block**

- ▶ **BY REGIONAL ADMINISTRATION**
- ▶ **Adult:** 100–200 mg/minute, alternatively may be given in incremental doses; dose adjusted according to site of administration and response, and in elderly and debilitated patients (smaller doses may be required); maximum 400 mg per course

PRILOTEKAL®**Spinal anaesthesia**

- ▶ **BY INTRATHECAL INJECTION**
- ▶ **Adult:** Usual dose 40–60 mg (max. per dose 80 mg), dose may need to be reduced in elderly or debilitated patients, or in late pregnancy

DOSES AT EXTREMES OF BODY-WEIGHT

- ▶ To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

IMPORTANT SAFETY INFORMATION

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

CONTRA-INDICATIONS

- **GENERAL CONTRA-INDICATIONS** Acquired methaemoglobinaemia · anaemia · avoid injection into infected tissues · avoid injection into inflamed tissues · congenital methaemoglobinaemia · preparations containing preservatives should not be used for caudal, epidural, or spinal block

SPECIFIC CONTRA-INDICATIONS

- ▶ With intrathecal use Serious cardiac conduction disorders

CONTRA-INDICATIONS, FURTHER INFORMATION

- ▶ **Injection site** Manufacturer advises local anaesthetics should not be injected into inflamed or infected tissues. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.

- **CAUTIONS** Cardiovascular disease · debilitated patients (consider dose reduction) · elderly (consider dose

reduction) · epilepsy · hypovolaemia · impaired cardiac conduction · impaired respiratory function · myasthenia gravis · severe or untreated hypertension · shock

● **INTERACTIONS** → Appendix 1: anaesthetics, local

● **SIDE-EFFECTS**

▶ **Common or very common** Arrhythmias · dizziness · hypertension · hypotension · nausea · paraesthesia · vomiting

▶ **Uncommon** Neurotoxicity

▶ **Rare or very rare** Cardiac arrest · methaemoglobinaemia · nerve disorders

▶ **Frequency not known** Diplopia · respiratory depression

SIDE-EFFECTS, FURTHER INFORMATION Toxic effects
Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection. The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems. The onset of toxicity can be unpredictable and delayed. Monitor as per local protocol for at least 30 minutes after administration.

Methaemoglobinaemia Methaemoglobinaemia can be treated with an intravenous injection of methylthionium chloride.

● **ALLERGY AND CROSS-SENSITIVITY**

▶ **Hypersensitivity and cross-sensitivity** Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

● **PREGNANCY** Large doses during delivery can cause neonatal respiratory depression, hypotonia, and bradycardia after epidural block. Avoid paracervical or pudendal block in obstetrics (neonatal methaemoglobinaemia reported).

Dose adjustments Use lower doses for intrathecal use during late pregnancy.

● **BREAST FEEDING** Present in milk but not known to be harmful.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution. **Dose adjustments** ▶ With intrathecal use Manufacturer advises consider dose reduction.

● **RENAL IMPAIRMENT** Use with caution.

Dose adjustments Lower doses may be required for intrathecal anaesthesia.

Ropivacaine hydrochloride

09-Dec-2019

● **INDICATIONS AND DOSE**

Acute pain, peripheral nerve block

▶ BY REGIONAL ADMINISTRATION

▶ Adult: 10–20 mg/hour, dose administered as a continuous infusion or by intermittent injection using a 2 mg/mL (0.2%) solution

Acute pain, field block

▶ BY REGIONAL ADMINISTRATION

▶ Adult: 2–200 mg, dose administered using a 2 mg/mL (0.2%) solution

Acute pain, lumbar epidural block

▶ BY LUMBAR EPIDURAL

▶ Adult: 20–40 mg, followed by 20–30 mg at least every 30 minutes, dose administered using a 2 mg/mL (0.2%) solution

Acute labour pain

▶ BY CONTINUOUS EPIDURAL INFUSION

▶ Adult: 12–20 mg/hour, dose administered using a 2 mg/mL (0.2%) solution

Acute postoperative pain

▶ BY CONTINUOUS EPIDURAL INFUSION

▶ Adult: Up to 28 mg/hour, dose administered using a 2 mg/mL (0.2%) solution

Postoperative pain, thoracic epidural block

▶ BY CONTINUOUS EPIDURAL INFUSION

▶ Adult: 12–28 mg/hour, dose administered using a 2 mg/mL (0.2%) solution

Surgical anaesthesia, field block

▶ BY REGIONAL ADMINISTRATION

▶ Adult: 7.5–225 mg, dose administered using a 7.5 mg/mL (0.75%) solution

Surgical anaesthesia, major nerve block (brachial plexus block)

▶ BY REGIONAL ADMINISTRATION

▶ Adult: 225–300 mg, dose administered using a 7.5 mg/mL (0.75%) solution

Surgical anaesthesia, thoracic epidural block (to establish block for postoperative pain)

▶ BY THORACIC EPIDURAL

▶ Adult: 38–113 mg, dose administered using a 7.5 mg/mL (0.75%) solution

continued →

Surgical anaesthesia for caesarean section

- ▶ BY LUMBAR EPIDURAL
- ▶ Adult: 113–150 mg, to be administered in incremental doses using a 7.5 mg/mL (0.75%) solution

Surgical anaesthesia, lumbar epidural block

- ▶ BY LUMBAR EPIDURAL
- ▶ Adult: 113–200 mg, dose administered using a 7.5 mg/mL (0.75%) or 10 mg/mL (1%) solution

DOSES AT EXTREMES OF BODY-WEIGHT

- ▶ To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal bodyweight.

IMPORTANT SAFETY INFORMATION

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

- **CONTRA-INDICATIONS** Avoid injection into infected tissues · avoid injection into inflamed tissues · intravenous regional anaesthesia (Bier's block) · preparations containing preservatives should not be used for caudal, epidural, or spinal block

CONTRA-INDICATIONS, FURTHER INFORMATION

- ▶ Injection site Manufacturer advises local anaesthetics should not be injected into inflamed or infected tissues. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.
- **CAUTIONS** Acute porphyrias p. 1114 · cardiovascular disease · complete heart block · debilitated patients (consider dose reduction) · elderly (consider dose reduction) · epilepsy · hypovolaemia · impaired cardiac conduction · impaired respiratory function · myasthenia gravis · shock

- **INTERACTIONS** → Appendix 1: anaesthetics, local

SIDE-EFFECTS

- **Common or very common** Arrhythmias · back pain · chills · dizziness · headache · hypertension · hypotension · nausea · sensation abnormal · urinary retention · vomiting
- ▶ **Uncommon** Anxiety · dyspnoea · hypothermia · neurotoxicity · syncope
- ▶ **Rare or very rare** Cardiac arrest
- ▶ **Frequency not known** Dyskinesia

SIDE-EFFECTS, FURTHER INFORMATION Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection. The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems. The onset of toxicity can be unpredictable and delayed. Monitor as per local protocol for at least 30 minutes after administration.

ALLERGY AND CROSS-SENSITIVITY

- Hypersensitivity and cross-sensitivity Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.
- **PREGNANCY** Not known to be harmful. Do not use for paracervical block in obstetrics.
- **BREAST FEEDING** Not known to be harmful.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment.

Dose adjustments Manufacturer advises consider dose reduction for repeat doses in severe impairment.

- **RENAL IMPAIRMENT** Caution in severe impairment. Increased risk of systemic toxicity in chronic renal failure.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Poisoning, emergency treatment

22-Mar-2021

Overview

These notes provide only an overview of the treatment of poisoning, and it is strongly recommended that either **TOXBASE** or the **UK National Poisons Information Service** be consulted when there is doubt about the degree of risk or about management.

Hospital admission

Patients who have features of poisoning should generally be admitted to hospital. Patients who have taken poisons with delayed action should also be admitted, even if they appear well. Delayed-action poisons include aspirin p. 133, iron, paracetamol p. 468, tricyclic antidepressants, and co-phenotrope (diphenoxylate with atropine, *Lomotil*®) p. 72; the effects of modified-release preparations are also delayed. A note of all relevant information, including what treatment has been given, should accompany the patient to hospital.

Further information

TOXBASE, the primary clinical toxicology database of the National Poisons Information Service, is available on the internet to registered users at www.toxbase.org (a backup site is available at www.toxbasebackup.org if the main site cannot be accessed). It provides information about routine diagnosis, treatment, and management of patients exposed to drugs, household products, and industrial and agricultural chemicals.

Specialist information and advice on the treatment of poisoning is available day and night from the **UK National Poisons Information Service** on the following number: Tel: 0344 892 0111.

Advice on laboratory analytical services can be obtained from **TOXBASE** or from the National Poisons Information Service. Help with identifying capsules or tablets may be available from a regional medicines information centre or from the National Poisons Information Service (out of hours).

Storage of specialist antidotes

Due to the risk of unintended administration, NHS England advises emergency departments and pharmacies to ensure that 'specialist antidotes' are stored either in automatic dispensing cabinets/systems, or in a separate area specifically designated for antidotes. Those requiring refrigeration should be separated from other medicines in the medication fridge and clearly identified as antidotes. If 'specialist antidotes' are kept in the emergency/out-of-hours

medicine cupboards, they should be separated from other medicines and clearly identified as antidotes.

'Specialist antidotes' are defined as those on the **Royal College of Emergency Medicine/ UK National Poisons Information Service** list (available at www.npis.org/Publications.html) and only used in emergency departments as a specific antidote.

General care

It is often impossible to establish with certainty the identity of the poison and the size of the dose. This is not usually important because only a few poisons (such as opioids, paracetamol, and iron) have specific antidotes; few patients require active removal of the poison. In most patients, treatment is directed at managing symptoms as they arise. Nevertheless, knowledge of the type and timing of poisoning can help in anticipating the course of events. All relevant information should be sought from the poisoned individual and from carers or parents. However, such information should be interpreted with care because it may not be complete or entirely reliable. Sometimes symptoms arise from other illnesses and patients should be assessed carefully. Accidents may involve domestic and industrial products (the contents of which are not generally known). The **National Poisons Information Service** should be consulted when there is doubt about any aspect of suspected poisoning.

Respiration

Respiration is often impaired in unconscious patients. An obstructed airway requires immediate attention. In the absence of trauma, the airway should be opened with simple measures such as chin lift or jaw thrust. An oropharyngeal or nasopharyngeal airway may be useful in patients with reduced consciousness to prevent obstruction, provided ventilation is adequate. Intubation and ventilation should be considered in patients whose airway cannot be protected or who have respiratory acidosis because of inadequate ventilation; such patients should be monitored in a critical care area.

Most poisons that impair consciousness also depress respiration. Assisted ventilation (either mouth-to-mouth or using a bag-valve-mask device) may be needed. Oxygen is not a substitute for adequate ventilation, although it should be given in the highest concentration possible in poisoning with carbon monoxide and irritant gases.

Blood pressure

Hypotension is common in severe poisoning with central nervous system depressants. A systolic blood pressure of less than 70 mmHg may lead to irreversible brain damage or renal

tubular necrosis. Hypotension should be corrected initially by raising the foot of the bed and administration of an infusion of either sodium chloride p. 1096 or a colloid. Vasoconstrictor sympathomimetics are rarely required and their use may be discussed with the National Poisons Information Service.

Fluid depletion without hypotension is common after prolonged coma and after aspirin poisoning due to vomiting, sweating, and hyperpnoea.

Hypertension, often transient, occurs less frequently than hypotension in poisoning; it may be associated with sympathomimetic drugs such as amfetamines, phencyclidine, and cocaine.

Heart

Cardiac conduction defects and arrhythmias can occur in acute poisoning, notably with tricyclic antidepressants, some antipsychotics, and some antihistamines. Arrhythmias often respond to correction of underlying hypoxia, acidosis, or other biochemical abnormalities, but ventricular arrhythmias that cause serious hypotension require treatment. If the QT interval is prolonged, specialist advice should be sought because the use of some anti-arrhythmic drugs may be inappropriate. Supraventricular arrhythmias are seldom life-threatening and drug treatment is best withheld until the patient reaches hospital.

Body temperature

Hypothermia may develop in patients of any age who have been deeply unconscious for some hours, particularly following overdose with barbiturates or phenothiazines. It may be missed unless core temperature is measured using a low-reading rectal thermometer or by some other means. Hypothermia should be managed by prevention of further heat loss and appropriate re-warming as clinically indicated.

Hyperthermia can develop in patients taking CNS stimulants; children and the elderly are also at risk when taking therapeutic doses of drugs with antimuscarinic properties. Hyperthermia is initially managed by removing all unnecessary clothing and using a fan. Sponging with tepid water will promote evaporation. Advice should be sought from the National Poisons Information Service on the management of severe hyperthermia resulting from conditions such as the serotonin syndrome.

Both hypothermia and hyperthermia require **urgent** hospitalisation for assessment and supportive treatment.

Convulsions during poisoning

Single short-lived convulsions (lasting less than 5 minutes) do not require treatment. If convulsions are protracted or recur frequently, lorazepam p. 361 or diazepam p. 366 (preferably as emulsion) should be given by slow intravenous injection into a large vein. Benzodiazepines should not be given by the intramuscular route for convulsions. If the intravenous route is not readily available, midazolam oromucosal solution p. 362 [unlicensed use in adults and children under 3 months] can be given by the buccal route or diazepam p. 366 can be administered as a rectal solution.

Methaemoglobinaemia

Drug- or chemical-induced methaemoglobinaemia should be treated with methylthioninium chloride p. 1443 if the methaemoglobin concentration is 30% or higher, or if symptoms of tissue hypoxia are present despite oxygen therapy. Methylthioninium chloride reduces the ferric iron of methaemoglobin back to the ferrous iron of haemoglobin; in high doses, methylthioninium chloride can itself cause methaemoglobinaemia.

Poison removal and elimination

Prevention of absorption

Given by mouth, charcoal, activated p. 1438 can bind many poisons in the gastro-intestinal system, thereby reducing their absorption. The **sooner** it is given the **more effective** it is, but it may still be effective up to 1 hour after ingestion of the poison—longer in the case of modified-release preparations or of drugs with antimuscarinic (anticholinergic) properties. It is particularly useful for the prevention of absorption of poisons that are toxic in small amounts, such as antidepressants.

Active elimination techniques

Repeated doses of charcoal, activated by mouth *enhance the elimination* of some drugs after they have been absorbed; repeated doses are given after overdose with:

- Carbamazepine
- Dapsone
- Phenobarbital
- Quinine
- Theophylline

If vomiting occurs after dosing it should be treated (e.g. with an antiemetic drug) since it may reduce the efficacy of charcoal treatment. In cases of intolerance, the dose may be reduced and the frequency increased but this may compromise efficacy.

Charcoal, activated should **not** be used for poisoning with petroleum distillates, corrosive substances, alcohols, malathion, cyanides and metal salts including iron and lithium salts.

Other techniques intended to enhance the elimination of poisons after absorption are only practicable in hospital and are only suitable for a small number of severely poisoned patients. Moreover, they only apply to a limited number of poisons. Examples include:

- haemodialysis for ethylene glycol, lithium, methanol, phenobarbital, salicylates, and sodium valproate;
- alkalinisation of the urine for salicylates.

Removal from the gastro-intestinal tract

Gastric lavage is rarely required; for substances that cannot be removed effectively by other means (e.g. iron), it should be considered only if a life-threatening amount has been ingested within the previous hour. It should be carried out only if the airway can be protected adequately. Gastric lavage is contra-indicated if a corrosive substance or a petroleum distillate has been ingested, but it may occasionally be considered in patients who have ingested drugs that are not adsorbed by charcoal, such as iron or lithium. Induction of *emesis* (e.g. with ipecacuanha) is **not** recommended because there is no evidence that it affects absorption and it may increase the risk of aspiration.

Whole bowel irrigation (by means of a bowel cleansing preparation) has been used in poisoning with certain modified-release or enteric-coated formulations, in severe poisoning with iron and lithium salts, and if illicit drugs are carried in the gastro-intestinal tract ('body-packing'). However, it is not clear that the procedure improves outcome and advice should be sought from the National Poisons Information Service.

Alcohol, acute intoxication

Acute intoxication with alcohol (ethanol) is common in adults but also occurs in children. The features include ataxia, dysarthria, nystagmus, and drowsiness, which may progress to coma, with hypotension and acidosis. Aspiration of vomit is a special hazard and hypoglycaemia may occur in children and some adults. Patients are managed supportively, with particular attention to maintaining a clear airway and measures to reduce the risk of aspiration of gastric contents. The blood glucose is measured and glucose given if indicated.

Paracetamol overdose treatment graph

Patients whose plasma-paracetamol concentrations are on or above the **treatment line** should be treated with acetylcysteine by intravenous infusion.

The prognostic accuracy after 15 hours is uncertain, but a plasma-paracetamol concentration on or above the treatment line should be regarded as carrying a serious risk of liver damage.

Graph reproduced courtesy of Medicines and Healthcare products Regulatory Agency

Aspirin poisoning

The main features of salicylate poisoning are hyperventilation, tinnitus, deafness, vasodilatation, and sweating. Coma is uncommon but indicates very severe poisoning. The associated acid-base disturbances are complex.

Treatment must be in hospital, where plasma salicylate, pH, and electrolytes can be measured; absorption of aspirin may be slow and the plasma-salicylate concentration may continue to rise for several hours, requiring repeated measurement. Plasma-salicylate concentration may not correlate with clinical severity in the young and the elderly, and clinical and biochemical assessment is necessary. Generally, the clinical severity of poisoning is less below a plasma-salicylate concentration of 500 mg/litre (3.6 mmol/litre), unless there is evidence of metabolic acidosis. Activated charcoal can be given within 1 hour of ingesting more than 125 mg/kg of aspirin. Fluid losses should be replaced and intravenous sodium bicarbonate may be given (ensuring plasma-potassium concentration is within the reference range) to enhance urinary salicylate excretion (optimum urinary pH 7.5–8.5).

Plasma-potassium concentration should be corrected before giving sodium bicarbonate as hypokalaemia may complicate alkalinisation of the urine.

Haemodialysis is the treatment of choice for severe salicylate poisoning and should be considered when the plasma-salicylate concentration exceeds 700 mg/litre (5.1 mmol/litre) or in the presence of severe metabolic acidosis.

Opioid poisoning

Opioids (narcotic analgesics) cause coma, respiratory depression, and pinpoint pupils. The specific antidote naloxone hydrochloride p. 1441 is indicated if there is coma or bradypnoea. Since naloxone has a shorter duration of action than many opioids, close monitoring and repeated injections are necessary according to the respiratory rate and depth of coma. When repeated administration of naloxone is required, it can be given by continuous intravenous infusion instead and the rate of infusion adjusted according to vital signs. The effects of some opioids, such as buprenorphine, are only partially reversed by naloxone.

Dextropropoxyphene and methadone have very long durations of action; patients may need to be monitored for long periods following large overdoses.

Naloxone reverses the opioid effects of dextropropoxyphene. The long duration of action of dextropropoxyphene calls for prolonged monitoring and further doses of naloxone may be required. Norpropoxyphene, a metabolite of dextropropoxyphene, also has cardiotoxic effects which may require treatment with sodium bicarbonate p. 1094 or magnesium sulfate p. 1107, or both. Arrhythmias may occur for up to 12 hours.

Paracetamol poisoning

In all cases of **intravenous paracetamol poisoning** clinicians are encouraged to contact the National Poisons Information Service for advice on risk assessment and management.

Toxic doses of paracetamol p. 468 may cause severe hepatocellular necrosis and, much less frequently, renal

tubular necrosis. Nausea and vomiting, the early features of poisoning, usually settle within 24 hours. The recurrence of nausea and vomiting after 2–3 days, often associated with the onset of right subcostal pain and tenderness, usually indicates development of hepatic necrosis. Liver damage is maximal 3–4 days after paracetamol overdose and may lead to liver failure, encephalopathy, coma, and death.

The following guidance provides only an overview of the management of paracetamol overdose from the *National Poisons Information Service TOXBASE* database.

To avoid underestimating the potentially toxic paracetamol dose ingested by obese patients who weigh more than 110 kg, use a body-weight of 110 kg (rather than their actual body-weight) when calculating the total dose of paracetamol ingested (in mg/kg).

Acetylcysteine p. 1442 prevents or reduces the severity of liver damage if given up to, and possibly beyond (in patients at risk of severe liver disease) 24 hours of ingesting paracetamol. It is most effective if given within 8 hours of paracetamol ingestion, after which effectiveness declines. Very rarely, giving acetylcysteine by mouth (unlicensed) is an alternative if intravenous access is not possible (for further information, see **Acetylcysteine—oral doses**, available from TOXBASE).

Acute overdose

Acute overdose involves ingestion of a potentially toxic dose of paracetamol in 1 hour or less.

For **adults and children aged 6 years and over**, serious toxicity is unlikely to occur from a single ingestion of less than 75 mg/kg of paracetamol taken in less than 1 hour. Refer patients to hospital for medical assessment if they meet any of the following criteria:

- have ingested paracetamol in the context of self-harm,
- are symptomatic,
- have ingested 75 mg/kg or more of paracetamol in 1 hour or less, or
- where the time of ingestion is uncertain but the dose ingested is 75 mg/kg or more.

For **children aged under 6 years**, serious toxicity is unlikely to occur from a single ingestion of less than 150 mg/kg of paracetamol taken in less than 1 hour. Refer children to hospital for medical assessment if they meet any of the following criteria:

- are symptomatic,
- have ingested 150 mg/kg or more of paracetamol in 1 hour or less, or
- where there is uncertainty about the dose ingested or circumstance of ingestion.

Although the benefit of gastric decontamination is uncertain, charcoal, activated p. 1438 should be considered if the patient presents within 1 hour of ingesting paracetamol in excess of 150 mg/kg.

Patients at risk of liver damage and therefore requiring acetylcysteine, can be identified from a single measurement of the plasma-paracetamol concentration related to the time from ingestion, provided this time interval is not less than 4 hours; earlier samples cannot be interpreted. The concentration is plotted on a paracetamol treatment graph, with a reference line ("treatment line") joining plots of 100 mg/litre (0.66 mmol/litre) at 4 hours and 3.13 mg/litre (0.02 mmol/litre) at 24 hours, see *Paracetamol overdose treatment graph*.

Acetylcysteine treatment should commence in patients:

- whose plasma-paracetamol concentration falls on or above the *treatment line* on the paracetamol treatment graph;
- who present within 8 hours of ingestion of more than 150 mg/kg of paracetamol if there is going to be a delay of 8 hours or more in obtaining the paracetamol concentration after the overdose;

- who present 8–24 hours after ingestion of an acute overdose of more than 150 mg/kg of paracetamol even if the plasma-paracetamol concentration is not yet available;
- who present more than 24 hours after ingestion of an overdose if they are clearly jaundiced or have hepatic tenderness, their ALT is above the upper limit of normal (patients with chronically elevated ALT should be discussed with the National Poisons Information Service), their INR is greater than 1.3 (in the absence of another cause), or the paracetamol concentration is detectable.

Consider acetylcysteine treatment in patients who present within 24 hours of an overdose if biochemical tests suggest acute liver injury, even if the plasma paracetamol concentration is below the treatment line on the paracetamol treatment graph.

If the patient is not at risk of liver toxicity (i.e. the paracetamol concentration is below the treatment line or undetectable; the INR and ALT are normal; and the patient is asymptomatic) no treatment with an antidote is indicated; acetylcysteine may be discontinued if it has been started.

Where the time of ingestion is unknown, patients should be managed as a *staggered overdose*.

Therapeutic excess or staggered overdose

Patients who have ingested more than 150 mg/kg of paracetamol in any 24-hour period are at risk of serious toxicity. Toxicity rarely occurs with paracetamol doses between 75–150 mg/kg in any 24-hour period. Doses consistently less than 75 mg/kg in any 24-hour period are very unlikely to be toxic; however risk may be increased if this dose is repeatedly ingested over 2 or more days. Ingestion of a licensed dose of paracetamol is not considered an overdose.

Therapeutic excess is the ingestion of a potentially toxic dose of paracetamol with intent to treat pain or fever and without self-harm intent during its clinical use. All patients should be referred to hospital for medical assessment if they meet any of the following criteria:

- are symptomatic,
- have ingested more than a licensed dose and more than or equal to 75 mg/kg in any 24-hour period, or
- have ingested more than the licensed dose but less than 75 mg/kg/24 hours on each of the preceding 2 or more days.

Patients with clinical features of hepatic injury such as jaundice or hepatic tenderness should be treated urgently with acetylcysteine. For other patients, management is determined by the maximum dose of paracetamol ingested in any 24-hour period.

When there is uncertainty about whether the presentation was due to therapeutic excess, the patient should be managed as a *staggered overdose*.

A **staggered overdose** involves ingestion of a potentially toxic dose of paracetamol over more than 1 hour, with the possible intention of causing self-harm. All patients who have taken a staggered overdose should be referred to hospital for medical assessment. The MHRA advises that all patients who have ingested a staggered overdose should be treated with acetylcysteine without delay.

Clinically significant hepatotoxicity is unlikely and the patient is not considered to be at risk if, there has been at least 4 hours or more since the last paracetamol ingestion, the patient has no symptoms suggesting liver damage, the paracetamol concentration is less than 10 mg/L, their ALT is within the normal range, and their INR is 1.3 or less. Acetylcysteine can be discontinued in patients not considered to be at risk of clinically significant liver damage. If there is uncertainty about a patient's risk of toxicity after paracetamol overdose, advice should be sought from the National Poisons Information Service.

Acetylcysteine dose and administration

For paracetamol overdosage, there are two intravenous acetylcysteine p. 1442 regimens: the standard 21-hour regimen and the modified 12-hour regimen (also known as the Scottish and Newcastle Acetylcysteine Protocol (SNAP)). The SNAP regimen [unlicensed] is not endorsed by the MHRA, and its efficacy with regard to preventing liver toxicity is not fully established in all patterns of paracetamol overdosage—it should only be used after discussion with a senior clinician. For further information, see **Acetylcysteine SNAP Doses—Adult and Acetylcysteine SNAP Doses—Children**, available from TOXBASE.

For the standard 21-hour regimen, acetylcysteine is given in a total dose that is divided into 3 consecutive intravenous infusions over a total of 21 hours. The tables below include the dose of acetylcysteine for adults and children of body-weight 40 kg and over, in terms of the volume of acetylcysteine Concentrate for Intravenous Infusion required for each of the 3 infusions. The requisite dose of acetylcysteine is added to glucose 5% p. 1097 or sodium chloride 0.9% Intravenous Infusion p. 1096. For information on dosing/administration for adults and children who weigh less than 40 kg, see **Acetylcysteine Doses—Children**, available from TOXBASE.

First infusion

Body-weight	Volume of Acetylcysteine Concentrate for Intravenous Infusion 200 mg/mL required to prepare first infusion
40–49 kg	34 mL
50–59 kg	42 mL
60–69 kg	49 mL
70–79 kg	57 mL
80–89 kg	64 mL
90–99 kg	72 mL
100–109 kg	79 mL
≥110 kg	83 mL (max. dose)

First infusion (based on an acetylcysteine dose of approx. 150 mg/kg)—add requisite volume of Acetylcysteine Concentrate for Intravenous Infusion to 200 mL Glucose 5% or sodium chloride 0.9% Intravenous Infusion; infuse over 1 hour.

Second infusion

Body-weight	Volume of Acetylcysteine Concentrate for Intravenous Infusion 200 mg/mL required to prepare second infusion
40–49 kg	12 mL
50–59 kg	14 mL
60–69 kg	17 mL
70–79 kg	19 mL
80–89 kg	22 mL
90–99 kg	24 mL
100–109 kg	27 mL
≥110 kg	28 mL (max. dose)

Second infusion (based on an acetylcysteine dose of approx. 50 mg/kg; start immediately after completion of first infusion)—add requisite volume of Acetylcysteine Concentrate for Intravenous Infusion to 500 mL Glucose 5% or sodium chloride 0.9% Intravenous Infusion; infuse over 4 hours.

Third infusion

Body-weight	Volume of Acetylcysteine Concentrate for Intravenous Infusion 200 mg/mL required to prepare third infusion
40–49 kg	23 mL
50–59 kg	28 mL
60–69 kg	33 mL
70–79 kg	38 mL
80–89 kg	43 mL
90–99 kg	48 mL
100–109 kg	53 mL
≥110 kg	55 mL (max. dose)

Third infusion (based on an acetylcysteine dose of approx. 100 mg/kg; start immediately after completion of second infusion)—add requisite volume of Acetylcysteine Concentrate for Intravenous Infusion to 1 litre Glucose 5% or sodium chloride 0.9% Intravenous Infusion; infuse over 16 hours.

Antidepressant poisoning**Tricyclic and related antidepressants**

Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. Metabolic acidosis may complicate severe poisoning; delirium with confusion, agitation, and visual and auditory hallucinations are common during recovery.

Assessment in hospital is strongly advised in case of poisoning by tricyclic and related antidepressants but symptomatic treatment can be given before transfer. Supportive measures to ensure a clear airway and adequate ventilation during transfer are mandatory. Intravenous lorazepam or intravenous diazepam (preferably in emulsion form) may be required to treat convulsions. Activated charcoal given within 1 hour of the overdose reduces absorption of the drug. Although arrhythmias are worrying, some will respond to correction of hypoxia and acidosis. The use of anti-arrhythmic drugs is best avoided, but intravenous infusion of sodium bicarbonate can arrest arrhythmias or prevent them in those with an extended QRS duration. Diazepam given by mouth is usually adequate to sedate delirious patients but large doses may be required.

Selective serotonin re-uptake inhibitors (SSRIs)

Symptoms of poisoning by selective serotonin re-uptake inhibitors include nausea, vomiting, agitation, tremor, nystagmus, drowsiness, and sinus tachycardia; convulsions may occur. Rarely, severe poisoning results in the serotonin syndrome, with marked neuropsychiatric effects, neuromuscular hyperactivity, and autonomic instability; hyperthermia, rhabdomyolysis, renal failure, and coagulopathies may develop.

Management of SSRI poisoning is supportive. Activated charcoal given within 1 hour of the overdose reduces absorption of the drug. Convulsions can be treated with lorazepam, diazepam, or midazolam oromucosal solution [unlicensed use in adults and children under 3 months] (see *Convulsions*). Contact the National Poisons Information Service for the management of hyperthermia or the serotonin syndrome.

Antimalarial poisoning

Overdosage with quinine, chloroquine, or hydroxychloroquine is extremely hazardous and difficult to treat. Urgent advice from the National Poisons Information Service is essential. Life-threatening features include

arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable).

Antipsychotic poisoning

Phenothiazines and related drugs

Phenothiazines cause less depression of consciousness and respiration than other sedatives. Hypotension, hypothermia, sinus tachycardia, and arrhythmias may complicate poisoning. Dystonic reactions can occur with therapeutic doses (particularly with prochlorperazine and trifluoperazine), and convulsions may occur in severe cases. Arrhythmias may respond to correction of hypoxia, acidosis, and other biochemical abnormalities, but specialist advice should be sought if arrhythmias result from a prolonged QT interval; the use of some anti-arrhythmic drugs can worsen such arrhythmias. Dystonic reactions are rapidly abolished by injection of drugs such as procyclidine hydrochloride p. 435 or diazepam p. 366 (emulsion preferred).

Second-generation antipsychotic drugs

Features of poisoning by second-generation antipsychotic drugs include drowsiness, convulsions, extrapyramidal symptoms, hypotension, and ECG abnormalities (including prolongation of the QT interval). Management is supportive. Charcoal, activated p. 1438 can be given within 1 hour of ingesting a significant quantity of a second-generation antipsychotic drug.

Benzodiazepine poisoning

Benzodiazepines taken alone cause drowsiness, ataxia, dysarthria, nystagmus, and occasionally respiratory depression, and coma. Charcoal, activated can be given within 1 hour of ingesting a significant quantity of benzodiazepine, provided the patient is awake and the airway is protected. Benzodiazepines potentiate the effects of other central nervous system depressants taken concomitantly. Use of the benzodiazepine antagonist flumazenil p. 1440 [unlicensed indication] can be hazardous, particularly in mixed overdoses involving tricyclic antidepressants or in benzodiazepine-dependent patients. Flumazenil may prevent the need for ventilation, particularly in patients with severe respiratory disorders; it should be used on expert advice only and not as a diagnostic test in patients with a reduced level of consciousness.

Beta-blockers poisoning

Overdosages with beta-blockers may cause cardiac effects such as bradycardia, hypotension, syncope, conduction abnormalities, and heart failure. Bradycardia is the most common arrhythmia, but some beta-blockers may induce ventricular tachyarrhythmias secondary to prolongation of QT interval (e.g. sotalol) or QRS duration (e.g. propranolol). Although the predominant effects of beta-blocker overdose are on the heart, other features may also occur, such as central nervous system effects (including drowsiness, confusion, convulsions, hallucinations, and in severe cases coma), respiratory depression, and bronchospasm. The effects of overdosage can vary from one beta-blocker to another; propranolol overdosage in particular may cause coma and convulsions.

The following guidance provides only an overview of the management of beta-blocker overdosage from the *National Poisons Information Service TOXBASE database*.

All patients who have been exposed to beta-blockers as a result of self-harm should be referred for assessment. Medical assessment is recommended for all patients who are symptomatic or have ingested more than a toxic dose; and in those who are treatment naive or have taken more than their therapeutic dose, and have a significant cardiac history, asthma, chronic obstructive pulmonary disease, or are elderly. All patients who have exceeded their prescribed daily dose of 2 or more cardiotoxic agents should also be referred for medical assessment irrespective of the dose

ingested. Hospital clinicians are encouraged to discuss all serious cases with the UK National Poisons Information Service.

For patients presenting with overdose, maintain a clear airway and adequate ventilation. Although the benefit of gastric decontamination is uncertain, charcoal, activated p. 1438 can be considered if the patient presents within 1 hour of ingestion of more than a potentially toxic dose.

For the management of hypotension, ensure adequate fluid resuscitation; in an emergency, vasopressors and inotropes can be initiated under the advice of an experienced physician. Intravenous glucagon p. 767 [unlicensed] is a treatment option for severe hypotension, heart failure, or cardiogenic shock. In severe cases, an insulin and glucose infusion can improve myocardial contractility and systemic perfusion, especially in the presence of acidosis. Consider intravenous sodium bicarbonate p. 1094 for correction of metabolic acidosis that persists despite correction of hypoxia and adequate fluid resuscitation—rapid correction is particularly important if QRS duration is prolonged. For symptomatic bradycardia, give intravenous atropine sulfate p. 1402; dobutamine p. 238 [unlicensed] or isoprenaline [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) may be considered if bradycardia is associated with hypotension. A temporary cardiac pacemaker can be used to increase the heart rate.

Treat bronchospasm with nebulised bronchodilators and corticosteroids.

If convulsions occur give oxygen, and correct acid-base and metabolic disturbances as required. Prolonged or frequent convulsions should be controlled with intravenous diazepam p. 366, lorazepam p. 361, or midazolam p. 362. If convulsions are unresponsive to treatment, the patient should be referred urgently to critical care.

Calcium-channel blockers poisoning

Features of calcium-channel blocker poisoning include nausea, vomiting, dizziness, agitation, confusion, and coma in severe poisoning. Metabolic acidosis and hyperglycaemia may occur. Verapamil and diltiazem have a profound cardiac depressant effect causing hypotension and arrhythmias, including complete heart block and asystole. The dihydropyridine calcium-channel blockers cause severe hypotension secondary to profound peripheral vasodilatation.

Charcoal, activated should be considered if the patient presents within 1 hour of overdosage with a calcium-channel blocker; repeated doses of activated charcoal are considered if a modified-release preparation is involved. In patients with significant features of poisoning, calcium chloride p. 1104 or calcium gluconate p. 1104 is given by injection; atropine sulfate is given to correct symptomatic bradycardia. In severe cases, an insulin and glucose infusion may be required in the management of hypotension and myocardial failure. For the management of hypotension, the choice of inotropic sympathomimetic depends on whether hypotension is secondary to vasodilatation or to myocardial depression—advice should be sought from the National Poisons Information Service.

Iron salts poisoning

Iron poisoning in childhood is usually accidental. The symptoms are nausea, vomiting, abdominal pain, diarrhoea, haematemesis, and rectal bleeding. Hypotension and hepatocellular necrosis can occur later. Coma, shock, and metabolic acidosis indicate severe poisoning.

Advice should be sought from the National Poisons Information Service if a significant quantity of iron has been ingested within the previous hour.

Mortality is reduced by intensive and specific therapy with desferrioxamine mesilate p. 1082, which chelates iron. The serum-iron concentration is measured as an emergency and

intravenous desferrioxamine mesilate given to chelate absorbed iron in excess of the expected iron binding capacity. In severe toxicity intravenous desferrioxamine mesilate should be given immediately without waiting for the result of the serum-iron measurement.

Lithium poisoning

Most cases of lithium intoxication occur as a complication of long-term therapy and are caused by reduced excretion of the drug because of a variety of factors including dehydration, deterioration of renal function, infections, and co-administration of diuretics or NSAIDs (or other drugs that interact). Acute deliberate overdoses may also occur with delayed onset of symptoms (12 hours or more) owing to slow entry of lithium into the tissues and continuing absorption from modified-release formulations.

The early clinical features are non-specific and may include apathy and restlessness which could be confused with mental changes arising from the patient's depressive illness. Vomiting, diarrhoea, ataxia, weakness, dysarthria, muscle twitching, and tremor may follow. Severe poisoning is associated with convulsions, coma, renal failure, electrolyte imbalance, dehydration, and hypotension.

Therapeutic serum-lithium concentrations are within the range of 0.4–1 mmol/litre; concentrations in excess of 2 mmol/litre are usually associated with serious toxicity and such cases may need treatment with haemodialysis if neurological symptoms or renal failure are present. In acute overdosage much higher serum-lithium concentrations may be present without features of toxicity and all that is usually necessary is to take measures to increase urine output (e.g. by increasing fluid intake but avoiding diuretics). Otherwise, treatment is supportive with special regard to electrolyte balance, renal function, and control of convulsions. Gastric lavage may be considered if it can be performed within 1 hour of ingesting significant quantities of lithium. Whole-bowel irrigation should be considered for significant ingestion, but advice should be sought from the National Poisons Information Service.

Stimulant-drug poisoning

Amfetamines cause wakefulness, excessive activity, paranoia, hallucinations, and hypertension followed by exhaustion, convulsions, hyperthermia, and coma. The early stages can be controlled by diazepam or lorazepam; advice should be sought from the National Poisons Information Service on the management of hypertension. Later, tepid sponging, anticonvulsants, and artificial respiration may be needed.

Cocaine

Cocaine stimulates the central nervous system, causing agitation, dilated pupils, tachycardia, hypertension, hallucinations, hyperthermia, hypertonia, and hyperreflexia; cardiac effects include chest pain, myocardial infarction, and arrhythmias.

Initial treatment of cocaine poisoning involves intravenous administration of diazepam to control agitation and cooling measures for hyperthermia (see Body temperature); hypertension and cardiac effects require specific treatment and expert advice should be sought.

Ecstasy

Ecstasy (methylenedioxyamfetamine, MDMA) may cause severe reactions, even at doses that were previously tolerated. The most serious effects are delirium, coma, convulsions, ventricular arrhythmias, hyperthermia, rhabdomyolysis, acute renal failure, acute hepatitis, disseminated intravascular coagulation, adult respiratory distress syndrome, hyperreflexia, hypotension and intracerebral haemorrhage; hyponatraemia has also been associated with ecstasy use.

Treatment of methylenedioxyamfetamine poisoning is supportive, with diazepam p. 366 to control severe

agitation or persistent convulsions and close monitoring including ECG. Self-induced water intoxication should be considered in patients with ecstasy poisoning.

'Liquid ecstasy' is a term used for sodium oxybate (gamma-hydroxybutyrate, GHB), which is a sedative.

Theophylline poisoning

Theophylline and related drugs are often prescribed as modified-release formulations and toxicity can therefore be delayed. They cause vomiting (which may be severe and intractable), agitation, restlessness, dilated pupils, sinus tachycardia, and hyperglycaemia. More serious effects are haematemesis, convulsions, and supra-ventricular and ventricular arrhythmias. Severe hypokalaemia may develop rapidly.

Repeated doses of activated charcoal can be used to eliminate theophylline even if more than 1 hour has elapsed after ingestion and especially if a modified-release preparation has been taken (see also under Active Elimination Techniques). Ondansetron p. 458 may be effective for severe vomiting that is resistant to other antiemetics [unlicensed indication]. Hypokalaemia is corrected by intravenous infusion of potassium chloride p. 1113 and may be so severe as to require 60 mmol/hour (high doses require ECG monitoring). Convulsions should be controlled by intravenous administration of lorazepam p. 361 or diazepam (see Convulsions). Sedation with diazepam may be necessary in agitated patients.

Provided the patient does not suffer from asthma, a short-acting beta-blocker can be administered intravenously to reverse severe tachycardia, hypokalaemia, and hyperglycaemia.

Cyanide poisoning

Oxygen should be administered to patients with cyanide poisoning. The choice of antidote depends on the severity of poisoning, certainty of diagnosis, and the cause. Dicobalt edetate p. 1438 is the antidote of choice when there is a strong clinical suspicion of severe cyanide poisoning, but it should **not** be used as a precautionary measure. Dicobalt edetate itself is toxic, associated with anaphylactoid reactions, and is potentially fatal if administered in the absence of cyanide poisoning. A regimen of sodium nitrite p. 1439 followed by sodium thiosulfate p. 1439 is an alternative if dicobalt edetate is not available.

Hydroxocobalamin p. 1079 (*Cyanokit*[®])—no other preparation of hydroxocobalamin is suitable) can be considered for use in victims of smoke inhalation who show signs of significant cyanide poisoning.

Ethylene glycol and methanol poisoning

Fomepizole (available from 'special-order' manufacturers or specialist importing companies) is the treatment of choice for ethylene glycol and methanol (methyl alcohol) poisoning. If necessary, ethanol (by mouth or by intravenous infusion) can be used, but with caution. Advice on the treatment of ethylene glycol and methanol poisoning should be obtained from the National Poisons Information Service. It is important to start antidote treatment promptly in cases of suspected poisoning with these agents.

Heavy metal poisoning

Heavy metal antidotes include succimer (DMSA) [unlicensed], unithiol (DMPS) [unlicensed], sodium calcium edetate [unlicensed], and dimercaprol. Dimercaprol in the management of heavy metal poisoning has been superseded by other chelating agents. In all cases of heavy metal poisoning, the advice of the National Poisons Information Service should be sought.

Noxious gases poisoning

Carbon monoxide

Carbon monoxide poisoning is usually due to inhalation of smoke, car exhaust, or fumes caused by blocked flues or incomplete combustion of fuel gases in confined spaces.

Immediate treatment of carbon monoxide poisoning is essential. The person should be moved to fresh air, the airway cleared, and high-flow oxygen 100% administered through a tight-fitting mask with an inflated face seal. Artificial respiration should be given as necessary and continued until adequate spontaneous breathing starts, or stopped only after persistent and efficient treatment of cardiac arrest has failed. The patient should be admitted to hospital because complications may arise after a delay of hours or days. Cerebral oedema may occur in severe poisoning and is treated with an intravenous infusion of mannitol p. 246. Referral for hyperbaric oxygen treatment should be discussed with the National Poisons Information Service if the patient is pregnant or in cases of severe poisoning, such as if the patient is or has been unconscious, or has psychiatric or neurological features other than a headache, or has myocardial ischaemia or an arrhythmia, or has a blood carboxyhaemoglobin concentration of more than 20%.

Sulfur dioxide, chlorine, phosgene, and ammonia

All of these gases can cause upper respiratory tract and conjunctival irritation. Pulmonary oedema, with severe breathlessness and cyanosis may develop suddenly up to 36 hours after exposure. Death may occur. Patients are kept under observation and those who develop pulmonary oedema are given oxygen. Assisted ventilation may be necessary in the most serious cases.

CS Spray poisoning

CS spray, which is used for riot control, irritates the eyes (hence 'tear gas') and the respiratory tract; symptoms normally settle spontaneously within 15 minutes. If symptoms persist, the patient should be removed to a well-ventilated area, and the exposed skin washed with soap and water after removal of contaminated clothing. Contact lenses should be removed and rigid ones washed (soft ones should be discarded). Eye symptoms should be treated by irrigating the eyes with physiological saline (or water if saline is not available) and advice sought from an ophthalmologist. Patients with features of severe poisoning, particularly respiratory complications, should be admitted to hospital for symptomatic treatment.

Nerve agent poisoning

Treatment of nerve agent poisoning is similar to organophosphorus insecticide poisoning, but advice must be sought from the National Poisons Information Service. The risk of cross-contamination is significant; adequate decontamination and protective clothing for healthcare personnel are essential. In emergencies involving the release of nerve agents, kits ('NAAS pods') containing pralidoxime chloride p. 1439 can be obtained through the Ambulance Service from the National Blood Service (or the Welsh Blood Service in South Wales or designated hospital pharmacies in Northern Ireland and Scotland—see TOXBASE for list of designated centres).

Pesticide poisoning

Organophosphorus insecticides

Organophosphorus insecticides are usually supplied as powders or dissolved in organic solvents. All are absorbed through the bronchi and intact skin as well as through the gut and inhibit cholinesterase activity, thereby prolonging and intensifying the effects of acetylcholine. Toxicity between different compounds varies considerably, and onset may be delayed after skin exposure.

Anxiety, restlessness, dizziness, headache, miosis, nausea, hypersalivation, vomiting, abdominal colic, diarrhoea, bradycardia, and sweating are common features of organophosphorus poisoning. Muscle weakness and fasciculation may develop and progress to generalised flaccid paralysis, including the ocular and respiratory muscles. Convulsions, coma, pulmonary oedema with copious bronchial secretions, hypoxia, and arrhythmias occur in severe cases. Hyperglycaemia and glycosuria without ketonuria may also be present.

Further absorption of the organophosphorus insecticide should be prevented by moving the patient to fresh air, removing soiled clothing, and washing contaminated skin. In severe poisoning it is vital to ensure a clear airway, frequent removal of bronchial secretions, and adequate ventilation and oxygenation; gastric lavage may be considered provided that the airway is protected. Atropine sulfate p. 1402 will reverse the muscarinic effects of acetylcholine and is given by intravenous injection until the skin becomes flushed and dry, the pupils dilate, and bradycardia is abolished.

Pralidoxime chloride p. 1439, a cholinesterase reactivator, is used as an adjunct to atropine sulfate in moderate or severe poisoning. It improves muscle tone within 30 minutes of administration. Pralidoxime chloride is continued until the patient has not required atropine sulfate for 12 hours. Pralidoxime chloride can be obtained from designated centres, the names of which are held by the National Poisons Information Service.

Snake bites and animal stings

Snake bites

Envenoming from snake bite is uncommon in the UK. Many exotic snakes are kept, some illegally, but the only indigenous venomous snake is the adder (*Vipera berus*). The bite may cause local and systemic effects. Local effects include pain, swelling, bruising, and tender enlargement of regional lymph nodes. Systemic effects include early anaphylactic symptoms (transient hypotension with syncope, angioedema, urticaria, abdominal colic, diarrhoea, and vomiting), with later persistent or recurrent hypotension, ECG abnormalities, spontaneous systemic bleeding, coagulopathy, adult respiratory distress syndrome, and acute renal failure. Fatal envenoming is rare but the potential for severe envenoming must not be underestimated.

Early anaphylactic symptoms should be treated with **adrenaline/epinephrine p. 239**. Indications for European viper snake venom antiserum p. 1444 treatment include *systemic envenoming*, especially hypotension, ECG abnormalities, vomiting, haemostatic abnormalities, and marked local envenoming such that after bites on the hand or foot, swelling extends beyond the wrist or ankle within 4 hours of the bite. For those patients who present with clinical features of *severe envenoming* (e.g. shock, ECG abnormalities, or local swelling that has advanced from the foot to above the knee or from the hand to above the elbow within 2 hours of the bite), a higher initial dose of the European viper snake venom antiserum is recommended; if symptoms of *systemic envenoming* persist contact the National Poisons Information Service. Adrenaline/epinephrine injection must be immediately to hand for treatment of anaphylactic reactions to the European viper snake venom antiserum.

Antivenom is available for bites by certain foreign snakes and spiders, stings by scorpions and fish. For information on identification, management, and for supply in an emergency, telephone the National Poisons Information Service. Whenever possible the TOXBASE entry should be read, and relevant information collected, before telephoning the National Poisons Information Service.

Insect stings

Stings from ants, wasps, hornets, and bees cause local pain and swelling but seldom cause severe direct toxicity unless many stings are inflicted at the same time. If the sting is in the mouth or on the tongue local swelling may threaten the upper airway. The stings from these insects are usually treated by cleaning the area with a topical antiseptic. Bee stings should be removed as quickly as possible.

Anaphylactic reactions require immediate treatment with intramuscular **adrenaline/epinephrine**; self-administered intramuscular adrenaline/epinephrine (e.g. *EpiPen*[®]) is the best first-aid treatment for patients with severe hypersensitivity. An inhaled bronchodilator should be used for asthmatic reactions, see also the management of anaphylaxis. A short course of an **oral antihistamine** or a **topical corticosteroid** may help to reduce inflammation and relieve itching. A vaccine containing extracts of bee and wasp venom can be used to reduce the risk of anaphylaxis and systemic reactions in patients with systemic hypersensitivity to bee or wasp stings.

Marine stings

The severe pain of weeverfish (*Trachinus vipera*) and Portuguese man-o'-war stings can be relieved by immersing the stung area immediately in uncomfortably hot, but not scalding, water (not more than 45°C). People stung by jellyfish and Portuguese man-o'-war around the UK coast should be removed from the sea as soon as possible. Adherent tentacles should be lifted off carefully (wearing gloves or using tweezers) or washed off with seawater. Alcoholic solutions, including suntan lotions, should **not** be applied because they can cause further discharge of stinging hairs. Ice packs can be used to reduce pain.

Other poisons

Consult either the National Poisons Information Service day and night or TOXBASE.

The **National Poisons Information Service** (Tel: 0344 892 0111) will provide specialist advice on all aspects of poisoning day and night.

- ▶ Child 12-17 years: Initially 50 g, then 50 g every 4 hours, reduced if not tolerated to 25 g every 2 hours, alternatively 12.5 g every 1 hour, reduced dose may compromise efficacy
- ▶ Adult: Initially 50 g, then 50 g every 4 hours, reduced if not tolerated to 25 g every 2 hours, alternatively 12.5 g every 1 hour, reduced dose may compromise efficacy

Accelerated elimination of teriflunomide

- ▶ BY MOUTH USING GRANULES
- ▶ Adult: 50 g every 12 hours for 11 days

Accelerated elimination of leflunomide (washout procedure)

- ▶ BY MOUTH USING GRANULES
- ▶ Adult: 50 g 4 times a day for 11 days

UNLICENSED USE

- ▶ In adults Activated charcoal doses in BNF may differ from those in product literature.

- **CAUTIONS** Comatose patient (risk of aspiration—ensure airway is protected) · drowsy patient (risk of aspiration—ensure airway protected) · reduced gastrointestinal motility (risk of obstruction)

- **SIDE-EFFECTS** Bezoar · constipation · diarrhoea · gastrointestinal disorders

- **DIRECTIONS FOR ADMINISTRATION** TOXBASE advises suspension or reconstituted powder may be mixed with soft drinks (e.g. caffeine-free diet cola) or fruit juices to mask the taste.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Oral suspension

- ▶ **Charcodote** (Teva UK Ltd)

Activated charcoal **200 mg per 1 ml** Charcodote 200mg/ml oral suspension sugar-free | 250 ml | £11.88

Granules

- ▶ **Carbomix** (Kent Pharmaceuticals Ltd)

Activated charcoal **813 mg per 1 gram** Carbomix 81.3% granules sugar-free | 50 gram | £11.90

1 Active elimination from the gastro-intestinal tract

ANTIDOTES AND CHELATORS > INTESTINAL ADSORBENTS

Charcoal, activated

23-Jul-2020

- **INDICATIONS AND DOSE**

Reduction of absorption of poisons in the gastro-intestinal system

- ▶ BY MOUTH

- ▶ Neonate: 1 g/kg.

- ▶ Child 1 month-11 years: 1 g/kg (max. per dose 50 g)
- ▶ Child 12-17 years: 50 g
- ▶ Adult: 50 g

Active elimination of poisons

- ▶ BY MOUTH

- ▶ Neonate: 1 g/kg every 4 hours, dose may be reduced and the frequency increased if not tolerated, reduced dose may compromise efficacy.

- ▶ Child 1 month-11 years: 1 g/kg every 4 hours (max. per dose 50 g), dose may be reduced and the frequency increased if not tolerated, reduced dose may compromise efficacy

2 Chemical toxicity

2.1 Cyanide toxicity

ANTIDOTES AND CHELATORS

Dicobalt edetate

- **INDICATIONS AND DOSE**

Severe poisoning with cyanides

- ▶ BY INTRAVENOUS INJECTION
- ▶ Child: Consult the National Poisons Information Service
- ▶ Adult: 300 mg, to be given over 1 minute (or 5 minutes if condition less serious), dose to be followed immediately by 50 mL of glucose intravenous infusion 50%; if response inadequate a second dose of both may be given, but risk of cobalt toxicity

- **CAUTIONS** Owing to toxicity to be used only for definite cyanide poisoning when patient tending to lose, or has lost, consciousness

- **SIDE-EFFECTS** Reflex tachycardia · vomiting

- **EXCEPTIONS TO LEGAL CATEGORY** Prescription only medicine restriction does not apply where administration is for saving life in emergency.

- **MEDICINAL FORMS** No licensed medicines listed.

Sodium nitrite

05-May-2021

● INDICATIONS AND DOSE

Poisoning with cyanides (used in conjunction with sodium thiosulfate)

- ▶ BY INTRAVENOUS INJECTION
- ▶ Child: Consult the National Poisons Information Service
- ▶ Adult: 300 mg

IMPORTANT SAFETY INFORMATION

NHS IMPROVEMENT PATIENT SAFETY ALERT: RISK OF DEATH FROM UNINTENDED ADMINISTRATION OF SODIUM NITRITE (AUGUST 2020)

Cases of unintended administration of sodium nitrite have been reported, including 2 fatalities. Sodium nitrite can cause significant side-effects such as methaemoglobinaemia and nitric oxide-induced vasodilation.

Acute trusts are advised to check all clinical areas to ensure that sodium nitrite injection has not been inadvertently supplied, and to only retain stock in emergency departments. Unlicensed sodium nitrite ampoules in emergency departments should also be destroyed appropriately and replaced with licensed vials.

For information on the storage of 'specialist antidotes', see Poisoning, emergency treatment p. 1430.

- **SIDE-EFFECTS** Arrhythmias · dizziness · headache · hypotension · methaemoglobinaemia · palpitations
- **EXCEPTIONS TO LEGAL CATEGORY** Prescription only medicine restriction does not apply where administration is for saving life in emergency.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ Sodium nitrite (Non-proprietary)

Sodium nitrite 30 mg per 1 ml Sodium nitrite 300mg/10ml solution for injection vials | 1 vial   (Hospital only)

Sodium thiosulfate

16-Mar-2018

● INDICATIONS AND DOSE

Poisoning with cyanides

- ▶ BY INTRAVENOUS INJECTION
- ▶ Child: Consult the National Poisons Information Service
- ▶ Adult: 12.5 g, to be given over 10 minutes, dose may be repeated in severe cyanide poisoning

DOSE EQUIVALENCE AND CONVERSION

- ▶ 12.5 g equates to 50 mL of a 25% solution or 25 mL of a 50% solution.

- **EXCEPTIONS TO LEGAL CATEGORY** Prescription only medicine restriction does not apply where administration is for saving life in emergency.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection

▶ Sodium thiosulfate (Non-proprietary)

Sodium thiosulfate 250 mg per 1 ml Sodium thiosulfate 12.5g/50ml solution for injection vials | 1 vial   (Hospital only)

2.2 Organophosphorus toxicity

Other drugs used for Organophosphorus toxicity Atropine sulfate, p. 1402

ANTIDOTES AND CHELATORS

Pralidoxime chloride

30-Jul-2020

● INDICATIONS AND DOSE

Adjunct to atropine in the treatment of poisoning by organophosphorus insecticide or nerve agent

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child: Initially 30 mg/kg, to be given over 20 minutes, followed by 8 mg/kg/hour; maximum 12 g per day
- ▶ Adult: Initially 30 mg/kg, to be given over 20 minutes, followed by 8 mg/kg/hour; maximum 12 g per day

- **UNLICENSED USE** Pralidoxime chloride doses may differ from those in product literature.
- ▶ In children Licensed for use in children (age range not specified by manufacturer).
- **CONTRA-INDICATIONS** Poisoning with carbamates · poisoning with organophosphorus compounds without anticholinesterase activity
- **CAUTIONS** Myasthenia gravis
- **SIDE-EFFECTS** Dizziness · drowsiness · headache · hyperventilation · muscle weakness · nausea · tachycardia · vision disorders
- **RENAL IMPAIRMENT** Use with caution.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises the loading dose may be administered by intravenous injection (diluted to a concentration of 50 mg/mL with water for injections) over at least 5 minutes if pulmonary oedema is present or if it is not practical to administer an intravenous infusion.
- ▶ In children For *intravenous infusion*, manufacturer advises reconstitute each vial with 20 mL Water for Injections, then dilute to a concentration of 10–20 mg/mL with Sodium Chloride 0.9%.
- **PRESCRIBING AND DISPENSING INFORMATION** Available from designated centres for organophosphorus insecticide poisoning or from the National Blood Service (or Welsh Ambulance Services for Mid West and South East Wales)—see TOXBASE for list of designated centres.
- **EXCEPTIONS TO LEGAL CATEGORY** Prescription only medicine restriction does not apply where administration is for saving life in emergency.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

▶ Protopam Chloride (Imported (United States))

Pralidoxime chloride 1 gram Protopam Chloride 1g powder for solution for injection vials | 6 vial  

3 Drug toxicity

3.1 Benzodiazepine toxicity

ANTIDOTES AND CHELATORS > BENZODIAZEPINE ANTAGONISTS

Flumazenil

24-Jul-2020

● INDICATIONS AND DOSE

Reversal of sedative effects of benzodiazepines in anaesthesia and clinical procedures

▶ BY INTRAVENOUS INJECTION

- ▶ Adult: 200 micrograms, dose to be administered over 15 seconds, then 100 micrograms every 1 minute if required; usual dose 300–600 micrograms; maximum 1 mg per course

Reversal of sedative effects of benzodiazepines in intensive care

▶ BY INTRAVENOUS INJECTION

- ▶ Adult: 300 micrograms, dose to be administered over 15 seconds, then 100 micrograms every 1 minute if required; maximum 2 mg per course

Reversal of sedative effects of benzodiazepines in intensive care (if drowsiness recurs after injection)

▶ INITIALLY BY INTRAVENOUS INFUSION

- ▶ Adult: 100–400 micrograms/hour, adjusted according to response, alternatively (by intravenous injection) 300 micrograms, adjusted according to response

IMPORTANT SAFETY INFORMATION

Flumazenil should only be administered by, or under the direct supervision of, personnel experienced in its use.

- **CONTRA-INDICATIONS** Life-threatening condition (e.g. raised intracranial pressure, status epilepticus) controlled by benzodiazepines

- **CAUTIONS** Avoid rapid injection following major surgery · avoid rapid injection in high-risk or anxious patients · benzodiazepine dependence (may precipitate withdrawal symptoms) · elderly · ensure neuromuscular blockade cleared before giving · head injury (rapid reversal of benzodiazepine sedation may cause convulsions) · history of panic disorders (risk of recurrence) · prolonged benzodiazepine therapy for epilepsy (risk of convulsions) · short-acting (repeat doses may be necessary—benzodiazepine effects may persist for at least 24 hours)

● SIDE-EFFECTS

- ▶ **Common or very common** Anxiety · diplopia · dry mouth · eye disorders · flushing · headache · hiccups · hyperhidrosis · hyperventilation · hypotension · insomnia · nausea · palpitations · paraesthesia · speech disorder · tremor · vertigo · vomiting
- ▶ **Uncommon** Abnormal hearing · arrhythmias · chest pain · chills · cough · dyspnoea · nasal congestion · seizure (more common in patients with epilepsy)
- ▶ **Frequency not known** Withdrawal syndrome

- **PREGNANCY** Not known to be harmful.

- **BREAST FEEDING** Avoid breast-feeding for 24 hours.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of increased half-life).

Dose adjustments Manufacturer advises cautious dose titration.

- **DIRECTIONS FOR ADMINISTRATION** For *continuous intravenous infusion*, manufacturer advises dilute with Glucose 5% or Sodium Chloride 0.9%.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ Flumazenil (Non-proprietary)

Flumazenil 100 microgram per 1 ml Flumazenil 500micrograms/5ml solution for injection ampoules | 5 ampoule [PoM] £65.50-£72.46 (Hospital only) | 10 ampoule [PoM] £140.00 (Hospital only)

3.2 Digoxin toxicity

ANTIDOTES AND CHELATORS > ANTIBODIES

Digoxin-specific antibody

20-Jul-2020

● INDICATIONS AND DOSE

Treatment of known or strongly suspected life-threatening digoxin toxicity associated with ventricular arrhythmias or bradyarrhythmias unresponsive to atropine and when measures beyond the withdrawal of digoxin and correction of any electrolyte abnormalities are considered necessary

▶ BY INTRAVENOUS INFUSION

- ▶ Child: Serious cases of digoxin toxicity should be discussed with the National Poisons Information Service (consult product literature)
- ▶ Adult: Serious cases of digoxin toxicity should be discussed with the National Poisons Information Service (consult product literature)

● DIRECTIONS FOR ADMINISTRATION

- ▶ In adults For *intravenous infusion (DigiFab®)*, manufacturer advises give intermittently in Sodium chloride 0.9%. Reconstitute with water for injections (4 mL/vial), then dilute with infusion fluid and give over 30 minutes.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

▶ DigiFab (BTG International Ltd)

Digoxin-specific antibody fragments 40 mg DigiFab 40mg powder for solution for infusion vials | 1 vial [PoM] £750.00 (Hospital only)

3.3 Heparin toxicity

ANTIDOTES AND CHELATORS

Protamine sulfate

02-Dec-2020

● INDICATIONS AND DOSE

Overdosage with intravenous injection of unfractionated heparin

▶ BY INTRAVENOUS INJECTION

- ▶ Adult: Dose to be administered at a rate not exceeding 5 mg/minute, 1 mg neutralises 80–100 units heparin when given within 15 minutes; if longer than 15 minute since heparin, less protamine required (consult product literature for details) as heparin rapidly excreted; maximum 50 mg

Overdosage with intravenous infusion of unfractionated heparin

▶ BY INTRAVENOUS INJECTION

- ▶ Adult: 25–50 mg, to be administered once heparin infusion stopped at a rate not exceeding 5 mg/minute

Overdosage with subcutaneous injection of unfractionated heparin

▶ INITIALLY BY INTRAVENOUS INJECTION

- ▶ Adult: Initially 25–50 mg, to be administered at a rate not exceeding 5 mg/minute, 1 mg neutralises 100 units

heparin, then (by intravenous infusion), any remaining dose to be administered over 8–16 hours; maximum 50 mg per course

Overdose with subcutaneous injection of low molecular weight heparin

- ▶ BY INTRAVENOUS INJECTION, OR BY CONTINUOUS INTRAVENOUS INFUSION
- ▶ Adult: Dose to be administered by intermittent intravenous injection at a rate not exceeding 5 mg/minute, 1 mg neutralises approx. 100 units low molecular weight heparin (consult product literature of low molecular weight heparin for details); maximum 50 mg

- **CAUTIONS** Excessive doses can have an anticoagulant effect
- **SIDE-EFFECTS**
- ▶ **Rare or very rare** Hypertension · pulmonary oedema non-cardiogenic
- ▶ **Frequency not known** Acute pulmonary vasoconstriction · back pain · bradycardia · circulatory collapse · dyspnoea · fatigue · feeling hot · flushing · nausea · pulmonary hypertension · vomiting
- **ALLERGY AND CROSS-SENSITIVITY**  Caution if increased risk of allergic reaction to protamine (includes previous treatment with protamine or protamine insulin, allergy to fish, men who are infertile or who have had a vasectomy and who may have antibodies to protamine). 
- **MONITORING REQUIREMENTS** Monitor activated partial thromboplastin time or other appropriate blood clotting parameters.
- **PRESCRIBING AND DISPENSING INFORMATION** The long half-life of low molecular weight heparins should be taken into consideration when determining the dose of protamine sulfate; the effects of low molecular weight heparins can persist for up to 24 hours after administration.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Protamine sulfate (Non-proprietary)**
Protamine sulfate 10 mg per 1 ml Protamine sulfate 100mg/10ml solution for injection ampoules | 5 ampoule  
Protamine sulfate 50mg/5ml solution for injection ampoules | 10 ampoule  £49.55

3.4 Opioid toxicity

OPIOID RECEPTOR ANTAGONISTS

Naloxone hydrochloride

23-Apr-2021

● INDICATIONS AND DOSE

Acute opioid overdose—high-dose regimen [when rapid titration with naloxone is necessary to reverse potentially life-threatening effects]

- ▶ BY INTRAVENOUS INJECTION
- ▶ Child 1 month–11 years: Initially 100 micrograms/kg (max. per dose 2 mg), if no response, repeat at intervals of 1 minute to a total max. of 2 mg, then review diagnosis; further doses may be required if respiratory function deteriorates following initial response, intravenous administration has more rapid onset of action, doses may be given by intramuscular route but only if intravenous route is not feasible
- ▶ Child 12–17 years: Initially 400 micrograms, then 800 micrograms for up to 2 doses at 1 minute intervals if no response to preceding dose, then increased to

2 mg for 1 dose if still no response (4 mg dose may be required in seriously poisoned patients), then review diagnosis; further doses may be required if respiratory function deteriorates following initial response, intravenous administration has more rapid onset of action, doses may be given by intramuscular route but only if intravenous route is not feasible

- ▶ Adult: Initially 400 micrograms, then 800 micrograms for up to 2 doses at 1 minute intervals if no response to preceding dose, then increased to 2 mg for 1 dose if still no response (4 mg dose may be required in seriously poisoned patients), then review diagnosis; further doses may be required if respiratory function deteriorates following initial response, intravenous administration has more rapid onset of action, doses may be given by intramuscular route but only if intravenous route is not feasible
- ▶ BY CONTINUOUS INTRAVENOUS INFUSION
- ▶ Child: Using an infusion pump, adjust rate according to response (initially, rate may be set at 60% of the initial resuscitative intravenous injection dose per hour). The initial resuscitative intravenous injection dose is that which maintained satisfactory respiratory effort for at least 15 minutes
- ▶ Adult: Using an infusion pump, adjust rate according to response (initially, rate may be set at 60% of the initial resuscitative intravenous injection dose per hour). The initial resuscitative intravenous injection dose is that which maintained satisfactory respiratory effort for at least 15 minutes

Opioid overdose—low-dose regimen [when there is risk of acute withdrawal, or when a continued therapeutic effect is required (e.g. postoperative use, palliative care)]

- ▶ BY INTRAVENOUS INJECTION
 - ▶ Child 1 month–11 years: Initially 1–10 micrograms/kg (max. per dose 200 micrograms), if no response, repeat at intervals of 1 minute up to 5 times, if no response then give a single dose of 100 micrograms/kg (max. dose 2 mg) then review diagnosis if still no response, further doses may be required if respiratory function deteriorates following initial response, intravenous administration has a more rapid onset of action, doses may be given by intramuscular route but only if intravenous route is not feasible
 - ▶ Child 12–17 years: Initially 100–200 micrograms, then 100 micrograms for up to 2 doses at 1 minute intervals if no response to preceding dose, continue titrating up to a max. of 2 mg until adequate response achieved. If still no response, give a further 2 mg dose (4 mg dose may be required in seriously poisoned patients), then review diagnosis; further doses may be required if respiratory function deteriorates following initial response, intravenous administration has a more rapid onset of action, doses may be given by intramuscular route but only if intravenous route is not feasible
 - ▶ Adult: Initially 100–200 micrograms, then 100 micrograms for up to 2 doses at 1 minute intervals if no response to preceding dose, continue titrating up to a max. of 2 mg until adequate response achieved. If still no response, give a further 2 mg dose (4 mg dose may be required in seriously poisoned patients), then review diagnosis; further doses may be required if respiratory function deteriorates following initial response, intravenous administration has a more rapid onset of action, doses may be given by intramuscular route but only if intravenous route is not feasible
- Opioid overdose in non-medical and medical settings**
- ▶ BY INTRAVENOUS ADMINISTRATION
 - ▶ Child 14–17 years: 1.8 mg, administered into one nostril, if no response, give a second dose after continued →

2–3 minutes. If the patient responds to the first dose then relapses into respiratory depression, give the second dose immediately. Further doses should be administered into alternate nostrils

- ▶ **Adult:** 1.8 mg, administered into one nostril, if no response, give a second dose after 2–3 minutes. If the patient responds to the first dose then relapses into respiratory depression, give the second dose immediately. Further doses should be administered into alternate nostrils

Opioid overdose in a non-medical setting

▶ BY INTRAMUSCULAR INJECTION

- ▶ **Adult:** 400 micrograms every 2–3 minutes, each dose given in subsequent resuscitation cycles if patient not breathing normally, continue until consciousness regained, breathing normally, medical assistance available, or contents of syringe used up; to be injected into deltoid region or anterolateral thigh

DOSE EQUIVALENCE AND CONVERSION

- ▶ With intranasal use
- ▶ 1 spray equivalent to 1.8 mg.

PHARMACOKINETICS

- ▶ Naloxone has a short duration of action; repeated doses or infusion may be necessary to reverse effects of opioids with longer duration of action.

- **UNLICENSED USE** TOXBASE advises naloxone is used in both high- and low-dose regimens for the management of opioid overdose, but these may differ from those licensed.

IMPORTANT SAFETY INFORMATION

SAFE PRACTICE

Doses used in acute opioid overdose may not be appropriate when there is risk of acute withdrawal (e.g. chronic opioid use), or when a continued therapeutic effect is required (e.g. postoperative use, palliative care).

- **CAUTIONS** Cardiovascular disease or those receiving cardiotoxic drugs (serious adverse cardiovascular effects reported) · chronic opioid use (risk of acute withdrawal) · maternal chronic opioid use (risk of acute withdrawal in newborn) · palliative care (risk of returning pain and acute withdrawal) · postoperative use (risk of returning pain)

CAUTIONS, FURTHER INFORMATION

- ▶ Titration of dose [\[EvGr\]](#) In postoperative use, the dose should be titrated for each patient in order to obtain sufficient respiratory response; however, naloxone antagonises analgesia. 

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Arrhythmias · dizziness · headache · hypertension · hypotension · nausea · vomiting
- ▶ **Uncommon** Diarrhoea · dry mouth · hyperhidrosis · hyperventilation · tremor
- ▶ **Rare or very rare** Cardiac arrest · erythema multiforme · pulmonary oedema

SPECIFIC SIDE-EFFECTS

- ▶ **Uncommon**
- ▶ With parenteral use Inflammation localised · pain · vascular irritation
- ▶ **Rare or very rare**
- ▶ With parenteral use Anxiety · seizure
- ▶ **Frequency not known**
- ▶ With parenteral use Analgesia reversed · asthenia · chills · death · dyspnoea · fever · irritability · nasal complaints · piloerection · yawning

- **PREGNANCY** Use only if potential benefit outweighs risk.

- **BREAST FEEDING** Not orally bioavailable.

● DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use in children For *continuous intravenous infusion*, dilute to a concentration of up to 200 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%.
- ▶ With intravenous use in adults For *intravenous infusion* (*Minijet*[®] Naloxone Hydrochloride), give continuously in Glucose 5% or Sodium Chloride 0.9%. Dilute to a concentration of up to 200 micrograms/mL and administer via an infusion pump.

● PRESCRIBING AND DISPENSING INFORMATION

- ▶ With intranasal use The manufacturer has provided a *Healthcare Professional Guidance Document*.
- **PATIENT AND CARER ADVICE** Patients and carers should be given advice on how to administer naloxone nasal spray.
- ▶ With intranasal use Patient training and information cards should be provided.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ Naloxone hydrochloride (Non-proprietary)

Naloxone hydrochloride 20 microgram per 1 ml Naloxone 40micrograms/2ml solution for injection ampoules | 10 ampoule [\[PoM\]](#) £55.00

Naloxone hydrochloride (as Naloxone hydrochloride dihydrate) 400 microgram per 1 ml Naloxone 400micrograms/1ml solution for injection ampoules | 10 ampoule [\[PoM\]](#) £36.72-£45.00 DT = £40.51

Naloxone hydrochloride 1 mg per 1 ml Naloxone 2mg/2ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [\[PoM\]](#) £16.80 DT = £18.00

▶ Prenoxad (Martindale Pharmaceuticals Ltd)

Naloxone hydrochloride 1 mg per 1 ml Prenoxad 2mg/2ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [\[PoM\]](#) £18.00 DT = £18.00

Spray

▶ Nyxoid (Napp Pharmaceuticals Ltd)

Naloxone (as Naloxone hydrochloride dihydrate) 18 mg per 1 ml Nyxoid 1.8mg/0.1ml nasal spray 0.1ml unit dose | 2 unit dose [\[PoM\]](#) £26.00

3.5 Paracetamol toxicity

ANTIDOTES AND CHELATORS

Acetylcysteine

05-Oct-2020

● INDICATIONS AND DOSE

Paracetamol overdose

▶ BY INTRAVENOUS INFUSION

- ▶ **Child** (body-weight up to 20 kg): Initially 150 mg/kg over 1 hour, dose to be administered in 3 mL/kg glucose 5%, followed by 50 mg/kg over 4 hours, dose to be administered in 7 mL/kg glucose 5%, then 100 mg/kg over 16 hours, dose to be administered in 14 mL/kg glucose 5%
- ▶ **Child** (body-weight 20–39 kg): Initially 150 mg/kg over 1 hour, dose to be administered in 100 mL glucose 5%, followed by 50 mg/kg over 4 hours, dose to be administered in 250 mL glucose 5%, then 100 mg/kg over 16 hours, dose to be administered in 500 mL glucose 5%
- ▶ **Child** (body-weight 40 kg and above): 150 mg/kg over 1 hour, dose to be administered in 200 mL glucose 5%, then 50 mg/kg over 4 hours, to be started immediately after completion of first infusion, dose to be administered in 500 mL glucose 5%, then 100 mg/kg over 16 hours, to be started immediately after completion of second infusion, dose to be administered in 1 litre glucose 5%
- ▶ **Adult** (body-weight 40 kg and above): 150 mg/kg over 1 hour, dose to be administered in 200 mL glucose 5%,

then 50 mg/kg over 4 hours, to be started immediately after completion of first infusion, dose to be administered in 500 mL glucose 5%, then 100 mg/kg over 16 hours, to be started immediately after completion of second infusion, dose to be administered in 1 litre glucose 5%

DOSES AT EXTREMES OF BODY-WEIGHT

- ▶ To avoid excessive dosage in obese patients, a ceiling weight of 110 kg should be used when calculating the dose for paracetamol overdosage.

NACSYS® EFFERVESCENT TABLETS

Reduction of sputum viscosity

- ▶ BY MOUTH
- ▶ Adult: 600 mg once daily

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: INTRAVENOUS ACETYLCYSTEINE FOR PARACETAMOL OVERDOSE: REMINDER OF AUTHORISED DOSE REGIMEN; POSSIBLE NEED FOR CONTINUED TREATMENT (JANUARY 2017)

The authorised dose regimen for acetylcysteine in paracetamol overdose is 3 consecutive intravenous infusions given over a total of 21 hours.

Continued treatment (given at the dose and rate as used in the third infusion) may be necessary depending on the clinical evaluation of the individual patient.

- **CAUTIONS** Asthma (see Side-effects for management of asthma but do not delay acetylcysteine treatment) · atopy · may slightly increase INR · may slightly increase prothrombin time
- **SIDE-EFFECTS**
- ▶ **Frequency not known** Acidosis · anaphylactoid reaction · angioedema · anxiety · arrhythmias · cardiac arrest · chest discomfort · cough · cyanosis · eye pain · eye swelling · generalised seizure · hyperhidrosis · hypertension · hypotension · joint disorders · malaise · nausea · pain facial · respiratory disorders · skin reactions · syncope · thrombocytopenia · vasodilation · vision blurred · vomiting
- SIDE-EFFECTS, FURTHER INFORMATION** Anaphylactoid reactions can be managed by suspending treatment and initiating appropriate management. Treatment may then be restarted at lower rate.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion, manufacturer advises Glucose 5% is preferred fluid; Sodium Chloride 0.9% is an alternative if Glucose 5% unsuitable.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion
- Solution for infusion**
- ELECTROLYTES: May contain Sodium
- ▶ **Acetylcysteine (Non-proprietary)**
- Acetylcysteine 200 mg per 1 ml** Acetylcysteine 6g/30ml solution for infusion vials | 4 vial PoM S (Hospital only)
- Acetylcysteine 2g/10ml solution for infusion ampoules | 10 ampoule PoM £21.26 DT = £21.26
- ▶ **Parvolex** (Phoenix Labs Ltd)
- Acetylcysteine 200 mg per 1 ml** Parvolex 2g/10ml concentrate for solution for infusion ampoules | 10 ampoule PoM £22.50 DT = £21.26

4 Methaemoglobinaemia

ANTIDOTES AND CHELATORS

Methylthionium chloride

29-Jul-2020

(Methylene blue)

● INDICATIONS AND DOSE

Drug- or chemical-induced methaemoglobinaemia

- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Child 3 months-17 years: Initially 1–2 mg/kg, then 1–2 mg/kg after 30–60 minutes if required, to be given over 5 minutes, seek advice from National Poisons Information Service if further repeat doses are required; maximum 7 mg/kg per course
- ▶ Adult: Initially 1–2 mg/kg, then 1–2 mg/kg after 30–60 minutes if required, to be given over 5 minutes, seek advice from National Poisons Information Service if further repeat doses are required; maximum 7 mg/kg per course

Aniline- or dapsone-induced methaemoglobinaemia

- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Child 3 months-17 years: Initially 1–2 mg/kg, then 1–2 mg/kg after 30–60 minutes if required, to be given over 5 minutes, seek advice from National Poisons Information Service if further repeat doses are required; maximum 4 mg/kg per course
- ▶ Adult: Initially 1–2 mg/kg, then 1–2 mg/kg after 30–60 minutes if required, to be given over 5 minutes, seek advice from National Poisons Information Service if further repeat doses are required; maximum 4 mg/kg per course

- **CAUTIONS** Chlorate poisoning (reduces efficacy of methylthionium) · G6PD deficiency (seek advice from National Poisons Information Service) · methaemoglobinaemia due to treatment of cyanide poisoning with sodium nitrite (seek advice from National Poisons Information Service) · pulse oximetry may give false estimation of oxygen saturation
- **INTERACTIONS** → Appendix 1: methylthionium chloride
- **SIDE-EFFECTS**
- ▶ **Common or very common** Abdominal pain · anxiety · chest pain · dizziness · headache · hyperhidrosis · nausea · pain in extremity · paraesthesia · skin reactions · taste altered · urine discolouration · vomiting
- ▶ **Frequency not known** Aphasia · arrhythmias · confusion · faeces discoloured · fever · haemolytic anaemia · hyperbilirubinaemia (in infants) · hypertension · hypotension · injection site necrosis · mydriasis · tremor
- **PREGNANCY** No information available, but risk to fetus of untreated methaemoglobinaemia likely to be significantly higher than risk of treatment.
- **BREAST FEEDING** Manufacturer advises avoid breastfeeding for up to 6 days after administration—no information available.
- **RENAL IMPAIRMENT**
- Dose adjustments** Use with caution in severe impairment; dose reduction may be required.
- **DIRECTIONS FOR ADMINISTRATION**
- ▶ In children For intravenous injection, manufacturer advises may be diluted with Glucose 5% to minimise injection-site pain; not compatible with Sodium Chloride 0.9%.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection

- ▶ **Methylthionium chloride (Non-proprietary)**

Methylthionium chloride 5 mg per 1 ml Methylthionium chloride Proveblue 50mg/10ml solution for injection ampoules | 5 ampoule [PoM] £196.89

Methylthionium chloride 10 mg per 1 ml Methylthionium chloride 50mg/5ml concentrate for solution for injection vials | 5 vial [PoM] £150.00 (Hospital only)

5 Snake bites

IMMUNE SERA AND IMMUNOGLOBULINS › ANTITOXINS

European viper snake venom antiserum

05-Feb-2021

- **INDICATIONS AND DOSE**

VIPERATAB[®]

Envenoming from *Vipera berus* bites (under expert supervision)

- ▶ BY INTRAVENOUS INFUSION

- ▶ Child: Initially 8 mL for 1 dose, then 8 mL if required, the second and subsequent doses should only be given if signs and symptoms of envenomation persist or recur, if signs and symptoms of envenoming progress or persist contact the National Poisons Information Service
- ▶ Adult: Initially 8 mL for 1 dose, then 8 mL if required, the second and subsequent doses should only be given if signs and symptoms of envenomation persist or recur, if signs and symptoms of envenoming progress or persist contact the National Poisons Information Service

- **DIRECTIONS FOR ADMINISTRATION**

VIPERATAB[®] [EvGr] For *intravenous infusion*, dilute with 100 mL of Sodium Chloride 0.9%; give over 30 minutes. ⚠

- **PRESCRIBING AND DISPENSING INFORMATION** To order, email immform@dh.gsi.gov.uk.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

Appendix 1

Interactions

Two or more drugs given at the same time can exert their effects independently or they can interact. Interactions may be beneficial and exploited therapeutically; this type of interaction is not within the scope of this appendix. Many interactions are harmless, and even those that are potentially harmful can often be managed, allowing the drugs to be used safely together. Nevertheless, adverse drug interactions should be reported to the Medicines and Healthcare products Regulatory Agency (MHRA), through the Yellow Card Scheme (see Adverse reactions to drugs p. 12), as for other adverse drug reactions.

Potentially harmful drug interactions may occur in only a small number of patients, but the true incidence is often hard to establish. Furthermore the severity of a harmful interaction is likely to vary from one patient to another. Patients at increased risk from drug interactions include the elderly and those with impaired renal or hepatic function.

Interactions can result in the potentiation or antagonism of one drug by another, or result in another effect, such as renal impairment. Drug interactions may develop either through pharmacokinetic or pharmacodynamic mechanisms.

Pharmacodynamic interactions

These are interactions between drugs which have similar or antagonistic pharmacological effects or side-effects. They might be due to competition at receptor sites, or occur between drugs acting on the same physiological system. They are usually predictable from a knowledge of the pharmacology of the interacting drugs; in general, those demonstrated with one drug are likely to occur with related drugs.

Pharmacokinetic interactions

These occur when one drug alters the absorption, distribution, metabolism, or excretion of another, thus increasing or decreasing the amount of drug available to produce its pharmacological effects. Pharmacokinetic interactions occurring with one drug do not necessarily occur uniformly across a group of related drugs.

Affecting absorption The rate of absorption and the total amount absorbed can both be altered by drug interactions. Delayed absorption is rarely of clinical importance unless a rapid effect is required (e.g. when giving an analgesic). Reduction in the total amount absorbed, however, can result in ineffective therapy.

Affecting distribution *Due to changes in protein binding:* To a variable extent most drugs are loosely bound to plasma proteins. Protein-binding sites are non-specific and one drug can displace another thereby increasing the proportion free to diffuse from plasma to its site of action. This only produces a detectable increase in effect if it is an extensively bound drug (more than 90%) that is not widely distributed throughout the body. Even so displacement rarely produces more than transient potentiation because this increased concentration of free drug will usually be eliminated.

Displacement from protein binding plays a part in the potentiation of warfarin by sulfonamides but these interactions become clinically relevant mainly because warfarin metabolism is also inhibited.

Induction or inhibition of drug transporter proteins: Drug transporter proteins, such as P-glycoprotein, actively transport drugs across biological membranes. Transporters can be induced or inhibited, resulting in changes in the concentrations of drugs that are substrates for the transporter. For example, rifampicin induces P-glycoprotein, particularly in the gut wall, resulting in decreased plasma concentrations of digoxin, a P-glycoprotein substrate.

Affecting metabolism Many drugs are metabolised in the liver. Drugs are either metabolised by phase I reactions (oxidation, reduction, or hydrolysis) or by phase II reactions (e.g. glucoronidation).

Phase I reactions are mainly carried out by the cytochrome P450 family of isoenzymes, of which CYP3A4 is the most important isoenzyme involved in the metabolism of drugs. Induction of cytochrome P450 isoenzymes by one drug can increase the rate of metabolism of another, resulting in lower plasma concentrations and a reduced effect. On withdrawal of the inducing drug, plasma concentrations increase and toxicity can occur.

Conversely when one drug inhibits cytochrome P450 isoenzymes, it can decrease the metabolism of another, leading to higher plasma concentrations, resulting in an increased effect with a risk of toxicity.

Isoenzymes of the hepatic cytochrome P450 system interact with a wide range of drugs. With knowledge of which isoenzymes are involved in a drug's metabolism, it is possible to predict whether certain pharmacokinetic interactions will occur. For example, carbamazepine is a potent inducer of CYP3A4, ketoconazole is potent inhibitor of CYP3A4, and midazolam is a substrate of CYP3A4. Carbamazepine reduces midazolam concentrations, and it is therefore likely that other drugs that are potent inducers of CYP3A4 will interact similarly with midazolam. Ketoconazole, however, increases midazolam concentrations, and it can be predicted that other drugs that are potent inhibitors of CYP3A4 will interact similarly.

Less is known about the enzymes involved in phase II reactions. These include UDP-glucuronyltransferases which, for example, might be induced by rifampicin, resulting in decreased metabolism of mycophenolate (a substrate for this enzyme) to its active form, mycophenolic acid.

Affecting renal excretion Drugs are eliminated through the kidney both by glomerular filtration and by active tubular secretion. Competition occurs between those which share active transport mechanisms in the proximal tubule. For example, salicylates and some other NSAIDs delay the excretion of methotrexate; serious methotrexate toxicity is possible. Changes in urinary pH can also affect the reabsorption of a small number of drugs, including methenamine.

Relative importance of interactions

Levels of severity: Most interactions have been assigned a severity; this describes the likely effect of an unmanaged interaction on the patient.

Severe—the result may be a life-threatening event or have a permanent detrimental effect.

Moderate—the result could cause considerable distress or partially incapacitate a patient; they are unlikely to be life-threatening or result in long-term effects.

Mild—the result is unlikely to cause concern or incapacitate the majority of patients.

Unknown—used for those interactions that are predicted, but there is insufficient evidence to hazard a guess at the outcome.

Levels of evidence: Most interactions have been assigned a rating to indicate the weight of evidence behind the interaction.

Study—for interactions where the information is based on formal study including those for other drugs with same mechanism (e.g. known inducers, inhibitors, or substrates of cytochrome P450 isoenzymes or P-glycoprotein).

Anecdotal—interactions based on either a single case report or a limited number of case reports.

Theoretical—interactions that are predicted based on sound theoretical considerations. The information may have been derived from *in vitro* studies or based on the way other members in the same class act.

Action messages: Each interaction describes the effect that occurs, and the action to be taken, either based on manufacturer's advice from the relevant Summary of Product Characteristics or advice from a relevant authority (e.g. MHRA). An action message is only included where the combination is to be avoided, where a dose adjustment is required, or where specific administration requirements (e.g. timing of doses) are recommended. **Pharmacodynamic interactions**, with the exception of interactions with drugs that may prolong the QT interval, do not have an action message included as these will depend on individual patient circumstances.

A1

Interactions | Appendix 1

Appendix 1 structure

1 Drugs

Drugs are listed alphabetically. If a drug is a member of a drug class, all interactions for that drug will be listed under the drug class entry; in this case the drug entry provides direction to the relevant drug class where its interactions can be found.

Within a drug or drug class entry, interactions are listed alphabetically by the interacting drug or drug class. The interactions describe the effect that occurs, and the action to be taken, either based on manufacturer's advice from the relevant Summary of Product Characteristics or advice from a relevant authority (e.g. MHRA). An action message is only included where the combination is to be avoided, where a dose adjustment is required, or where specific administration requirements (e.g. timing of doses) are recommended. If two drugs have a pharmacodynamic effect in addition to a pharmacokinetic interaction, a cross-reference to the relevant pharmacodynamic effect table is included at the end of the pharmacokinetic message.

2 Drug classes

The drugs that are members of a drug class are listed underneath the drug class entry in a blue box. Interactions for the class are then listed alphabetically by the interacting drug or drug class. If the interaction only applies to certain drugs in the class, these drugs will be shown in brackets after the drug class name.

3 Supplementary information

If a drug has additional important information to be considered, this is shown in a blue box underneath the drug or drug class entry. This information might be food and lifestyle advice (including smoking and alcohol consumption), relate to the pharmacology of the drug or applicability of interactions to certain routes of administration, or it might be advice about separating administration times.

4 Pharmacodynamic effects

Tables at the beginning of Appendix 1 cover pharmacodynamic effects. If a drug is included in one or more of these tables, this will be indicated at the top of the

1	Drug entry <ul style="list-style-type: none"> Details of interaction between drug entry and another drug or drug class. Action statement. [Severity] Evidence Details of interaction between drug entry and another drug or drug class. Action statement. [Severity] Evidence → Also see TABLE 1 Drug entry → see Drug class entry						
2	Drug class entry Drug A · Drug B · Drug C · Drug D <ul style="list-style-type: none"> Details of interaction between drug class entry and another drug or drug class. Action statement. [Severity] Evidence 						
3	Drug entry or Drug class entry Supplementary information						
4	Drug entry or Drug class entry → see TABLE 1 TABLE 1 Name of pharmacodynamic effect Explanation of the effect <table border="1"> <tbody> <tr> <td>Drug</td> <td>Drug</td> <td>Drug</td> </tr> <tr> <td>Drug</td> <td>Drug</td> <td>Drug</td> </tr> </tbody> </table>	Drug	Drug	Drug	Drug	Drug	Drug
Drug	Drug	Drug					
Drug	Drug	Drug					

list of interactions for the drug or drug class. In addition to the list of interactions for a drug or drug class, these tables should always be consulted.

Each table describes the relevant pharmacodynamic effect and lists those drugs that are commonly associated with the effect. Concurrent use of two or more drugs from the same table is expected to increase the risk of the pharmacodynamic effect occurring. Please note these tables are not exhaustive.

TABLE 1**Drugs that cause hepatotoxicity**

The following is a list of some drugs that cause hepatotoxicity (note that this list is not exhaustive). Concurrent use of two or more drugs from the list might increase this risk.

alcohol	dactinomycin	itraconazole	minocycline	streptozocin
alectinib	dantrolene	leflunomide	neratinib	sulfasalazine
asparaginase	demeclocycline	lenalidomide	oxytetracycline	teriflunomide
atorvastatin	doxycycline	lomitapide	paracetamol	tetracycline
bedaquiline	flucloxacillin	lymecycline	pegaspargase	tigecycline
carbamazepine	fluconazole	mercaptopurine	pravastatin	trabectedin
clavulanate	fluvastatin	methotrexate	rosuvastatin	valproate
crisantaspase	isoniazid	micafungin	simvastatin	vincristine

TABLE 2**Drugs that cause nephrotoxicity**

The following is a list of some drugs that cause nephrotoxicity (note that this list is not exhaustive). Concurrent use of two or more drugs from the list might increase this risk.

aceclofenac	cefoxitin	diclofenac	nabumetone	telavancin
aciclovir	cefradine	etodolac	naproxen	tenofovir disoproxil
adefovir	ceftaroline	etoricoxib	neomycin	tenoxicam
amikacin	ceftazidime	flurbiprofen	oxaliplatin	tiaprofenic acid
amphotericin B	ceftobiprole	foscarnet	parecoxib	tobramycin
bacitracin	ceftolozane	ganciclovir	pemetrexed	tolfenamic acid
capreomycin	ceftriaxone	gentamicin	penicillamine	trimethoprim
carboplatin	cefuroxime	ibuprofen	pentamidine	valaciclovir
cefaclor	celecoxib	ifosfamide	phenazone	valganciclovir
cefadroxil	ciclosporin	indometacin	piroxicam	vancomycin
cefalexin	cidofovir	ketoprofen	polymyxin b	zidovudine
cefazolin	cisplatin	ketorolac	streptomycin	zoledronate
cefepime	colistemetate (particularly intravenous)	mefenamic acid	streptozocin	
cefixime	dexketoprofen	meloxicam	sulindac	
cefotaxime		methotrexate	tacrolimus	

TABLE 3**Drugs with anticoagulant effects**

The following is a list of drugs that have anticoagulant effects. Concurrent use of two or more drugs from this list might increase the risk of bleeding; concurrent use of drugs with antiplatelet effects (see table of drugs with antiplatelet effects) might also increase this risk.

acenocoumarol	dabigatran	eptifibatid	rivaroxaban	urokinase
alteplase	dalteparin	fondaparinux	streptokinase	warfarin
apixaban	danaparoid	heparin	tenecteplase	
argatroban	edoxaban	nicotinic acid	tinzaparin	
bivalirudin	enoxaparin	phenindione	tirofiban	

TABLE 4**Drugs with antiplatelet effects**

The following is a list of drugs that have antiplatelet effects (note that this list is not exhaustive). Concurrent use of two or more drugs from this list might increase the risk of bleeding; concurrent use of drugs with anticoagulant effects (see table of drugs with anticoagulant effects) might also increase this risk.

acalabrutinib	clopidogrel	fluvoxamine	nintedanib	tenoxicam
aceclofenac	dapoxetine	ibrutinib	omega-3-acid ethyl esters	tiaprofenic acid
anagrelide	dasatinib	ibuprofen	parecoxib	ticagrelor
aspirin	dexketoprofen	iloprost	paroxetine	tolfenamic acid
axitinib	diclofenac	indometacin	phenazone	trametinib
bevacizumab	dipyridamole	inotersen	piroxicam	trastuzumab emtansine
bosutinib	duloxetine	ketoprofen	ponatinib	treprostinil
bromfenac	epoprostenol	ketorolac	prasugrel	vandetanib
cabozantinib	escitalopram	lenvatinib	regorafenib	venlafaxine
cangrelor	etodolac	mefenamic acid	ruxolitinib	vortioxetine
celecoxib	etoricoxib	meloxicam	sertraline	
cilostazol	fluooxetine	nabumetone	sulindac	
citalopram	flurbiprofen	naproxen	sunitinib	

TABLE 5

Drugs that cause thromboembolism

The following is a list of some drugs that cause thromboembolism (note that this list is not exhaustive). Concurrent use of two or more drugs from the list might increase this risk.

bleomycin	epoetin zeta	methoxy polyethylene	strontium	tretinoin
cyclophosphamide	fluorouracil	glycol-epoetin beta	tamoxifen	vinblastine
darbepoetin alfa	fulvestrant	mitomycin	thalidomide	vincristine
doxorubicin	lenalidomide	pentostatin	tibolone	vinorelbine
epoetin alfa	methotrexate	pomalidomide	toremifene	vinflunine
epoetin beta		raxofifene	tranexamic acid	vinorelbine

TABLE 6

Drugs that cause bradycardia

The following is a list of drugs that cause bradycardia (note that this list is not exhaustive). Concurrent use of two or more drugs from the list might increase this risk.

acebutolol	carvedilol	esmolol	metoprolol	remifentanyl
alectinib	celiprolol	fentanyl	nadolol	rivastigmine
alfentanil	ceritinib	fingolimid	neбивол	selegiline
amiodarone	cisatracurium	flecainide	neostigmine	siponimod
apraclonidine	clonidine	galantamine	ozanimod	sotalol
atenolol	crizotinib	ivabradine	pasireotide	thalidomide
betaxolol	digoxin	labetalol	pidolol	timolol
bisoprolol	diltiazem	levobunolol	prpranolol	tizanidine
brimonidine	donepezil	methadone	pyridostigmine	verapamil

TABLE 7

Drugs that cause first dose hypotension

The following is a list of some drugs that can cause first-dose hypotension (note that this list is not exhaustive). Concurrent use of two or more drugs from the list might increase this risk.

alfuzosin	eprosartan	isosorbide dinitrate	prazosin	trandolapril
azilsartan	fosinopril	isosorbide mononitrate	quinapril	valsartan
candesartan	glyceryl trinitrate	lisinopril	ramipril	
captopril	imidapril	losartan	tamsulosin	
doxazosin	indoramin	olmesartan	telmisartan	
enalapril	irbesartan	perindopril	terazosin	

TABLE 8

Drugs that cause hypotension

The following is a list of some drugs that cause hypotension (note that this list is not exhaustive). Concurrent use of two or more drugs from the list might increase this risk.

acebutolol	chlorothiazide	haloperidol	minoxidil	risperidone
alcohol	chlormpromazine	hydralazine	moxisylyte	ropinrole
alfuzosin	chlortalidone	hydrochlorothiazide	moxonidine	rotigotine
aliskiren	clomipramine	hydroflumethiazide	nadolol	sacubitril
alprostadil	clonidine	iloprost	neбивол	sapropterin
amantadine	clozapine	imidapril	nicardipine	selegiline
amitriptyline	dapagliflozin	imipramine	nicorandil	sevoflurane
amlodipine	desflurane	indapamide	nifedipine	sildenafil
apomorphine	diazoxide	indoramin	nimodipine	sodium oxybate
apraclonidine	diltiazem	irbesartan	nitroprusside	sotalol
aripiprazole	dipyridamole	isocarboxazid	nitrous oxide	spironolactone
asenapine	dosulepin	isoflurane	nortriptyline	sulpiride
atenolol	doxazosin	isosorbide dinitrate	olanzapine	tadalafil
avanafil	doxepin	isosorbide mononitrate	olmesartan	tamsulosin
azilsartan	droperidol	ketamine	paliperidone	telmisartan
baclofen	empagliflozin	labetalol	pericyazine	terazosin
bendroflumethiazide	enalapril	lacidipine	perindopril	thiopental
benperidol	eplerenone	lercanidipine	phenelzine	timolol
betaxolol	epoprosteno	levobunolol	pimozide	tizanidine
bisoprolol	eprosartan	levodopa	pinidolol	torasemide
bortezomib	ertugliflozin	levomepromazine	pramipexole	trandolapril
brimonidine	esketamine	lisinopril	prazosin	tranylcypromine
bromocriptine	esmolol	lofepramine	prochlorperazine	treprostinil
bumetanide	etomidate	lofexidine	promazine	trifluoperazine
cabergoline	felodipine	losartan	propofol	trimipramine
canagliflozin	flupentixol	loxapine	propranolol	valsartan
candesartan	fluphenazine	lurasidone	quetiapine	verdenafil
captopril	fosinopril	methoxyflurane	quinagolide	verapamil
cariprazine	furosemide	methylidopa	quinapril	vernakalant
carvedilol	glyceryl trinitrate	metolazone	ramipril	xipamide
celiprolol	guanfacine	metoprolol	riociguat	zuclopenthixol

TABLE 9
Drugs that prolong the QT interval

The following is a list of some drugs that prolong the QT-interval (note that this list is not exhaustive). In general, manufacturers advise that the use of two or more drugs that are associated with QT prolongation should be avoided. Increasing age, female sex, cardiac disease, and some metabolic disturbances (notably hypokalaemia) predispose to QT prolongation—concurrent use of drugs that reduce serum potassium might further increase this risk (see table of drugs that reduce serum potassium).

Drugs that are not known to prolong the QT interval but are predicted (by the manufacturer) to increase the risk of QT prolongation include: domperidone, fingolimod, granisetron, ivabradine, mefloquine, mizolastine, ozanimod, palonosetron, intravenous pentamidine, and siponimod. Most manufacturers advise avoiding concurrent use with drugs that prolong the QT interval.

amifampridine	clarithromycin	flecainide	ondansetron	sulpiride
amiodarone	clomipramine	fluconazole	osimertinib	sunitinib
amisulpride	crizotinib	glasdegib	paliperidone	telavancin
anagrelide	dasatinib	haloperidol	panobinostat	tetrabenazine
apalutamide	delamanid	hydroxyzine	pasireotide	tizanidine
apomorphine	desflurane	inotuzumab ozogamicin	pazopanib	tolterodine
arsenic trioxide	disopyramide	isoflurane	pimozide	toremifene
artemether	dronedrone	lapatinib	quinine	vandetanib
artemimol	droperidol	lenvatinib	varnolazine	varafenil
bedaquiline	efavirenz	levomepromazine	ribociclib	vemurafenib
bosutinib	encorafenib	lithium	risperidone	venlafaxine
cabozantinib	entrectinib	lofexidine	sevoflurane	venakalant
ceritinib	eribulin	methadone	sildenafil	vinflunine
chlorpromazine	erythromycin	moxifloxacin	sonifenil	voriconazole
citalopram	escitalopram	nilotinib	sotalol	zuclopenthixol

TABLE 10
Drugs with antimuscarinic effects

The following is a list of some drugs that have antimuscarinic effects (note that this list is not exhaustive). Concurrent use of two or more drugs from this list might increase the risk of these effects occurring.

aclidinium	cyclopentolate	haloperidol	orphenadrine	tiotropium
amantadine	cyproheptadine	homatropine	oxybutynin	tolterodine
amitriptyline	darifenacin	hydroxyzine	pimozide	trifluoperazine
atropine	dicycloverine	hyoscine	pridolol	trihexyphenidyl
baclofen	dimenhydrinate	imipramine	prochlorperazine	trimipramine
chlorphenamine	disopyramide	ipratropium	procyclidine	trospicamide
chlorpromazine	dosulepin	levomepromazine	promethazine	trospium
clemastine	doxepin	lofepramine	propafenone	umeclidinium
clomipramine	fesoterodine	loxapine	propantheline	
clozapine	flavoxate	nefopam	propiverine	
cyclizine	glycopyrronium	nortriptyline	solifenacin	

TABLE 11
Drugs with CNS depressant effects

The following is a list of some drugs with CNS depressant effects (note that this list is not exhaustive). Concurrent use of two or more drugs from this list might increase the risk of CNS depressant effects, such as drowsiness, which might affect the ability to perform skilled tasks (see 'Drugs and Driving' in Guidance on Prescribing p. 1).

agomelatine	clobazam	guanfacine	midazolam	quetiapine
alcohol	clomethiazole	haloperidol	mirtazapine	remifentanyl
alfentanil	clomipramine	hydromorphone	morphine	risperidone
alimemazine	clonazepam	hydroxyzine	moxonidine	ropivacaine
alprazolam	clonidine	imipramine	nabilone	sevoflurane
amisulpride	clozapine	isoflurane	nitrazepam	sodium oxybate
amitriptyline	codeine	ketamine	nitrous oxide	sulpiride
apraclonidine	cyclizine	ketotifen	nortriptyline	tapentadol
aripiprazole	cyproheptadine	lamotrigine	olanzapine	temazepam
articaine	desflurane	levetiracetam	oxazepam	tetrabenazine
asenapine	dexmedetomidine	levomepromazine	oxycodone	tetracaine
baclofen	diamorphine	lidocaine	oxycodone	thalidomide
benperidol	diazepam	lofepramine	pentazocine	thiopental
brimonidine	dihydrocodeine	lofexidine	perampanel	tizanidine
buclizine	dipipanone	lorazepam	pericyazine	tramadol
bupivacaine	dosulepin	lorazepam	pethidine	trazodone
buprenorphine	doxepin	lormetazepam	permethrin	trifluoperazine
cannabidiol	dronabinol	loxapine	pimozide	trimipramine
cariprazine	droperidol	lurasidone	pizotifen	venlafaxine
chloral hydrate	esketamine	melatonin	pregabalin	zolidem
chlordiazepoxide	etomidate	mepivacaine	prilocaïne	zopiclone
chlorprocaine	fentanyl	mepitazinol	primidone	zuclopenthixol
chlorphenamine	flupentixol	methadone	prochlorperazine	
chlorpromazine	fluphenazine	methocarbamol	promazine	
cinnarizine	flurazepam	methoxyflurane	promethazine	
clemastine	gabapentin	mianserin	propofol	

TABLE 12

Drugs that cause peripheral neuropathy

The following is a list of some drugs that cause peripheral neuropathy (note that this list is not exhaustive). Concurrent use of two or more drugs from the list might increase this risk.

amiodarone	disulfiram	lamivudine	thalidomide	vinorelbine
bortezomib	docetaxel	metronidazole	vinblastine	
brentuximab vedotin	eribulin	nitrofurantoin	vincristine	
cabazitaxel	fosphenytoin	paclitaxel	vindesine	
cisplatin	isoniazid	phenytoin	vinflunine	

TABLE 13

Drugs that cause serotonin syndrome

The following is a list of some drugs that cause serotonin syndrome (note that this list is not exhaustive). See 'Serotonin Syndrome' and 'Monoamine-Oxidase Inhibitors' under Antidepressant drugs p 392 for more information and for specific advice on avoiding monoamine-oxidase inhibitors during and after administration of other serotonergic drugs.

almotriptan	fluoxetine	methadone	pethidine	tramadol
citalopram	fluvoxamine	methylthioninium chloride	phenelzine	tranylcypromine
clomipramine	frovatriptan	mirtazapine	rasagiline	trazodone
dapoxetine	granisetron	moclobemide	rizatriptan	tryptophan
dexamfetamine	imipramine	naratriptan	safinamide	venlafaxine
duloxetine	isocarboxazid	ondansetron	selegiline	vortioxetine
eletriptan	linezolid	palonosetron	sertraline	zolmitriptan
escitalopram	lisdexamfetamine	paroxetine	St John's wort	
fentanyl	lithium	pentazocine	sumatriptan	

TABLE 14

Antidiabetic drugs

The following is a list of antidiabetic drugs (note that this list is not exhaustive). Concurrent use of two or more drugs from the list might increase the risk of hypoglycaemia.

acarbose	empagliflozin	glimepiride	lixisenatide	semaglutide
alogliptin	ertugliflozin	glipizide	metformin	sitagliptin
canagliflozin	exenatide	insulin	pioglitazone	tolbutamide
dapagliflozin	glibenclamide	linagliptin	repaglinide	vildagliptin
dulaglutide	gliclazide	liraglutide	saxagliptin	

TABLE 15

Drugs that cause myelosuppression

The following is a list of some drugs that cause myelosuppression (note that this list is not exhaustive). Concurrent use of two or more drugs from the list might increase this risk.

adalimumab	carmustine	fluorouracil	nelarabine	sorafenib
aldesleukin	ceritinib	ganciclovir	nilotinib	streptozocin
alemtuzumab	certolizumab pegol	gemcitabine	niraparib	sulfasalazine
amsacrine	chlorambucil	gemtuzumab ozogamicin	nivolumab	sunitinib
arsenic trioxide	cisplatin	golimumab	obinutuzumab	talazoparib
asparaginase	cladribine	hydroxycarbamide	olaparib	tegafur
axitinib	clofarabine	ibrutinib	oxaliplatin	temozolomide
azacitidine	crisantaspase	idarubicin	paclitaxel	temsirolimus
azathioprine	cyclophosphamide	ifosfamide	palbociclib	thalidomide
belatacept	cytarabine	imatatinib	panobinostat	thiotepa
bendamustine	dacarbazine	infilximab	pegaspargase	tioguanine
bevacizumab	dactinomycin	inotuzumab ozogamicin	peginterferon alfa	topotecan
bexarotene	daratumumab	ipilimumab	pembrolizumab	trabectedin
bleomycin	dasatinib	irinotecan	pemetrexed	trastuzumab
blinatumomab	daunorubicin	leflunomide	pentostatin	trastuzumab deruxtecan
bortezomib	decitabine	lenalidomide	pixantrone	trastuzumab emtansine
bosutinib	dexrazoxane	lomustine	pomalidomide	treosulfan
brentuximab vedotin	dinutuximab	melfhalan	procabazine	valganciclovir
busulfan	docetaxel	mercaptopurine	raltitrexed	vinblastine
cabazitaxel	doxorubicin	methotrexate	ramucirumab	vincristine
cabozantinib	epirubicin	mifamurtide	regorafenib	vindesine
canakinumab	eribulin	mitomycin	ribociclib	vinflunine
capecitabine	estramustine	mitotane	rituximab	vinorelbine
carboplatin	etoposide	mitoxantrone	rucaparib	
carfilzomib	fludarabine	mogamulizumab	ruixolitinib	

TABLE 16

Drugs that increase serum potassium

The following is a list of some drugs that increase serum potassium concentrations (note that this list is not exhaustive). Concurrent use of two or more drugs from this list might increase the risk of hyperkalaemia (hyperkalaemia is particularly notable when ACE inhibitors or angiotensin-II receptor antagonists are given with spironolactone or eplerenone).

aceclofenac	drospirenone	ibuprofen	olmesartan	tacrolimus
aliskiren	enalapril	imidapril	parecoxib	telmisartan
amiloride	enoxaparin	indometacin	perindopril	tenoxicam
azilsartan	eplerenone	irbesartan	phenazone	tiaprofenic acid
candesartan	epoetin alfa	ketoprofen	piroxicam	tirozaparin
captopril	epoetin beta	ketorolac	potassium aminobenzoate	tolfenamic acid
celecoxib	epoetin zeta	lisinopril	potassium canrenoate	tolvaptan
ciclosporin	erosartan	losartan	potassium chloride	trandolapril
dalteparin	etodolac	mefenamic acid	quinapril	triamterene
darbepoetin alfa	etoricoxib	meloxicam	ramipril	trimethoprim
dexketoprofen	flurbiprofen	nabumetone	spironolactone	valsartan
diclofenac	heparin	naproxen	sulindac	

TABLE 17

Drugs that reduce serum potassium

The following is a list of some drugs that reduce serum potassium concentrations (note that this list is not exhaustive and that other drugs can cause hypokalaemia in overdose). Concurrent use of two or more drugs from this list might increase the risk of hypokalaemia. Hypokalaemia can increase the risk of torsade de pointes, which might be additive with the effects of drugs that prolong the QT interval (see table of drugs that prolong the QT interval).

aminophylline	bumetanide	furosemide	metolazone	torasemide
amphotericin B	chlorothiazide	hydrochlorothiazide	olodaterol	triamcinolone
bambuterol	chlortalidone	hydrocortisone	prednisolone	vilanterol
beclometasone	deflazacort	hydroflumethiazide	salbutamol	xipamide
bendroflumethiazide	dexamethasone	indacaterol	salmeterol	
betamethasone	fludrocortisone	indapamide	terbutaline	
budesonide	formoterol	methylprednisolone	theophylline	

TABLE 18

Drugs that cause hyponatraemia

The following is a list of some drugs that reduce sodium concentrations (note that this list is not exhaustive). Concurrent use of two or more drugs from this list might increase the risk of hyponatraemia.

aceclofenac	desmopressin	fluvoxamine	meloxicam	sulindac
amiloride	dexketoprofen	furosemide	metolazone	tenoxicam
amitriptyline	diclofenac	gabapentin	nabumetone	tiaprofenic acid
bendroflumethiazide	dosulepin	hydrochlorothiazide	naproxen	tolfenamic acid
bumetanide	doxepin	hydroflumethiazide	nortriptyline	torasemide
carbamazepine	duloxetine	ibuprofen	parecoxib	triamterene
celecoxib	eplerenone	imipramine	paroxetine	trimethoprim
chlorothiazide	escitalopram	indapamide	phenazone	trimipramine
chlortalidone	etodolac	indometacin	piroxicam	xipamide
citalopram	etoricoxib	ketoprofen	sertraline	
clomipramine	fluoxetine	ketorolac	sodium picosulfate	
dapoxetine	flurbiprofen	mefenamic acid	spironolactone	

TABLE 19

Drugs that cause ototoxicity

The following is a list of some drugs that cause ototoxicity (note that this list is not exhaustive). Concurrent use of two or more drugs from the list might increase this risk.

amikacin	cisplatin	oxaliplatin	torasemide	vindesine
bumetanide	furosemide	streptomycin	vancomycin	vinflunine
capreomycin	gentamicin	telavancin	vinblastine	vinorelbine
carboplatin	neomycin	tobramycin	vincristine	

TABLE 20

Drugs with neuromuscular blocking effects

The following is a list of some drugs with neuromuscular blocking effects (note that this list is not exhaustive). Concurrent use of two or more drugs from the list might increase this risk.

amikacin	cisatracurium	neomycin	streptomycin
atracurium	colistimethate	pancuronium	suxamethonium
botulinum toxin type A	gentamicin	polymyxin b	tobramycin
botulinum toxin type B	mivacurium	rocuronium	vecuronium

List of drug interactions

The following is an alphabetical list of drugs and their interactions; to avoid excessive cross-referencing each drug or group is listed twice: in the alphabetical list and also against the drug or group with which it interacts.

5-HT₃-receptor antagonists → see TABLE 13 p. 1450 (serotonin syndrome), TABLE 9 p. 1449 (QT-interval prolongation)

granisetron · ondansetron · palonosetron

- ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to ondansetron. [Moderate] Study → Also see TABLE 9 p. 1449
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to ondansetron. [Moderate] Study
- ▶ **Dopamine receptor agonists (apomorphine)** increase the risk of severe hypotension when given with ondansetron. Avoid. [Severe] Study → Also see TABLE 9 p. 1449
- ▶ **Dopamine receptor agonists (apomorphine)** are predicted to increase the risk of severe hypotension when given with 5-HT₃-receptor antagonists (granisetron, palonosetron). [Severe] Theoretical
- ▶ **Mitotane** is predicted to decrease the exposure to ondansetron. [Moderate] Study
- ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to ondansetron. [Moderate] Study

Abacavir → see NRTIs

Abatacept

- ▶ **Filgotinib** is predicted to increase the risk of immunosuppression when given with abatacept. Avoid. [Severe] Theoretical
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with abatacept. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Abatacept** is predicted to increase the risk of generalised infection (possibly life-threatening) when given with monoclonal antibodies (golimumab). Avoid. [Severe] Theoretical

Abemaciclib

- ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to markedly decrease the exposure to abemaciclib. Avoid. [Severe] Study
- ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to abemaciclib. [Moderate] Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to markedly decrease the exposure to abemaciclib. Avoid. [Severe] Study
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to abemaciclib. [Moderate] Study
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to abemaciclib. Avoid or adjust abemaciclib dose, p. 1015. [Severe] Study
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to abemaciclib. [Moderate] Study
- ▶ **Cobiciclat** is predicted to increase the exposure to abemaciclib. Avoid or adjust abemaciclib dose, p. 1015. [Severe] Study
- ▶ **Crizotinib** is predicted to increase the exposure to abemaciclib. [Moderate] Study
- ▶ **Grapefruit juice** is predicted to increase the exposure to abemaciclib. Avoid. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to abemaciclib. Avoid or adjust abemaciclib dose, p. 1015. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to abemaciclib. Avoid or adjust abemaciclib dose, p. 1015. [Severe] Study
- ▶ **Imatinib** is predicted to increase the exposure to abemaciclib. [Moderate] Study
- ▶ **Letermovir** is predicted to increase the exposure to abemaciclib. [Moderate] Study
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to abemaciclib. Avoid or adjust abemaciclib dose, p. 1015. [Severe] Study
- ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to abemaciclib. [Moderate] Study
- ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to abemaciclib. [Moderate] Study
- ▶ **Mitotane** is predicted to decrease the exposure to abemaciclib. [Moderate] Study
- ▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to increase the exposure to abemaciclib. [Moderate] Study
- ▶ **Nilotinib** is predicted to increase the exposure to abemaciclib. [Moderate] Study
- ▶ **Rifamycins (rifampicin)** are predicted to markedly decrease the exposure to abemaciclib. Avoid. [Severe] Study
- ▶ **St John's wort** is predicted to decrease the exposure to abemaciclib. Avoid. [Severe] Study

Abiraterone → see anti-androgens

Acalabrutinib → see TABLE 4 p. 1447 (antiplatelet effects)

- ▶ **Oral antacids** are predicted to decrease the exposure to oral acalabrutinib. Separate administration by at least 2 hours. [Moderate] Study
- ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to acalabrutinib. Avoid. [Severe] Study
- ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to acalabrutinib. Avoid or monitor. [Severe] Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to acalabrutinib. Avoid. [Severe] Study
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to acalabrutinib. Avoid or monitor. [Severe] Study
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to acalabrutinib. Avoid. [Severe] Study
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to acalabrutinib. Avoid or monitor. [Severe] Study
- ▶ **Oral calcium salts (calcium carbonate)** -containing antacids modestly decrease the exposure to oral acalabrutinib. Separate administration by at least 2 hours. [Moderate] Study
- ▶ **Cobiciclat** is predicted to increase the exposure to acalabrutinib. Avoid. [Severe] Study
- ▶ **Crizotinib** is predicted to increase the exposure to acalabrutinib. Avoid or monitor. [Severe] Study
- ▶ **Dabrafenib** is predicted to decrease the exposure to acalabrutinib. [Severe] Study
- ▶ **Endothelin receptor antagonists (bosentan)** are predicted to decrease the exposure to acalabrutinib. [Severe] Study
- ▶ **H₂ receptor antagonists** are predicted to decrease the exposure to acalabrutinib. Acalabrutinib should be taken 2 hours before or 10 hours after H₂ receptor antagonists. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to acalabrutinib. Avoid. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to acalabrutinib. Avoid. [Severe] Study
- ▶ **Imatinib** is predicted to increase the exposure to acalabrutinib. Avoid or monitor. [Severe] Study
- ▶ **Letermovir** is predicted to increase the exposure to acalabrutinib. Avoid or monitor. [Severe] Study
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to acalabrutinib. Avoid. [Severe] Study
- ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to acalabrutinib. Avoid or monitor. [Severe] Study
- ▶ **Mitotane** is predicted to decrease the exposure to acalabrutinib. Avoid. [Severe] Study
- ▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to increase the exposure to acalabrutinib. Avoid or monitor. [Severe] Study
- ▶ **Nilotinib** is predicted to increase the exposure to acalabrutinib. Avoid or monitor. [Severe] Study
- ▶ **NNRTIs (efavirenz, nevirapine)** are predicted to decrease the exposure to acalabrutinib. [Severe] Study
- ▶ **Proton pump inhibitors** are predicted to decrease the exposure to acalabrutinib. Avoid. [Moderate] Study
- ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to acalabrutinib. Avoid. [Severe] Study

- ▶ Oral **sodium bicarbonate** –containing antacids are predicted to decrease the exposure to oral **acalabrutinib**. Separate administration by at least 2 hours. [\[Moderate\]](#) Study
- ▶ **St John's wort** is predicted to decrease the exposure to **acalabrutinib**. Avoid. [\[Severe\]](#) Study

Acarbose → see TABLE 14 p. 1450 (antidiabetic drugs)

- ▶ **Acarbose** decreases the concentration of **digoxin**. [\[Moderate\]](#) Study

- ▶ **Pancratin** is predicted to decrease the effects of **acarbose**. Avoid. [\[Moderate\]](#) Theoretical

ACE inhibitors → see TABLE 7 p. 1448 (first-dose hypotension), TABLE 8 p. 1448 (hypotension), TABLE 16 p. 1451 (increased serum potassium)

- ▶ **captopril** · **enalapril** · **fosinopril** · **imidapril** · **lisinopril** · **perindopril** · **quinapril** · **ramipril** · **trandolapril**
- ▶ **ACE inhibitors** increase the risk of renal impairment when given with **aliskiren**. Use with caution or avoid **aliskiren** in selected patients, p. 194. [\[Severe\]](#) Study → Also see TABLE 8 p. 1448 → Also see TABLE 16 p. 1451
- ▶ **ACE inhibitors** are predicted to increase the risk of hypersensitivity and haematological reactions when given with **allopurinol**. [\[Severe\]](#) Anecdotal
- ▶ **ACE inhibitors** are predicted to increase the risk of anaemia and/or leucopenia when given with **azathioprine**. [\[Severe\]](#) Anecdotal
- ▶ **Everolimus** potentially increases the risk of angioedema when given with **ACE inhibitors**. [\[Severe\]](#) Anecdotal
- ▶ **ACE inhibitors** are predicted to increase the risk of hypersensitivity when given with **gold**. [\[Severe\]](#) Anecdotal
- ▶ **ACE inhibitors** are predicted to decrease the efficacy of **icatibant** and **icatibant** is predicted to decrease the efficacy of **ACE inhibitors**. Avoid. [\[Moderate\]](#) Theoretical
- ▶ **ACE inhibitors** are predicted to increase the concentration of **lithium**. Monitor and adjust dose. [\[Severe\]](#) Anecdotal
- ▶ **ACE inhibitors** are predicted to increase the risk of angioedema when given with **temsirolimus**. [\[Moderate\]](#) Theoretical
- ▶ Oral **quinapril** (magnesium carbonate-containing forms) might decrease the absorption of oral **tetracyclines**. Avoid. [\[Moderate\]](#) Study
- Acebutolol** → see beta blockers, selective
- Aceclofenac** → see NSAIDs
- Acenocoumarol** → see coumarins
- Acetazolamide**
 - ▶ **Acetazolamide** potentially increases the risk of toxicity when given with **antiepileptics (valproate)**. [\[Severe\]](#) Study
 - ▶ **Acetazolamide** potentially increases the risk of overheating and dehydration when given with **antiepileptics (zonisamide)**. Avoid in children. [\[Severe\]](#) Theoretical
 - ▶ **Acetazolamide** increases the risk of severe toxic reaction when given with **aspirin** (high-dose). [\[Severe\]](#) Study
 - ▶ **Acetazolamide** alters the concentration of **lithium**. [\[Severe\]](#) Anecdotal
 - ▶ **Acetazolamide** is predicted to decrease the efficacy of **methenamine**. Avoid. [\[Moderate\]](#) Theoretical
 - ▶ **Acetazolamide** increases the urinary excretion of **methotrexate**. [\[Moderate\]](#) Study
- Aciclovir** → see TABLE 2 p. 1447 (nephrotoxicity)
 - ROUTE-SPECIFIC INFORMATION** Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.
 - ▶ **Aciclovir** increases the exposure to **aminophylline**. Monitor and adjust dose. [\[Severe\]](#) Anecdotal
 - ▶ **Mycophenolate** is predicted to increase the risk of haematological toxicity when given with **aciclovir**. [\[Moderate\]](#) Theoretical
 - ▶ **Aciclovir** is predicted to increase the exposure to **theophylline**. Monitor and adjust dose. [\[Severe\]](#) Theoretical
- Acipimox**
 - ▶ **Acipimox** is predicted to increase the risk of rhabdomyolysis when given with **fibrates**. [\[Severe\]](#) Theoretical
 - ▶ **Acipimox** is predicted to increase the risk of rhabdomyolysis when given with **statins**. [\[Severe\]](#) Theoretical
- Acitretin** → see retinoids
- Acidinium** → see TABLE 10 p. 1449 (antimuscarinics)
- Acrivastine** → see antihistamines, non-sedating

Adalimumab → see monoclonal antibodies

Adapalene → see retinoids

Adefovir → see TABLE 2 p. 1447 (nephrotoxicity)

- ▶ **Leflunomide** is predicted to increase the exposure to **adefovir**. [\[Moderate\]](#) Theoretical
- ▶ **Nitisinone** is predicted to increase the exposure to **adefovir**. [\[Moderate\]](#) Study
- ▶ **Teriflunomide** is predicted to increase the exposure to **adefovir**. [\[Moderate\]](#) Study
- Adenosine** → see antiarrhythmics
- Adrenaline/epinephrine** → see sympathomimetics, vasoconstrictor
- Afatinib**
 - ▶ **Antiarrhythmics (amiodarone, dronedarone)** are predicted to increase the exposure to **afatinib**. Separate administration by 12 hours. [\[Moderate\]](#) Study
 - ▶ **Antiepileptics (carbamazepine)** are predicted to decrease the exposure to **afatinib**. [\[Moderate\]](#) Study
 - ▶ **Antiepileptics (phenobarbital, phenytoin)** are predicted to decrease the exposure to **afatinib**. [\[Moderate\]](#) Theoretical
 - ▶ **Antifungals, azoles (itraconazole, ketoconazole)** are predicted to increase the exposure to **afatinib**. Separate administration by 12 hours. [\[Moderate\]](#) Study
 - ▶ **Calcium channel blockers (verapamil)** are predicted to increase the exposure to **afatinib**. Separate administration by 12 hours. [\[Moderate\]](#) Study
 - ▶ **Ciclosporin** is predicted to increase the exposure to **afatinib**. Separate administration by 12 hours. [\[Moderate\]](#) Study
 - ▶ **HIV-protease inhibitors (lopinavir, ritonavir)** are predicted to increase the exposure to **afatinib**. Separate administration by 12 hours. [\[Moderate\]](#) Study
 - ▶ **Ivacaftor** is predicted to increase the exposure to **afatinib**. Separate administration by 12 hours. [\[Moderate\]](#) Study
 - ▶ **Lapatinib** is predicted to increase the exposure to **afatinib**. Separate administration by 12 hours. [\[Moderate\]](#) Study
 - ▶ **Macrolides** are predicted to increase the exposure to **afatinib**. Separate administration by 12 hours. [\[Moderate\]](#) Study
 - ▶ **Neratinib** is predicted to increase the exposure to **afatinib**. Separate administration by 12 hours. [\[Moderate\]](#) Study
 - ▶ **Ranolazine** is predicted to increase the exposure to **afatinib**. Separate administration by 12 hours. [\[Moderate\]](#) Study
 - ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **afatinib**. [\[Moderate\]](#) Study
 - ▶ **Rucaparib** is predicted to increase the exposure to **afatinib**. Separate administration by 12 hours. [\[Moderate\]](#) Study
 - ▶ **St John's wort** is predicted to decrease the exposure to **afatinib**. [\[Moderate\]](#) Study
 - ▶ **Tacrolimus** is predicted to increase the exposure to **afatinib**. Separate administration by 12 hours. [\[Moderate\]](#) Theoretical
 - ▶ **Vandetanib** is predicted to increase the exposure to **afatinib**. Separate administration by 12 hours. [\[Moderate\]](#) Study
 - ▶ **Vemurafenib** is predicted to increase the exposure to **afatinib**. Separate administration by 12 hours. [\[Moderate\]](#) Study
- Aflibercept**
 - ROUTE-SPECIFIC INFORMATION** Interactions do not generally apply to topical use unless specified.
- Agalsidase alfa**
 - ▶ **Aminoglycosides** are predicted to decrease the effects of **agalsidase alfa**. Avoid. [\[Moderate\]](#) Theoretical
 - ▶ **Antiarrhythmics (amiodarone)** are predicted to decrease the effects of **agalsidase alfa**. Avoid. [\[Moderate\]](#) Theoretical
 - ▶ **Antimalarials (chloroquine)** are predicted to decrease the effects of **agalsidase alfa**. Avoid. [\[Moderate\]](#) Theoretical
 - ▶ **Hydroxychloroquine** is predicted to decrease the effects of **agalsidase alfa**. [\[Moderate\]](#) Theoretical
- Agalsidase beta**
 - ▶ **Aminoglycosides** are predicted to decrease the effects of **agalsidase beta**. Avoid. [\[Moderate\]](#) Theoretical
 - ▶ **Antiarrhythmics (amiodarone)** are predicted to decrease the effects of **agalsidase beta**. Avoid. [\[Moderate\]](#) Theoretical
 - ▶ **Antimalarials (chloroquine)** are predicted to decrease the effects of **agalsidase beta**. Avoid. [\[Moderate\]](#) Theoretical
 - ▶ **Hydroxychloroquine** is predicted to decrease the exposure to **agalsidase beta**. [\[Moderate\]](#) Theoretical
- Agomelatine** → see TABLE 11 p. 1449 (CNS depressant effects)

Agomelatine (continued)

- ▶ Dose adjustment might be necessary if smoking started or stopped during treatment.
- ▶ Caution with concomitant use of drugs associated with hepatic injury.
- ▶ Antiepileptics (**fosphenytoin**, **phenytoin**) are predicted to decrease the exposure to **agomelatine**. [Moderate] Theoretical
- ▶ **Axitinib** is predicted to increase the exposure to **agomelatine**. [Moderate] Theoretical
- ▶ **Combined hormonal contraceptives** is predicted to increase the exposure to **agomelatine**. [Moderate] Study
- ▶ HIV-protease inhibitors (**ritonavir**) are predicted to decrease the exposure to **agomelatine**. [Moderate] Theoretical
- ▶ **Leflunomide** is predicted to decrease the exposure to **agomelatine**. [Moderate] Theoretical
- ▶ **Mexiletine** is predicted to increase the exposure to **agomelatine**. [Moderate] Study
- ▶ **Quinolones (ciprofloxacin)** are predicted to increase the exposure to **agomelatine**. [Moderate] Study
- ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **agomelatine**. [Moderate] Theoretical
- ▶ **Rucaparib** is predicted to increase the exposure to **agomelatine**. [Moderate] Study
- ▶ **SSRIs (fluvoxamine)** very markedly increase the exposure to **agomelatine**. Avoid. [Severe] Study
- ▶ **Teriflunomide** is predicted to decrease the exposure to **agomelatine**. [Moderate] Theoretical
- ▶ **Vemurafenib** is predicted to increase the exposure to **agomelatine**. [Moderate] Study

Albendazole

- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) decrease the concentration of **albendazole**. [Moderate] Study
- ▶ **H₂ receptor antagonists (cimetidine)** decrease the clearance of **albendazole**. [Moderate] Study
- ▶ HIV-protease inhibitors (**ritonavir**) decrease the exposure to **albendazole**. [Moderate] Study
- ▶ **Albendazole** slightly decreases the exposure to **levamisole** and **levamisole** moderately decreases the exposure to **albendazole**. [Moderate] Study

Alcohol → see TABLE 1 p. 1447 (hepatotoxicity), TABLE 8 p. 1448 (hypotension), TABLE 11 p. 1449 (CNS depressant effects)

ROUTE-SPECIFIC INFORMATION Interactions do not generally apply to alcohol used for topical action unless specified.

- ▶ **Alcohol** potentially increases the risk of visual disturbances when given with **antiepileptics (retigabine)**. [Moderate] Study
- ▶ **Alcohol** potentially causes a disulfiram-like reaction when given with **antifungals, azoles (ketoconazole)**. Avoid. [Moderate] Anecdotal
- ▶ **Alcohol** causes serious, potentially fatal, CNS depression when given with **clomethiazole**. Avoid. [Severe] Study → Also see TABLE 11 p. 1449
- ▶ **Alcohol** (in those who drink heavily) potentially decreases the anticoagulant effect of **coumarins**. [Severe] Study
- ▶ **Alcohol** (excessive consumption) potentially increases the risk of gastrointestinal adverse effects when given with **dimethyl fumarate**. Avoid. [Moderate] Theoretical
- ▶ **Alcohol** causes an extremely unpleasant systemic reaction when given with **disulfiram**. Avoid for at least 24 hours before and up to 14 days after stopping treatment. [Severe] Study
- ▶ **Alcohol** potentially causes a disulfiram-like reaction when given with **griseofulvin**. [Moderate] Anecdotal
- ▶ **Alcohol** potentially causes a disulfiram-like reaction when given with **levamisole**. [Moderate] Study
- ▶ **Alcohol** (excessive consumption) potentially increases the risk of lactic acidosis when given with **metformin**. Avoid excessive alcohol consumption. [Moderate] Theoretical
- ▶ **Alcohol** potentially causes a disulfiram-like reaction when given with **metronidazole**. Avoid for at least 48 hours stopping treatment. [Moderate] Study
- ▶ **Alcohol** causes rapid release of **opioids (hydromorphone, morphine)** from extended-release preparations. Avoid. [Severe] Study → Also see TABLE 11 p. 1449
- ▶ **Alcohol** (in those who drink heavily) causes severe liver damage when given with **paracetamol**. [Severe] Study → Also see TABLE 1 p. 1447
- ▶ **Alcohol** increases the risk of facial flushing and skin irritation when given with topical **pimecrolimus**. [Moderate] Study
- ▶ **Alcohol** potentially causes a disulfiram-like reaction when given with **procarbazine**. [Moderate] Anecdotal
- ▶ **Alcohol** potentially increases the concentration of **retinoids (acitretin)**. Avoid and for 2 months after stopping **acitretin**. [Moderate] Study
- ▶ **Alcohol** increases the risk of facial flushing and skin irritation when given with topical **tacrolimus**. [Moderate] Study
- ▶ **Alcohol** potentially causes a disulfiram-like reaction when given with **tinidazole**. Avoid for 72 hours stopping treatment. [Moderate] Theoretical

Adolesleukin → see TABLE 15 p. 1450 (myelosuppression)

Aldosterone antagonists → see TABLE 18 p. 1451 (hyponatraemia), TABLE 8 p. 1448 (hypotension), TABLE 16 p. 1451 (increased serum potassium)

eplerenone · spironolactone

- ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to **eplerenone**. Avoid. [Moderate] Theoretical
- ▶ **Spironolactone** is predicted to oppose the effects of **anti-androgens (abiraterone)**. Avoid. [Severe] Theoretical
- ▶ **Antiarrhythmics (amiodarone)** are predicted to increase the exposure to **eplerenone**. Adjust **eplerenone** dose, p. 209. [Severe] Theoretical
- ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to **eplerenone**. Adjust **eplerenone** dose, p. 209. [Severe] Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **eplerenone**. Avoid. [Moderate] Theoretical → Also see TABLE 18 p. 1451
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **eplerenone**. Adjust **eplerenone** dose, p. 209. [Severe] Study
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to markedly increase the exposure to **eplerenone**. Avoid. [Severe] Study
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **eplerenone**. Adjust **eplerenone** dose, p. 209. [Severe] Study → Also see TABLE 8 p. 1448
- ▶ **Cobicistat** is predicted to markedly increase the exposure to **eplerenone**. Avoid. [Severe] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **eplerenone**. Adjust **eplerenone** dose, p. 209. [Severe] Study
- ▶ **Eplerenone** very slightly increases the exposure to **digoxin**. [Mid] Study
- ▶ **Spironolactone** increases the concentration of **digoxin**. Monitor and adjust dose. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to markedly increase the exposure to **eplerenone**. Avoid. [Severe] Study
- ▶ **Idelalisib** is predicted to markedly increase the exposure to **eplerenone**. Avoid. [Severe] Study
- ▶ **Imatinib** is predicted to increase the exposure to **eplerenone**. Adjust **eplerenone** dose, p. 209. [Severe] Study
- ▶ **Letermovir** is predicted to increase the exposure to **eplerenone**. Adjust **eplerenone** dose, p. 209. [Severe] Study
- ▶ **Eplerenone** potentially increases the concentration of **lithium**. Avoid. [Moderate] Theoretical
- ▶ **Spironolactone** potentially increases the concentration of **lithium**. [Moderate] Study
- ▶ **Macrolides (clarithromycin)** are predicted to markedly increase the exposure to **eplerenone**. Avoid. [Severe] Study
- ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **eplerenone**. Adjust **eplerenone** dose, p. 209. [Severe] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **eplerenone**. Avoid. [Moderate] Theoretical
- ▶ **Spironolactone** is predicted to decrease the effects of **mitotane**. Avoid. [Severe] Anecdotal

- ▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to increase the exposure to **eplerenone**. Adjust **eplerenone** dose, p. 209. [Severe] Study
 - ▶ **Nilotinib** is predicted to increase the exposure to **eplerenone**. Adjust **eplerenone** dose, p. 209. [Severe] Study
 - ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **eplerenone**. Avoid. [Moderate] Theoretical
 - ▶ **St John's wort** is predicted to slightly decrease the exposure to **eplerenone**. Avoid. [Moderate] Study
- Alectinib** → see TABLE 6 p. 1448 (bradycardia), TABLE 1 p. 1447 (hepatotoxicity)
- Alemtuzumab** → see monoclonal antibodies
- Alendronate** → see bisphosphonates
- Alfacalcidol** → see vitamin D substances
- Alfentanil** → see opioids
- Alfuzosin** → see alpha blockers
- Alimemazine** → see antihistamines, sedating
- Aliskiren** → see TABLE 8 p. 1448 (hypotension), TABLE 16 p. 1451 (increased serum potassium)

FOOD AND LIFESTYLE Avoid apple juice and orange juice as they greatly decrease aliskiren concentrations and plasma renin activity.

- ▶ **ACE inhibitors** increase the risk of renal impairment when given with **aliskiren**. Use with caution or avoid **aliskiren** in selected patients, p. 194. [Severe] Study → Also see TABLE 8 p. 1448 → Also see TABLE 16 p. 1451
 - ▶ **Angiotensin-II receptor antagonists** increase the risk of renal impairment when given with **aliskiren**. Use with caution or avoid **aliskiren** in selected patients, p. 194. [Severe] Study → Also see TABLE 8 p. 1448 → Also see TABLE 16 p. 1451
 - ▶ **Antiarrhythmics (amiodarone, dronedarone)** are predicted to increase the exposure to **aliskiren**. [Severe] Study
 - ▶ **Antiepileptics (carbamazepine)** decrease the exposure to **aliskiren**. [Moderate] Study
 - ▶ **Antifungals, azoles (itraconazole)** markedly increase the exposure to **aliskiren**. Avoid. [Severe] Study
 - ▶ **Antifungals, azoles (ketoconazole)** moderately increase the exposure to **aliskiren**. [Moderate] Study
 - ▶ **Calcium channel blockers (verapamil)** moderately increase the exposure to **aliskiren**. [Moderate] Study → Also see TABLE 8 p. 1448
 - ▶ **Ceritinib** is predicted to increase the exposure to **aliskiren**. [Moderate] Theoretical
 - ▶ **Ciclosporin** markedly increases the exposure to **aliskiren**. Avoid. [Severe] Study → Also see TABLE 16 p. 1451
 - ▶ **Eliglustat** is predicted to increase the exposure to **aliskiren**. Adjust dose. [Moderate] Study
 - ▶ **Grapefruit** juice moderately decreases the exposure to **aliskiren**. Avoid. [Severe] Study
 - ▶ **HIV-protease inhibitors (ritonavir)** are predicted to increase the exposure to **aliskiren**. [Moderate] Theoretical
 - ▶ **Ibrutinib** is predicted to increase the exposure to **aliskiren**. Separate administration by at least 6 hours. [Moderate] Theoretical
 - ▶ **Ivacaftor** is predicted to increase the exposure to **aliskiren**. [Moderate] Study
 - ▶ **Lapatinib** is predicted to increase the exposure to **aliskiren**. [Moderate] Theoretical
 - ▶ **Aliskiren** slightly decreases the exposure to **loop diuretics (furosemide)**. [Moderate] Study → Also see TABLE 8 p. 1448
 - ▶ **Lorlatinib** is predicted to decrease the exposure to **aliskiren**. [Moderate] Study
 - ▶ **Macrolides (azithromycin)** are predicted to increase the exposure to **aliskiren**. [Moderate] Theoretical
 - ▶ **Macrolides (clarithromycin, erythromycin)** are predicted to increase the exposure to **aliskiren**. [Moderate] Study
 - ▶ **Mirabegron** is predicted to increase the exposure to **aliskiren**. [Mild] Theoretical
 - ▶ **Neratinib** is predicted to increase the exposure to **aliskiren**. [Moderate] Study
 - ▶ **Olaparib** might increase the exposure to **aliskiren**. [Moderate] Theoretical
 - ▶ **Osimertinib** is predicted to increase the exposure to **aliskiren**. [Moderate] Study
 - ▶ **Pibrentasvir** with glecaprevir is predicted to increase the exposure to **aliskiren**. [Moderate] Study
 - ▶ **Pitolisant** is predicted to decrease the exposure to **aliskiren**. [Mild] Theoretical
 - ▶ **Ranolazine** is predicted to increase the exposure to **aliskiren**. [Moderate] Theoretical
 - ▶ **Rifamycins (rifampicin)** decrease the exposure to **aliskiren**. [Moderate] Study
 - ▶ **St John's wort** decreases the exposure to **aliskiren**. [Moderate] Study
 - ▶ **Statins (atorvastatin)** slightly to moderately increase the exposure to **aliskiren**. [Moderate] Study
 - ▶ **Vandetanib** is predicted to increase the exposure to **aliskiren**. [Moderate] Study
 - ▶ **Velpatasvir** is predicted to increase the exposure to **aliskiren**. [Severe] Theoretical
 - ▶ **Vemurafenib** is predicted to increase the exposure to **aliskiren**. Use with caution and adjust dose. [Moderate] Theoretical
- Alitreinoin** → see retinoids
- Alkylating agents** → see TABLE 15 p. 1450 (myelosuppression), TABLE 2 p. 1447 (nephrotoxicity), TABLE 5 p. 1448 (thrombocytopenia)
- bendamustine · busulfan · carmustine · chlorambucil · cyclophosphamide · dacarbazine · estramustine · ifosfamide · lomustine · melphalan · temozolomide · thiotepa · treosulfan
- ▶ Oral **antacids** are predicted to decrease the absorption of oral **estramustine**. Avoid. [Moderate] Study
 - ▶ **Antifungals, azoles (isavuconazole)** are predicted to increase the exposure to **cyclophosphamide**. [Moderate] Study
 - ▶ **Antifungals, azoles (itraconazole)** increase the risk of busulfan toxicity when given with **busulfan**. Monitor and adjust dose. [Moderate] Study
 - ▶ **Antifungals, azoles (miconazole)** are predicted to increase the concentration of **busulfan**. Use with caution and adjust dose. [Moderate] Theoretical
 - ▶ Oral **calcium salts** decrease the absorption of **estramustine**. [Severe] Study
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **alkylating agents**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
 - ▶ **Metronidazole** increases the risk of toxicity when given with **busulfan**. [Severe] Study
 - ▶ **Neurokinin-1 receptor antagonists (aprepitant, fosaprepitant)** are predicted to increase the exposure to **ifosfamide**. [Severe] Theoretical
 - ▶ **Neurokinin-1 receptor antagonists (netupitant)** very slightly increase the exposure to **cyclophosphamide**. [Moderate] Study
 - ▶ **Neurokinin-1 receptor antagonists (netupitant)** are predicted to increase the exposure to **ifosfamide**. [Moderate] Study
 - ▶ **Paracetamol** is predicted to decrease the clearance of **busulfan**. [Moderate] Theoretical
 - ▶ **Cyclophosphamide** (high-dose) increases the risk of toxicity when given with **pentostatin**. Avoid. [Severe] Anecdotal → Also see TABLE 15 p. 1450 → Also see TABLE 5 p. 1448
 - ▶ **Cyclophosphamide** increases the risk of prolonged neuromuscular blockade when given with **suxamethonium**. [Moderate] Study
- Allopurinol**
- ▶ **ACE inhibitors** are predicted to increase the risk of hypersensitivity and haematological reactions when given with **allopurinol**. [Severe] Anecdotal
 - ▶ **Allopurinol** potentially increases the risk of haematological toxicity when given with **azathioprine**. Adjust **azathioprine** dose, p. 886. [Severe] Study
 - ▶ **Allopurinol** is predicted to decrease the effects of **capecitabine**. Avoid. [Severe] Study
 - ▶ **Allopurinol** potentially increases the risk of haematological toxicity when given with **mercaptopurine**. Adjust **mercaptopurine** dose, p. 962. [Severe] Study
 - ▶ **Allopurinol** increases the risk of skin rash when given with **penicillins (amoxicillin, ampicillin)**. [Moderate] Study
 - ▶ **Allopurinol** is predicted to increase the risk of hyperuricaemia when given with **pyrazinamide**. [Moderate] Theoretical
 - ▶ **Thiazide diuretics** are predicted to increase the risk of hypersensitivity reactions when given with **allopurinol**. [Severe] Theoretical
- Almotriptan** → see triptans

Alogliptin → see dipeptidylpeptidase-4 inhibitors

Alpelisib

- ▶ **Alpelisib** is predicted to decrease the efficacy of **bupropion**. [Mild] Theoretical
- ▶ **Ciclosporin** is predicted to increase the exposure to **alpelisib**. [Moderate] Theoretical
- ▶ **Alpelisib** is predicted to decrease the efficacy of **coumarins (warfarin)**. [Moderate] Theoretical
- ▶ **Eltrombopag** is predicted to increase the exposure to **alpelisib**. [Moderate] Theoretical
- ▶ **Lapatinib** is predicted to increase the exposure to **alpelisib**. [Moderate] Theoretical
- ▶ **Leflunomide** is predicted to increase the exposure to **alpelisib**. [Moderate] Theoretical
- ▶ **Proton pump inhibitors (pantoprazole)** are predicted to increase the exposure to **alpelisib**. [Moderate] Theoretical
- ▶ **Teriflunomide** is predicted to increase the exposure to **alpelisib**. [Moderate] Theoretical

Alpha blockers → see TABLE 7 p. 1448 (first-dose hypotension), TABLE 8 p. 1448 (hypotension)

alfuzosin · doxazosin · indoramin · prazosin · tamsulosin · terazosin

- ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to **tamsulosin**. [Moderate] Theoretical
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **tamsulosin**. [Moderate] Theoretical
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **doxazosin**. [Moderate] Study
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to moderately increase the exposure to alpha blockers (**alfuzosin, tamsulosin**). Use with caution or avoid. [Moderate] Study
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **tamsulosin**. [Moderate] Theoretical → Also see TABLE 8 p. 1448
- ▶ **Cobicistat** is predicted to moderately increase the exposure to alpha blockers (**alfuzosin, tamsulosin**). Use with caution or avoid. [Moderate] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **doxazosin**. [Moderate] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **tamsulosin**. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to moderately increase the exposure to alpha blockers (**alfuzosin, tamsulosin**). Use with caution or avoid. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **doxazosin**. [Moderate] Study
- ▶ **Idelalisib** is predicted to moderately increase the exposure to alpha blockers (**alfuzosin, tamsulosin**). Use with caution or avoid. [Moderate] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **doxazosin**. [Moderate] Study
- ▶ **Imatinib** is predicted to increase the exposure to **tamsulosin**. [Moderate] Theoretical
- ▶ **Letermovir** is predicted to increase the exposure to **tamsulosin**. [Moderate] Theoretical
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **doxazosin**. [Moderate] Study
- ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **tamsulosin**. [Moderate] Theoretical
- ▶ **Macrolides (clarithromycin)** are predicted to moderately increase the exposure to alpha blockers (**alfuzosin, tamsulosin**). Use with caution or avoid. [Moderate] Study
- ▶ **MAOs, irreversible** are predicted to increase the effects of **indoramin**. Avoid. [Severe] Theoretical → Also see TABLE 8 p. 1448
- ▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to increase the exposure to **tamsulosin**. [Moderate] Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to **tamsulosin**. [Moderate] Theoretical
- ▶ **Alpha blockers** cause significant hypotensive effects when given with **phosphodiesterase type-5 inhibitors**. Patient should be stabilised on first drug then second drug should be added

at the lowest recommended dose. [Severe] Study → Also see TABLE 8 p. 1448

- ▶ **Ribociclib** (high-dose) is predicted to increase the exposure to **alfuzosin**. Avoid. [Moderate] Theoretical

Alprazolam → see benzodiazepines

Alprostadil → see TABLE 8 p. 1448 (hypotension)

Alteplase → see TABLE 3 p. 1447 (anticoagulant effects)

Aluminium hydroxide

SEPARATION OF ADMINISTRATION Aluminium-containing antacids should preferably not be taken at the same time as other drugs since they might impair absorption. **Aluminium-containing antacids** might damage enteric coatings designed to prevent dissolution in the stomach.

- ▶ Oral **aluminium hydroxide** decreases the absorption of **chenodeoxycholic acid**. [Moderate] Study
- ▶ **Aluminium hydroxide** increases the risk of blocked enteral or nasogastric tubes when given with **enteral feeds**. [Moderate] Study
- ▶ **Aluminium hydroxide** is predicted to decrease the exposure to **iron chelators (deferasirox)**. Avoid. [Moderate] Theoretical
- ▶ **Aluminium hydroxide** is predicted to decrease the absorption of **iron chelators (deferiprone)**. Avoid. [Moderate] Theoretical
- ▶ **Amantadine** → see dopamine receptor agonists
- ▶ **Ambrisentan** → see endothelin receptor antagonists
- ▶ **Amfetamines** → see TABLE 13 p. 1450 (serotonin syndrome)

dexamfetamine · lisdexamfetamine

- ▶ **Amfetamines** are predicted to decrease the effects of **apraclonidine**. Avoid. [Severe] Theoretical
- ▶ **Amfetamines** are predicted to increase the risk of adverse effects when given with **atomoxetine**. [Severe] Theoretical
- ▶ **HIV-protease inhibitors (ritonavir, tipranavir)** are predicted to increase the exposure to **amfetamines**. [Severe] Theoretical
- ▶ **MAO-B inhibitors (rasagiline, selegiline)** are predicted to increase the risk of severe hypertension when given with **amfetamines**. Avoid. [Severe] Theoretical → Also see TABLE 13 p. 1450
- ▶ **MAO-B inhibitors (safinamide)** are predicted to increase the risk of severe hypertension when given with **amfetamines**. [Severe] Theoretical → Also see TABLE 13 p. 1450
- ▶ **Amfetamines** are predicted to increase the risk of a hypertensive crisis when given with **MAOs, irreversible**. Avoid and for 14 days after stopping the MAOI. [Severe] Anecdotal → Also see TABLE 13 p. 1450
- ▶ **Amfetamines** are predicted to increase the risk of a hypertensive crisis when given with **moclobemide**. Avoid. [Severe] Theoretical → Also see TABLE 13 p. 1450
- ▶ **Nabilone** is predicted to increase the risk of cardiovascular adverse effects when given with **amfetamines**. [Severe] Theoretical
- ▶ **Phenothiazines** are predicted to decrease the effects of **amfetamines** and **amfetamines** are predicted to decrease the effects of **phenothiazines**. [Moderate] Study
- ▶ **SSRIs (fluoxetine, paroxetine)** are predicted to increase the exposure to **amfetamines**. [Severe] Theoretical → Also see TABLE 13 p. 1450

Amifampridine → see TABLE 9 p. 1449 (QT-interval prolongation)

Amikacin → see aminoglycosides

Amiloride → see potassium-sparing diuretics

Aminoglycosides → see TABLE 2 p. 1447 (nephrotoxicity), TABLE 19 p. 1451 (ototoxicity), TABLE 20 p. 1451 (neuromuscular blocking effects)

amikacin · gentamicin · streptomycin · tobramycin

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application, the possibility of interactions with topical **gentamicin** and **tobramycin** should be borne in mind.

- ▶ **Aminoglycosides** are predicted to decrease the effects of **agalsidase alfa**. Avoid. [Moderate] Theoretical
- ▶ **Aminoglycosides** are predicted to decrease the effects of **agalsidase beta**. Avoid. [Moderate] Theoretical
- ▶ **Antifungals, azoles (miconazole)** potentially decrease the exposure to **tobramycin**. [Moderate] Anecdotal
- ▶ **Ataluren** is predicted to increase the risk of nephrotoxicity when given with intravenous **aminoglycosides**. Avoid. [Severe] Study

- ▶ **Aminoglycosides** increase the risk of hypocalcaemia when given with **bisphosphonates**. [Moderate] Anecdotal → Also see TABLE 2 p. 1447
 - ▶ **Aminoglycosides** potentially increase the concentration of **digoxin**. Monitor and adjust dose. [Mid] Study
 - ▶ **Loop diuretics** increase the risk of nephrotoxicity when given with **aminoglycosides**. Avoid. [Moderate] Study → Also see TABLE 19 p. 1451
 - ▶ **Aminoglycosides** are predicted to decrease the effects of **neostigmine**. [Moderate] Theoretical
 - ▶ **Aminoglycosides** are predicted to decrease the effects of **pyridostigmine**. [Moderate] Theoretical
- Aminophylline** → see TABLE 17 p. 1451 (reduced serum potassium)
- FOOD AND LIFESTYLE** Smoking can increase aminophylline clearance and increased doses of aminophylline are therefore required; dose adjustments are likely to be necessary if smoking started or stopped during treatment.
- ▶ **Aciclovir** increases the exposure to **aminophylline**. Monitor and adjust dose. [Severe] Anecdotal
 - ▶ **Aminophylline** is predicted to decrease the efficacy of **antiarrhythmics (adenosine)**. Separate administration by 24 hours. [Mid] Theoretical
 - ▶ **Antiepileptics (fosphenytoin)** are predicted to decrease the exposure to **aminophylline**. Adjust dose. [Moderate] Study
 - ▶ **Antiepileptics (phenobarbital)** are predicted to decrease the exposure to **aminophylline**. Adjust dose. [Moderate] Theoretical
 - ▶ **Antiepileptics (phenytoin)** decrease the exposure to **aminophylline**. Adjust dose. [Moderate] Study
 - ▶ **Antiepileptics (primidone)** are predicted to increase the clearance of **aminophylline**. Adjust dose. [Moderate] Theoretical
 - ▶ **Antiepileptics (stiripentol)** are predicted to increase the exposure to **aminophylline**. Avoid. [Moderate] Theoretical
 - ▶ **Axitinib** is predicted to increase the exposure to **aminophylline**. [Moderate] Theoretical
 - ▶ **Beta blockers, non-selective** are predicted to increase the risk of bronchospasm when given with **aminophylline**. Avoid. [Severe] Theoretical
 - ▶ **Beta blockers, selective** are predicted to increase the risk of bronchospasm when given with **aminophylline**. Avoid. [Severe] Theoretical
 - ▶ **Combined hormonal contraceptives** is predicted to increase the exposure to **aminophylline**. Adjust dose. [Moderate] Theoretical
 - ▶ **Aminophylline** increases the risk of agitation when given with **doxapram**. [Moderate] Study
 - ▶ **Esketamine** is predicted to increase the risk of seizures when given with **aminophylline**. Avoid. [Severe] Theoretical
 - ▶ **H₂ receptor antagonists (cimetidine)** increase the concentration of **aminophylline**. Adjust dose. [Severe] Study
 - ▶ **HIV-protease inhibitors (ritonavir)** decrease the exposure to **aminophylline**. Adjust dose. [Moderate] Study
 - ▶ **Interferons** are predicted to slightly increase the exposure to **aminophylline**. Adjust dose. [Moderate] Theoretical
 - ▶ **Iron chelators (deferasirox)** are predicted to increase the exposure to **aminophylline**. Avoid. [Moderate] Theoretical
 - ▶ **Isoniazid** is predicted to affect the clearance of **aminophylline**. [Severe] Theoretical
 - ▶ **Leflunomide** decreases the exposure to **aminophylline**. Adjust dose. [Moderate] Study
 - ▶ **Aminophylline** is predicted to decrease the concentration of **lithium**. [Moderate] Theoretical
 - ▶ **Macrolides (azithromycin)** are predicted to increase the exposure to **aminophylline**. [Moderate] Theoretical
 - ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **aminophylline**. Adjust dose. [Moderate] Theoretical
 - ▶ **Aminophylline** is predicted to decrease the exposure to **macrolides (erythromycin)**. Adjust dose. [Severe] Study
 - ▶ **Methotrexate** is predicted to decrease the clearance of **aminophylline**. [Moderate] Theoretical
 - ▶ **Metreleptin** might alter the exposure to **aminophylline**. [Severe] Theoretical
 - ▶ **Mexiletine** is predicted to increase the exposure to **aminophylline**. Adjust dose. [Moderate] Theoretical
 - ▶ **Monoclonal antibodies (blinatumomab)** are predicted to transiently increase the exposure to **aminophylline**. Monitor and adjust dose. [Moderate] Theoretical
 - ▶ **Monoclonal antibodies (sarilumab)** potentially affect the exposure to **aminophylline**. Monitor and adjust dose. [Moderate] Theoretical
 - ▶ **Monoclonal antibodies (tocilizumab)** are predicted to decrease the exposure to **aminophylline**. Monitor and adjust dose. [Moderate] Theoretical
 - ▶ **Pentoxifylline** is predicted to increase the concentration of **aminophylline**. Use with caution or avoid. [Severe] Theoretical
 - ▶ **Aminophylline** is predicted to slightly increase the exposure to **phosphodiesterase type-4 inhibitors (roflumilast)**. Avoid. [Moderate] Theoretical
 - ▶ **Quinolones (ciprofloxacin)** are predicted to increase the exposure to **aminophylline**. Adjust dose. [Moderate] Theoretical
 - ▶ **Rifamycins (rifampicin)** decrease the exposure to **aminophylline**. Adjust dose. [Moderate] Study
 - ▶ **Rucaparib** is predicted to increase the exposure to **aminophylline**. Adjust dose. [Moderate] Theoretical
 - ▶ **SSRIs (fluvoxamine)** moderately to markedly increase the exposure to **aminophylline**. Avoid. [Severe] Study
 - ▶ **St John's wort** is predicted to decrease the concentration of **aminophylline**. [Severe] Theoretical
 - ▶ **Sympathomimetics, vasoconstrictor (ephedrine)** increase the risk of adverse effects when given with **aminophylline**. Avoid in children. [Moderate] Study
 - ▶ **Teriflunomide** decreases the exposure to **aminophylline**. Adjust dose. [Moderate] Study
 - ▶ **Valaciclovir** is predicted to increase the exposure to **aminophylline**. [Severe] Anecdotal
 - ▶ **Vemurafenib** is predicted to increase the exposure to **aminophylline**. Adjust dose. [Moderate] Theoretical
- Aminosalicilyc acid**
- ▶ **Aminosalicilyc acid** is predicted to increase the risk of methaemoglobinemia when given with topical **anaesthetics, local (prilocaine)**. Use with caution or avoid. [Severe] Theoretical
 - ▶ **Aminosalicilyc acid** is predicted to increase the risk of methaemoglobinemia when given with **dapsone**. [Severe] Theoretical
- Amiodarone** → see antiarrhythmics
- Amisulpride** → see antipsychotics, second generation
- Amitriptyline** → see tricyclic antidepressants
- Amiodipine** → see calcium channel blockers
- Amoxicillin** → see penicillins
- Amphotericin B** → see TABLE 2 p. 1447 (nephrotoxicity), TABLE 17 p. 1451 (reduced serum potassium)
- ▶ **Amphotericin B** increases the risk of toxicity when given with **flucytosine**. [Severe] Study
 - ▶ **Micafungin** slightly increases the exposure to **amphotericin B**. Avoid or monitor toxicity. [Moderate] Study
- Ampicillin** → see penicillins
- Amsacrine** → see TABLE 15 p. 1450 (myelosuppression)
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **amsacrine**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- Anaesthetics, local** → see TABLE 11 p. 1449 (CNS depressant effects)
- bupivacaine · levobupivacaine · mepivacaine · oxybuprocaine · prilocaine · proxymetacaine · ropivacaine · tetracaine
- ROUTE-SPECIFIC INFORMATION** Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.
- ▶ **Aminosalicilyc acid** is predicted to increase the risk of methaemoglobinemia when given with topical **prilocaine**. Use with caution or avoid. [Severe] Theoretical
 - ▶ **Anaesthetics, local** are predicted to increase the risk of cardiodepression when given with **antiarrhythmics**. [Severe] Theoretical → Also see TABLE 11 p. 1449
 - ▶ **Antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to increase the risk of methaemoglobinemia when given with topical **prilocaine**. Use with caution or avoid. [Severe] Theoretical → Also see TABLE 11 p. 1449
 - ▶ **Antiepileptics (phenytoin)** are predicted to decrease the exposure to **ropivacaine**. [Moderate] Theoretical

Anaesthetics, local (continued)

- ▶ **Antimalarials (chloroquine, primaquine)** are predicted to increase the risk of methaemoglobinemia when given with topical **prilocaine**. Use with caution or avoid. [Severe] Theoretical
 - ▶ **Axitinib** is predicted to increase the exposure to **ropivacaine**. [Moderate] Theoretical
 - ▶ **Combined hormonal contraceptives** is predicted to increase the exposure to **ropivacaine**. [Moderate] Theoretical
 - ▶ **Dapsone** is predicted to increase the risk of methaemoglobinemia when given with topical **prilocaine**. Use with caution or avoid. [Severe] Theoretical
 - ▶ **HIV-protease inhibitors (ritonavir)** are predicted to decrease the exposure to **ropivacaine**. [Moderate] Theoretical
 - ▶ **Leflunomide** is predicted to decrease the exposure to **ropivacaine**. [Moderate] Theoretical
 - ▶ **Metoclopramide** is predicted to increase the risk of methaemoglobinemia when given with topical **prilocaine**. Avoid. [Severe] Theoretical
 - ▶ **Mexiletine** is predicted to increase the exposure to **ropivacaine**. [Moderate] Theoretical
 - ▶ **Nitrates** are predicted to increase the risk of methaemoglobinemia when given with topical **prilocaine**. Avoid. [Severe] Theoretical
 - ▶ **Nitrofurantoin** is predicted to increase the risk of methaemoglobinemia when given with topical **prilocaine**. Use with caution or avoid. [Severe] Theoretical
 - ▶ **Nitroprusside** is predicted to increase the risk of methaemoglobinemia when given with **prilocaine**. [Severe] Theoretical
 - ▶ **Paracetamol** is predicted to increase the risk of methaemoglobinemia when given with topical **prilocaine**. Use with caution or avoid. [Severe] Theoretical
 - ▶ **Quinolones (ciprofloxacin)** are predicted to increase the exposure to **ropivacaine**. [Moderate] Theoretical
 - ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **ropivacaine**. [Moderate] Theoretical
 - ▶ **Rucaparib** is predicted to increase the exposure to **ropivacaine**. [Moderate] Theoretical
 - ▶ **SSRIs (fluvoxamine)** decrease the clearance of **ropivacaine**. Avoid prolonged use. [Moderate] Study
 - ▶ **Sulfonamides** potentially increase the risk of methaemoglobinemia when given with topical **prilocaine**. Use with caution or avoid. [Severe] Anecdotal
 - ▶ **Terflunomide** is predicted to decrease the exposure to **ropivacaine**. [Moderate] Theoretical
 - ▶ **Vemurafenib** is predicted to increase the exposure to **ropivacaine**. [Moderate] Theoretical
 - ▶ **Anagrelide** → see TABLE 9 p. 1449 (QT-interval prolongation), TABLE 4 p. 1447 (antiplatelet effects)
 - ▶ **Combined hormonal contraceptives** is predicted to increase the exposure to **anagrelide**. [Moderate] Theoretical
 - ▶ **Mexiletine** is predicted to increase the exposure to **anagrelide**. [Moderate] Theoretical
 - ▶ **Quinolones (ciprofloxacin)** are predicted to increase the exposure to **anagrelide**. [Moderate] Theoretical
 - ▶ **Rucaparib** is predicted to increase the exposure to **anagrelide**. [Moderate] Theoretical
 - ▶ **SSRIs (fluvoxamine)** are predicted to increase the exposure to **anagrelide**. [Moderate] Theoretical → Also see TABLE 4 p. 1447
 - ▶ **Vemurafenib** is predicted to increase the exposure to **anagrelide**. [Moderate] Theoretical → Also see TABLE 9 p. 1449
- Anakinra**
- ▶ **Anakinra** is predicted to increase the risk of generalised infection (possibly life-threatening) when given with **etanercept**. Avoid. [Severe] Theoretical
 - ▶ **Filgotinib** is predicted to increase the risk of immunosuppression when given with **anakinra**. Avoid. [Severe] Theoretical
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **anakinra**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
 - ▶ **Anakinra** is predicted to increase the risk of generalised infection (possibly life-threatening) when given with **monoclonal antibodies (golimumab)**. Avoid. [Severe] Theoretical

Andexanet alfa

- ▶ **Andexanet alfa** has been reported to affect the anticoagulant effect of **heparin**. Avoid. [Severe] Anecdotal
 - ▶ **Andexanet alfa** is predicted to affect the anticoagulant effect of **low molecular-weight heparins**. Avoid. [Severe] Theoretical
- Angiotensin-II receptor antagonists** → see TABLE 7 p. 1448 (first-dose hypotension), TABLE 8 p. 1448 (hypotension), TABLE 16 p. 1451 (increased serum potassium)
- azilsartan · candesartan · eprosartan · irbesartan · losartan · olmesartan · telmisartan · valsartan
- ▶ **Angiotensin-II receptor antagonists** increase the risk of renal impairment when given with **aliskiren**. Use with caution or avoid **aliskiren** in selected patients, p. 194. [Severe] Study → Also see TABLE 8 p. 1448 → Also see TABLE 16 p. 1451
 - ▶ **Filgotinib** is predicted to increase the exposure to **valsartan**. Avoid. [Moderate] Theoretical
 - ▶ **Angiotensin-II receptor antagonists** potentially increase the concentration of **lithium**. Monitor concentration and adjust dose. [Severe] Anecdotal

Antacids

SEPARATION OF ADMINISTRATION Aluminium- and magnesium-containing antacids should preferably not be taken at the same time as other drugs since they might impair absorption. Aluminium- and magnesium-containing antacids might damage enteric coatings designed to prevent dissolution in the stomach.

- ▶ Oral **antacids** are predicted to decrease the exposure to oral **acalabrutinib**. Separate administration by at least 2 hours. [Moderate] Study
- ▶ Oral **antacids** are predicted to decrease the absorption of oral **alkylating agents (estramustine)**. Avoid. [Moderate] Study
- ▶ Oral **antacids** decrease the absorption of oral **antiepileptics (gabapentin)**. **Gabapentin** should be taken 2 hours after antacids. [Moderate] Study
- ▶ Oral **antacids** decrease the absorption of oral **antifungals, azoles (itraconazole)** capsules. **Itraconazole** should be taken 2 hours before or 1 hour after antacids. [Moderate] Study
- ▶ Oral **antacids** decrease the absorption of oral **antifungals, azoles (ketoconazole)**. Separate administration by at least 2 hours. [Moderate] Study
- ▶ Oral **antacids** decrease the absorption of oral **antihistamines, non-sedating (fexofenadine)**. Separate administration by 2 hours. [Mild] Study
- ▶ Oral **antacids** decrease the absorption of oral **antimalarials (chloroquine)**. Separate administration by at least 4 hours. [Moderate] Study
- ▶ Oral **antacids** are predicted to decrease the absorption of oral **antimalarials (proguanil)**. Separate administration by at least 2 hours. [Moderate] Study
- ▶ Oral **antacids** decrease the absorption of oral **aspirin** (high-dose). [Moderate] Study
- ▶ Oral **antacids** decrease the exposure to oral **bictegravir**. Separate administration by at least 2 hours. [Moderate] Study
- ▶ Oral **antacids** decrease the absorption of oral **bisphosphonates (alendronate)**. **Alendronate** should be taken at least 30 minutes before antacids. [Moderate] Study
- ▶ Oral **antacids** decrease the absorption of oral **bisphosphonates (clodronate)**. Avoid antacids for 2 hours before or 1 hour after **clodronate**. [Moderate] Study
- ▶ Oral **antacids** are predicted to decrease the absorption of oral **bisphosphonates (ibandronate)**. Avoid antacids for at least 6 hours before or 1 hour after **ibandronate**. [Moderate] Theoretical
- ▶ Oral **antacids** decrease the absorption of oral **bisphosphonates (risedronate)**. Separate administration by at least 2 hours. [Moderate] Study
- ▶ Oral **antacids** are predicted to decrease the absorption of oral **bosutinib**. **Bosutinib** should be taken at least 12 hours before antacids. [Moderate] Theoretical
- ▶ Oral **antacids** are predicted to decrease the absorption of oral **ceritinib**. Separate administration by 2 hours. [Moderate] Theoretical
- ▶ Oral **antacids** are predicted to decrease the absorption of oral **cholic acid**. Separate administration by 5 hours. [Mild] Theoretical

- Oral **antacids** are predicted to decrease the absorption of oral **corticosteroids (deflazacort)**. Separate administration by 2 hours. [Moderate] Theoretical
 - Oral **antacids** decrease the absorption of oral **corticosteroids (dexamethasone)**. [Moderate] Study
 - Oral **antacids** decrease the absorption of oral **dasatinib**. Separate administration by at least 2 hours. [Moderate] Study
 - Oral **antacids** decrease the absorption of oral **digoxin**. Separate administration by 2 hours. [Mild] Study
 - Oral **antacids** are predicted to decrease the absorption of oral **dipyridamole** (immediate release tablets). [Moderate] Theoretical
 - Oral **antacids** decrease the exposure to oral **dolutegravir**. **Dolutegravir** should be taken 2 hours before or 6 hours after antacids. [Moderate] Study
 - Oral **antacids** decrease the absorption of oral **eltrombopag**. **Eltrombopag** should be taken 2 hours before or 4 hours after antacids. [Severe] Study
 - Oral **antacids** decrease the exposure to oral **elvitegravir**. Separate administration by at least 4 hours. [Moderate] Study
 - Oral **antacids** are predicted to decrease the absorption of oral **erlotinib**. **Erlotinib** should be taken 2 hours before or 4 hours after antacids. [Moderate] Theoretical
 - Oral **antacids** decrease the exposure to oral **fibrates (gemfibrozil)**. [Moderate] Study
 - Oral **antacids** are predicted to decrease the exposure to oral **gefitinib**. [Moderate] Theoretical
 - Oral **antacids** are predicted to decrease the absorption of oral **HIV-protease inhibitors (atazanavir)**. **Atazanavir** should be taken 2 hours before or 1 hour after antacids. [Severe] Theoretical
 - Oral **antacids** are predicted to decrease the absorption of oral **HIV-protease inhibitors (tipranavir)**. Separate administration by 2 hours. [Moderate] Study
 - Oral **antacids** decrease the absorption of oral **hydroxychloroquine**. Separate administration by at least 4 hours. [Moderate] Study
 - Oral **antacids** decrease the absorption of oral **iron**. Manufacturer advises iron should be taken 1 hour before or 2 hours after antacids. [Moderate] Study
 - Oral **antacids** is predicted to decrease the absorption of oral **lapatinib**. Avoid. [Moderate] Theoretical
 - Oral **antacids** are predicted to decrease the exposure to oral **ledipasvir**. Separate administration by 4 hours. [Moderate] Theoretical
 - Oral **antacids** decrease the exposure to oral **mycophenolate**. [Moderate] Study
 - Oral **antacids** are predicted to decrease the exposure to oral **neratinib**. Separate administration by at least 3 hours. [Mild] Theoretical
 - Oral **antacids** might affect the absorption of oral **nilotinib**. Separate administration by at least 2 hours. [Moderate] Theoretical
 - Oral **antacids** are predicted to decrease the exposure to oral **NNRTIs (rilpivirine)**. **Rilpivirine** should be taken 4 hours before or 2 hours after antacids. [Severe] Theoretical
 - Oral **antacids** are predicted to decrease the absorption of oral **pazopanib**. **Pazopanib** should be taken 1 hour before or 2 hours after antacids. [Moderate] Theoretical
 - Oral **antacids** decrease the absorption of oral **penicillamine**. Separate administration by 2 hours. [Mild] Study
 - Oral **antacids** decrease the absorption of oral **phenothiazines**. [Moderate] Anecdotal
 - Oral **antacids** increase the risk of metabolic alkalosis when given with oral **polystyrene sulfonate**. [Severe] Anecdotal
 - Oral **antacids** decrease the absorption of oral **quinolones**. **Quinolones** should be taken 2 hours before or 4 hours after antacids. [Moderate] Study
 - Oral **antacids** decrease the exposure to oral **raltegravir**. Avoid. [Moderate] Study
 - Oral **antacids** decrease the absorption of oral **rifamycins (rifampicin)**. **Rifampicin** should be taken 1 hour before antacids. [Moderate] Study
 - Oral **antacids** decrease the exposure to oral **riociguat**. **Riociguat** should be taken 1 hour before or 2 hours after antacids. [Mild] Study
 - Oral **antacids** decrease the absorption of oral **statins (rosuvastatin)**. Separate administration by 2 hours. [Moderate] Study
 - Oral **antacids** decrease the absorption of oral **strontium**. Separate administration by 2 hours. [Moderate] Study
 - Oral **antacids** decrease the absorption of oral **sulpiride**. Separate administration by 2 hours. [Moderate] Study
 - Oral **antacids** greatly decrease the absorption of oral **tetracyclines**. Separate administration by 2 to 3 hours. [Moderate] Study
 - Oral **antacids** are predicted to decrease the absorption of oral **thyroid hormones (levothyroxine)**. Separate administration by at least 4 hours. [Moderate] Anecdotal
 - Oral **antacids** are predicted to decrease the absorption of oral **ursodeoxycholic acid**. Separate administration by 2 hours. [Moderate] Theoretical
 - Oral **antacids** are predicted to decrease the concentration of oral **velpatasvir**. Separate administration by 4 hours. [Moderate] Theoretical
- Antazoline** → see antihistamines, sedating
- Anthracyclines** → see TABLE 15 p. 1450 (myelosuppression), TABLE 5 p. 1448 (thromboembolism)
- daunorubicin • doxorubicin • epirubicin • idarubicin • mitoxantrone • pixantrone
- GENERAL INFORMATION** Caution is necessary with concurrent use of **anthracyclines** with cardiotoxic drugs, or drugs that reduce cardiac contractility.
- Calcium channel blockers (verapamil)** moderately increase the exposure to **doxorubicin**. [Moderate] Study
 - Cyclosporin** increases the concentration of anthracyclines (**daunorubicin**, **doxorubicin**, **epirubicin**, **idarubicin**, **mitoxantrone**). [Severe] Study
 - H₂ receptor antagonists (cimetidine)** slightly increase the exposure to **epirubicin**. Avoid. [Moderate] Study
 - Leflunomide** is predicted to increase the exposure to anthracyclines (**daunorubicin**, **doxorubicin**, **mitoxantrone**). [Moderate] Theoretical → Also see TABLE 15 p. 1450
 - Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **anthracyclines**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
 - Anthracyclines** are predicted to increase the risk of cardiotoxicity when given with **monoclonal antibodies (trastuzumab, trastuzumab emtansine)**. Avoid. [Severe] Theoretical → Also see TABLE 15 p. 1450
 - Anthracyclines** are predicted to increase the risk of cardiotoxicity when given with **monoclonal antibodies (trastuzumab deruxtecan)**. [Severe] Theoretical → Also see TABLE 15 p. 1450
 - Teriflunomide** is predicted to increase the exposure to anthracyclines (**daunorubicin**, **doxorubicin**, **mitoxantrone**). [Moderate] Theoretical
- Anti-androgens** → see TABLE 9 p. 1449 (QT-interval prolongation)
- abiraterone • apalutamide • bicalutamide • cyproterone • darolutamide • enzalutamide • flutamide
- GENERAL INFORMATION** Caution with concurrent chemotherapy—safety and efficacy with **abiraterone** and **enzalutamide** not established.
- Anti-androgens (**apalutamide**, **enzalutamide**) are predicted to decrease the exposure to **5-HT₃-receptor antagonists (ondansetron)**. [Moderate] Study → Also see TABLE 9 p. 1449
 - Anti-androgens (**apalutamide**, **enzalutamide**) are predicted to markedly decrease the exposure to **abemaciclib**. Avoid. [Severe] Study
 - Anti-androgens (**apalutamide**, **enzalutamide**) are predicted to decrease the exposure to **acalabrutinib**. Avoid. [Severe] Study
 - Aldosterone antagonists (spironolactone)** are predicted to oppose the effects of **abiraterone**. Avoid. [Severe] Theoretical
 - Anti-androgens (**apalutamide**, **enzalutamide**) are predicted to decrease the exposure to **aldosterone antagonists (eplerenone)**. Avoid. [Moderate] Theoretical

Anti-androgens (continued)

- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to anti-androgens (**abiraterone**). Avoid. [\[Severe\]](#) Study
- ▶ Anti-androgens (**apalutamide**) are predicted to decrease the exposure to anti-androgens (**darolutamide**). Avoid. [\[Moderate\]](#) Study
- ▶ Anti-androgens (**enzalutamide**) are predicted to decrease the exposure to anti-androgens (**darolutamide**). Avoid. [\[Moderate\]](#) Study
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **antiarrhythmics (disopyramide, dronedarone)**. Avoid. [\[Severe\]](#) Study → Also see TABLE 9 p. 1449
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the efficacy of **antiarrhythmics (propafenone)**. [\[Moderate\]](#) Study
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **anticholinesterases, centrally acting (donepezil)**. [\[Mid\]](#) Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **abiraterone**. Avoid. [\[Severe\]](#) Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **darolutamide**. Avoid. [\[Moderate\]](#) Study
- ▶ **Enzalutamide** is predicted to slightly decrease the exposure to **antiepileptics (brivaracetam)**. [\[Moderate\]](#) Theoretical
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **antiepileptics (perampanel)**. Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ **Apalutamide** potentially decreases the exposure to **antiepileptics (valproate)**. [\[Mid\]](#) Theoretical
- ▶ **Antifungals, azoles (itraconazole)** slightly increase the exposure to **darolutamide**. Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **apalutamide**. [\[Mid\]](#) Study → Also see TABLE 9 p. 1449
- ▶ **Antifungals, azoles (ketoconazole)** are predicted to increase the exposure to **darolutamide**. Monitor and adjust dose. [\[Moderate\]](#) Theoretical
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **antifungals, azoles (isavuconazole)**. Avoid. [\[Severe\]](#) Study
- ▶ **Apalutamide** slightly decreases the exposure to **antihistamines, non-sedating (fexofenadine)**. [\[Mid\]](#) Study
- ▶ **Darolutamide** is predicted to increase the concentration of **antihistamines, non-sedating (fexofenadine)**. [\[Moderate\]](#) Theoretical
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **antimalarials (artemether)** with lumefantrine. Avoid. [\[Severe\]](#) Study → Also see TABLE 9 p. 1449
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the concentration of **antimalarials (piperquine)**. Avoid. [\[Moderate\]](#) Theoretical
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to moderately decrease the exposure to **antipsychotics, second generation (aripiprazole)**. Adjust aripiprazole dose, p. 418. [\[Moderate\]](#) Study
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **antipsychotics, second generation (cariprazine)**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Enzalutamide** is predicted to decrease the exposure to **antipsychotics, second generation (clozapine)**. [\[Moderate\]](#) Theoretical
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **antipsychotics, second generation (lurasidone)**. Avoid. [\[Moderate\]](#) Study
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **antipsychotics, second generation (paliperidone)**. Monitor and adjust dose. [\[Severe\]](#) Study → Also see TABLE 9 p. 1449
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **antipsychotics, second generation (quetiapine)**. [\[Moderate\]](#) Study
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **antipsychotics, second generation (risperidone)**. Adjust dose. [\[Moderate\]](#) Study → Also see TABLE 9 p. 1449
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **avapritinib**. Avoid. [\[Severe\]](#) Study
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **axitinib**. Avoid or adjust dose. [\[Moderate\]](#) Study
- ▶ Anti-androgens (**apalutamide, enzalutamide**) decrease the exposure to **bedaquiline**. Avoid. [\[Severe\]](#) Study → Also see TABLE 9 p. 1449
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **benzodiazepines (alprazolam)**. Adjust dose. [\[Moderate\]](#) Theoretical
- ▶ **Apalutamide** is predicted to decrease the exposure to **benzodiazepines (diazepam)**. Avoid or monitor. [\[Mid\]](#) Study
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **benzodiazepines (midazolam)**. Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ **Abiraterone** is predicted to increase the exposure to **beta blockers, selective (metoprolol)**. [\[Moderate\]](#) Study
- ▶ **Apalutamide** is predicted to decrease the exposure to **beta₂ agonists (salmeterol)**. Avoid or monitor. [\[Moderate\]](#) Study
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **bictegravir**. Avoid. [\[Moderate\]](#) Study
- ▶ Anti-androgens (**apalutamide, enzalutamide**) slightly decrease the exposure to **bortezomib**. Avoid. [\[Severe\]](#) Study
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to very markedly decrease the exposure to **bosutinib**. Avoid. [\[Severe\]](#) Study → Also see TABLE 9 p. 1449
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **brigatinib**. Avoid. [\[Severe\]](#) Study
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **buspirone**. Use with caution and adjust dose. [\[Severe\]](#) Study
- ▶ Anti-androgens (**apalutamide, enzalutamide**) moderately decrease the exposure to **cabozantinib**. Avoid. [\[Moderate\]](#) Study → Also see TABLE 9 p. 1449
- ▶ **Enzalutamide** is predicted to decrease the exposure to **calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine)**. Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ **Apalutamide** is predicted to decrease the exposure to **calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nimodipine)**. Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ **Enzalutamide** is predicted to decrease the exposure to **calcium channel blockers (diltiazem, verapamil)**. [\[Severe\]](#) Study
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **cannabidiol**. Adjust dose. [\[Moderate\]](#) Study
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **certinib**. Avoid. [\[Severe\]](#) Study → Also see TABLE 9 p. 1449
- ▶ Anti-androgens (**apalutamide, enzalutamide**) decrease the concentration of **ciclosporin**. [\[Severe\]](#) Study
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to alter the effects of **cilostazol**. [\[Moderate\]](#) Theoretical
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **cinacalcet**. Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ Anti-androgens (**apalutamide, enzalutamide**) decrease the exposure to **clomethiazole**. Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ **Clopidogrel** is predicted to increase the exposure to **apalutamide**. [\[Mid\]](#) Study
- ▶ **Clopidogrel** moderately increases the exposure to **enzalutamide**. Avoid or adjust enzalutamide dose, p. 997. [\[Severe\]](#) Study
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **cobicicstat**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Cobicicstat** is predicted to increase the exposure to **apalutamide**. [\[Mid\]](#) Study
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **cobimetinib**. Avoid. [\[Severe\]](#) Theoretical

- ▶ **Apalutamide** is predicted to decrease the exposure to **colchicine**. [Mild] Study
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **corticosteroids (budesonide, deflazacort, dexamethasone, fludrocortisone, hydrocortisone, methylprednisolone, prednisolone, triamcinolone)**. Monitor and adjust dose. [Moderate] Study
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **corticosteroids (fluticasone)**. [Unknown] Theoretical
- ▶ **Apalutamide** is predicted to decrease the exposure to **coumarins**. Avoid or monitor. [Mild] Study
- ▶ **Enzalutamide** potentially decreases the exposure to **coumarins**. Avoid or adjust dose and monitor INR. [Severe] Study
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to markedly decrease the exposure to **crizotinib**. Avoid. [Severe] Study → Also see TABLE 9 p. 1449
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **dabrafenib**. Avoid. [Moderate] Theoretical
- ▶ **Dabrafenib** is predicted to decrease the exposure to **darolutamide**. Avoid. [Moderate] Theoretical
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **darifenacin**. [Moderate] Theoretical
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to markedly decrease the exposure to **dasatinib**. Avoid. [Severe] Study → Also see TABLE 9 p. 1449
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to slightly decrease the exposure to **delamanid**. Avoid. [Moderate] Study → Also see TABLE 9 p. 1449
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to markedly decrease the exposure to **dienogest**. [Severe] Study
- ▶ **Apalutamide** is predicted to decrease the exposure to **digoxin**. [Mild] Study
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **dipeptidylpeptidase-4 inhibitors (linagliptin)**. [Moderate] Study
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to moderately decrease the exposure to **dipeptidylpeptidase-4 inhibitors (saxagliptin)**. [Moderate] Study
- ▶ Anti-androgens (**apalutamide, enzalutamide**) decrease the exposure to **dolutegravir**. Adjust dose. [Severe] Study
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **dronabinol**. Avoid or adjust dose. [Mild] Study
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **elbasvir**. Avoid. [Severe] Study
- ▶ Anti-androgens (**apalutamide, enzalutamide**) is predicted to decrease the exposure to **elxacaftor**. Avoid. [Severe] Theoretical
- ▶ **Abiraterone** is predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **eliglustat**. Avoid. [Severe] Study
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the concentration of **elvitegravir**. Avoid. [Severe] Theoretical
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **encorafenib**. [Severe] Theoretical → Also see TABLE 9 p. 1449
- ▶ **Endothelin receptor antagonists (bosentan)** are predicted to decrease the exposure to **darolutamide**. Avoid. [Moderate] Theoretical
- ▶ Anti-androgens (**apalutamide, enzalutamide**) affect the exposure to **endothelin receptor antagonists (bosentan)**. Avoid. [Severe] Study
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **endothelin receptor antagonists (macitentan)**. Avoid. [Severe] Study
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **entrectinib**. Avoid. [Severe] Study → Also see TABLE 9 p. 1449
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the effects of **ergotamine**. [Moderate] Theoretical
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **erlotinib**. Avoid or adjust **erlotinib** dose, p. 1030. [Severe] Study
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **esketamine**. Adjust dose. [Moderate] Theoretical
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the concentration of **everolimus**. Avoid or adjust dose. [Severe] Study
- ▶ Anti-androgens (**apalutamide, enzalutamide**) moderately decrease the exposure to **exemestane**. [Moderate] Study
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **factor XA inhibitors (apixaban)**. [Moderate] Study
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **factor XA inhibitors (rivaroxaban)**. Avoid unless patient can be monitored for signs of thrombosis. [Severe] Study
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **fosetorodine**. Avoid. [Moderate] Study
- ▶ **Fibrates (gemfibrozil)** are predicted to increase the exposure to **apalutamide**. [Mild] Study
- ▶ **Fibrates (gemfibrozil)** moderately increase the exposure to **enzalutamide**. Avoid or adjust **enzalutamide** dose, p. 997. [Severe] Study
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **foxtamatinib**. Avoid. [Severe] Study
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **gefitinib**. Avoid. [Severe] Study
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to moderately decrease the exposure to **glasdegib**. Avoid. [Severe] Study → Also see TABLE 9 p. 1449
- ▶ **Enzalutamide** is predicted to greatly decrease the concentration of **glecaprevir**. Avoid. [Severe] Study
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **grazoprevir**. Avoid. [Severe] Study
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the concentration of **guanfacine**. Adjust **guanfacine** dose, p. 375. [Moderate] Study
- ▶ Anti-androgens (**apalutamide, enzalutamide**) decrease the concentration of **haloperidol**. Adjust dose. [Moderate] Study → Also see TABLE 9 p. 1449
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **apalutamide**. [Mild] Study
- ▶ **HIV-protease inhibitors (lopinavir, ritonavir)** are predicted to increase the exposure to **darolutamide**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **ibrutinib**. Avoid or monitor. [Severe] Study
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **idealalisib**. Avoid. [Severe] Study
- ▶ **Idealalisib** is predicted to increase the exposure to **apalutamide**. [Mild] Study
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **imatinitib**. Avoid. [Moderate] Study
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **irinotecan**. Avoid. [Severe] Study
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **ivabradine**. Adjust dose. [Moderate] Theoretical
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **ivacaftor**. Avoid. [Severe] Study
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **ixazomib**. Avoid. [Severe] Study
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **lapatinib**. Avoid. [Severe] Study → Also see TABLE 9 p. 1449
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to moderately decrease the exposure to **larotrectinib**. Avoid. [Moderate] Study
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **lomitapide**. Monitor and adjust dose. [Moderate] Theoretical

Anti-androgens (continued)

- ▶ **Bicalutamide** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
- ▶ Anti-androgens (**apalutamide**, **enzalutamide**) are predicted to decrease the exposure to **lorlatinib**. Avoid. [Severe] Study
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **apalutamide**. [Mid] Study → Also see TABLE 9 p. 1449
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **darolutamide**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ Anti-androgens (**apalutamide**, **enzalutamide**) are predicted to decrease the exposure to **maraviroc**. Adjust dose. [Severe] Study
- ▶ **Darolutamide** is predicted to increase the concentration of **meglitinides (repaglinide)**. [Moderate] Theoretical
- ▶ Anti-androgens (**apalutamide**, **enzalutamide**) are predicted to decrease the exposure to **meglitinides (repaglinide)**. Monitor blood glucose and adjust dose. [Moderate] Study
- ▶ **Apalutamide** is predicted to decrease the exposure to **methotrexate**. [Mid] Study
- ▶ **Darolutamide** is predicted to increase the concentration of **methotrexate**. [Moderate] Theoretical
- ▶ Anti-androgens (**apalutamide**, **enzalutamide**) are predicted to decrease the exposure to **midostaurin**. Avoid. [Severe] Study
- ▶ Anti-androgens (**apalutamide**, **enzalutamide**) are predicted to decrease the exposure to **mirtazapine**. Adjust dose. [Moderate] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **abiraterone**. Avoid. [Severe] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **darolutamide**. Avoid. [Moderate] Study
- ▶ **Apalutamide** is predicted to decrease the exposure to **moclobemide**. Avoid or monitor. [Mid] Study
- ▶ Anti-androgens (**apalutamide**, **enzalutamide**) are predicted to decrease the exposure to **monoclonal antibodies (polatuzumab vedotin)**. [Moderate] Theoretical
- ▶ Anti-androgens (**apalutamide**, **enzalutamide**) are predicted to decrease the exposure to **montelukast**. [Mid] Study
- ▶ Anti-androgens (**apalutamide**, **enzalutamide**) are predicted to markedly decrease the exposure to **naldemedine**. Avoid. [Severe] Study
- ▶ Anti-androgens (**apalutamide**, **enzalutamide**) are predicted to markedly decrease the exposure to **naloxegol**. Avoid. [Moderate] Study
- ▶ Anti-androgens (**apalutamide**, **enzalutamide**) are predicted to decrease the exposure to **neratinib**. Avoid. [Severe] Study
- ▶ Anti-androgens (**apalutamide**, **enzalutamide**) are predicted to markedly decrease the exposure to **neurokinin-1 receptor antagonists (aprepitant)**. Avoid. [Moderate] Study
- ▶ Anti-androgens (**apalutamide**, **enzalutamide**) are predicted to decrease the exposure to **neurokinin-1 receptor antagonists (fosaprepitant)**. Avoid. [Moderate] Theoretical
- ▶ Anti-androgens (**apalutamide**, **enzalutamide**) are predicted to decrease the exposure to **neurokinin-1 receptor antagonists (netupitant)**. Avoid. [Severe] Study
- ▶ Anti-androgens (**apalutamide**, **enzalutamide**) are predicted to moderately decrease the exposure to **niotinib**. Avoid. [Severe] Study → Also see TABLE 9 p. 1449
- ▶ Anti-androgens (**apalutamide**, **enzalutamide**) are predicted to decrease the exposure to **nitisinone**. Adjust dose. [Moderate] Theoretical
- ▶ **NNRTIs (efavirenz, nevirapine)** are predicted to decrease the exposure to **darolutamide**. Avoid. [Moderate] Theoretical
- ▶ Anti-androgens (**apalutamide**, **enzalutamide**) are predicted to decrease the exposure to **NNRTIs (doravirine)**. Avoid. [Severe] Study
- ▶ Anti-androgens (**apalutamide**, **enzalutamide**) are predicted to decrease the exposure to **NNRTIs (etravirine)**. Avoid. [Severe] Theoretical
- ▶ **Enzalutamide** is predicted to decrease the exposure to **NNRTIs (nevirapine)**. [Severe] Theoretical
- ▶ Anti-androgens (**apalutamide**, **enzalutamide**) markedly decrease the exposure to **NNRTIs (rilpivirine)**. Avoid. [Severe] Study
- ▶ Anti-androgens (**apalutamide**, **enzalutamide**) are predicted to decrease the exposure to **olaparib**. Avoid. [Moderate] Theoretical
- ▶ Anti-androgens (**apalutamide**, **enzalutamide**) are predicted to decrease the exposure to **opioids (alfentanil, fentanyl)**. [Moderate] Study
- ▶ Anti-androgens (**apalutamide**, **enzalutamide**) are predicted to decrease the exposure to **opioids (buprenorphine)**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ Anti-androgens (**apalutamide**, **enzalutamide**) decrease the exposure to **opioids (methadone)**. Monitor and adjust dose. [Severe] Study → Also see TABLE 9 p. 1449
- ▶ Anti-androgens (**apalutamide**, **enzalutamide**) are predicted to decrease the exposure to **opioids (oxycodone)**. Monitor and adjust dose. [Moderate] Study
- ▶ Anti-androgens (**apalutamide**, **enzalutamide**) are predicted to moderately decrease the exposure to **osimertinib**. Avoid. [Moderate] Study → Also see TABLE 9 p. 1449
- ▶ Anti-androgens (**apalutamide**, **enzalutamide**) are predicted to moderately decrease the exposure to **ospemifene**. [Moderate] Study
- ▶ Anti-androgens (**apalutamide**, **enzalutamide**) are predicted to decrease the exposure to **palbociclib**. Avoid. [Severe] Study
- ▶ Anti-androgens (**apalutamide**, **enzalutamide**) are predicted to decrease the exposure to **panobinostat**. Avoid. [Moderate] Theoretical → Also see TABLE 9 p. 1449
- ▶ Anti-androgens (**apalutamide**, **enzalutamide**) are predicted to decrease the exposure to **pazopanib**. Avoid. [Severe] Theoretical → Also see TABLE 9 p. 1449
- ▶ Anti-androgens (**apalutamide**, **enzalutamide**) moderately decrease the exposure to **phosphodiesterase type-4 inhibitors (apremilast)**. Avoid. [Severe] Study
- ▶ Anti-androgens (**apalutamide**, **enzalutamide**) are predicted to decrease the exposure to **phosphodiesterase type-4 inhibitors (roflumilast)**. Avoid. [Moderate] Study
- ▶ Anti-androgens (**apalutamide**, **enzalutamide**) are predicted to decrease the exposure to **phosphodiesterase type-5 inhibitors (avanafil, tadalafil)**. Avoid. [Severe] Study
- ▶ Anti-androgens (**apalutamide**, **enzalutamide**) are predicted to decrease the exposure to **phosphodiesterase type-5 inhibitors (sildenafil, vardenafil)**. [Moderate] Theoretical → Also see TABLE 9 p. 1449
- ▶ Anti-androgens (**apalutamide**, **enzalutamide**) are predicted to moderately to markedly decrease the exposure to **pibrentasvir**. Avoid. [Severe] Study
- ▶ Anti-androgens (**apalutamide**, **enzalutamide**) are predicted to moderately decrease the exposure to **pitolisant**. [Moderate] Study
- ▶ Anti-androgens (**apalutamide**, **enzalutamide**) are predicted to decrease the exposure to **ponatinib**. Avoid. [Moderate] Theoretical
- ▶ Anti-androgens (**apalutamide**, **enzalutamide**) are predicted to markedly decrease the exposure to **praziquantel**. Avoid. [Moderate] Study
- ▶ **Apalutamide** is predicted to decrease the exposure to **proton pump inhibitors (lansoprazole, rabeprazole)**. Avoid or monitor. [Mid] Study
- ▶ **Apalutamide** markedly decreases the exposure to **proton pump inhibitors (omeprazole)**. Avoid or monitor. [Moderate] Study
- ▶ Anti-androgens (**apalutamide**, **enzalutamide**) are predicted to decrease the exposure to **ranolazine**. Avoid. [Severe] Study → Also see TABLE 9 p. 1449
- ▶ Anti-androgens (**apalutamide**, **enzalutamide**) are predicted to decrease the exposure to **reboxetine**. [Moderate] Anecdotal
- ▶ Anti-androgens (**apalutamide**, **enzalutamide**) are predicted to decrease the exposure to **regorafenib**. Avoid. [Moderate] Study
- ▶ Anti-androgens (**apalutamide**, **enzalutamide**) potentially decrease the exposure to **remdesivir**. Avoid. [Moderate] Theoretical
- ▶ Anti-androgens (**apalutamide**, **enzalutamide**) are predicted to markedly decrease the exposure to **ribociclib**. Avoid. [Severe] Study → Also see TABLE 9 p. 1449
- ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **abiraterone**. Avoid. [Severe] Study
- ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **darolutamide**. Avoid. [Moderate] Study
- ▶ Anti-androgens (**apalutamide**, **enzalutamide**) are predicted to decrease the exposure to **ruxolitinib**. Monitor and adjust dose. [Moderate] Study

- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **siponimod**. [Severe] Study
 - ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the concentration of **sirolimus**. Avoid. [Severe] Study
 - ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **solifenacin**. [Moderate] Theoretical
 - ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **sorafenib**. [Moderate] Theoretical → Also see TABLE 9 p. 1449
 - ▶ **Apalutamide** is predicted to decrease the exposure to **SSRIs (citalopram)**. Avoid or monitor. [Mild] Study → Also see TABLE 9 p. 1449
 - ▶ **St John's wort** is predicted to decrease the exposure to **darolutamide**. Avoid. [Moderate] Theoretical
 - ▶ **Apalutamide** is predicted to decrease the exposure to **statins (atorvastatin)**. [Moderate] Study
 - ▶ **Darolutamide** is predicted to increase the exposure to **statins (atorvastatin, fluvastatin, rosuvastatin)**. Avoid. [Severe] Theoretical
 - ▶ **Enzalutamide** is predicted to decrease the exposure to **statins (atorvastatin, simvastatin)**. [Moderate] Study
 - ▶ **Darolutamide** is predicted to increase the concentration of **statins (pravastatin, simvastatin)**. [Moderate] Theoretical
 - ▶ **Apalutamide** slightly decreases the exposure to **statins (rosuvastatin)**. [Mild] Study
 - ▶ **Apalutamide** is predicted to decrease the exposure to **statins (simvastatin)**. Avoid or monitor. [Moderate] Study
 - ▶ **Darolutamide** is predicted to increase the exposure to **sulfasalazine**. Avoid. [Severe] Theoretical
 - ▶ **Darolutamide** is predicted to increase the concentration of **sulfonylureas (glibenclamide)**. [Moderate] Theoretical
 - ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **sunitinib**. Avoid or adjust sunitinib dose, p. 1051. [Moderate] Study → Also see TABLE 9 p. 1449
 - ▶ Anti-androgens (**apalutamide, enzalutamide**) decrease the concentration of **tacrolimus**. Monitor and adjust dose. [Severe] Study
 - ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **taxanes (cabazitaxel, paclitaxel)**. Avoid. [Severe] Study
 - ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **taxanes (docetaxel)**. [Severe] Theoretical
 - ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the concentration of **temsirolimus**. Avoid. [Severe] Study
 - ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **tezacaftor**. Avoid. [Severe] Theoretical
 - ▶ **Apalutamide** is predicted to decrease the exposure to **thrombin inhibitors (dabigatran)**. [Mild] Study
 - ▶ **Apalutamide** potentially decreases the exposure to **thyroid hormones (levothyroxine)**. [Mild] Theoretical
 - ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to markedly decrease the exposure to **ticagrelor**. Avoid. [Severe] Study
 - ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **tivozanib**. [Severe] Study
 - ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **tofacitinib**. Avoid. [Severe] Study
 - ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **tolvaptan**. Use with caution or avoid depending on indication. [Severe] Study
 - ▶ **Darolutamide** is predicted to increase the exposure to **topotecan**. Avoid. [Severe] Theoretical
 - ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **toremifene**. Adjust dose. [Moderate] Study → Also see TABLE 9 p. 1449
 - ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **trabectedin**. Avoid. [Severe] Theoretical
 - ▶ **Enzalutamide** is predicted to markedly decrease the exposure to **ulipristal**. Avoid and for 4 weeks after stopping **ulipristal**. [Severe] Theoretical
 - ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **upadacitinib**. [Moderate] Study
 - ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **vandetanib**. Avoid. [Moderate] Study → Also see TABLE 9 p. 1449
 - ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to moderately decrease the exposure to **velpatasvir**. Avoid. [Severe] Study
 - ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **vemurafenib**. Avoid. [Severe] Study → Also see TABLE 9 p. 1449
 - ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **venetoclax**. Avoid. [Severe] Study
 - ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **vinca alkaloids (vinblastine, vincristine, vindesine)**. [Severe] Theoretical
 - ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **vinca alkaloids (vinflunine)**. Avoid. [Severe] Theoretical → Also see TABLE 9 p. 1449
 - ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **vinca alkaloids (vinorelbine)**. Use with caution or avoid. [Severe] Theoretical
 - ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **vismodegib**. Avoid. [Moderate] Theoretical
 - ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **vortioxetine**. Monitor and adjust dose. [Moderate] Study
 - ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the concentration of **voxilaprevir**. Avoid. [Severe] Study
 - ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to **zopiclone**. Adjust dose. [Moderate] Study
- Anti-D (Rh₀) immunoglobulin** → see immunoglobulins
- Antiarrhythmics** → see TABLE 6 p. 1448 (bradycardia), TABLE 8 p. 1448 (hypotension), TABLE 12 p. 1450 (peripheral neuropathy), TABLE 9 p. 1449 (QT-interval prolongation), TABLE 11 p. 1449 (CNS depressant effects), TABLE 10 p. 1449 (antimuscarinics)
- adenosine · amiodarone · disopyramide · dronedarone · flecainide · lidocaine · propafenone · sotalolant
- ▶ **Amiodarone** has a long half-life; there is potential for drug interactions to occur for several weeks (or even months) after treatment with it has been stopped.
 - ▶ Since systemic absorption can follow topical application of **lidocaine**, the possibility of interactions should be borne in mind.
 - ▶ Avoid intravenous class I and class III antiarrhythmics for 4 hours before and after **vernakalant**.
- ▶ **Dronedarone** is predicted to increase the exposure to **abemaciclib**. [Moderate] Study
 - ▶ **Dronedarone** is predicted to increase the exposure to **acalabrutinib**. Avoid or monitor. [Severe] Study
 - ▶ Antiarrhythmics (**amiodarone, dronedarone**) are predicted to increase the exposure to **afatinib**. Separate administration by 12 hours. [Moderate] Study
 - ▶ **Amiodarone** is predicted to decrease the effects of **agalsidase alfa**. Avoid. [Moderate] Theoretical
 - ▶ **Amiodarone** is predicted to decrease the effects of **agalsidase beta**. Avoid. [Moderate] Theoretical
 - ▶ **Amiodarone** is predicted to increase the exposure to **aldosterone antagonists (epplerenone)**. Adjust **epplerenone** dose, p. 209. [Severe] Theoretical
 - ▶ **Dronedarone** is predicted to increase the exposure to **aldosterone antagonists (epplerenone)**. Adjust **epplerenone** dose, p. 209. [Severe] Study
 - ▶ Antiarrhythmics (**amiodarone, dronedarone**) are predicted to increase the exposure to **aliskiren**. [Severe] Study
 - ▶ **Dronedarone** is predicted to increase the exposure to **alpha blockers (tamsulosin)**. [Moderate] Theoretical
 - ▶ **Aminophylline** is predicted to decrease the efficacy of **adenosine**. Separate administration by 24 hours. [Mild] Theoretical
 - ▶ **Anaesthetics, local** are predicted to increase the risk of cardiodepression when given with antiarrhythmics. [Severe] Theoretical → Also see TABLE 11 p. 1449

Antiarrhythmics (continued)

- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the efficacy of **propafenone**. [Moderate] Study
- ▶ Anti-androgens (**apalutamide, enzalutamide**) are predicted to decrease the exposure to antiarrhythmics (**disopyramide, dronedarone**). Avoid. [Severe] Study → Also see TABLE 9 p. 1449
- ▶ Antiarrhythmics (**propafenone**) are predicted to increase the risk of cardiodepression when given with antiarrhythmics (**amiodarone**). Monitor and adjust dose. [Severe] Theoretical
- ▶ Antiarrhythmics (**amiodarone**) increase the concentration of antiarrhythmics (**flecainide**). Adjust **flecainide** dose and monitor adverse effects. [Severe] Study → Also see TABLE 6 p. 1448 → Also see TABLE 9 p. 1449
- ▶ Antiarrhythmics (**propafenone**) are predicted to increase the risk of cardiodepression when given with antiarrhythmics (**lidocaine**). [Moderate] Study
- ▶ Antiarrhythmics (**dronedarone**) are predicted to increase the exposure to antiarrhythmics (**propafenone**). Monitor and adjust dose. [Moderate] Study
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the efficacy of **propafenone**. [Moderate] Study
- ▶ Antiepileptics (**fosphenytoin, phenytoin**) are predicted to decrease the exposure to **lidocaine**. [Severe] Anecdotal
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to antiarrhythmics (**disopyramide, dronedarone**). Avoid. [Severe] Study
- ▶ **Amiodarone** is predicted to slightly increase the concentration of antiepileptics (**fosphenytoin, phenytoin**). Monitor and adjust dose. [Severe] Study → Also see TABLE 12 p. 1450
- ▶ Antifungals, azoles (**fluconazole**) are predicted to increase the exposure to **dronedarone**. [Severe] Theoretical → Also see TABLE 9 p. 1449
- ▶ Antifungals, azoles (**fluconazole, isavuconazole, posaconazole**) are predicted to increase the exposure to **propafenone**. Monitor and adjust dose. [Moderate] Study
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to increase the exposure to **disopyramide**. Avoid. [Severe] Theoretical → Also see TABLE 9 p. 1449
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) very markedly increase the exposure to **dronedarone**. Avoid. [Severe] Study → Also see TABLE 9 p. 1449
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to increase the exposure to **propafenone**. Monitor and adjust dose. [Severe] Study
- ▶ Antifungals, azoles (**miconazole**) are predicted to increase the exposure to **disopyramide**. Use with caution and adjust dose. [Severe] Theoretical
- ▶ Antifungals, azoles (**posaconazole**) are predicted to increase the exposure to antiarrhythmics (**disopyramide, dronedarone**). Avoid. [Severe] Theoretical
- ▶ **Dronedarone** is predicted to increase the exposure to antihistamines, non-sedating (**efexofenadine, mizolastine**). [Severe] Theoretical
- ▶ **Dronedarone** is predicted to increase the exposure to antihistamines, non-sedating (**rupatadine**). Avoid. [Moderate] Study
- ▶ **Dronedarone** is predicted to increase the concentration of antimalarials (**piperazine**). [Severe] Theoretical
- ▶ **Dronedarone** is predicted to increase the exposure to antipsychotics, second generation (**cariprazine**). Avoid. [Severe] Study
- ▶ **Dronedarone** is predicted to increase the exposure to antipsychotics, second generation (**lurasidone**). Adjust **lurasidone** dose. [Moderate] Study
- ▶ **Dronedarone** is predicted to increase the exposure to antipsychotics, second generation (**quetiapine**). Avoid. [Moderate] Study
- ▶ **Dronedarone** is predicted to increase the exposure to **avapritinib**. Avoid or adjust **avapritinib** dose, p. 1019. [Moderate] Study
- ▶ **Dronedarone** is predicted to increase the exposure to **axitinib**. [Moderate] Study
- ▶ **Dronedarone** is predicted to increase the exposure to **bedaquiline**. Avoid prolonged use. [Mild] Theoretical → Also see TABLE 9 p. 1449
- ▶ **Dronedarone** is predicted to increase the exposure to **benzodiazepines (alprazolam)**. [Severe] Study
- ▶ **Dronedarone** is predicted to increase the exposure to **benzodiazepines (midazolam)**. Monitor adverse effects and adjust dose. [Severe] Study
- ▶ Antiarrhythmics (**amiodarone, disopyramide, dronedarone, flecainide, lidocaine**) are predicted to increase the risk of cardiovascular adverse effects when given with **beta blockers, non-selective**. Use with caution or avoid. [Severe] Study → Also see TABLE 6 p. 1448 → Also see TABLE 9 p. 1449
- ▶ **Propafenone** is predicted to increase the risk of cardiovascular adverse effects when given with **beta blockers, non-selective (labetalol, levobunolol, nadolol, pindolol, sotalol)**. Use with caution or avoid. [Severe] Study
- ▶ **Propafenone** increases the risk of cardiovascular adverse effects when given with **beta blockers, non-selective (propranolol)**. Use with caution or avoid. [Severe] Study
- ▶ **Propafenone** is predicted to increase the exposure to **beta blockers, non-selective (timolol)** and **beta blockers, non-selective (timolol)** are predicted to increase the risk of cardiodepression when given with **propafenone**. [Severe] Anecdotal
- ▶ Antiarrhythmics (**amiodarone, disopyramide, dronedarone, flecainide, lidocaine**) are predicted to increase the risk of cardiovascular adverse effects when given with **beta blockers, selective**. Use with caution or avoid. [Severe] Study → Also see TABLE 6 p. 1448
- ▶ **Propafenone** is predicted to increase the risk of cardiovascular adverse effects when given with **beta blockers, selective (acebutolol, atenolol, betaxolol, bisoprolol, celiprolol, esmolol)**. Use with caution or avoid. [Severe] Study
- ▶ **Propafenone** is predicted to increase the exposure to **beta blockers, selective (metoprolol)**. [Moderate] Study
- ▶ **Propafenone** is predicted to increase the exposure to **beta blockers, selective (nebivolol)** and **beta blockers, selective (nebivolol)** are predicted to increase the risk of cardiodepression when given with **propafenone**. Avoid. [Severe] Theoretical
- ▶ Antiarrhythmics (**amiodarone, dronedarone**) are predicted to increase the exposure to **bictegravir**. Use with caution or avoid. [Moderate] Theoretical
- ▶ **Dronedarone** is predicted to increase the exposure to **bosutinib**. Avoid or adjust dose. [Severe] Study → Also see TABLE 9 p. 1449
- ▶ **Dronedarone** is predicted to increase the exposure to **brigatinib**. [Moderate] Study
- ▶ **Dronedarone** is predicted to increase the exposure to **bupirone**. Use with caution and adjust dose. [Moderate] Study
- ▶ **Dronedarone** is predicted to increase the exposure to **cabozantinib**. [Moderate] Study → Also see TABLE 9 p. 1449
- ▶ **Caffeine citrate** decreases the efficacy of **adenosine**. Separate administration by 24 hours. [Mild] Study
- ▶ **Calcium channel blockers (diltiazem, verapamil)** increase the exposure to **dronedarone** and **dronedarone** increases the exposure to **calcium channel blockers (diltiazem, verapamil)**. [Moderate] Study
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **propafenone**. Monitor and adjust dose. [Moderate] Study
- ▶ **Calcium channel blockers (verapamil)** increase the risk of cardiodepression when given with **flecainide**. [Severe] Anecdotal → Also see TABLE 6 p. 1448
- ▶ **Dronedarone** is predicted to increase the exposure to **calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nifedipine, nimodipine)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Amiodarone** is predicted to increase the risk of cardiodepression when given with **calcium channel blockers (diltiazem, verapamil)**. Avoid. [Severe] Theoretical → Also see TABLE 6 p. 1448
- ▶ **Disopyramide** is predicted to increase the risk of cardiodepression when given with **calcium channel blockers (verapamil)**. [Severe] Theoretical

- ▶ **Dronedaron** is predicted to increase the exposure to **ceritinib**. [Moderate] Study → Also see TABLE 9 p. 1449
- ▶ **Chlorpropocaine** is predicted to increase the risk of cardiovascular adverse effects when given with antiarrhythmics (amiodarone, dronedarone, vernakalant). [Severe] Theoretical
- ▶ **Amiodarone** increases the concentration of **ciclosporin**. Monitor concentration and adjust dose. [Severe] Study
- ▶ **Dronedaron** is predicted to increase the concentration of **ciclosporin**. [Severe] Study
- ▶ **Cobicistat** potentially increases the concentration of antiarrhythmics (amiodarone, disopyramide, flecainide, lidocaine). [Severe] Theoretical
- ▶ **Cobicistat** very markedly increases the exposure to dronedarone. Avoid. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **propafenone**. Monitor and adjust dose. [Severe] Study
- ▶ **Dronedaron** is predicted to increase the exposure to **cobimetinib**. [Severe] Study
- ▶ **Amiodarone** is predicted to increase the exposure to **colchicine**. Avoid P-glycoprotein inhibitors or adjust colchicine dose, p. 1175. [Severe] Theoretical
- ▶ **Dronedaron** is predicted to increase the exposure to **colchicine**. Adjust colchicine dose with moderate CYP3A4 inhibitors, p. 1175. [Severe] Study
- ▶ **Dronedaron** is predicted to increase the exposure to **corticosteroids (methylprednisolone)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Amiodarone** increases the anticoagulant effect of **coumarins**. [Severe] Study
- ▶ **Propafenone** increases the anticoagulant effect of **coumarins**. Monitor INR and adjust dose. [Moderate] Study
- ▶ **Dronedaron** is predicted to increase the exposure to **crizotinib**. [Moderate] Study → Also see TABLE 9 p. 1449
- ▶ **Crizotinib** is predicted to increase the exposure to **propafenone**. Monitor and adjust dose. [Moderate] Study
- ▶ **Dronedaron** is predicted to increase the exposure to **dabrafenib**. [Moderate] Study
- ▶ **Dronedaron** is predicted to increase the exposure to **darifenacin**. [Moderate] Study
- ▶ **Darifenacin** is predicted to increase the concentration of flecainide. [Moderate] Theoretical
- ▶ **Dronedaron** is predicted to increase the exposure to **dasatinib**. [Severe] Study → Also see TABLE 9 p. 1449
- ▶ **Dronedaron** is predicted to slightly increase the exposure to **dienogest**. [Moderate] Study
- ▶ Antiarrhythmics (**amiodarone, dronedarone**) are predicted to moderately increase the exposure to **digoxin**. Monitor and adjust digoxin dose, p. 117. [Severe] Study → Also see TABLE 6 p. 1448
- ▶ **Propafenone** increases the concentration of **digoxin**. Monitor and adjust dose. [Severe] Study
- ▶ **Dronedaron** is predicted to increase the exposure to **dipeptidylpeptidase-4 inhibitors (saxagliptin)**. [Mild] Study
- ▶ **Dipyridamole** increases the exposure to **adenosine**. Avoid or adjust dose. [Severe] Study
- ▶ **Dronedaron** is predicted to increase the exposure to **domperidone**. Avoid. [Severe] Study
- ▶ **Dronedaron** is predicted to increase the exposure to **dopamine receptor agonists (bromocriptine)**. [Severe] Theoretical
- ▶ **Dronedaron** is predicted to increase the concentration of **dopamine receptor agonists (cabergoline)**. [Severe] Anecdotal
- ▶ **Dronedaron** is predicted to moderately increase the exposure to **dutasteride**. [Mild] Study
- ▶ **Dronedaron** is predicted to increase the exposure to **elxacaftor**. Adjust tezacaftor with ivacaftor and elxacaftor p. 514 dose with moderate CYP3A4 inhibitors. [Severe] Theoretical
- ▶ Antiarrhythmics (**dronedaron, propafenone**) are predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
- ▶ **Dronedaron** is predicted to moderately increase the exposure to **encorafenib**. [Moderate] Study → Also see TABLE 9 p. 1449
- ▶ **Endothelin receptor antagonists (bosentan)** are predicted to decrease the exposure to **dronedaron**. [Severe] Theoretical
- ▶ **Dronedaron** is predicted to increase the exposure to **entrectinib**. Avoid moderate CYP3A4 inhibitors or adjust entrectinib dose, p. 1030. [Severe] Theoretical → Also see TABLE 9 p. 1449
- ▶ **Dronedaron** is predicted to increase the risk of ergotism when given with **ergometrine**. [Severe] Theoretical
- ▶ **Dronedaron** is predicted to increase the risk of ergotism when given with **ergotamine**. [Severe] Theoretical
- ▶ **Amiodarone** is predicted to increase the exposure to **erlotinib**. [Moderate] Theoretical
- ▶ **Dronedaron** is predicted to increase the exposure to **erlotinib**. [Moderate] Study
- ▶ **Dronedaron** is predicted to increase the concentration of **everolimus**. Avoid or adjust dose. [Moderate] Study
- ▶ Antiarrhythmics (**amiodarone, dronedaron**) are predicted to increase the exposure to **factor XA inhibitors (apixaban)**. [Moderate] Theoretical
- ▶ **Amiodarone** slightly increases the exposure to **factor XA inhibitors (edoxaban)**. [Severe] Study
- ▶ **Dronedaron** slightly increases the exposure to **factor XA inhibitors (edoxaban)**. Adjust edoxaban dose, p. 138. [Severe] Study
- ▶ **Amiodarone** might increase the exposure to **factor XA inhibitors (rivaroxaban)**. [Moderate] Study
- ▶ **Dronedaron** might increase the exposure to **factor XA inhibitors (rivaroxaban)**. Avoid. [Moderate] Study
- ▶ **Dronedaron** is predicted to increase the exposure to **fesoterodine**. Adjust fesoterodine dose with moderate CYP3A4 inhibitors in hepatic and renal impairment, p. 824. [Mild] Study
- ▶ Antiarrhythmics (**amiodarone, dronedaron**) are predicted to increase the exposure to **fidaxomicin**. Avoid. [Moderate] Study
- ▶ **Dronedaron** is predicted to increase the exposure to **gefitinib**. [Moderate] Study
- ▶ Antiarrhythmics (**amiodarone, dronedaron**) are predicted to increase the exposure to **gilteritinib**. [Moderate] Theoretical
- ▶ **Dronedaron** potentially increases the exposure to **glecaprevir**. [Moderate] Theoretical
- ▶ **Grapefruit** juice increases the exposure to **amiodarone**. Avoid. [Moderate] Study
- ▶ **Grapefruit** juice moderately increases the exposure to **dronedaron**. Avoid. [Severe] Study
- ▶ **Grapefruit** juice increases the exposure to **propafenone**. Monitor and adjust dose. [Moderate] Study
- ▶ **Dronedaron** is predicted to increase the concentration of **guanfacine**. Adjust guanfacine dose, p. 375. [Moderate] Theoretical
- ▶ **H₂ receptor antagonists (cimetidine)** increase the exposure to **amiodarone**. [Moderate] Study
- ▶ **H₂ receptor antagonists (cimetidine)** slightly increase the exposure to **flecainide**. Monitor and adjust dose. [Mild] Study
- ▶ **H₂ receptor antagonists (cimetidine)** increase the exposure to **lidocaine**. Monitor and adjust dose. [Moderate] Study
- ▶ **H₂ receptor antagonists (cimetidine)** are predicted to increase the exposure to **propafenone**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **amiodarone**. Avoid. [Severe] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **disopyramide**. [Severe] Theoretical
- ▶ **HIV-protease inhibitors** very markedly increase the exposure to **dronedaron**. Avoid. [Severe] Study
- ▶ **HIV-protease inhibitors (ritonavir)** are predicted to increase the exposure to **flecainide**. Avoid or monitor adverse effects. [Severe] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **lidocaine**. Avoid. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **propafenone**. Monitor and adjust dose. [Severe] Study
- ▶ **Amiodarone** is predicted to increase the exposure to **ibrutinib**. Adjust ibrutinib dose, p. 1034. [Severe] Theoretical
- ▶ **Dronedaron** is predicted to increase the exposure to **ibrutinib**. Adjust ibrutinib dose with moderate CYP3A4 inhibitors, p. 1034. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **amiodarone**. Avoid. [Moderate] Theoretical
- ▶ **Idelalisib** very markedly increases the exposure to **dronedaron**. Avoid. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **propafenone**. Monitor and adjust dose. [Severe] Study

Antiarrhythmics (continued)

- ▶ **Imatinib** is predicted to increase the exposure to **dronedaron**. [\[Severe\]](#) Theoretical
- ▶ **Imatinib** is predicted to increase the exposure to **propafenone**. Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ **Dronedaron** is predicted to increase the exposure to **ivabradine**. Adjust **ivabradine** dose, p. 228. [\[Severe\]](#) Theoretical
- ▶ **Dronedaron** is predicted to increase the exposure to **ivacaftor**. Adjust dose with moderate CYP3A4 inhibitors, see **ivacaftor** p. 312, **tezacaftor** with **ivacaftor** p. 314, and **tezacaftor** with **ivacaftor** and **elxacaftor** p. 314. [\[Moderate\]](#) Study
- ▶ **Dronedaron** is predicted to increase the exposure to **lapatinib**. [\[Moderate\]](#) Study → Also see **TABLE 9** p. 1449
- ▶ Antiarrhythmics (**amiodarone**, **dronedaron**) are predicted to increase the exposure to **larotrectinib**. [\[Mild\]](#) Theoretical
- ▶ **Ledipasvir** increases the risk of severe bradycardia or heart block when given with **amiodarone**. Refer to specialist literature. [\[Severe\]](#) Anecdotal
- ▶ **Letermovir** is predicted to increase the concentration of **amiodarone**. [\[Moderate\]](#) Theoretical
- ▶ **Letermovir** is predicted to increase the exposure to **propafenone**. Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ **Amiodarone** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [\[Moderate\]](#) Theoretical
- ▶ **Dronedaron** is predicted to increase the exposure to **lomitapide**. Avoid. [\[Moderate\]](#) Theoretical
- ▶ **Dronedaron** is predicted to increase the exposure to **loperamide**. [\[Severe\]](#) Theoretical
- ▶ **Macrolides (clarithromycin)** very markedly increase the exposure to **dronedaron**. Avoid. [\[Severe\]](#) Study → Also see **TABLE 9** p. 1449
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **propafenone**. Monitor and adjust dose. [\[Severe\]](#) Study
- ▶ **Macrolides (clarithromycin, erythromycin)** are predicted to increase the exposure to **lidocaine**. [\[Moderate\]](#) Theoretical
- ▶ **Macrolides (erythromycin)** are predicted to moderately increase the exposure to **dronedaron**. Avoid. [\[Severe\]](#) Theoretical → Also see **TABLE 9** p. 1449
- ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **propafenone**. Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ **Mexiletine** is predicted to increase the risk of torsade de pointes when given with antiarrhythmics. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Dronedaron** is predicted to increase the exposure to **midostaurin**. [\[Moderate\]](#) Theoretical
- ▶ **Mitotane** is predicted to decrease the exposure to antiarrhythmics (**disopyramide**, **dronedaron**). Avoid. [\[Severe\]](#) Study
- ▶ **Mitotane** is predicted to decrease the efficacy of **propafenone**. [\[Moderate\]](#) Study
- ▶ **Dronedaron** increases the risk of neutropenia when given with **monoclonal antibodies (brentuximab vedotin)**. Monitor and adjust dose. [\[Severe\]](#) Theoretical
- ▶ Antiarrhythmics (**amiodarone**, **dronedaron**) are predicted to increase the exposure to **naldemedine**. [\[Moderate\]](#) Study
- ▶ **Dronedaron** is predicted to increase the exposure to **naloxegol**. Adjust **naloxegol** dose and monitor adverse effects, p. 71. [\[Moderate\]](#) Study
- ▶ **Dronedaron** is predicted to increase the exposure to **neratinib**. Avoid moderate CYP3A4 inhibitors or adjust **neratinib** dose and monitor for gastrointestinal adverse effects, p. 1041. [\[Severe\]](#) Study
- ▶ **Neurokinin-1 receptor antagonists (aprepitant)** increase the exposure to **dronedaron**. [\[Severe\]](#) Theoretical
- ▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to increase the exposure to **propafenone**. Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ **Nilotinib** is predicted to increase the exposure to **propafenone**. Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ Antiarrhythmics (**amiodarone**, **dronedaron**) are predicted to increase the exposure to **nintedanib**. [\[Moderate\]](#) Study
- ▶ **NNRTIs (efavirenz, nevirapine)** are predicted to decrease the exposure to **dronedaron**. [\[Severe\]](#) Theoretical → Also see **TABLE 9** p. 1449
- ▶ **NSAIDs (celecoxib)** are predicted to increase the exposure to antiarrhythmics (**flecainide**, **propafenone**). Monitor and adjust dose. [\[Moderate\]](#) Theoretical
- ▶ **Dronedaron** is predicted to increase the exposure to **olaparib**. Avoid moderate CYP3A4 inhibitors or adjust **olaparib** dose, p. 1057. [\[Moderate\]](#) Theoretical
- ▶ **Dronedaron** is predicted to increase the exposure to **opioids (alfentanil, buprenorphine, fentanyl, oxycodone)**. Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ **Amiodarone** is predicted to increase the concentration of **opioids (fentanyl)**. [\[Moderate\]](#) Theoretical → Also see **TABLE 6** p. 1448
- ▶ **Dronedaron** is predicted to increase the exposure to **opioids (methadone)**. [\[Moderate\]](#) Theoretical → Also see **TABLE 9** p. 1449
- ▶ Antiarrhythmics (**amiodarone**, **dronedaron**) are predicted to increase the exposure to **panobinostat**. Adjust dose. [\[Moderate\]](#) Theoretical → Also see **TABLE 9** p. 1449
- ▶ **Dronedaron** is predicted to increase the exposure to **pazopanib**. [\[Moderate\]](#) Study → Also see **TABLE 9** p. 1449
- ▶ **Propafenone** is predicted to increase the anticoagulant effect of **phenindione**. Monitor and adjust dose. [\[Moderate\]](#) Theoretical
- ▶ **Dronedaron** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (avanafil)**. Adjust **avanafil** dose, p. 862. [\[Moderate\]](#) Theoretical
- ▶ **Dronedaron** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (sildenafil)**. Monitor or adjust **sildenafil** dose with moderate CYP3A4 inhibitors, p. 863. [\[Moderate\]](#) Study → Also see **TABLE 9** p. 1449
- ▶ **Dronedaron** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (tadalafil)**. [\[Severe\]](#) Theoretical
- ▶ **Dronedaron** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (vardenafil)**. Adjust dose. [\[Severe\]](#) Theoretical → Also see **TABLE 9** p. 1449
- ▶ **Amiodarone** is predicted to increase the exposure to **pibrentasvir**. [\[Moderate\]](#) Theoretical
- ▶ **Dronedaron** potentially increases the exposure to **pibrentasvir**. [\[Moderate\]](#) Theoretical
- ▶ **Dronedaron** is predicted to increase the exposure to **pimozide**. Avoid. [\[Severe\]](#) Theoretical → Also see **TABLE 9** p. 1449
- ▶ **Dronedaron** is predicted to increase the exposure to **ponatinib**. [\[Moderate\]](#) Study
- ▶ **Quinolones (ciprofloxacin)** slightly increase the exposure to **lidocaine**. [\[Mild\]](#) Study
- ▶ **Dronedaron** is predicted to increase the exposure to **ranolazine**. [\[Severe\]](#) Study → Also see **TABLE 9** p. 1449
- ▶ **Dronedaron** is predicted to increase the exposure to **regorafenib**. [\[Moderate\]](#) Study
- ▶ **Amiodarone** is predicted to increase the exposure to **retinoids (alitretinoin)**. Adjust **alitretinoin** dose, p. 1315. [\[Moderate\]](#) Theoretical
- ▶ **Ribociclib** (high-dose) is predicted to increase the exposure to **amiodarone**. Avoid. [\[Moderate\]](#) Theoretical → Also see **TABLE 9** p. 1449
- ▶ **Dronedaron** is predicted to increase the exposure to **ribociclib**. [\[Moderate\]](#) Study → Also see **TABLE 9** p. 1449
- ▶ **Rifamycins (rifampicin)** are predicted to decrease the efficacy of **propafenone**. [\[Moderate\]](#) Study
- ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to antiarrhythmics (**disopyramide**, **dronedaron**). Avoid. [\[Severe\]](#) Study
- ▶ **Dronedaron** is predicted to increase the exposure to **roxolitinib**. [\[Moderate\]](#) Study
- ▶ Antiarrhythmics (**amiodarone**, **dronedaron**) are predicted to increase the exposure to **siponimod**. Avoid depending on other drugs taken—consult product literature. [\[Severe\]](#) Study → Also see **TABLE 6** p. 1448
- ▶ **Amiodarone** is predicted to increase the concentration of **sirilimus**. [\[Severe\]](#) Anecdotal
- ▶ **Dronedaron** increases the concentration of **sirilimus**. Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ **Sofosbuvir** is predicted to increase the risk of severe bradycardia or heart block when given with **amiodarone**. Refer to specialist literature. [\[Severe\]](#) Anecdotal

- ▶ **SSRIs (fluvoxamine)** are predicted to increase the exposure to **propafenone**. Monitor and adjust dose. [Moderate] Study
 - ▶ **Dronedaron** is predicted to increase the exposure to **SSRIs (citalopram, escitalopram, fluoxetine, fluvoxamine, paroxetine, sertraline)**. [Severe] Theoretical → Also see TABLE 9 p. 1449
 - ▶ **Dronedaron** is predicted to increase the exposure to **SSRIs (dapoxetine)**. Adjust **dapoxetine** dose with moderate CYP3A4 inhibitors, p. 870. [Moderate] Theoretical
 - ▶ **St John's wort** is predicted to decrease the exposure to **dronedaron**. Avoid. [Severe] Theoretical
 - ▶ **Amiodaron** is predicted to increase the exposure to **statins (atorvastatin)**. Monitor and adjust dose. [Moderate] Theoretical
 - ▶ **Dronedaron** slightly increases the exposure to **statins (atorvastatin)**. Monitor and adjust dose. [Severe] Study
 - ▶ **Amiodaron** is predicted to increase the exposure to **statins (fluvastatin)**. [Moderate] Study
 - ▶ **Dronedaron** slightly increases the exposure to **statins (rosuvastatin)**. Adjust dose. [Severe] Study
 - ▶ **Amiodaron** increases the exposure to **statins (simvastatin)**. Adjust **simvastatin** dose, p. 221. [Severe] Study
 - ▶ **Dronedaron** moderately increases the exposure to **statins (simvastatin)**. Monitor and adjust dose. [Severe] Study
 - ▶ **Amiodaron** is predicted to increase the exposure to **sulfonamides**. Use with caution and adjust dose. [Moderate] Study
 - ▶ **Dronedaron** is predicted to increase the exposure to **sunitinib**. [Moderate] Study → Also see TABLE 9 p. 1449
 - ▶ **Lidocaine** is predicted to increase the effects of **suxamethonium**. [Moderate] Study
 - ▶ **Amiodaron** is predicted to increase the concentration of **tacrolimus**. [Severe] Anecdotal
 - ▶ **Dronedaron** is predicted to increase the concentration of **tacrolimus**. [Severe] Study
 - ▶ Antiarrhythmics (**amiodaron**, **dronedaron**) are predicted to slightly increase the exposure to **talazoparib**. Avoid or adjust **talazoparib** dose, p. 1059. [Severe] Study
 - ▶ **Propafenone** is predicted to increase the exposure to **talazoparib**. Avoid or adjust **talazoparib** dose, p. 1059. [Moderate] Theoretical
 - ▶ **Dronedaron** is predicted to increase the exposure to **taxanes (cabazitaxel)**. [Moderate] Theoretical
 - ▶ **Dronedaron** is predicted to increase the exposure to **taxanes (paclitaxel)**. [Severe] Theoretical
 - ▶ **Dronedaron** is predicted to increase the concentration of **temsirolimus**. Use with caution or avoid. [Moderate] Theoretical
 - ▶ **Dronedaron** is predicted to increase the exposure to **tezacaftor**. Adjust dose with moderate CYP3A4 inhibitors, see **tezacaftor** with **ivacaftor** p. 314 and **tezacaftor** with **ivacaftor** and **elixacaftor** p. 314. [Severe] Study
 - ▶ **Theophylline** decreases the efficacy of **adenosine**. Separate administration by 24 hours. [Mild] Study
 - ▶ **Amiodaron** increases the exposure to **thrombin inhibitors (dabigatran)**. Monitor and adjust dose. [Severe] Study
 - ▶ **Dronedaron** moderately increases the exposure to **thrombin inhibitors (dabigatran)**. Avoid. [Severe] Study
 - ▶ **Amiodaron** is predicted to increase the risk of thyroid dysfunction when given with **thyroid hormones**. Avoid. [Moderate] Study
 - ▶ **Amiodaron** is predicted to increase the exposure to **ticagrelor**. Use with caution or avoid. [Severe] Study
 - ▶ Antiarrhythmics (**amiodaron**, **dronedaron**) might increase the exposure to **tigecycline**. [Mild] Anecdotal
 - ▶ **Dronedaron** given with a potent CYP2C19 inhibitor is predicted to increase the exposure to **tofacitinib**. Adjust **tofacitinib** dose, p. 1163. [Moderate] Study
 - ▶ **Dronedaron** is predicted to increase the exposure to **tolvaptan**. Manufacturer advises caution or adjust **tolvaptan** dose with moderate CYP3A4 inhibitors, p. 711. [Moderate] Study
 - ▶ Antiarrhythmics (**amiodaron**, **dronedaron**) are predicted to increase the exposure to **topotecan**. [Severe] Study
 - ▶ Antiarrhythmics (**amiodaron**, **dronedaron**) are predicted to increase the concentration of **trametinib**. [Moderate] Theoretical
 - ▶ **Dronedaron** is predicted to increase the exposure to **trazodone**. [Moderate] Theoretical
 - ▶ **Dronedaron** is predicted to increase the exposure to **tricyclic antidepressants**. Avoid. [Severe] Theoretical → Also see TABLE 9 p. 1449
 - ▶ **Propafenone** is predicted to increase the concentration of **tricyclic antidepressants**. [Moderate] Theoretical → Also see TABLE 10 p. 1449
 - ▶ **Dronedaron** is predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [Moderate] Study
 - ▶ **Amiodaron** is predicted to increase the concentration of **velpatasvir**. Avoid or monitor. [Moderate] Theoretical
 - ▶ **Dronedaron** is predicted to increase the exposure to **vemurafenib**. [Severe] Theoretical → Also see TABLE 9 p. 1449
 - ▶ **Amiodaron** is predicted to increase the exposure to **venetoclax**. Avoid or monitor for toxicity. [Severe] Theoretical
 - ▶ **Dronedaron** is predicted to increase the exposure to **venetoclax**. Avoid or adjust dose—consult product literature. [Severe] Study
 - ▶ **Amiodaron** might increase the exposure to **vinca alkaloids**. [Severe] Theoretical → Also see TABLE 12 p. 1450 → Also see TABLE 9 p. 1449
 - ▶ **Dronedaron** is predicted to increase the exposure to **vinca alkaloids**. [Severe] Theoretical → Also see TABLE 9 p. 1449
 - ▶ **Dronedaron** is predicted to increase the exposure to **zopiclone**. Adjust dose. [Moderate] Study
- Anticholinesterases, centrally acting** → see TABLE 6 p. 1448 (bradycardia)
- donepezil • galantamine • rivastigmine
- ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to **donepezil**. [Mild] Study
 - ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **donepezil**. [Mild] Study
 - ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **galantamine**. Monitor and adjust dose. [Moderate] Study
 - ▶ **Bupropion** is predicted to increase the exposure to **galantamine**. Monitor and adjust dose. [Moderate] Study
 - ▶ **Cinacalcet** is predicted to increase the exposure to **galantamine**. Monitor and adjust dose. [Moderate] Study
 - ▶ **Cobicistat** is predicted to increase the exposure to **galantamine**. Monitor and adjust dose. [Moderate] Study
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **galantamine**. Monitor and adjust dose. [Moderate] Study
 - ▶ **Idelalisib** is predicted to increase the exposure to **galantamine**. Monitor and adjust dose. [Moderate] Study
 - ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **galantamine**. Monitor and adjust dose. [Moderate] Study
 - ▶ **Mitotane** is predicted to decrease the exposure to **donepezil**. [Mild] Study
 - ▶ **Anticholinesterases, centrally acting** are predicted to decrease the effects of **neuromuscular blocking drugs, non-depolarising**. [Moderate] Theoretical → Also see TABLE 6 p. 1448
 - ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **donepezil**. [Mild] Study
 - ▶ **SSRIs (fluoxetine, paroxetine)** are predicted to increase the exposure to **galantamine**. Monitor and adjust dose. [Moderate] Study
 - ▶ **Anticholinesterases, centrally acting** increase the effects of **suxamethonium**. [Moderate] Theoretical
 - ▶ **Terbinafine** is predicted to increase the exposure to **galantamine**. Monitor and adjust dose. [Moderate] Study
- Antiepileptics** → see TABLE 1 p. 1447 (hepatotoxicity), TABLE 18 p. 1451 (hyponatraemia), TABLE 12 p. 1450 (peripheral neuropathy), TABLE 11 p. 1449 (CNS depressant effects)
- brivaracetam • carbamazepine • eslicarbazepine • ethosuximide • fosphenytoin • gabapentin • lacosamide • lamotrigine • levetiracetam • oxcarbazepine • paraldehyde • perampanel • phenobarbital • phenytoin • pregabalin • primidone • retigabine • rufinamide • stiripentol • tiagabine • topiramate • valproate • vigabatrin • zonisamide
- ▶ **Manufacturer** advises caution on concurrent use of **eslicarbazepine** with drugs that prolong the PR interval

Antiepileptics (continued)

- ▶ Avoid taking milk, dairy products, carbonated drinks, fruit juices, or caffeine-containing food and drinks at the same time as **striptentol**.
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **5-HT₃-receptor antagonists (ondansetron)**. [Moderate] Study
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to markedly decrease the exposure to **abemaciclib**. Avoid. [Severe] Study
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **acalabrutinib**. Avoid. [Severe] Study
- ▶ **Acetazolamide** potentially increases the risk of toxicity when given with **valproate**. [Severe] Study
- ▶ **Acetazolamide** potentially increases the risk of overheating and dehydration when given with **zonisamide**. Avoid in children. [Severe] Theoretical
- ▶ Antiepileptics (**phenobarbital, phenytoin**) are predicted to decrease the exposure to **afatinib**. [Moderate] Theoretical
- ▶ **Carbamazepine** is predicted to decrease the exposure to **afatinib**. [Moderate] Study
- ▶ Antiepileptics (**fosphenytoin, phenytoin**) are predicted to decrease the exposure to **agomelatine**. [Moderate] Theoretical
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) decrease the concentration of **albendazole**. [Moderate] Study
- ▶ **Alcohol** potentially increases the risk of visual disturbances when given with **retigabine**. [Moderate] Study
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **aldosterone antagonists (eplerenone)**. Avoid. [Moderate] Theoretical → Also see TABLE 18 p. 1451
- ▶ **Carbamazepine** decreases the exposure to **aliskiren**. [Moderate] Study
- ▶ **Fosphenytoin** is predicted to decrease the exposure to **aminophylline**. Adjust dose. [Moderate] Study
- ▶ **Phenobarbital** is predicted to decrease the exposure to **aminophylline**. Adjust dose. [Moderate] Theoretical
- ▶ **Phenytoin** decreases the exposure to **aminophylline**. Adjust dose. [Moderate] Study
- ▶ **Primidone** is predicted to increase the clearance of **aminophylline**. Adjust dose. [Moderate] Theoretical
- ▶ **Stiripentol** is predicted to increase the exposure to **aminophylline**. Avoid. [Moderate] Theoretical
- ▶ Antiepileptics (**fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to increase the risk of methaemoglobinemia when given with topical **anaesthetics, local (prilocaine)**. Use with caution or avoid. [Severe] Theoretical → Also see TABLE 11 p. 1449
- ▶ **Phenytoin** is predicted to decrease the exposure to **anaesthetics, local (ropivacaine)**. [Moderate] Theoretical
- ▶ Oral **antacids** decrease the absorption of oral **gabapentin**. **Gabapentin** should be taken 2 hours after antacids. [Moderate] Study
- ▶ **Anti-androgens (apalutamide)** potentially decrease the exposure to **valproate**. [Mild] Theoretical
- ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to **perampanel**. Monitor and adjust dose. [Moderate] Study
- ▶ **Anti-androgens (enzalutamide)** are predicted to slightly decrease the exposure to **brivaracetam**. [Moderate] Theoretical
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **anti-androgens (abiraterone)**. Avoid. [Severe] Study
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **anti-androgens (darolutamide)**. Avoid. [Moderate] Study
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **antiarrhythmics (disopyramide, dronedarone)**. Avoid. [Severe] Study
- ▶ **Antiarrhythmics (amiodarone)** are predicted to slightly increase the concentration of antiepileptics (**fosphenytoin, phenytoin**). Monitor and adjust dose. [Severe] Study → Also see TABLE 12 p. 1450
- ▶ Antiepileptics (**fosphenytoin, phenytoin**) are predicted to decrease the exposure to **antiarrhythmics (lidocaine)**. [Severe] Anecdotal
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the efficacy of **antiarrhythmics (propafenone)**. [Moderate] Study
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **anticholinesterases, centrally acting (donepezil)**. [Mild] Study
- ▶ Antiepileptics (**carbamazepine**) decrease the concentration of antiepileptics (**brivaracetam**). [Moderate] Study
- ▶ Antiepileptics (**fosphenytoin, phenytoin**) decrease the concentration of antiepileptics (**brivaracetam**). [Moderate] Study
- ▶ Antiepileptics (**lamotrigine**) potentially increase the concentration of antiepileptics (**carbamazepine**) and antiepileptics (**carbamazepine**) decrease the concentration of antiepileptics (**lamotrigine**). Adjust **lamotrigine** dose and monitor **carbamazepine** concentration, p. 338, p. 330. [Moderate] Study
- ▶ Antiepileptics (**phenobarbital**) affect the concentration of antiepileptics (**carbamazepine**) and antiepileptics (**carbamazepine**) increase the concentration of antiepileptics (**phenobarbital**). Adjust dose. [Moderate] Study
- ▶ Antiepileptics (**topiramate**) increase the risk of carbamazepine toxicity when given with antiepileptics (**carbamazepine**). [Moderate] Study
- ▶ Antiepileptics (**stiripentol**) increase the concentration of antiepileptics (**carbamazepine, phenobarbital**). Avoid in Dravet syndrome. [Severe] Study
- ▶ Antiepileptics (**carbamazepine**) slightly decrease the exposure to antiepileptics (**eslicarbazepine, oxcarbazepine**). Monitor and adjust dose. [Moderate] Study
- ▶ Antiepileptics (**oxcarbazepine**) are predicted to increase the concentration of antiepileptics (**fosphenytoin**). Monitor concentration and adjust dose. [Moderate] Study
- ▶ Antiepileptics (**stiripentol**) are predicted to increase the concentration of antiepileptics (**fosphenytoin**). [Severe] Study
- ▶ Antiepileptics (**carbamazepine**) affect the concentration of antiepileptics (**fosphenytoin, phenytoin**) and antiepileptics (**fosphenytoin, phenytoin**) decrease the concentration of antiepileptics (**carbamazepine**). Monitor and adjust dose. [Severe] Study
- ▶ Antiepileptics (**eslicarbazepine**) increase the exposure to antiepileptics (**fosphenytoin, phenytoin**) and antiepileptics (**fosphenytoin, phenytoin**) decrease the exposure to antiepileptics (**eslicarbazepine**). Monitor and adjust dose. [Moderate] Study
- ▶ Antiepileptics (**valproate**) affect the concentration of antiepileptics (**fosphenytoin, phenytoin**) and antiepileptics (**fosphenytoin, phenytoin**) decrease the concentration of antiepileptics (**valproate**). [Severe] Study
- ▶ Antiepileptics (**vigabatrin**) decrease the concentration of antiepileptics (**fosphenytoin, phenytoin**). [Mild] Study
- ▶ Antiepileptics (**fosphenytoin**) decrease the concentration of antiepileptics (**lamotrigine**). Monitor and adjust **lamotrigine** dose, p. 338. [Moderate] Study
- ▶ Antiepileptics (**phenobarbital, phenytoin, primidone**) decrease the concentration of antiepileptics (**lamotrigine**). Monitor and adjust **lamotrigine** dose, p. 338. [Moderate] Study → Also see TABLE 11 p. 1449
- ▶ Antiepileptics (**valproate**) increase the exposure to antiepileptics (**lamotrigine**). Adjust **lamotrigine** dose and monitor rash, p. 338. [Severe] Study
- ▶ Antiepileptics (**lamotrigine**) are predicted to increase the concentration of antiepileptics (**oxcarbazepine**) and antiepileptics (**oxcarbazepine**) are predicted to decrease the concentration of antiepileptics (**lamotrigine**). Monitor adverse effects and adjust dose. [Moderate] Study
- ▶ Antiepileptics (**carbamazepine, fosphenytoin**) are predicted to decrease the exposure to antiepileptics (**perampanel**). Monitor and adjust dose. [Moderate] Study
- ▶ Antiepileptics (**oxcarbazepine**) decrease the concentration of antiepileptics (**perampanel**) and antiepileptics (**perampanel**) increase the concentration of antiepileptics (**oxcarbazepine**). Monitor and adjust dose. [Moderate] Study

- ▶ Antiepileptics (**phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to antiepileptics (**perampanel**). Monitor and adjust dose. [Moderate] Study → Also see TABLE 11 p. 1449
- ▶ Antiepileptics (**phenytoin**) increase the concentration of antiepileptics (**phenobarbital**) and antiepileptics (**phenobarbital**) affect the concentration of antiepileptics (**phenytoin**). [Moderate] Study
- ▶ Antiepileptics (**fosphenytoin**) increase the concentration of antiepileptics (**phenobarbital**, **primidone**) and antiepileptics (**phenobarbital**, **primidone**) affect the concentration of antiepileptics (**fosphenytoin**). [Moderate] Study
- ▶ Antiepileptics (**oxcarbazepine**) are predicted to increase the concentration of antiepileptics (**phenytoin**). Monitor concentration and adjust dose. [Moderate] Study
- ▶ Antiepileptics (**stiripentol**) are predicted to increase the concentration of antiepileptics (**phenytoin**). Avoid in Dravet syndrome. [Severe] Study
- ▶ Antiepileptics (**carbamazepine**) potentially decrease the concentration of antiepileptics (**primidone**) and antiepileptics (**primidone**) potentially decrease the concentration of antiepileptics (**carbamazepine**). Adjust dose. [Moderate] Anecdotal
- ▶ Antiepileptics (**phenytoin**) increase the concentration of antiepileptics (**primidone**) and antiepileptics (**primidone**) affect the concentration of antiepileptics (**phenytoin**). [Moderate] Study
- ▶ Antiepileptics (**stiripentol**) are predicted to increase the concentration of antiepileptics (**primidone**). [Severe] Theoretical
- ▶ Antiepileptics (**valproate**) affect the concentration of antiepileptics (**primidone**). Monitor and adjust dose. [Severe] Study
- ▶ Antiepileptics (**carbamazepine**) slightly increase the clearance of antiepileptics (**retigabine**). [Moderate] Study
- ▶ Antiepileptics (**fosphenytoin**, **phenytoin**) are predicted to slightly increase the clearance of antiepileptics (**retigabine**). [Moderate] Study
- ▶ Antiepileptics (**valproate**) increase the exposure to antiepileptics (**rufinamide**). Adjust **rufinamide** dose, p. 347. [Moderate] Study
- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) decrease the exposure to antiepileptics (**tiagabine**). Monitor and adjust **tiagabine** dose, p. 352. [Moderate] Study
- ▶ Antiepileptics (**fosphenytoin**, **phenytoin**) decrease the concentration of antiepileptics (**topiramate**) and antiepileptics (**topiramate**) increase the concentration of antiepileptics (**fosphenytoin**, **phenytoin**). Monitor and adjust dose. [Moderate] Study
- ▶ Antiepileptics (**phenobarbital**, **primidone**) are predicted to decrease the concentration of antiepileptics (**topiramate**). [Mild] Study
- ▶ Antiepileptics (**phenobarbital**) decrease the concentration of antiepileptics (**valproate**) and antiepileptics (**valproate**) increase the concentration of antiepileptics (**phenobarbital**). Monitor and adjust dose. [Moderate] Study
- ▶ Antiepileptics (**topiramate**) increase the risk of toxicity when given with antiepileptics (**valproate**). [Severe] Study
- ▶ Antiepileptics (**carbamazepine**) slightly to moderately decrease the concentration of antiepileptics (**zonisamide**) and antiepileptics (**zonisamide**) affect the concentration of antiepileptics (**carbamazepine**). Monitor and adjust dose. [Moderate] Study
- ▶ Antiepileptics (**fosphenytoin**, **phenytoin**) slightly to moderately decrease the concentration of antiepileptics (**zonisamide**). Monitor and adjust dose. [Moderate] Study
- ▶ Antiepileptics (**phenobarbital**, **primidone**) are predicted to decrease the concentration of antiepileptics (**zonisamide**). Monitor and adjust dose. [Moderate] Study
- ▶ Antiepileptics (**topiramate**) potentially increase the risk of overheating and dehydration when given with antiepileptics (**zonisamide**). Avoid in children. [Severe] Theoretical
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to very slightly increase the exposure to **perampanel**. [Mild] Study
- ▶ **Antifungals, azoles (miconazole)** increase the risk of carbamazepine toxicity when given with carbamazepine. Monitor and adjust dose. [Severe] Anecdotal
- ▶ **Antifungals, azoles (miconazole)** increase the risk of phenytoin toxicity when given with fosphenytoin. Monitor and adjust dose. [Severe] Anecdotal
- ▶ **Antifungals, azoles (miconazole)** increase the risk of phenytoin toxicity when given with phenytoin. Monitor and adjust dose. [Severe] Anecdotal
- ▶ **Carbamazepine** is predicted to decrease the efficacy of antifungals, azoles (**fluconazole**) and antifungals, azoles (**fluconazole**) increase the concentration of carbamazepine. Avoid or monitor carbamazepine concentration and adjust dose accordingly, p. 330. [Severe] Theoretical → Also see TABLE 1 p. 1447
- ▶ **Antifungals, azoles (fluconazole)** increase the concentration of antiepileptics (**fosphenytoin**, **phenytoin**). Monitor concentration and adjust dose. [Moderate] Study
- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to antifungals, azoles (**isavuconazole**). Avoid. [Severe] Study
- ▶ **Fosphenytoin** very markedly decreases the exposure to antifungals, azoles (**itraconazole**). Avoid and for 14 days after stopping fosphenytoin. [Moderate] Study
- ▶ **Phenobarbital** decreases the concentration of antifungals, azoles (**itraconazole**). Avoid and for 14 days after stopping phenobarbital. [Moderate] Study
- ▶ **Phenytoin** very markedly decreases the exposure to antifungals, azoles (**itraconazole**). Avoid and for 14 days after stopping phenytoin. [Moderate] Study
- ▶ **Primidone** is predicted to decrease the concentration of antifungals, azoles (**itraconazole**). [Moderate] Theoretical
- ▶ **Carbamazepine** is predicted to decrease the efficacy of antifungals, azoles (**itraconazole**, **voriconazole**) and antifungals, azoles (**itraconazole**, **voriconazole**) increase the concentration of carbamazepine. Avoid or adjust dose. [Moderate] Theoretical → Also see TABLE 1 p. 1447
- ▶ **Carbamazepine** is predicted to decrease the efficacy of antifungals, azoles (**ketoconazole**) and antifungals, azoles (**ketoconazole**) increase the concentration of carbamazepine. Avoid or monitor carbamazepine concentration and adjust dose accordingly, p. 330. [Moderate] Study
- ▶ **Phenobarbital** is predicted to decrease the concentration of antifungals, azoles (**ketoconazole**). Avoid. [Moderate] Study
- ▶ Antiepileptics (**fosphenytoin**, **phenytoin**) decrease the exposure to antifungals, azoles (**ketoconazole**). Avoid. [Moderate] Study
- ▶ **Primidone** is predicted to decrease the concentration of antifungals, azoles (**ketoconazole**, **posaconazole**). Avoid. [Moderate] Study
- ▶ **Carbamazepine** is predicted to decrease the efficacy of antifungals, azoles (**posaconazole**) and antifungals, azoles (**posaconazole**) increase the concentration of carbamazepine. Avoid. [Moderate] Theoretical
- ▶ **Phenobarbital** is predicted to decrease the concentration of antifungals, azoles (**posaconazole**). Avoid. [Moderate] Study
- ▶ Antiepileptics (**fosphenytoin**, **phenytoin**) are predicted to decrease the exposure to antifungals, azoles (**posaconazole**). Avoid. [Moderate] Study
- ▶ **Fosphenytoin** decreases the exposure to antifungals, azoles (**voriconazole**) and antifungals, azoles (**voriconazole**) increase the exposure to fosphenytoin. Avoid or adjust voriconazole dose and monitor phenytoin concentration, p. 644. [Moderate] Study
- ▶ **Phenytoin** decreases the exposure to antifungals, azoles (**voriconazole**) and antifungals, azoles (**voriconazole**) increase the exposure to phenytoin. Avoid or adjust voriconazole dose and monitor phenytoin concentration, p. 644, p. 343. [Moderate] Study
- ▶ Antiepileptics (**phenobarbital**, **primidone**) are predicted to decrease the concentration of antifungals, azoles (**voriconazole**). Avoid. [Moderate] Theoretical
- ▶ **Antihistamines, sedating (hydroxyzine)** potentially increase the risk of overheating and dehydration when given with zonisamide. Avoid in children. [Severe] Theoretical
- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure

Antiepileptics (continued)

- to **antimalarials (artemether)** with lumefantrine. Avoid. [\[Severe\]](#) Study
- ▶ **Antimalarials (pyrimethamine)** increase the risk of haematological toxicity when given with antiepileptics (**fospheytoin, phenytoin**). [\[Severe\]](#) Study
 - ▶ **Antimalarials (pyrimethamine)** are predicted to increase the risk of haematological toxicity when given with antiepileptics (**phenobarbital, primidone**). [\[Severe\]](#) Theoretical
 - ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the concentration of **antimalarials (piperaquine)**. Avoid. [\[Moderate\]](#) Theoretical
 - ▶ Antiepileptics (**carbamazepine, phenobarbital, primidone**) potentially increase the risk of toxicity when given with **antimalarials (quinine)**. [\[Unknown\]](#) Study
 - ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to moderately decrease the exposure to **antipsychotics, second generation (aripiprazole)**. Adjust aripiprazole dose, p. 418. [\[Moderate\]](#) Study → Also see TABLE 11 p. 1449
 - ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **antipsychotics, second generation (cariprazine)**. Avoid. [\[Severe\]](#) Theoretical → Also see TABLE 11 p. 1449
 - ▶ **Carbamazepine** is predicted to increase the risk of myelosuppression when given with **antipsychotics, second generation (clozapine)**. Avoid. [\[Severe\]](#) Anecdotal
 - ▶ Antiepileptics (**fospheytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **antipsychotics, second generation (clozapine)**. [\[Moderate\]](#) Anecdotal → Also see TABLE 11 p. 1449
 - ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **antipsychotics, second generation (lurasidone)**. Avoid. [\[Moderate\]](#) Study → Also see TABLE 11 p. 1449
 - ▶ **Carbamazepine** potentially decreases the exposure to **antipsychotics, second generation (olanzapine)**. Monitor and adjust dose. [\[Moderate\]](#) Study
 - ▶ **Phenytoin** is predicted to decrease the exposure to **antipsychotics, second generation (olanzapine)**. Monitor and adjust dose. [\[Moderate\]](#) Study
 - ▶ **Valproate** increases the risk of adverse effects when given with **antipsychotics, second generation (olanzapine)**. [\[Severe\]](#) Study
 - ▶ **Valproate** slightly increases the exposure to **antipsychotics, second generation (paliperidone)**. Adjust dose. [\[Moderate\]](#) Study
 - ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **antipsychotics, second generation (paliperidone)**. Monitor and adjust dose. [\[Severe\]](#) Study → Also see TABLE 11 p. 1449
 - ▶ **Valproate** potentially increases the risk of neutropenia when given with **antipsychotics, second generation (quetiapine)**. [\[Moderate\]](#) Study
 - ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **antipsychotics, second generation (quetiapine)**. [\[Moderate\]](#) Study → Also see TABLE 11 p. 1449
 - ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **antipsychotics, second generation (risperidone)**. Adjust dose. [\[Moderate\]](#) Study → Also see TABLE 11 p. 1449
 - ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **avapritinib**. Avoid. [\[Severe\]](#) Study
 - ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **axitinib**. Avoid or adjust dose. [\[Moderate\]](#) Study
 - ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **bazedoxifene**. [\[Moderate\]](#) Theoretical
 - ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) decrease the exposure to **bedaquiline**. Avoid. [\[Severe\]](#) Study → Also see TABLE 1 p. 1447
 - ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **benzodiazepines (alprazolam)**. Adjust dose. [\[Moderate\]](#) Theoretical → Also see TABLE 11 p. 1449
 - ▶ **Stiripentol** increases the concentration of **benzodiazepines (clobazam)**. [\[Severe\]](#) Study
 - ▶ **Benzdiazepines (chloridiazepoxide)** affect the concentration of antiepileptics (**fospheytoin, phenytoin**). [\[Severe\]](#) Study
 - ▶ **Benzdiazepines (clobazam, clonazepam)** potentially affect the concentration of antiepileptics (**fospheytoin, phenytoin**). [\[Severe\]](#) Anecdotal
 - ▶ **Benzdiazepines (diazepam)** potentially affect the concentration of antiepileptics (**fospheytoin, phenytoin**). Monitor concentration and adjust dose. [\[Severe\]](#) Study
 - ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **benzodiazepines (midazolam)**. Monitor and adjust dose. [\[Moderate\]](#) Study → Also see TABLE 11 p. 1449
 - ▶ Antiepileptics (**phenobarbital, primidone**) are predicted to decrease the exposure to **beta blockers, non-selective (carvedilol, labetalol)**. [\[Moderate\]](#) Theoretical
 - ▶ Antiepileptics (**phenobarbital, primidone**) are predicted to decrease the exposure to **beta blockers, non-selective (propranolol)**. [\[Moderate\]](#) Study
 - ▶ Antiepileptics (**phenobarbital, primidone**) are predicted to decrease the exposure to **beta blockers, selective (acebutolol, bisoprolol, metoprolol, nebivolol)**. [\[Moderate\]](#) Study
 - ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **bictegravir**. Avoid. [\[Moderate\]](#) Study
 - ▶ **Oxcarbazepine** is predicted to decrease the exposure to **bictegravir**. Avoid. [\[Moderate\]](#) Theoretical
 - ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) slightly decrease the exposure to **bortezomib**. Avoid. [\[Severe\]](#) Study → Also see TABLE 12 p. 1450
 - ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to very markedly decrease the exposure to **bosutinib**. Avoid. [\[Severe\]](#) Study
 - ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **brigatinib**. Avoid. [\[Severe\]](#) Study
 - ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to markedly decrease the exposure to **bupropion**. [\[Severe\]](#) Study
 - ▶ **Valproate** increases the exposure to **bupropion**. [\[Severe\]](#) Study
 - ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **bupirone**. Use with caution and adjust dose. [\[Severe\]](#) Study
 - ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) moderately decrease the exposure to **cabozantinib**. Avoid. [\[Moderate\]](#) Study
 - ▶ Antiepileptics (**fospheytoin, phenytoin**) are predicted to moderately increase the clearance of **caffeine citrate**. Monitor and adjust dose. [\[Moderate\]](#) Study
 - ▶ **Calcium channel blockers (diltiazem)** increase the concentration of carbamazepine and carbamazepine is predicted to decrease the exposure to **calcium channel blockers (diltiazem)**. Monitor concentration and adjust dose. [\[Severe\]](#) Anecdotal
 - ▶ **Calcium channel blockers (verapamil)** increase the concentration of carbamazepine and carbamazepine is predicted to decrease the exposure to **calcium channel blockers (verapamil)**. [\[Severe\]](#) Anecdotal
 - ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine)**. Monitor and adjust dose. [\[Moderate\]](#) Study
 - ▶ Antiepileptics (**phenobarbital, primidone**) are predicted to decrease the exposure to **calcium channel blockers (diltiazem, verapamil)**. [\[Severe\]](#) Study
 - ▶ **Calcium channel blockers (diltiazem, verapamil)** potentially increase the concentration of antiepileptics (**fospheytoin, phenytoin**) and antiepileptics (**fospheytoin, phenytoin**) are predicted to decrease the exposure to **calcium channel blockers (diltiazem, verapamil)**. [\[Severe\]](#) Study
 - ▶ **Valproate** increases the exposure to **calcium channel blockers (nimodipine)**. Adjust dose. [\[Moderate\]](#) Study

- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **cannabidiol**. Adjust dose. [Moderate] Study → Also see TABLE 11 p. 1449
- ▶ **Cannabidiol** increases the risk of increased ALT concentrations when given with **valproate**. Avoid or adjust dose. [Severe] Study
- ▶ **Capecitabine** increases the concentration of antiepileptics (**fosphenytoin, phenytoin**). [Severe] Anecdotal
- ▶ **Carbapenems** decrease the concentration of **valproate**. Avoid. [Severe] Anecdotal
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenytoin**) are predicted to decrease the concentration of **caspofungin**. Adjust **caspofungin** dose, p. 637. [Moderate] Theoretical
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **ceritinib**. Avoid. [Severe] Study
- ▶ Antiepileptics (**phenobarbital, primidone**) are predicted to affect the efficacy of **chenodeoxycholic acid**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ Antiepileptics (**phenobarbital, primidone**) decrease the concentration of **chloramphenicol**. [Moderate] Study
- ▶ Intravenous **chloramphenicol** increases the concentration of antiepileptics (**fosphenytoin, phenytoin**) and antiepileptics (**fosphenytoin, phenytoin**) affect the concentration of intravenous **chloramphenicol**. Monitor concentration and adjust dose. [Severe] Study
- ▶ **Phenobarbital** decreases the effects of **cholic acid**. Avoid. [Moderate] Study
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) decrease the concentration of **ciclosporin**. [Severe] Study
- ▶ **Oxcarbazepine** decreases the concentration of **ciclosporin**. [Severe] Anecdotal
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to alter the effects of **cilostazol**. [Moderate] Theoretical
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **cinacalcet**. Monitor and adjust dose. [Moderate] Study
- ▶ **Carbamazepine** is predicted to increase the risk of haematological toxicity when given with oral **cladribine**. [Moderate] Theoretical
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) decrease the exposure to **clomethiazole**. Monitor and adjust dose. [Moderate] Study → Also see TABLE 11 p. 1449
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **cobicistat**. Avoid. [Severe] Theoretical
- ▶ **Oxcarbazepine** is predicted to decrease the concentration of **cobicistat**. [Severe] Theoretical
- ▶ **Cobicistat** is predicted to very slightly increase the exposure to **perampanel**. [Mild] Study
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **cobimetinib**. Avoid. [Severe] Theoretical
- ▶ Antiepileptics (**carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate**) are predicted to decrease the efficacy of **combined hormonal contraceptives**. For FSRH guidance, see Contraceptives, interactions p. 843. [Severe] Study
- ▶ **Combined hormonal contraceptives** alter the exposure to **lamotrigine**. Adjust dose. [Moderate] Study
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **corticosteroids (budesonide, deflazacort, dexamethasone, fludrocortisone, hydrocortisone, methylprednisolone, prednisolone, triamcinolone)**. Monitor and adjust dose. [Moderate] Study
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **corticosteroids (fluticasone)**. [Unknown] Theoretical
- ▶ Antiepileptics (**fosphenytoin, phenytoin**) are predicted to alter the anticoagulant effect of **coumarins**. [Moderate] Anecdotal
- ▶ Antiepileptics (**phenobarbital, primidone**) decrease the anticoagulant effect of **coumarins**. Monitor INR and adjust dose. [Moderate] Study
- ▶ **Carbamazepine** decreases the effects of **coumarins**. Monitor and adjust dose. [Severe] Study
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to markedly decrease the exposure to **crizotinib**. Avoid. [Severe] Study
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **dabrafenib**. Avoid. [Moderate] Theoretical
- ▶ Antiepileptics (**fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to increase the risk of methaemoglobinemia when given with **dapsone**. [Severe] Theoretical
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **darifenacin**. [Moderate] Theoretical
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to markedly decrease the exposure to **dasatinib**. Avoid. [Severe] Study
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to slightly decrease the exposure to **delamanid**. Avoid. [Moderate] Study
- ▶ **Lamotrigine** is predicted to increase the risk of hyponatraemia when given with **desmopressin**. [Severe] Theoretical
- ▶ Antiepileptics (**carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate**) are predicted to decrease the efficacy of **desogestrel**. For FSRH guidance, see Contraceptives, interactions p. 843. [Severe] Theoretical
- ▶ **Desogestrel** is predicted to increase the exposure to **lamotrigine**. [Moderate] Study
- ▶ **Diazoxide** decreases the concentration of antiepileptics (**fosphenytoin, phenytoin**) and antiepileptics (**fosphenytoin, phenytoin**) are predicted to decrease the effects of **diazoxide**. Monitor concentration and adjust dose. [Moderate] Anecdotal
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to markedly decrease the exposure to **dienogest**. [Severe] Study
- ▶ Antiepileptics (**fosphenytoin, phenytoin**) are predicted to decrease the concentration of **digoxin**. [Moderate] Anecdotal
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **dipeptidylpeptidase-4 inhibitors (linagliptin)**. [Moderate] Study
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to moderately decrease the exposure to **dipeptidylpeptidase-4 inhibitors (saxagliptin)**. [Moderate] Study
- ▶ **Disulfiram** increases the concentration of antiepileptics (**fosphenytoin, phenytoin**). Monitor concentration and adjust dose. [Severe] Study → Also see TABLE 12 p. 1450
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) decrease the exposure to **dolutegravir**. Adjust dose. [Severe] Study
- ▶ **Oxcarbazepine** is predicted to decrease the exposure to **dolutegravir**. Adjust dose. [Severe] Theoretical
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **dronabinol**. Avoid or adjust dose. [Mild] Study → Also see TABLE 11 p. 1449
- ▶ **Phenytoin** is predicted to decrease the exposure to **duloxetine**. [Moderate] Theoretical
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **elbasvir**. Avoid. [Severe] Study
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **elxacaftor**. Avoid. [Severe] Theoretical
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **eliglustat**. Avoid. [Severe] Study
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the concentration of **elvitegravir**. Avoid. [Severe] Theoretical

- primidone, rufinamide, topiramate) are predicted to decrease the effects of **hormone replacement therapy**. [Moderate] Anecdotal
- ▶ **Hormone replacement therapy** is predicted to alter the exposure to **lamotrigine**. [Moderate] Theoretical
 - ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **ibrutinib**. Avoid or monitor. [Severe] Study
 - ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **idelalisib**. Avoid. [Severe] Study
 - ▶ **Idelalisib** is predicted to very slightly increase the exposure to **perampanel**. [Mild] Study
 - ▶ Antiepileptics (**carbamazepine, fosphenytoin, oxcarbazepine, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **imatinib**. Avoid. [Moderate] Study
 - ▶ **Eslicarbazepine** is predicted to decrease the exposure to **imatinib**. [Moderate] Theoretical
 - ▶ **Topiramate** is predicted to decrease the exposure to **imatinib**. [Moderate] Study
 - ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **irinotecan**. Avoid. [Severe] Study
 - ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **iron chelators (deferisirox)**. Monitor serum ferritin and adjust dose. [Moderate] Theoretical
 - ▶ **Isoniazid** increases the concentration of antiepileptics (**fosphenytoin, phenytoin**). [Moderate] Study → Also see TABLE 12 p. 1450
 - ▶ **Isoniazid** markedly increases the concentration of **carbamazepine** and **carbamazepine** increases the risk of hepatotoxicity when given with **isoniazid**. Monitor concentration and adjust dose. [Severe] Study → Also see TABLE 1 p. 1447
 - ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **ivabradine**. Adjust dose. [Moderate] Theoretical
 - ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **ivacaftor**. Avoid. [Severe] Study
 - ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **ixazomib**. Avoid. [Severe] Study
 - ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **lapatinib**. Avoid. [Severe] Study
 - ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to moderately decrease the exposure to **larotrectinib**. Avoid. [Moderate] Study
 - ▶ Antiepileptics (**fosphenytoin, oxcarbazepine, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **ledipasvir**. Avoid. [Severe] Theoretical
 - ▶ **Carbamazepine** is predicted to decrease the exposure to **ledipasvir**. Avoid. [Severe] Study
 - ▶ Antiepileptics (**carbamazepine, phenobarbital, primidone**) are predicted to decrease the concentration of **letermovir**. [Moderate] Theoretical
 - ▶ **Letermovir** is predicted to decrease the concentration of antiepileptics (**fosphenytoin, phenytoin**) and antiepileptics (**fosphenytoin, phenytoin**) are predicted to decrease the concentration of **letermovir**. [Moderate] Theoretical
 - ▶ Antiepileptics (**fosphenytoin, phenytoin**) decrease the effects of **levodopa**. [Moderate] Study
 - ▶ Antiepileptics (**carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate**) are predicted to decrease the efficacy of **levonorgestrel**. For FSRH guidance, see Contraceptives, interactions p. 843. [Severe] Theoretical
 - ▶ Antiepileptics (**carbamazepine, oxcarbazepine**) are predicted to increase the risk of neurotoxicity when given with **lithium**. [Severe] Anecdotal
 - ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **lomitapide**. Monitor and adjust dose. [Moderate] Theoretical → Also see TABLE 1 p. 1447
 - ▶ Antiepileptics (**fosphenytoin, phenytoin**) decrease the effects of **loop diuretics (furosemide)**. [Moderate] Study
 - ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **lorlatinib**. Avoid. [Severe] Study
 - ▶ **Lumacaftor** is predicted to decrease the exposure to antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**). Avoid. [Severe] Theoretical
 - ▶ **Macrolides (clarithromycin)** slightly increase the concentration of **carbamazepine**. Monitor concentration and adjust dose. [Severe] Study
 - ▶ **Macrolides (clarithromycin)** are predicted to very slightly increase the exposure to **perampanel**. [Mild] Study
 - ▶ **Macrolides (erythromycin)** markedly increase the concentration of **carbamazepine**. Monitor concentration and adjust dose. [Severe] Study
 - ▶ Antiepileptics (**phenobarbital, primidone**) are predicted to increase the effects of **MAOs, irreversible**. [Severe] Theoretical
 - ▶ **Carbamazepine** is predicted to increase the risk of severe toxic reaction when given with **MAOs, irreversible**. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical
 - ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **maraviroc**. Adjust dose. [Severe] Study
 - ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **meglitinides (repaglinide)**. Monitor blood glucose and adjust dose. [Moderate] Study
 - ▶ **Phenytoin** is predicted to decrease the exposure to **melatonin**. [Moderate] Theoretical
 - ▶ **Levetiracetam** decreases the clearance of **methotrexate**. [Severe] Anecdotal
 - ▶ Antiepileptics (**phenobarbital, primidone**) are predicted to decrease the exposure to **metronidazole**. [Moderate] Study
 - ▶ Antiepileptics (**fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the effects of **metrapone**. Avoid. [Moderate] Study
 - ▶ **Phenytoin** is predicted to increase the clearance of **mexiletine**. Monitor and adjust dose. [Moderate] Study
 - ▶ Antiepileptics (**phenobarbital, primidone**) are predicted to decrease the exposure to **mianserin**. [Moderate] Study → Also see TABLE 11 p. 1449
 - ▶ **Carbamazepine** markedly decreases the exposure to **mianserin**. Adjust dose. [Moderate] Study
 - ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **midostaurin**. Avoid. [Severe] Study
 - ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **mirtazapine**. Adjust dose. [Moderate] Study → Also see TABLE 11 p. 1449
 - ▶ **Mitotane** is predicted to decrease the exposure to **perampanel**. Monitor and adjust dose. [Moderate] Study
 - ▶ Antiepileptics (**carbamazepine, phenobarbital, primidone**) are predicted to decrease the exposure to **modafinil**. [Mild] Theoretical
 - ▶ Antiepileptics (**fosphenytoin, phenytoin**) are predicted to decrease the exposure to **modafinil** and **modafinil** is predicted to increase the concentration of antiepileptics (**fosphenytoin, phenytoin**). Monitor concentration and adjust dose. [Moderate] Theoretical
 - ▶ **Carbamazepine** is predicted to decrease the effects of **monoclonal antibodies (brentuximab vedotin)**. [Severe] Theoretical
 - ▶ **Monoclonal antibodies (tocilizumab)** are predicted to decrease the exposure to antiepileptics (**fosphenytoin, phenytoin**). Monitor and adjust dose. [Moderate] Theoretical
 - ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **monoclonal antibodies (polatuzumab vedotin)**. [Moderate] Theoretical
 - ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **montelukast**. [Mild] Study

Antiepileptics (continued)

- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to markedly decrease the exposure to **naldemedine**. Avoid. [Severe] Study
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to markedly decrease the exposure to **naloxegol**. Avoid. [Moderate] Study
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **neratinib**. Avoid. [Severe] Study → Also see TABLE 1 p. 1447
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to markedly decrease the exposure to **neurokinin-1 receptor antagonists (aprepitant)**. Avoid. [Moderate] Study
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **neurokinin-1 receptor antagonists (fosaprepitant)**. Avoid. [Moderate] Theoretical
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **neurokinin-1 receptor antagonists (netupitant)**. Avoid. [Severe] Study
- ▶ **Carbamazepine** is predicted to decrease the effects of (but acute use increases the effects of) **neuromuscular blocking drugs, non-depolarising (atracurium, cisatracurium, pancuronium, rocuronium, vecuronium)**. Monitor and adjust dose. [Moderate] Study
- ▶ Antiepileptics (**fosphenytoin, phenytoin**) decrease the effects of (but acute use increases the effects of) **neuromuscular blocking drugs, non-depolarising (atracurium, cisatracurium, pancuronium, rocuronium, vecuronium)**. [Moderate] Study
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to moderately decrease the exposure to **nilotinib**. Avoid. [Severe] Study
- ▶ Antiepileptics (**phenobarbital, phenytoin**) are predicted to decrease the exposure to **nintedanib**. [Severe] Theoretical
- ▶ **Carbamazepine** is predicted to decrease the exposure to **nintedanib**. [Moderate] Study
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **nisitroson**. Adjust dose. [Moderate] Theoretical
- ▶ **NNRTIs (efavirenz)** are predicted to affect the efficacy of **primidone** and **primidone** is predicted to slightly decrease the exposure to **NNRTIs (efavirenz)**. [Severe] Theoretical
- ▶ **NNRTIs (nevirapine)** are predicted to decrease the concentration of antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) and antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the concentration of **NNRTIs (nevirapine)**. [Severe] Study
- ▶ **Oxcarbazepine** is predicted to decrease the exposure to **NNRTIs (doravirine)**. Avoid. [Severe] Theoretical
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **NNRTIs (doravirine)**. Avoid. [Severe] Study
- ▶ **Carbamazepine** slightly decreases the exposure to **NNRTIs (efavirenz)** and **NNRTIs (efavirenz)** slightly decrease the exposure to **carbamazepine**. [Severe] Study
- ▶ **Phenobarbital** is predicted to decrease the exposure to **NNRTIs (efavirenz)** and **NNRTIs (efavirenz)** affect the concentration of **phenobarbital**. [Severe] Theoretical
- ▶ Antiepileptics (**fosphenytoin, phenytoin**) slightly decrease the exposure to **NNRTIs (efavirenz)** and **NNRTIs (efavirenz)** affect the concentration of antiepileptics (**fosphenytoin, phenytoin**). [Severe] Theoretical
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **NNRTIs (etravirine)**. Avoid. [Severe] Theoretical
- ▶ **Oxcarbazepine** is predicted to decrease the concentration of **NNRTIs (rilpivirine)**. Avoid. [Severe] Theoretical
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) markedly decrease the exposure to **NNRTIs (rilpivirine)**. Avoid. [Severe] Study
- ▶ Antiepileptics (**carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate**) are predicted to decrease the efficacy of **norethisterone**. For FSRH guidance, see Contraceptives, interactions p. 843. [Severe] Anecdotal
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **NRTIs (abacavir)**. [Moderate] Theoretical
- ▶ **Valproate** slightly increases the exposure to **NRTIs (zidovudine)**. [Moderate] Study
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **olaparib**. Avoid. [Moderate] Theoretical
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **opioids (alfentanil, fentanyl)**. [Moderate] Study → Also see TABLE 11 p. 1449
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **opioids (buprenorphine)**. Monitor and adjust dose. [Moderate] Theoretical → Also see TABLE 11 p. 1449
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) decrease the exposure to **opioids (methadone)**. Monitor and adjust dose. [Severe] Study → Also see TABLE 11 p. 1449
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **opioids (oxycodone)**. Monitor and adjust dose. [Moderate] Study → Also see TABLE 11 p. 1449
- ▶ **Carbamazepine** decreases the concentration of **opioids (tramadol)**. Adjust dose. [Severe] Study
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to moderately decrease the exposure to **osimertinib**. Avoid. [Moderate] Study
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to moderately decrease the exposure to **ospemifene**. [Moderate] Study
- ▶ **Oxybutynin** potentially increases the risk of overheating and dehydration when given with **zonisamide**. Avoid in children. [Severe] Theoretical
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **palbociclib**. Avoid. [Severe] Study
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **panobinostat**. Avoid. [Moderate] Theoretical
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) decrease the exposure to **paracetamol**. [Moderate] Study → Also see TABLE 1 p. 1447
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **pazopanib**. Avoid. [Severe] Theoretical
- ▶ **Valproate** increases the risk of adverse effects when given with **penicillins (pivmecillinam)**. Avoid. [Severe] Anecdotal
- ▶ **Phenothiazines (chlorpromazine)** decrease the concentration of antiepileptics (**phenobarbital, primidone**) and antiepileptics (**phenobarbital, primidone**) decrease the concentration of **phenothiazines (chlorpromazine)**. [Moderate] Study → Also see TABLE 11 p. 1449
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) moderately decrease the exposure to **phosphodiesterase type-4 inhibitors (apremilast)**. Avoid. [Severe] Study
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **phosphodiesterase type-4 inhibitors (roflumilast)**. Avoid. [Moderate] Study
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **phosphodiesterase type-5 inhibitors (avanafil, tadalafil)**. Avoid. [Severe] Study
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **phosphodiesterase type-5 inhibitors (sildenafil, vardenafil)**. [Moderate] Theoretical

- ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately to markedly decrease the exposure to **pibrentasvir**. Avoid. [Severe] Study
- ▶ Antiepileptics (eslicarbazepine, oxcarbazepine) potentially decrease the exposure to **pibrentasvir**. Avoid. [Severe] Theoretical
- ▶ Antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the exposure to **pirfenidone**. [Moderate] Theoretical
- ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to **pitolisant**. [Moderate] Study
- ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **ponatinib**. Avoid. [Moderate] Theoretical
- ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to **praziquantel**. Avoid. [Moderate] Study
- ▶ Antiepileptics (carbamazepine, phenobarbital, phenytoin, primidone) are predicted to increase the risk of hypersensitivity reactions when given with **procarbazine**. [Severe] Anecdotal
- ▶ Fosphenytoin is predicted to increase the risk of hypersensitivity when given with **procarbazine**. [Severe] Anecdotal
- ▶ Valproate potentially increases the concentration of **propofol**. Adjust dose. [Severe] Theoretical
- ▶ Quinolones (ciprofloxacin) affect the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. [Severe] Study
- ▶ Antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to affect the exposure to **raltegravir**. Use with caution or avoid. [Moderate] Theoretical
- ▶ Carbamazepine is predicted to affect the exposure to **raltegravir**. [Moderate] Theoretical
- ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **ranolazine**. Avoid. [Severe] Study
- ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **reboxetine**. [Moderate] Anecdotal
- ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **regorafenib**. Avoid. [Moderate] Study
- ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) potentially decrease the exposure to **remdesivir**. Avoid. [Moderate] Theoretical
- ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to **ribociclib**. Avoid. [Severe] Study
- ▶ Rifamycins (rifampicin) slightly decrease the exposure to **brivacetam**. Adjust dose. [Moderate] Study
- ▶ Rifamycins (rifampicin) markedly increase the clearance of **lamotrigine**. Adjust lamotrigine dose, p. 338. [Moderate] Study
- ▶ Rifamycins (rifampicin) are predicted to decrease the exposure to **perampamil**. Monitor and adjust dose. [Moderate] Study
- ▶ Rifamycins (rifampicin) decrease the concentration of antiepileptics (fosphenytoin, phenytoin). Use with caution and adjust dose. [Moderate] Study
- ▶ Antiepileptics (phenobarbital, primidone) are predicted to decrease the exposure to **rifamycins (rifampicin)** and **rifamycins (rifampicin)** are predicted to decrease the exposure to antiepileptics (phenobarbital, primidone). Use with caution and adjust dose. [Moderate] Study
- ▶ Rucaparib is predicted to increase the exposure to phenytoin. Monitor and adjust dose. [Moderate] Study
- ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **roxolitinib**. Monitor and adjust dose. [Moderate] Study
- ▶ Antiepileptics (carbamazepine, fosphenytoin, phenytoin) are predicted to decrease the exposure to the active metabolite of **selexipag**. Adjust dose. [Moderate] Study
- ▶ Valproate is predicted to increase the exposure to **selexipag**. [Unknown] Theoretical
- ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **siponimod**. [Severe] Study
- ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of **sirolimus**. Avoid. [Severe] Study
- ▶ Valproate increases the exposure to **sodium oxybate**. Adjust sodium oxybate dose, p. 516. [Moderate] Study
- ▶ Valproate potentially decreases the effects of **sodium phenylbutyrate**. [Moderate] Anecdotal
- ▶ Antiepileptics (fosphenytoin, oxcarbazepine, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **sofosbuvir**. Avoid. [Severe] Theoretical
- ▶ Carbamazepine is predicted to decrease the exposure to **sofosbuvir**. Avoid. [Severe] Study
- ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **solifenacin**. [Moderate] Theoretical
- ▶ Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **sorafenib**. [Moderate] Theoretical
- ▶ Oxcarbazepine is predicted to decrease the exposure to **sorafenib**. [Moderate] Study
- ▶ SSRIs (fluoxetine, fluvoxamine) are predicted to increase the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor and adjust dose. [Severe] Anecdotal
- ▶ SSRIs (sertraline) potentially increase the risk of toxicity when given with antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. [Severe] Anecdotal
- ▶ Antiepileptics (fosphenytoin, phenytoin) decrease the concentration of SSRIs (paroxetine). [Moderate] Study
- ▶ St John's wort is predicted to decrease the concentration of antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone). Avoid. [Severe] Theoretical
- ▶ St John's wort is predicted to decrease the exposure to **brivacetam**. [Moderate] Theoretical
- ▶ St John's wort is predicted to decrease the concentration of **carbamazepine**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ St John's wort is predicted to decrease the exposure to **perampamil**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ St John's wort is predicted to decrease the exposure to **tiagabine**. Avoid. [Mild] Theoretical
- ▶ Carbamazepine is predicted to decrease the exposure to **statins (atorvastatin)**. Monitor and adjust dose. [Moderate] Study → Also see TABLE 1 p. 1447
- ▶ Eslicarbazepine is predicted to decrease the exposure to **statins (atorvastatin)**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ Phenytoin moderately decreases the exposure to **statins (atorvastatin)**. [Moderate] Study
- ▶ Oxcarbazepine is predicted to decrease the exposure to **statins (atorvastatin, simvastatin)**. [Moderate] Theoretical
- ▶ Antiepileptics (fosphenytoin, phenobarbital, primidone) are predicted to decrease the exposure to **statins (atorvastatin, simvastatin)**. [Moderate] Study
- ▶ Eslicarbazepine decreases the exposure to **statins (rosuvastatin)**. [Moderate] Study
- ▶ Phenytoin is predicted to decrease the exposure to **statins (simvastatin)**. [Moderate] Study
- ▶ Antiepileptics (carbamazepine, eslicarbazepine) moderately decrease the exposure to **statins (simvastatin)**. Monitor and adjust dose. [Moderate] Study → Also see TABLE 1 p. 1447
- ▶ Sulfonamides (sulfadiazine) are predicted to increase the concentration of **fosphenytoin**. Monitor and adjust dose. [Moderate] Study
- ▶ Sulfonamides (sulfadiazine) increase the concentration of **phenytoin**. Monitor and adjust dose. [Moderate] Study
- ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **sunitinib**. Avoid or adjust sunitinib dose, p. 1051. [Moderate] Study
- ▶ Antiepileptics (fosphenytoin, phenytoin) increase the effects of **suxamethonium**. [Moderate] Study
- ▶ Carbamazepine increases the risk of prolonged neuromuscular blockade when given with **suxamethonium**. [Moderate] Study
- ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the concentration of **tacrolimus**. Monitor and adjust dose. [Severe] Study

Antiepileptics (continued)

- ▶ **Tamoxifen** (high-dose) might increase the concentration of **fosphenytoin** and **fosphenytoin** might decrease the concentration of **tamoxifen** (high-dose). [Severe] Theoretical
- ▶ **Tamoxifen** (high-dose) might increase the concentration of **phenytoin** and **phenytoin** might decrease the concentration of **tamoxifen** (high-dose). [Severe] Anecdotal
- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **taxanes** (**cabazitaxel**, **paclitaxel**). Avoid. [Severe] Study → Also see TABLE 12 p. 1450
- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **taxanes** (**docetaxel**). [Severe] Theoretical → Also see TABLE 12 p. 1450
- ▶ **Tegafur** potentially increases the concentration of antiepileptics (**fosphenytoin**, **phenytoin**). Monitor concentration and adjust dose. [Severe] Anecdotal
- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the concentration of **temsirolimus**. Avoid. [Severe] Study
- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **oxcarbazepine**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **tenofovir alafenamide**. Avoid. [Moderate] Theoretical
- ▶ **Fosphenytoin** is predicted to decrease the concentration of **tetracyclines** (**doxycycline**). Adjust dose. [Moderate] Theoretical
- ▶ Antiepileptics (**carbamazepine**, **phenobarbital**, **phenytoin**, **primidone**) decrease the concentration of **tetracyclines** (**doxycycline**). Adjust dose. [Moderate] Study → Also see TABLE 1 p. 1447
- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **tezacaftor**. Avoid. [Severe] Theoretical
- ▶ Antiepileptics (**fosphenytoin**, **phenytoin**) are predicted to decrease the exposure to **theophylline**. Adjust dose. [Moderate] Study
- ▶ Antiepileptics (**phenobarbital**, **primidone**) are predicted to increase the clearance of **theophylline**. Adjust dose. [Moderate] Theoretical
- ▶ **Carbamazepine** potentially increases the clearance of **theophylline** and **theophylline** decreases the exposure to **carbamazepine**. Adjust dose. [Moderate] Anecdotal
- ▶ **Stiripentol** is predicted to increase the exposure to **theophylline**. Avoid. [Moderate] Theoretical
- ▶ **Carbamazepine** is predicted to decrease the exposure to **thrombin inhibitors** (**dabigatran**). Avoid. [Severe] Study
- ▶ **Phenytoin** is predicted to decrease the exposure to **thrombin inhibitors** (**dabigatran**). Avoid. [Severe] Theoretical
- ▶ Antiepileptics (**fosphenytoin**, **phenytoin**) are predicted to increase the risk of hypothyroidism when given with **thyroid hormones**. [Moderate] Study
- ▶ Antiepileptics (**phenobarbital**, **primidone**) are predicted to decrease the effects of **thyroid hormones**. [Moderate] Theoretical
- ▶ **Carbamazepine** is predicted to increase the risk of hypothyroidism when given with **thyroid hormones**. Monitor and adjust dose. [Moderate] Study
- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to markedly decrease the exposure to **ticagrelor**. Avoid. [Severe] Study
- ▶ **Carbamazepine** might decrease the exposure to **tigecycline**. [Mild] Theoretical → Also see TABLE 1 p. 1447
- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **tivozanib**. [Severe] Study
- ▶ Antiepileptics (**fosphenytoin**, **phenytoin**) moderately decrease the exposure to **tizanidine**. [Mild] Study
- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **tofacitinib**. Avoid. [Severe] Study
- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **tolvaptan**. Use with caution or avoid depending on indication. [Severe] Study
- ▶ Antiepileptics (**fosphenytoin**, **phenytoin**) increase the clearance of **topotecan**. [Moderate] Study
- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **torsemide**. Adjust dose. [Moderate] Study
- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **trabectedin**. Avoid. [Severe] Theoretical → Also see TABLE 1 p. 1447
- ▶ **Carbamazepine** decreases the concentration of **trazodone**. Adjust dose. [Moderate] Anecdotal
- ▶ Antiepileptics (**carbamazepine**, **phenobarbital**, **phenytoin**) are predicted to decrease the exposure to **treprostinil**. Adjust dose. [Mild] Theoretical
- ▶ Antiepileptics (**phenobarbital**, **primidone**) are predicted to decrease the exposure to **tricyclic antidepressants**. [Moderate] Study → Also see TABLE 11 p. 1449
- ▶ **Carbamazepine** decreases the exposure to **tricyclic antidepressants**. Adjust dose. [Moderate] Study → Also see TABLE 18 p. 1451
- ▶ **Tricyclic antidepressants** (**clomipramine**, **imipramine**) potentially increase the risk of overheating and dehydration when given with **zonisamide**. Avoid in children. [Severe] Theoretical
- ▶ **Valproate** increases the concentration of **tricyclic antidepressants** (**nortriptyline**). [Severe] Study
- ▶ **Trimethoprim** increases the concentration of antiepileptics (**fosphenytoin**, **phenytoin**). [Moderate] Study
- ▶ Antiepileptics (**carbamazepine**, **eslicarbazepine**, **fosphenytoin**, **oxcarbazepine**, **perampanel**, **phenobarbital**, **phenytoin**, **primidone**, **rufinamide**, **topiramate**) decrease the efficacy of **ulipristal**. For FSRH guidance, see Contraceptives, interactions p. 843. [Severe] Anecdotal
- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **upadacitinib**. [Moderate] Study
- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **vandetanib**. Avoid. [Moderate] Study
- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to moderately decrease the exposure to **velpatasvir**. Avoid. [Severe] Study
- ▶ **Oxcarbazepine** is predicted to decrease the exposure to **velpatasvir**. Avoid. [Severe] Theoretical
- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **vemurafenib**. Avoid. [Severe] Study
- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **venetoclax**. Avoid. [Severe] Study
- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **vinca alkaloids** (**vinblastine**, **vincristine**, **vindesine**). [Severe] Theoretical → Also see TABLE 1 p. 1447 → Also see TABLE 12 p. 1450
- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **vinca alkaloids** (**vinflunine**). Avoid. [Severe] Theoretical → Also see TABLE 12 p. 1450
- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **vinca alkaloids** (**vinorelbine**). Use with caution or avoid. [Severe] Theoretical → Also see TABLE 12 p. 1450
- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **vismodegib**. Avoid. [Moderate] Theoretical
- ▶ Antiepileptics (**fosphenytoin**, **phenytoin**) decrease the effects of **vitamin D substances**. [Moderate] Study
- ▶ Antiepileptics (**phenobarbital**, **primidone**) are predicted to decrease the effects of **vitamin D substances**. [Moderate] Theoretical
- ▶ **Carbamazepine** is predicted to decrease the effects of **vitamin D substances**. [Moderate] Study
- ▶ Antiepileptics (**phenobarbital**, **primidone**) potentially increase the risk of nephrotoxicity when given with **volatile halogenated anaesthetics** (**methoxyflurane**). Avoid. [Severe] Theoretical → Also see TABLE 11 p. 1449

- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **vortioxetine**. Monitor and adjust dose. [Moderate] Study
- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the concentration of **voxilaprevir**. Avoid. [Severe] Study
- ▶ **Oxcarbazepine** is predicted to decrease the concentration of **voxilaprevir**. Avoid. [Severe] Theoretical
- ▶ **Carbamazepine** moderately decreases the exposure to **zolidem**. [Moderate] Study
- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **zopiclone**. Adjust dose. [Moderate] Study → Also see TABLE 11 p. 1449

Antifungals, azoles → see TABLE 1 p. 1447 (hepatotoxicity), TABLE 9 p. 1449 (QT-interval prolongation)

clotrimazole · fluconazole · isavuconazole · itraconazole · ketoconazole · miconazole · posaconazole · voriconazole

- ▶ Since systemic absorption can follow topical application, the possibility of interactions with topical **clotrimazole** and **ketoconazole** should be borne in mind.
- ▶ In general, **fluconazole** interactions relate to multiple-dose treatment.
- ▶ The use of carbonated drinks, such as cola, improves **itraconazole**, **ketoconazole**, and **posaconazole** bioavailability.
- ▶ Interactions of **miconazole** apply to the oral gel formulation, as a sufficient quantity can be absorbed to cause systemic effects. Systemic absorption from intravaginal and topical formulations might also occur.
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **abemaciclib**. [Moderate] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **abemaciclib**. Avoid or adjust **abemaciclib** dose, p. 1015. [Severe] Study
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **acalabrutinib**. Avoid or monitor. [Severe] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **acalabrutinib**. Avoid. [Severe] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**) are predicted to increase the exposure to **afatinib**. Separate administration by 12 hours. [Moderate] Study
- ▶ **Alcohol** potentially causes a disulfiram-like reaction when given with **ketoconazole**. Avoid. [Moderate] Anecdotal
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **aldosterone antagonists (epplerenone)**. Adjust **epplerenone** dose, p. 209. [Severe] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to markedly increase the exposure to **aldosterone antagonists (epplerenone)**. Avoid. [Severe] Study
- ▶ **Itraconazole** markedly increases the exposure to **aliskiren**. Avoid. [Severe] Study
- ▶ **Ketoconazole** moderately increases the exposure to **aliskiren**. [Moderate] Study
- ▶ **Itraconazole** increases the risk of busulfan toxicity when given with **alkylating agents (busulfan)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Miconazole** is predicted to increase the concentration of **alkylating agents (busulfan)**. Use with caution and adjust dose. [Moderate] Theoretical
- ▶ **Isavuconazole** is predicted to increase the exposure to **alkylating agents (cyclophosphamide)**. [Moderate] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to moderately increase the exposure to **alpha blockers (alfuzosin, tamsulosin)**. Use with caution or avoid. [Moderate] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **alpha blockers (doxazosin)**. [Moderate] Study
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **alpha blockers (tamsulosin)**. [Moderate] Theoretical
- ▶ **Miconazole** potentially decreases the exposure to **aminoglycosides (tobramycin)**. [Moderate] Anecdotal
- ▶ Oral **antacids** decrease the absorption of oral **itraconazole** capsules. **Itraconazole** should be taken 2 hours before or 1 hour after antacids. [Moderate] Study
- ▶ Oral **antacids** decrease the absorption of oral **ketoconazole**. Separate administration by at least 2 hours. [Moderate] Study
- ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to **isavuconazole**. Avoid. [Severe] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **anti-androgens (apalutamide)**. [Mild] Study → Also see TABLE 9 p. 1449
- ▶ **Itraconazole** slightly increases the exposure to **anti-androgens (darolutamide)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Ketoconazole** is predicted to increase the exposure to **anti-androgens (darolutamide)**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Miconazole** is predicted to increase the exposure to **antiarrhythmics (disopyramide)**. Use with caution and adjust dose. [Severe] Theoretical
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **antiarrhythmics (disopyramide)**. Avoid. [Severe] Theoretical → Also see TABLE 9 p. 1449
- ▶ **Posaconazole** is predicted to increase the exposure to **antiarrhythmics (disopyramide, dronedarone)**. Avoid. [Severe] Theoretical
- ▶ **Fluconazole** is predicted to increase the exposure to **antiarrhythmics (dronedarone)**. [Severe] Theoretical → Also see TABLE 9 p. 1449
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) very markedly increase the exposure to **antiarrhythmics (dronedarone)**. Avoid. [Severe] Study → Also see TABLE 9 p. 1449
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **antiarrhythmics (propafenone)**. Monitor and adjust dose. [Moderate] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **antiarrhythmics (propafenone)**. Monitor and adjust dose. [Severe] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **anticholinesterases, centrally acting (galantamine)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Antiepileptics (carbamazepine)** are predicted to decrease the efficacy of **fluconazole** and **fluconazole** increases the concentration of **antiepileptics (carbamazepine)**. Avoid or monitor **carbamazepine** concentration and adjust dose accordingly, p. 330. [Severe] Theoretical → Also see TABLE 1 p. 1447
- ▶ **Antiepileptics (carbamazepine)** are predicted to decrease the efficacy of **ketoconazole** and **ketoconazole** slightly increases the concentration of **antiepileptics (carbamazepine)**. Avoid or monitor **carbamazepine** concentration and adjust dose accordingly, p. 330. [Moderate] Study
- ▶ **Antiepileptics (carbamazepine)** are predicted to decrease the efficacy of **posaconazole** and **posaconazole** increases the concentration of **antiepileptics (carbamazepine)**. Avoid. [Moderate] Theoretical
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **isavuconazole**. Avoid. [Severe] Study
- ▶ **Antiepileptics (fosphenytoin)** very markedly decrease the exposure to **itraconazole**. Avoid and for 14 days after stopping **fosphenytoin**. [Moderate] Study
- ▶ **Antiepileptics (fosphenytoin)** decrease the exposure to **voriconazole** and **voriconazole** increases the exposure to **antiepileptics (fosphenytoin)**. Avoid or adjust **voriconazole** dose and monitor phenytoin concentration, p. 644. [Moderate] Study
- ▶ **Antiepileptics (fosphenytoin, phenytoin)** decrease the exposure to **ketoconazole**. Avoid. [Moderate] Study
- ▶ **Antiepileptics (fosphenytoin, phenytoin)** are predicted to decrease the exposure to **posaconazole**. Avoid. [Moderate] Study

Antifungals, azoles (continued)

- ▶ Antiepileptics (**phenobarbital**) decrease the concentration of **itraconazole**. Avoid and for 14 days after stopping **phenobarbital**. [Moderate] Study
- ▶ Antiepileptics (**phenobarbital**) are predicted to decrease the concentration of **ketoconazole**. Avoid. [Moderate] Study
- ▶ Antiepileptics (**phenobarbital**) are predicted to decrease the concentration of **posaconazole**. Avoid. [Moderate] Study
- ▶ Antiepileptics (**phenobarbital, primidone**) are predicted to decrease the concentration of **voriconazole**. Avoid. [Moderate] Theoretical
- ▶ Antiepileptics (**phenytoin**) very markedly decrease the exposure to **itraconazole**. Avoid and for 14 days after stopping **phenytoin**. [Moderate] Study
- ▶ Antiepileptics (**phenytoin**) decrease the exposure to **voriconazole** and **voriconazole** increases the exposure to **antiepileptics (phenytoin)**. Avoid or adjust **voriconazole** dose and monitor **phenytoin** concentration, p. 644, p. 343. [Moderate] Study
- ▶ Antiepileptics (**primidone**) are predicted to decrease the concentration of **itraconazole**. [Moderate] Theoretical
- ▶ **Miconazole** increases the risk of carbamazepine toxicity when given with **antiepileptics (carbamazepine)**. Monitor and adjust dose. [Severe] Anecdotal
- ▶ **Miconazole** increases the risk of phenytoin toxicity when given with **antiepileptics (fosphenytoin)**. Monitor and adjust dose. [Severe] Anecdotal
- ▶ **Fluconazole** increases the concentration of **antiepileptics (fosphenytoin, phenytoin)**. Monitor concentration and adjust dose. [Moderate] Study
- ▶ Antiepileptics (**carbamazepine**) are predicted to decrease the efficacy of antifungals, azoles (**itraconazole, voriconazole**) and antifungals, azoles (**itraconazole, voriconazole**) increase the concentration of **antiepileptics (carbamazepine)**. Avoid or adjust dose. [Moderate] Theoretical → Also see TABLE 1 p. 1447
- ▶ Antiepileptics (**primidone**) are predicted to decrease the concentration of antifungals, azoles (**ketoconazole, posaconazole**). Avoid. [Moderate] Study
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to very slightly increase the exposure to **antiepileptics (perampanel)**. [Mild] Study
- ▶ **Miconazole** increases the risk of phenytoin toxicity when given with **antiepileptics (phenytoin)**. Monitor and adjust dose. [Severe] Anecdotal
- ▶ Antifungals, azoles (**fluconazole**) are predicted to increase the exposure to antifungals, azoles (**isavuconazole**). [Severe] Theoretical
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to increase the exposure to antifungals, azoles (**isavuconazole**). Avoid or monitor adverse effects. [Severe] Study
- ▶ Antifungals, azoles (**posaconazole**) are predicted to increase the exposure to antifungals, azoles (**isavuconazole**). [Moderate] Theoretical
- ▶ **Miconazole** is predicted to increase the exposure to **antihistamines, non-sedating (mizolastine)**. Avoid. [Moderate] Theoretical
- ▶ Antifungals, azoles (**fluconazole, isavuconazole, posaconazole**) are predicted to increase the exposure to **antihistamines, non-sedating (mizolastine)**. [Severe] Theoretical
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to increase the exposure to **antihistamines, non-sedating (mizolastine)**. Avoid. [Severe] Study
- ▶ Antifungals, azoles (**fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole**) are predicted to increase the exposure to **antihistamines, non-sedating (rupatadine)**. Avoid. [Moderate] Study
- ▶ **Ketoconazole** increases the exposure to **antimalarials (mefloquine)**. [Moderate] Study
- ▶ Antifungals, azoles (**fluconazole, itraconazole, posaconazole, voriconazole**) are predicted to increase the exposure to **antimalarials (mefloquine)**. [Moderate] Theoretical
- ▶ Antifungals, azoles (**fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole**) are predicted to increase the concentration of antimalarials (**piperazine**). [Severe] Theoretical
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to slightly increase the exposure to **antipsychotics,**

second generation (aripiprazole). Adjust aripiprazole dose, p. 418.

- [Moderate] Study
- ▶ Antifungals, azoles (**fluconazole, isavuconazole, posaconazole**) are predicted to increase the exposure to **antipsychotics, second generation (cariprazine)**. Avoid. [Severe] Study
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to moderately increase the exposure to **antipsychotics, second generation (cariprazine)**. Avoid. [Severe] Study
- ▶ **Posaconazole** moderately increases the exposure to **antipsychotics, second generation (lurasidone)**. Avoid. [Severe] Study
- ▶ Antifungals, azoles (**fluconazole, isavuconazole**) are predicted to increase the exposure to **antipsychotics, second generation (lurasidone)**. Adjust lurasidone dose. [Moderate] Study
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to increase the exposure to **antipsychotics, second generation (lurasidone, quetiapine)**. Avoid. [Severe] Study
- ▶ Antifungals, azoles (**fluconazole, isavuconazole, posaconazole**) are predicted to increase the exposure to **antipsychotics, second generation (quetiapine)**. Avoid. [Moderate] Study
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to increase the exposure to **antipsychotics, second generation (risperidone)**. Adjust dose. [Moderate] Study → Also see TABLE 9 p. 1449
- ▶ Antifungals, azoles (**fluconazole, isavuconazole, posaconazole**) are predicted to increase the exposure to **avapritinib**. Avoid or adjust **avapritinib** dose, p. 1019. [Moderate] Study
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to increase the exposure to **avapritinib**. Avoid. [Moderate] Study
- ▶ Antifungals, azoles (**fluconazole, isavuconazole, posaconazole**) are predicted to increase the exposure to **axitinib**. [Moderate] Study
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to increase the exposure to **axitinib**. Avoid or adjust dose. [Moderate] Study
- ▶ Antifungals, azoles (**fluconazole, isavuconazole, posaconazole**) are predicted to increase the exposure to **bedaquiline**. Avoid prolonged use. [Mild] Theoretical → Also see TABLE 1 p. 1447 → Also see TABLE 9 p. 1449
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to increase the exposure to **bedaquiline**. Avoid prolonged use. [Mild] Study → Also see TABLE 1 p. 1447 → Also see TABLE 9 p. 1449
- ▶ **Miconazole** is predicted to increase the exposure to **benzodiazepines (alprazolam)**. Use with caution and adjust dose. [Moderate] Theoretical
- ▶ Antifungals, azoles (**fluconazole, isavuconazole, posaconazole**) are predicted to increase the exposure to **benzodiazepines (alprazolam)**. [Severe] Study
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) moderately increase the exposure to **benzodiazepines (alprazolam)**. Avoid. [Moderate] Study
- ▶ Antifungals, azoles (**fluconazole, voriconazole**) potentially increase the exposure to **benzodiazepines (clonazepam)**. Adjust dose. [Moderate] Theoretical
- ▶ Antifungals, azoles (**fluconazole, voriconazole**) moderately increase the exposure to **benzodiazepines (diazepam)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Miconazole** is predicted to increase the exposure to intravenous **benzodiazepines (midazolam)**. Use with caution and adjust dose. [Moderate] Theoretical
- ▶ **Miconazole** is predicted to increase the exposure to oral **benzodiazepines (midazolam)**. Avoid. [Moderate] Theoretical
- ▶ Antifungals, azoles (**fluconazole, isavuconazole, posaconazole**) are predicted to increase the exposure to **benzodiazepines (midazolam)**. Monitor adverse effects and adjust dose. [Severe] Study
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to markedly to very markedly increase the exposure to **benzodiazepines (midazolam)**. Avoid or adjust dose. [Severe] Study

- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**) are predicted to increase the exposure to **beta blockers**, **non-selective (nadolol)**. [Moderate] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **beta₂ agonists (salmeterol)**. Avoid. [Severe] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**) are predicted to increase the exposure to **bictegravir**. Use with caution or avoid. [Moderate] Theoretical
- ▶ **Posaconazole** is predicted to increase the exposure to **bictegravir**. [Moderate] Theoretical
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) slightly increase the exposure to **bortezomib**. [Moderate] Study
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **itraconazole**, **ketoconazole**, **posaconazole**, **voriconazole**) are predicted to increase the exposure to **bosutinib**. Avoid or adjust dose. [Severe] Study → Also see TABLE 9 p. 1449
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **brigatinib**. [Moderate] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **brigatinib**. Avoid or adjust **brigatinib** dose, p. 1022. [Severe] Study
- ▶ **Isavuconazole** slightly increases the exposure to **bupropion**. Adjust dose. [Moderate] Study
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **bupirone**. Use with caution and adjust dose. [Moderate] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **bupirone**. Adjust **bupirone** dose, p. 364. [Severe] Study
- ▶ **Miconazole** is predicted to increase the concentration of **bupirone**. Use with caution and adjust dose. [Moderate] Theoretical
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **itraconazole**, **ketoconazole**, **posaconazole**, **voriconazole**) are predicted to increase the exposure to **cabozantinib**. [Moderate] Study → Also see TABLE 9 p. 1449
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **isavuconazole**. [Moderate] Theoretical
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nifedipine, nifedipine, nimodipine)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Miconazole** is predicted to increase the exposure to **calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nifedipine, nifedipine, nimodipine, verapamil)**. Use with caution and adjust dose. [Moderate] Theoretical
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **calcium channel blockers (amlodipine, felodipine, lacidipine, nifedipine, nimodipine)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Miconazole** is predicted to increase the exposure to **calcium channel blockers (diltiazem)**. [Moderate] Theoretical
- ▶ **Fluconazole** (high-dose) is predicted to increase the exposure to **calcium channel blockers (diltiazem, verapamil)**. [Moderate] Theoretical
- ▶ **Posaconazole** is predicted to increase the exposure to **calcium channel blockers (diltiazem, verapamil)**. [Moderate] Theoretical
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **calcium channel blockers (diltiazem, verapamil)**. [Severe] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to markedly increase the exposure to **calcium channel blockers (lercanidipine)**. Avoid. [Severe] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **cannabidiol**. Avoid or adjust dose. [Mild] Study
- ▶ **Fluconazole** is predicted to increase the exposure to **cannabidiol**. [Moderate] Theoretical
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **ceritinib**. [Moderate] Study → Also see TABLE 9 p. 1449
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **ceritinib**. Avoid or adjust **ceritinib** dose, p. 1024. [Severe] Study → Also see TABLE 9 p. 1449
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the concentration of **ciclosporin**. [Severe] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) increase the concentration of **ciclosporin**. [Severe] Study
- ▶ **Miconazole** increases the concentration of **ciclosporin**. Monitor and adjust dose. [Severe] Anecdotal
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to moderately increase the exposure to **cilostazol**. Adjust **cilostazol** dose, p. 249. [Moderate] Study
- ▶ **Fluconazole** is predicted to increase the exposure to **cilostazol**. Adjust **cilostazol** dose, p. 249. [Moderate] Theoretical
- ▶ **Miconazole** is predicted to increase the exposure to **cilostazol**. Use with caution and adjust dose. [Moderate] Theoretical
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to moderately increase the exposure to **cinacalcet**. Adjust dose. [Moderate] Study
- ▶ **Fluconazole** is predicted to decrease the efficacy of **clopidogrel**. Avoid. [Severe] Theoretical
- ▶ **Voriconazole** is predicted to decrease the efficacy of **clopidogrel**. Avoid. [Moderate] Study
- ▶ **Cobicistat** is predicted to increase the exposure to antifungals, azoles (**fluconazole**, **posaconazole**). [Moderate] Theoretical
- ▶ **Cobicistat** is predicted to increase the exposure to antifungals, azoles (**itraconazole**, **ketoconazole**). Adjust dose. [Moderate] Theoretical
- ▶ **Cobicistat** is predicted to increase the exposure to **isavuconazole**. Avoid or monitor adverse effects. [Severe] Study
- ▶ **Cobicistat** is predicted to affect the exposure to **voriconazole**. Avoid. [Moderate] Theoretical
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **cobimetinib**. [Severe] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **cobimetinib**. Avoid or monitor for toxicity. [Severe] Study
- ▶ **Miconazole** is predicted to increase the exposure to **cobimetinib**. [Severe] Theoretical
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **colchicine**. Adjust **colchicine** dose with moderate CYP3A4 inhibitors, p. 1175. [Severe] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **colchicine**. Avoid potent CYP3A4 inhibitors or adjust **colchicine** dose, p. 1175. [Severe] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **corticosteroids (beclomethasone)** (risk with beclomethasone is likely to be lower than with other corticosteroids). [Moderate] Theoretical
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **corticosteroids (betamethasone, budesonide, ciclesonide, deflazacort, dexamethasone, fludrocortisone, fluticasone, hydrocortisone, methylprednisolone, mometasone, prednisolone, triamcinolone)**. Avoid or monitor adverse effects. [Severe] Study
- ▶ **Miconazole** is predicted to increase the concentration of **corticosteroids (methylprednisolone)**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **corticosteroids (methylprednisolone)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Fluconazole** increases the anticoagulant effect of **coumarins**. Monitor INR and adjust dose. [Severe] Study
- ▶ **Itraconazole** potentially increases the anticoagulant effect of **coumarins**. [Severe] Anecdotal
- ▶ **Ketoconazole** potentially increases the anticoagulant effect of **coumarins (warfarin)**. Monitor INR and adjust dose. [Severe] Anecdotal
- ▶ **Miconazole** greatly increases the anticoagulant effect of **coumarins**. MHRA advises avoid unless INR can be monitored closely; monitor for signs of bleeding. [Severe] Study

Antifungals, azoles (continued)

- ▶ **Voriconazole** increases the anticoagulant effect of **coumarins**. Monitor INR and adjust dose. [Moderate] Study
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**) are predicted to increase the exposure to **crizotinib**. [Moderate] Study → Also see TABLE 9 p. 1449
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **posaconazole**, **voriconazole**) are predicted to increase the exposure to **crizotinib**. Avoid. [Moderate] Study → Also see TABLE 9 p. 1449
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **dabrafenib**. [Moderate] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **dabrafenib**. Use with caution or avoid. [Moderate] Study
- ▶ **Dabrafenib** is predicted to decrease the exposure to **isavuconazole**. Avoid. [Severe] Theoretical
- ▶ Antifungals, azoles (**isavuconazole**, **posaconazole**) are predicted to increase the exposure to **darifenacin**. [Moderate] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to markedly to very markedly increase the exposure to **darifenacin**. Avoid. [Severe] Study
- ▶ **Fluconazole** slightly increases the exposure to **darifenacin**. [Moderate] Study
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **dasatinib**. [Severe] Study → Also see TABLE 9 p. 1449
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **dasatinib**. Avoid or adjust dose—consult product literature. [Severe] Study → Also see TABLE 9 p. 1449
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) very slightly increase the exposure to **delamanid**. [Severe] Study → Also see TABLE 9 p. 1449
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to slightly increase the exposure to **dienogest**. [Moderate] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to moderately increase the exposure to **dienogest**. [Moderate] Study
- ▶ **Isavuconazole** slightly increases the exposure to **digoxin**. Monitor and adjust dose. [Moderate] Study
- ▶ **Itraconazole** is predicted to markedly increase the concentration of **digoxin**. Monitor and adjust dose. [Severe] Study
- ▶ **Ketoconazole** is predicted to markedly increase the concentration of **digoxin**. [Severe] Study
- ▶ **Posaconazole** is predicted to increase the concentration of **digoxin**. [Severe] Study → Also see TABLE 9 p. 1449
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **dipeptidylpeptidase-4 inhibitors (saxagliptin)**. [Mild] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **dipeptidylpeptidase-4 inhibitors (saxagliptin)**. [Moderate] Study
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **itraconazole**, **ketoconazole**, **posaconazole**, **voriconazole**) are predicted to increase the exposure to **domperidone**. Avoid. [Severe] Study
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **dopamine receptor agonists (bromocriptine)**. [Severe] Theoretical
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) increase the exposure to **dopamine receptor agonists (bromocriptine)**. [Severe] Study
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **itraconazole**, **ketoconazole**, **posaconazole**, **voriconazole**) are predicted to increase the concentration of **dopamine receptor agonists (cabergoline)**. [Moderate] Anecdotal
- ▶ **Isavuconazole** is predicted to increase the exposure to **dopamine receptor agonists (pramipexole)**. Adjust dose. [Moderate] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **dronabinol**. Adjust dose. [Mild] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **drospirenone**. [Severe] Study
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to moderately increase the exposure to **dutasteride**. [Mild] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **dutasteride**. Monitor adverse effects and adjust dose. [Moderate] Theoretical
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **eloxacafator**. Adjust tezacaftor with ivacaftor and eloxacafator p. 314 dose with moderate CYP3A4 inhibitors. [Severe] Theoretical
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **eloxacafator**. Adjust tezacaftor with ivacaftor and eloxacafator p. 314 dose with potent CYP3A4 inhibitors. [Severe] Study
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **itraconazole**, **ketoconazole**, **posaconazole**, **voriconazole**) are predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to moderately increase the exposure to **encorafenib**. [Moderate] Study → Also see TABLE 9 p. 1449
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **encorafenib**. Avoid or monitor. [Severe] Study → Also see TABLE 9 p. 1449
- ▶ **Endothelin receptor antagonists (bosentan)** are predicted to decrease the exposure to **isavuconazole**. Avoid. [Severe] Theoretical
- ▶ **Fluconazole** is predicted to increase the exposure to **endothelin receptor antagonists (bosentan)**. Avoid. [Severe] Study
- ▶ **Itraconazole** is predicted to increase the exposure to **endothelin receptor antagonists (bosentan)**. [Moderate] Theoretical
- ▶ **Ketoconazole** moderately increases the exposure to **endothelin receptor antagonists (bosentan)**. [Moderate] Study
- ▶ **Voriconazole** is predicted to increase the exposure to **endothelin receptor antagonists (bosentan)**. Avoid. [Severe] Theoretical
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **endothelin receptor antagonists (macitentan)**. [Moderate] Study
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **entrectinib**. Avoid moderate CYP3A4 inhibitors or adjust entrectinib dose, p. 1030. [Severe] Theoretical → Also see TABLE 9 p. 1449
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **entrectinib**. Avoid potent CYP3A4 inhibitors or adjust entrectinib dose, p. 1030. [Severe] Study → Also see TABLE 9 p. 1449
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the risk of ergotism when given with **ergometrine**. [Severe] Theoretical
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the risk of ergotism when given with **ergometrine**. Avoid. [Severe] Theoretical
- ▶ **Miconazole** is predicted to increase the exposure to **ergometrine**. Avoid. [Moderate] Theoretical
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the risk of ergotism when given with **ergotamine**. [Severe] Theoretical
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the risk of ergotism when given with **ergotamine**. Avoid. [Severe] Theoretical
- ▶ **Miconazole** is predicted to increase the exposure to **ergotamine**. Avoid. [Moderate] Theoretical
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **erlotinib**. [Moderate] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **erlotinib**. Use with caution and adjust dose. [Severe] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **esketamine**. Adjust dose. [Moderate] Study

- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the concentration of **everolimus**. Avoid or adjust dose. [Moderate] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the concentration of **everolimus**. Avoid. [Severe] Study
- ▶ **Fluconazole** might increase the risk of bleeding when given with **factor XA inhibitors (apixaban)**. [Moderate] Study
- ▶ Antifungals, azoles (**posaconazole**, **voriconazole**) are predicted to increase the exposure to **factor XA inhibitors (apixaban)**. Avoid. [Moderate] Theoretical
- ▶ **Itraconazole** is predicted to increase the exposure to **factor XA inhibitors (apixaban, rivaroxaban)**. Avoid. [Severe] Theoretical
- ▶ **Ketoconazole** moderately increases the exposure to **factor XA inhibitors (apixaban, rivaroxaban)**. Avoid. [Severe] Study
- ▶ **Itraconazole** is predicted to increase the exposure to **factor XA inhibitors (edoxaban)**. [Severe] Theoretical
- ▶ **Ketoconazole** slightly increases the exposure to **factor XA inhibitors (edoxaban)**. Adjust **edoxaban** dose, p. 138. [Severe] Study
- ▶ Antifungals, azoles (**posaconazole**, **voriconazole**) are predicted to increase the exposure to **factor XA inhibitors (rivaroxaban)**. Avoid. [Severe] Theoretical
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **fesoterodine**. Adjust **fesoterodine** dose with moderate CYP3A4 inhibitors in hepatic and renal impairment, p. 824. [Mid] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to moderately increase the exposure to **fesoterodine**. Adjust **fesoterodine** dose with potent CYP3A4 inhibitors; avoid in hepatic and renal impairment, p. 824. [Severe] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**) are predicted to increase the exposure to **fidaxomicin**. Avoid. [Moderate] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **fostamatinib**. Monitor adverse effects and adjust dose. [Moderate] Study
- ▶ **Posaconazole** is predicted to increase the exposure to **fostamatinib**. Monitor adverse effects and adjust dose. [Moderate] Theoretical
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **gefitinib**. [Moderate] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **gefitinib**. [Severe] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **gilteritinib**. [Moderate] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to moderately increase the exposure to **glasdegib**. Use with caution or avoid. [Moderate] Study → Also see TABLE 9 p. 1449
- ▶ **Posaconazole** is predicted to increase the exposure to **glasdegib**. Use with caution or avoid. [Moderate] Theoretical
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**) potentially increase the exposure to **glecaprevir**. [Moderate] Theoretical
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to moderately to markedly increase the exposure to **glecaprevir**. Avoid. [Severe] Study
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the concentration of **guanfacine**. Adjust **guanfacine** dose, p. 375. [Moderate] Theoretical
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **guanfacine**. Adjust **guanfacine** dose, p. 375. [Moderate] Study
- ▶ **H₂ receptor antagonists** are predicted to decrease the absorption of **itraconazole**. Administer **itraconazole** capsules with an acidic beverage, p. 641. [Moderate] Study
- ▶ **H₂ receptor antagonists** are predicted to decrease the absorption of **ketoconazole**. Administer **ketoconazole** with an acidic beverage, p. 724. [Moderate] Study
- ▶ **H₂ receptor antagonists** are predicted to decrease the exposure to **posaconazole**. Avoid use of posaconazole oral suspension. [Moderate] Study
- ▶ **Itraconazole** increases the concentration of **haloperidol**. [Moderate] Study
- ▶ **Fluconazole** slightly increases the exposure to **HIV-protease inhibitors (tipranavir)**. Avoid or adjust dose. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **isavuconazole**. Avoid or monitor adverse effects. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **itraconazole**. Use with caution and adjust dose. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **ketoconazole**. Use with caution and adjust dose. [Moderate] Study
- ▶ **Miconazole** is predicted to increase the concentration of **HIV-protease inhibitors**. Use with caution and adjust dose. [Moderate] Theoretical
- ▶ **Posaconazole** is predicted to increase the exposure to **HIV-protease inhibitors**. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to affect the exposure to **voriconazole** and **voriconazole** potentially affects the exposure to **HIV-protease inhibitors**. [Severe] Study
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **ibrutinib**. Adjust **ibrutinib** dose with moderate CYP3A4 inhibitors, p. 1034. [Severe] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **ibrutinib**. Avoid potent CYP3A4 inhibitors or adjust **ibrutinib** dose, p. 1034. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **isavuconazole**. Avoid or monitor adverse effects. [Severe] Study
- ▶ Antifungals, azoles (**fluconazole**, **posaconazole**) are predicted to increase the exposure to **imatinitib**. [Moderate] Theoretical
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **imatinitib**. [Moderate] Study
- ▶ **Imatinib** is predicted to increase the exposure to **isavuconazole**. [Moderate] Theoretical
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the risk of toxicity when given with **irinotecan**. Avoid. [Moderate] Study
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **ivabradine**. Adjust **ivabradine** dose, p. 228. [Severe] Theoretical
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **ivabradine**. Avoid. [Severe] Study
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **ivacaftor**. Adjust dose with moderate CYP3A4 inhibitors, see **ivacaftor** p. 312, **tezacaftor** with **ivacaftor** p. 314, and **tezacaftor** with **ivacaftor** and **elxacaftor** p. 314. [Moderate] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **ivacaftor**. Adjust dose with potent CYP3A4 inhibitors, see **ivacaftor** p. 312, **lumacaftor** with **ivacaftor** p. 312, **tezacaftor** with **ivacaftor** p. 314, and **tezacaftor** with **ivacaftor** and **elxacaftor** p. 314. [Severe] Study
- ▶ **Lanthanum** is predicted to decrease the absorption of **ketoconazole**. Separate administration by at least 2 hours. [Moderate] Theoretical
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **lapatinib**. [Moderate] Study → Also see TABLE 9 p. 1449
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **lapatinib**. Avoid. [Moderate] Study → Also see TABLE 9 p. 1449
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to moderately increase the exposure to **larotrectinib**. Avoid or adjust **larotrectinib** dose, p. 1038. [Moderate] Study
- ▶ **Letermovir** slightly decreases the exposure to **voriconazole**. [Moderate] Study
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **lomitapide**. Avoid. [Moderate] Theoretical → Also see TABLE 1 p. 1447
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to markedly increase the exposure to **lomitapide**. Avoid. [Severe] Study → Also see TABLE 1 p. 1447

Antifungals, azoles (continued)

- ▶ **Clotrimazole** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **lorlatinib**. Avoid or adjust **lorlatinib** dose, p. 1040. [Severe] Study
- ▶ **Lumacaftor** is predicted to decrease the exposure to antifungals, azoles (**itraconazole**, **ketoconazole**, **posaconazole**, **voriconazole**). Avoid or monitor efficacy. [Moderate] Theoretical
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **isavuconazole**. Avoid or monitor adverse effects. [Severe] Study
- ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **isavuconazole**. [Moderate] Theoretical
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to markedly increase the exposure to **maraviroc**. Adjust dose. [Severe] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **meglitinides (repaglinide)**. [Moderate] Study
- ▶ **Metoclopramide** potentially decreases the absorption of **posaconazole** oral suspension. [Moderate] Study
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **midostaurin**. [Moderate] Theoretical
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to very markedly increase the exposure to **midostaurin**. Avoid or monitor for toxicity. [Severe] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **mirabegron**. Adjust **mirabegron** dose in hepatic and renal impairment, p. 828. [Moderate] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **mirtazapine**. [Moderate] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **isavuconazole**. Avoid. [Severe] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **modafinil**. [Mild] Theoretical
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**) increase the risk of neutropenia when given with **monoclonal antibodies (brentuximab vedotin)**. Monitor and adjust dose. [Severe] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **monoclonal antibodies (polatuzumab vedotin)**. [Moderate] Theoretical
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **monoclonal antibodies (trastuzumab emtansine)**. Avoid. [Severe] Theoretical
- ▶ **Isavuconazole** increases the exposure to **mycophenolate**. [Moderate] Study
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **naldemedine**. [Moderate] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **naldemedine**. Avoid or monitor. [Moderate] Study
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **naloxegol**. Adjust **naloxegol** dose and monitor adverse effects, p. 71. [Moderate] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to markedly increase the exposure to **naloxegol**. Avoid. [Severe] Study
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **neratinib**. Avoid moderate CYP3A4 inhibitors or adjust **neratinib** dose and monitor for gastrointestinal adverse effects, p. 1041. [Severe] Study → Also see TABLE 1 p. 1447
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **neratinib**. Avoid potent CYP3A4 inhibitors or adjust **neratinib** dose, p. 1041. [Severe] Study → Also see TABLE 1 p. 1447
- ▶ **Neurokinin-1 receptor antagonists (aprepitant)** are predicted to increase the exposure to **isavuconazole**. [Moderate] Theoretical
- ▶ **Neurokinin-1 receptor antagonists (netupitant)** are predicted to decrease the exposure to **isavuconazole**. [Moderate] Theoretical
- ▶ **Fluconazole** is predicted to increase the exposure to **neurokinin-1 receptor antagonists (aprepitant)**. [Moderate] Theoretical
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to markedly increase the exposure to **neurokinin-1 receptor antagonists (aprepitant)**. [Moderate] Study
- ▶ **Posaconazole** is predicted to increase the exposure to **neurokinin-1 receptor antagonists (aprepitant, fosaprepitant)**. [Moderate] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **neurokinin-1 receptor antagonists (fosaprepitant)**. [Moderate] Theoretical
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **neurokinin-1 receptor antagonists (netupitant)**. [Moderate] Study
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **nilotinib**. [Moderate] Study → Also see TABLE 9 p. 1449
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **nilotinib**. Avoid. [Severe] Study → Also see TABLE 9 p. 1449
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**) are predicted to increase the exposure to **nintedanib**. [Moderate] Study
- ▶ **Voriconazole** is predicted to increase the exposure to **nintedanib**. [Moderate] Theoretical
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **nitisnone**. Adjust dose. [Moderate] Theoretical
- ▶ **NNRTIs (efavirenz)** slightly decrease the exposure to **itraconazole**. Avoid and for 14 days after stopping **efavirenz**. [Moderate] Study
- ▶ **NNRTIs (efavirenz)** moderately decrease the exposure to **ketoconazole**. [Severe] Study
- ▶ **NNRTIs (efavirenz)** slightly decrease the exposure to **posaconazole**. Avoid. [Moderate] Study
- ▶ **NNRTIs (efavirenz)** moderately decrease the exposure to **voriconazole** and **voriconazole** slightly increases the exposure to **NNRTIs (efavirenz)**. Adjust dose. [Severe] Study → Also see TABLE 9 p. 1449
- ▶ **NNRTIs (efavirenz, nevirapine)** are predicted to decrease the exposure to **isavuconazole**. Avoid. [Severe] Theoretical
- ▶ **NNRTIs (nevirapine)** moderately decrease the exposure to **itraconazole**. Avoid and for 14 days after stopping **nevirapine**. [Moderate] Study
- ▶ **NNRTIs (nevirapine)** moderately decrease the exposure to **ketoconazole**. Avoid. [Severe] Study
- ▶ **NNRTIs (nevirapine)** are predicted to decrease the exposure to **voriconazole** and **voriconazole** increases the exposure to **NNRTIs (nevirapine)**. Monitor and adjust dose. [Severe] Theoretical
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **NNRTIs (doravirine)**. [Mild] Study
- ▶ **Fluconazole** slightly to moderately increases the exposure to **NNRTIs (nevirapine)**. [Moderate] Study
- ▶ **Fluconazole** slightly increases the exposure to **NRTIs (zidovudine)**. [Moderate] Study
- ▶ **Fluconazole** moderately increases the exposure to **NSAIDs (celecoxib)**. Adjust **celecoxib** dose, p. 1187. [Moderate] Study
- ▶ **Voriconazole** slightly increases the exposure to **NSAIDs (diclofenac)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Voriconazole** moderately increases the exposure to **NSAIDs (ibuprofen)**. Adjust dose. [Moderate] Study
- ▶ **Fluconazole** increases the exposure to **NSAIDs (parecoxib)**. Monitor and adjust dose. [Moderate] Study
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **olaparib**. Avoid moderate CYP3A4 inhibitors or adjust **olaparib** dose, p. 1057. [Moderate] Theoretical
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **olaparib**. Avoid potent CYP3A4 inhibitors or adjust **olaparib** dose, p. 1057. [Moderate] Study

- ▶ **Miconazole** is predicted to increase the exposure to **opioids (alfentanil)**. Use with caution and adjust dose. [\[Moderate\]](#) Theoretical
- ▶ Antifungals, azoles (**fluconazole, isavuconazole, posaconazole**) are predicted to increase the exposure to **opioids (alfentanil, buprenorphine, fentanyl, oxycodone)**. Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to increase the exposure to **opioids (alfentanil, buprenorphine, fentanyl, oxycodone)**. Monitor and adjust dose. [\[Severe\]](#) Study
- ▶ Antifungals, azoles (**fluconazole, isavuconazole, posaconazole**) are predicted to increase the exposure to **opioids (methadone)**. [\[Moderate\]](#) Theoretical → Also see TABLE 9 p. 1449
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to increase the exposure to **opioids (methadone)**. Adjust dose. [\[Severe\]](#) Theoretical → Also see TABLE 9 p. 1449
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to increase the exposure to **ospemifene**. Avoid in poor CYP2C9 metabolisers. [\[Moderate\]](#) Study
- ▶ **Fluconazole** increases the exposure to **ospemifene**. Use with caution or avoid. [\[Moderate\]](#) Study
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to increase the exposure to **oxybutynin**. [\[Mild\]](#) Study
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to increase the exposure to **palbociclib**. Avoid or adjust **palbociclib** dose, p. 1045. [\[Severe\]](#) Study
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to increase the exposure to **panobinostat**. Adjust **panobinostat** dose; in hepatic impairment avoid, p. 984. [\[Moderate\]](#) Study → Also see TABLE 9 p. 1449
- ▶ **Posaconazole** is predicted to increase the exposure to **panobinostat**. Adjust dose. [\[Moderate\]](#) Theoretical
- ▶ Antifungals, azoles (**fluconazole, isavuconazole, posaconazole**) are predicted to increase the exposure to **pazopanib**. [\[Moderate\]](#) Study → Also see TABLE 9 p. 1449
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to increase the exposure to **pazopanib**. Avoid or adjust **pazopanib** dose, p. 1045. [\[Moderate\]](#) Study → Also see TABLE 9 p. 1449
- ▶ **Miconazole** greatly increases the anticoagulant effect of **phenindione**. [\[Severe\]](#) Theoretical
- ▶ Antifungals, azoles (**fluconazole, isavuconazole, posaconazole**) are predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (avanafil)**. Adjust **avanafil** dose, p. 862. [\[Moderate\]](#) Theoretical
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (avanafil, vardenafil)**. Avoid. [\[Severe\]](#) Study → Also see TABLE 9 p. 1449
- ▶ **Miconazole** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (sildenafil)**. Use with caution and adjust dose. [\[Severe\]](#) Theoretical
- ▶ Antifungals, azoles (**fluconazole, isavuconazole, posaconazole**) are predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (sildenafil)**. Monitor or adjust **sildenafil** dose with moderate CYP3A4 inhibitors, p. 863. [\[Moderate\]](#) Study → Also see TABLE 9 p. 1449
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (sildenafil)**. Avoid potent CYP3A4 inhibitors or adjust **sildenafil** dose, p. 863. [\[Severe\]](#) Study → Also see TABLE 9 p. 1449
- ▶ Antifungals, azoles (**fluconazole, isavuconazole, posaconazole**) are predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (tadalafil)**. [\[Severe\]](#) Theoretical
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (tadalafil)**. Use with caution or avoid. [\[Severe\]](#) Study
- ▶ Antifungals, azoles (**fluconazole, isavuconazole, posaconazole**) are predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (vardenafil)**. Adjust dose. [\[Severe\]](#) Theoretical → Also see TABLE 9 p. 1449
- ▶ Antifungals, azoles (**itraconazole, ketoconazole**) are predicted to increase the exposure to **pibrentasvir**. [\[Moderate\]](#) Theoretical
- ▶ Antifungals, azoles (**fluconazole, isavuconazole, posaconazole**) are predicted to increase the exposure to **pimozide**. Avoid. [\[Severe\]](#) Theoretical → Also see TABLE 9 p. 1449
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to increase the exposure to **pimozide**. Avoid. [\[Severe\]](#) Study → Also see TABLE 9 p. 1449
- ▶ **Miconazole** is predicted to increase the exposure to **pimozide**. Avoid. [\[Moderate\]](#) Theoretical
- ▶ **Pioglitazone** potentially decreases the exposure to **isavuconazole**. Use with caution or avoid. [\[Moderate\]](#) Theoretical
- ▶ Antifungals, azoles (**fluconazole, isavuconazole, posaconazole**) are predicted to increase the exposure to **ponatinib**. [\[Moderate\]](#) Study
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to slightly increase the exposure to **ponatinib**. Monitor and adjust **ponatinib** dose, p. 1046. [\[Moderate\]](#) Study
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to moderately increase the exposure to **praziquantel**. [\[Mild\]](#) Study
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) given with carbimazole are predicted to increase the exposure to **propiverine**. Adjust starting dose. [\[Moderate\]](#) Theoretical
- ▶ **Proton pump inhibitors** decrease the absorption of **itraconazole**. Administer itraconazole capsules with an acidic beverage. [\[Moderate\]](#) Study
- ▶ **Proton pump inhibitors** decrease the absorption of **ketoconazole**. Administer ketoconazole with an acidic beverage. [\[Moderate\]](#) Study
- ▶ **Proton pump inhibitors** decrease the absorption of **posaconazole** oral suspension. Avoid. [\[Moderate\]](#) Study
- ▶ **Voriconazole** increases the exposure to **proton pump inhibitors (esomeprazole, omeprazole)**. Adjust dose. [\[Moderate\]](#) Study
- ▶ Antifungals, azoles (**fluconazole, isavuconazole, posaconazole**) are predicted to increase the exposure to **ranolazine**. [\[Severe\]](#) Study → Also see TABLE 9 p. 1449
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to increase the exposure to **ranolazine**. Avoid. [\[Severe\]](#) Study → Also see TABLE 9 p. 1449
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to increase the exposure to **reboxetine**. Avoid. [\[Moderate\]](#) Study
- ▶ **Miconazole** is predicted to increase the concentration of **reboxetine**. Use with caution and adjust dose. [\[Moderate\]](#) Theoretical
- ▶ Antifungals, azoles (**fluconazole, isavuconazole, posaconazole**) are predicted to increase the exposure to **regorafenib**. [\[Moderate\]](#) Study
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to increase the exposure to **regorafenib**. Avoid. [\[Moderate\]](#) Study
- ▶ Antifungals, azoles (**fluconazole, itraconazole, ketoconazole, miconazole, voriconazole**) are predicted to increase the exposure to **retinoids (alitretinoin)**. Adjust alitretinoin dose, p. 1315. [\[Moderate\]](#) Theoretical
- ▶ Antifungals, azoles (**fluconazole, ketoconazole, voriconazole**) are predicted to increase the risk of tretinoin toxicity when given with **retinoids (tretinoin)**. [\[Moderate\]](#) Study
- ▶ Antifungals, azoles (**fluconazole, isavuconazole, posaconazole**) are predicted to increase the exposure to **ribociclib**. [\[Moderate\]](#) Study → Also see TABLE 9 p. 1449
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to increase the exposure to **ribociclib**. Avoid or adjust **ribociclib** dose, p. 1048. [\[Moderate\]](#) Study → Also see TABLE 9 p. 1449
- ▶ **Rifamycins (rifabutin)** are predicted to decrease the exposure to **isavuconazole**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Rifamycins (rifabutin)** decrease the concentration of **voriconazole** and **voriconazole** increases the concentration of **rifamycins (rifabutin)**. Avoid or adjust **voriconazole** dose, p. 644. [\[Severe\]](#) Study
- ▶ **Rifamycins (rifampicin)** slightly decrease the exposure to **fluconazole**. Adjust dose. [\[Moderate\]](#) Study
- ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **isavuconazole**. Avoid. [\[Severe\]](#) Study

Antifungals, azoles (continued)

- ▶ **Rifamycins (rifampicin)** markedly decrease the exposure to **itraconazole**. Avoid and for 14 days after stopping **rifampicin**. [\[Moderate\]](#) Study
- ▶ **Rifamycins (rifampicin)** markedly decrease the exposure to **ketonazole** and **ketonazole** potentially decreases the exposure to **rifamycins (rifampicin)**. Avoid. [\[Moderate\]](#) Study
- ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **posaconazole**. Avoid. [\[Moderate\]](#) Anecdotal
- ▶ **Rifamycins (rifampicin)** very markedly decrease the exposure to **voriconazole**. Avoid. [\[Moderate\]](#) Study
- ▶ **Fluconazole** increases the risk of uveitis when given with **rifamycins (rifabutin)**. Adjust dose. [\[Severe\]](#) Study
- ▶ **Ketonazole** is predicted to increase the concentration of **rifamycins (rifabutin)** and **rifamycins (rifabutin)** are predicted to decrease the concentration of **ketonazole**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Miconazole** is predicted to increase the concentration of **rifamycins (rifabutin)**. Use with caution and adjust dose. [\[Moderate\]](#) Theoretical
- ▶ Antifungals, azoles (**itraconazole**, **posaconazole**) increase the concentration of **rifamycins (rifabutin)** and **rifamycins (rifabutin)** decrease the concentration of antifungals, azoles (**itraconazole**, **posaconazole**). Avoid. [\[Severe\]](#) Study
- ▶ Antifungals, azoles (**itraconazole**, **posaconazole**) are predicted to increase the exposure to **riociguat**. Adjust **riociguat** dose and monitor blood pressure, p. 199. [\[Moderate\]](#) Theoretical
- ▶ **Ketonazole** moderately increases the exposure to **riociguat**. Adjust **riociguat** dose and monitor blood pressure, p. 199. [\[Moderate\]](#) Study
- ▶ Antifungals, azoles (**isavuconazole**, **posaconazole**) are predicted to increase the exposure to **roxolitinib**. [\[Moderate\]](#) Study
- ▶ Antifungals, azoles (**itraconazole**, **ketonazole**, **voriconazole**) are predicted to increase the exposure to **roxolitinib**. Adjust dose and monitor adverse effects. [\[Moderate\]](#) Study
- ▶ **Fluconazole** is predicted to increase the exposure to **roxolitinib**. Avoid or adjust dose. [\[Moderate\]](#) Theoretical
- ▶ **Fluconazole** is predicted to increase the exposure to **selexipag**. [\[Unknown\]](#) Theoretical
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **miconazole**, **posaconazole**) are predicted to increase the exposure to **siponimod**. Avoid depending on other drugs taken—consult product literature. [\[Severe\]](#) Study
- ▶ Antifungals, azoles (**itraconazole**, **ketonazole**, **voriconazole**) are predicted to increase the exposure to **siponimod**. Avoid depending on other drugs taken—consult product literature. [\[Severe\]](#) Theoretical
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) increase the concentration of **sirolimus**. Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ Antifungals, azoles (**itraconazole**, **ketonazole**, **voriconazole**) are predicted to increase the concentration of **sirolimus**. Avoid. [\[Severe\]](#) Study
- ▶ **Miconazole** is predicted to increase the concentration of **sirolimus**. Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ Oral **sodium bicarbonate** decreases the absorption of **ketonazole**. [\[Moderate\]](#) Study
- ▶ **Sodium zirconium cyclosilicate** is predicted to decrease the exposure to **antifungals, azoles**. Separate administration by at least 2 hours. [\[Moderate\]](#) Theoretical
- ▶ Antifungals, azoles (**itraconazole**, **ketonazole**, **voriconazole**) are predicted to increase the exposure to **solifenacin**. Adjust solifenacin p. 826 or tamsulosin with solifenacin p. 832 dose; avoid in hepatic and renal impairment. [\[Severe\]](#) Study
- ▶ **Voriconazole** is predicted to increase the exposure to **SSRIs (citalopram)**. [\[Severe\]](#) Theoretical → Also see TABLE 9 p. 1449
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **SSRIs (dapoxetine)**. Adjust **dapoxetine** dose with moderate CYP3A4 inhibitors, p. 870. [\[Moderate\]](#) Theoretical
- ▶ Antifungals, azoles (**itraconazole**, **ketonazole**, **voriconazole**) are predicted to moderately increase the exposure to **SSRIs (dapoxetine)**. Avoid potent CYP3A4 inhibitors or adjust **dapoxetine** dose, p. 870. [\[Severe\]](#) Study
- ▶ Antifungals, azoles (**fluconazole**, **voriconazole**) are predicted to increase the exposure to **SSRIs (escitalopram)**. Use with caution and adjust dose. [\[Severe\]](#) Study → Also see TABLE 9 p. 1449
- ▶ **St John's wort** is predicted to decrease the exposure to **isavuconazole**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **St John's wort** moderately decreases the exposure to **voriconazole**. Avoid. [\[Moderate\]](#) Study
- ▶ **Isavuconazole** slightly increases the exposure to **statins (atorvastatin)**. [\[Moderate\]](#) Study
- ▶ **Miconazole** (including the oral gel) might increase the exposure to **statins (atorvastatin)**. [\[Moderate\]](#) Theoretical
- ▶ **Posaconazole** is predicted to increase the exposure to **statins (atorvastatin)**. Avoid. [\[Severe\]](#) Anecdotal
- ▶ Antifungals, azoles (**itraconazole**, **ketonazole**, **voriconazole**) are predicted to increase the exposure to **statins (atorvastatin)**. Avoid or adjust dose and monitor rhabdomyolysis. [\[Severe\]](#) Study → Also see TABLE 1 p. 1447
- ▶ **Fluconazole** is predicted to increase the exposure to **statins (atorvastatin, simvastatin)**. Monitor and adjust dose. [\[Severe\]](#) Anecdotal → Also see TABLE 1 p. 1447
- ▶ Antifungals, azoles (**fluconazole**, **miconazole**) are predicted to increase the exposure to **statins (fluvastatin)**. [\[Moderate\]](#) Study → Also see TABLE 1 p. 1447
- ▶ **Isavuconazole** is predicted to increase the exposure to **statins (fluvastatin, rosuvastatin)**. [\[Moderate\]](#) Theoretical
- ▶ **Isavuconazole** is predicted to increase the exposure to **statins (simvastatin)**. Monitor and adjust dose. [\[Severe\]](#) Theoretical
- ▶ **Miconazole** (including the oral gel) is predicted to increase the exposure to **statins (simvastatin)**. Avoid. [\[Severe\]](#) Anecdotal
- ▶ **Posaconazole** markedly to very markedly increases the exposure to **statins (simvastatin)**. Avoid. [\[Severe\]](#) Study
- ▶ Antifungals, azoles (**fluconazole**, **ketonazole**, **voriconazole**) are predicted to increase the exposure to **statins (simvastatin)**. Avoid. [\[Severe\]](#) Study → Also see TABLE 1 p. 1447
- ▶ **Isavuconazole** is predicted to increase the exposure to **sulfasalazine**. [\[Moderate\]](#) Theoretical
- ▶ Antifungals, azoles (**fluconazole**, **ketonazole**, **miconazole**) are predicted to increase the exposure to **sulfonylureas**. Use with caution and adjust dose. [\[Moderate\]](#) Study
- ▶ **Voriconazole** is predicted to increase the concentration of **sulfonylureas**. Use with caution and adjust dose. [\[Moderate\]](#) Study
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **sunitinib**. [\[Moderate\]](#) Study → Also see TABLE 9 p. 1449
- ▶ Antifungals, azoles (**itraconazole**, **ketonazole**, **voriconazole**) are predicted to increase the exposure to **sunitinib**. Avoid or adjust **sunitinib** dose, p. 1051. [\[Moderate\]](#) Study → Also see TABLE 9 p. 1449
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the concentration of **tacrolimus**. [\[Severe\]](#) Study
- ▶ Antifungals, azoles (**itraconazole**, **ketonazole**, **voriconazole**) are predicted to increase the concentration of **tacrolimus**. Monitor and adjust dose. [\[Severe\]](#) Study
- ▶ **Miconazole** is predicted to increase the concentration of **tacrolimus**. Monitor and adjust dose. [\[Severe\]](#) Theoretical
- ▶ Antifungals, azoles (**itraconazole**, **ketonazole**) are predicted to slightly increase the exposure to **talazoparib**. Avoid or adjust **talazoparib** dose, p. 1059. [\[Severe\]](#) Study
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **taxanes (cabazitaxel)**. [\[Moderate\]](#) Theoretical
- ▶ Antifungals, azoles (**itraconazole**, **ketonazole**, **voriconazole**) are predicted to increase the exposure to **taxanes (cabazitaxel)**. Avoid. [\[Severe\]](#) Study
- ▶ **Miconazole** is predicted to increase the concentration of **taxanes (docetaxel)**. Use with caution and adjust dose. [\[Moderate\]](#) Theoretical
- ▶ Antifungals, azoles (**itraconazole**, **ketonazole**, **voriconazole**) are predicted to moderately increase the exposure to **taxanes (docetaxel)**. Avoid or adjust dose. [\[Severe\]](#) Study
- ▶ Antifungals, azoles (**itraconazole**, **ketonazole**, **voriconazole**) are predicted to increase the exposure to **taxanes (paclitaxel)**. [\[Severe\]](#) Theoretical

- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the concentration of **temsirolimus**. Use with caution or avoid. [Moderate] Theoretical
 - ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the concentration of **temsirolimus**. Avoid. [Severe] Theoretical
 - ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **tezacaftor**. Adjust dose with moderate CYP3A4 inhibitors, see **tezacaftor** with **ivacaftor** p. 314 and **tezacaftor** with **ivacaftor** and **elxacaftor** p. 314. [Severe] Study
 - ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **tezacaftor**. Adjust dose with potent CYP3A4 inhibitors, see **tezacaftor** with **ivacaftor** p. 314 and **tezacaftor** with **ivacaftor** and **elxacaftor** p. 314. [Severe] Study
 - ▶ **Isavuconazole** is predicted to increase the exposure to **thrombin inhibitors (dabigatran)**. Monitor and adjust dose. [Moderate] Study
 - ▶ Antifungals, azoles (**fluconazole**, **posaconazole**, **voriconazole**) are predicted to increase the exposure to **thrombin inhibitors (dabigatran)**. [Severe] Study
 - ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**) are predicted to increase the exposure to **thrombin inhibitors (dabigatran)**. Avoid. [Severe] Study
 - ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to markedly increase the exposure to **ticagrelor**. Avoid. [Severe] Study
 - ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**) might increase the exposure to **tigecycline**. [Mid] Anecdotal → Also see TABLE 1 p. 1447
 - ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **tofacinib**. Adjust **tofacinib** dose, p. 1163. [Moderate] Study
 - ▶ **Fluconazole** increases the exposure to **tofacinib**. Adjust **tofacinib** dose, p. 1163. [Moderate] Study
 - ▶ **Isavuconazole** given with a potent CYP2C19 inhibitor is predicted to increase the exposure to **tofacinib**. Adjust **tofacinib** dose, p. 1163. [Moderate] Study
 - ▶ **Posaconazole** given with a potent CYP2C19 inhibitor is predicted to increase the exposure to **tofacinib**. Adjust **tofacinib** dose, p. 1163. [Moderate] Theoretical
 - ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **tolterodine**. Avoid. [Severe] Study → Also see TABLE 9 p. 1449
 - ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **tolvaptan**. Manufacturer advises caution or adjust **tolvaptan** dose with moderate CYP3A4 inhibitors, p. 711. [Moderate] Study
 - ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **tolvaptan**. Manufacturer advises caution or adjust **tolvaptan** dose with potent CYP3A4 inhibitors, p. 711. [Severe] Study
 - ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**) are predicted to increase the exposure to **topotecan**. [Severe] Study
 - ▶ **Isavuconazole** is predicted to increase the exposure to **topotecan**. [Moderate] Theoretical
 - ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **toremifene**. [Moderate] Theoretical → Also see TABLE 9 p. 1449
 - ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **trabectedin**. Avoid or adjust dose. [Severe] Theoretical → Also see TABLE 1 p. 1447
 - ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**) are predicted to increase the concentration of **trametinip**. [Moderate] Theoretical
 - ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **trazodone**. [Moderate] Theoretical
 - ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to moderately increase the exposure to **trazodone**. Avoid or adjust dose. [Moderate] Study
 - ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) increase the exposure to **triptans (almotriptan)**. [Mid] Study
 - ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to markedly increase the exposure to **triptans (eletriptan)**. Avoid. [Severe] Study
 - ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [Moderate] Study
 - ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [Severe] Study
 - ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **upadacitinib**. Use with caution or avoid. [Severe] Study
 - ▶ **Posaconazole** is predicted to increase the exposure to **upadacitinib**. Use with caution or avoid. [Moderate] Study
 - ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **itraconazole**, **ketoconazole**, **posaconazole**, **voriconazole**) are predicted to increase the exposure to **vmurafenib**. [Severe] Theoretical → Also see TABLE 9 p. 1449
 - ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **itraconazole**, **ketoconazole**, **posaconazole**, **voriconazole**) are predicted to increase the exposure to **venetoclax**. Avoid or adjust dose—consult product literature. [Severe] Study
 - ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **venlafaxine**. [Moderate] Study → Also see TABLE 9 p. 1449
 - ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **itraconazole**, **ketoconazole**, **posaconazole**, **voriconazole**) are predicted to increase the exposure to **vinca alkaloids**. [Severe] Theoretical → Also see TABLE 1 p. 1447 → Also see TABLE 9 p. 1449
 - ▶ **Miconazole** is predicted to increase the concentration of **vinca alkaloids**. Use with caution and adjust dose. [Moderate] Theoretical
 - ▶ Antifungals, azoles (**clotrimazole**, **ketoconazole**) are predicted to decrease the exposure to **vitamin D substances (colecalciferol)**. [Moderate] Theoretical
 - ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **vitamin D substances (paricalcitol)**. [Moderate] Study
 - ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **zopiclone**. Adjust dose. [Moderate] Study
 - ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **zopiclone**. Adjust dose. [Moderate] Theoretical
- Antihistamines, non-sedating** → see TABLE 9 p. 1449 (QT-interval prolongation)
- acrivastine · azelastine · bilastine · cetirizine · desloratadine · fexofenadine · levocetirizine · loratadine · mizolastine · rupatadine
- ▶ Since systemic absorption can follow topical application, the possibility of interactions with topical **azelastine** should be borne in mind.
 - ▶ Apple juice and orange juice decrease the exposure to **fexofenadine**.
- ▶ Oral **antacids** decrease the absorption of oral **fexofenadine**. Separate administration by 2 hours. [Mid] Study
 - ▶ **Anti-androgens (apalutamide)** slightly decrease the exposure to **fexofenadine**. [Mid] Study
 - ▶ **Anti-androgens (darolutamide)** are predicted to increase the concentration of **fexofenadine**. [Moderate] Theoretical
 - ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to **rupatadine**. Avoid. [Moderate] Study
 - ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to antihistamines, non-sedating (**fexofenadine**, **mizolastine**). [Severe] Theoretical
 - ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **itraconazole**, **ketoconazole**, **posaconazole**, **voriconazole**) are predicted to increase the exposure to **rupatadine**. Avoid. [Moderate] Study
 - ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **mizolastine**. [Severe] Theoretical
 - ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to increase the exposure to **mizolastine**. Avoid. [Severe] Study
 - ▶ Antifungals, azoles (**miconazole**) are predicted to increase the exposure to **mizolastine**. Avoid. [Moderate] Theoretical
 - ▶ **Antihistamines, non-sedating** are predicted to decrease the effects of **betahistine**. [Moderate] Theoretical

Antihistamines, non-sedating (continued)

- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **mizolastine**. [\[Severe\]](#) Theoretical
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **rupatadine**. Avoid. [\[Moderate\]](#) Study
- ▶ **Ceritinib** is predicted to increase the exposure to **feboxfenadine**. [\[Moderate\]](#) Theoretical
- ▶ **Cobicistat** is predicted to increase the exposure to **mizolastine**. Avoid. [\[Severe\]](#) Study
- ▶ **Cobicistat** is predicted to increase the exposure to **rupatadine**. Avoid. [\[Moderate\]](#) Study
- ▶ **Crizotinib** is predicted to increase the exposure to **mizolastine**. [\[Severe\]](#) Theoretical
- ▶ **Crizotinib** is predicted to increase the exposure to **rupatadine**. Avoid. [\[Moderate\]](#) Study
- ▶ **Eluxacaftor** is predicted to increase the exposure to **feboxfenadine**. [\[Moderate\]](#) Theoretical
- ▶ **Eliglustat** is predicted to increase the exposure to **feboxfenadine**. Adjust dose. [\[Moderate\]](#) Study
- ▶ **Filgotinib** is predicted to increase the exposure to **feboxfenadine**. Avoid. [\[Moderate\]](#) Theoretical
- ▶ **Grapefruit** juice slightly decreases the exposure to **bilastine**. **Bilastine** should be taken 1 hour before or 2 hours after grapefruit. [\[Moderate\]](#) Study
- ▶ **Grapefruit** juice increases the exposure to **rupatadine**. Avoid. [\[Moderate\]](#) Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **mizolastine**. Avoid. [\[Severe\]](#) Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **rupatadine**. Avoid. [\[Moderate\]](#) Study
- ▶ **Ibrutinib** is predicted to increase the exposure to **feboxfenadine**. Separate administration by at least 6 hours. [\[Moderate\]](#) Theoretical
- ▶ **Idelalisib** is predicted to increase the exposure to **mizolastine**. Avoid. [\[Severe\]](#) Study
- ▶ **Idelalisib** is predicted to increase the exposure to **rupatadine**. Avoid. [\[Moderate\]](#) Study
- ▶ **Imatinib** is predicted to increase the exposure to **mizolastine**. [\[Severe\]](#) Theoretical
- ▶ **Imatinib** is predicted to increase the exposure to **rupatadine**. Avoid. [\[Moderate\]](#) Study
- ▶ **Ivacaftor** is predicted to increase the exposure to **feboxfenadine**. [\[Moderate\]](#) Study
- ▶ **Lapatinib** is predicted to increase the exposure to **feboxfenadine**. [\[Moderate\]](#) Theoretical
- ▶ **Leflunomide** is predicted to increase the exposure to **feboxfenadine**. [\[Moderate\]](#) Study
- ▶ **Letermovir** is predicted to increase the concentration of **feboxfenadine**. [\[Moderate\]](#) Theoretical
- ▶ **Letermovir** is predicted to increase the exposure to **mizolastine**. [\[Severe\]](#) Theoretical
- ▶ **Letermovir** is predicted to increase the exposure to **rupatadine**. Avoid. [\[Moderate\]](#) Study
- ▶ **Lorlatinib** decreases the exposure to **feboxfenadine**. [\[Moderate\]](#) Study
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **mizolastine**. Avoid. [\[Severe\]](#) Study
- ▶ **Macrolides (clarithromycin, erythromycin)** are predicted to increase the exposure to **rupatadine**. Avoid. [\[Moderate\]](#) Study
- ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **mizolastine**. [\[Severe\]](#) Theoretical
- ▶ **MAOIs, irreversible** are predicted to increase the risk of antimuscarinic adverse effects when given with **antihistamines, non-sedating**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Mirabegron** is predicted to increase the exposure to **feboxfenadine**. [\[Mild\]](#) Theoretical
- ▶ **Neratinib** is predicted to increase the exposure to **feboxfenadine**. [\[Moderate\]](#) Study
- ▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to increase the exposure to **mizolastine**. [\[Severe\]](#) Theoretical
- ▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to increase the exposure to **rupatadine**. Avoid. [\[Moderate\]](#) Study

- ▶ **Nilotinib** is predicted to increase the exposure to **mizolastine**. [\[Severe\]](#) Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to **rupatadine**. Avoid. [\[Moderate\]](#) Study
- ▶ **Olaparib** might increase the exposure to **feboxfenadine**. [\[Moderate\]](#) Theoretical
- ▶ **Osimertinib** is predicted to increase the exposure to **feboxfenadine**. [\[Moderate\]](#) Study
- ▶ **Pibrentasvir** with glecaprevir is predicted to increase the exposure to **feboxfenadine**. [\[Moderate\]](#) Study
- ▶ **Pitolisant** is predicted to decrease the exposure to **feboxfenadine**. [\[Mild\]](#) Theoretical
- ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **bilastine**. [\[Moderate\]](#) Theoretical
- ▶ **Rifamycins (rifampicin)** increase the clearance of **feboxfenadine**. [\[Moderate\]](#) Study
- ▶ **Teriflunomide** is predicted to increase the exposure to **feboxfenadine**. [\[Moderate\]](#) Study
- ▶ **Vandetanib** is predicted to increase the exposure to **feboxfenadine**. [\[Moderate\]](#) Study
- ▶ **Velpatasvir** is predicted to increase the exposure to **feboxfenadine**. [\[Severe\]](#) Theoretical
- ▶ **Vemurafenib** is predicted to increase the exposure to **feboxfenadine**. Use with caution and adjust dose. [\[Severe\]](#) Theoretical
- ▶ **Venetoclax** is predicted to increase the exposure to **feboxfenadine**. [\[Moderate\]](#) Theoretical

Antihistamines, sedating → see TABLE 9 p. 1449 (QT-interval prolongation), TABLE 11 p. 1449 (CNS depressant effects), TABLE 10 p. 1449 (antimuscarinics)

alimemazine · antazoline · buclizine · chlorphenamine · cinnarizine · clemastine · cyclizine · cyproheptadine · doxylamine · hydroxyzine · ketotifen · pizotifen · promethazine

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application of **ketotifen**, the possibility of interactions should be borne in mind.

- ▶ **Hydroxyzine** potentially increases the risk of overheating and dehydration when given with **antiepileptics (zonisamide)**. Avoid in children. [\[Severe\]](#) Theoretical
- ▶ **Antihistamines, sedating** are predicted to decrease the effects of **betahistine**. [\[Moderate\]](#) Theoretical
- ▶ **MAOIs, irreversible** are predicted to increase the risk of antimuscarinic adverse effects when given with **antihistamines, sedating**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Cyproheptadine** decreases the effects of **metirapone**. Avoid. [\[Moderate\]](#) Study
- ▶ **Antihistamines, sedating** are predicted to decrease the efficacy of **pitolisant**. [\[Moderate\]](#) Theoretical
- ▶ **Cyproheptadine** potentially decreases the effects of **SSRIs**. [\[Moderate\]](#) Anecdotal

Antimalarials → see TABLE 9 p. 1449 (QT-interval prolongation)

artemether · arteminol · atovaquone · chloroquine · lumefantrine · mefloquine · piperaquine · primaquine · proguanil · pyrimethamine · quinine

PHARMACOLOGY **Piperaquine** has a long half-life; there is a potential for drug interactions to occur for up to 3 months after treatment has been stopped.

- ▶ **Chloroquine** is predicted to decrease the effects of **agalsidase alfa**. Avoid. [\[Moderate\]](#) Theoretical
- ▶ **Chloroquine** is predicted to decrease the effects of **agalsidase beta**. Avoid. [\[Moderate\]](#) Theoretical
- ▶ **Antimalarials (chloroquine, primaquine)** are predicted to increase the risk of methaemoglobinemia when given with topical **anaesthetics, local (prilocaine)**. Use with caution or avoid. [\[Severe\]](#) Theoretical
- ▶ **Oral antacids** decrease the absorption of oral **chloroquine**. Separate administration by at least 4 hours. [\[Moderate\]](#) Study
- ▶ **Oral antacids** are predicted to decrease the absorption of oral **proguanil**. Separate administration by at least 2 hours. [\[Moderate\]](#) Study

- ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to **artemether** with lumefantrine. Avoid. [\[Severe\]](#) Study → Also see TABLE 9 p. 1449
- ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the concentration of **piperazine**. Avoid. [\[Moderate\]](#) Theoretical
- ▶ **Antiarrhythmic (dronedaron)** are predicted to increase the concentration of **piperazine**. [\[Severe\]](#) Theoretical
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **artemether** with lumefantrine. Avoid. [\[Severe\]](#) Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the concentration of **piperazine**. Avoid. [\[Moderate\]](#) Theoretical
- ▶ **Antiepileptics (carbamazepine, phenobarbital, primidone)** potentially increase the risk of toxicity when given with **quinine**. [\[Unknown\]](#) Study
- ▶ **Pyrimethamine** increases the risk of haematological toxicity when given with **antiepileptics (fosphenytoin, phenytoin)**. [\[Severe\]](#) Study
- ▶ **Pyrimethamine** is predicted to increase the risk of haematological toxicity when given with **antiepileptics (phenobarbital, primidone)**. [\[Severe\]](#) Theoretical
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole)** are predicted to increase the concentration of **piperazine**. [\[Severe\]](#) Theoretical
- ▶ **Antifungals, azoles (fluconazole, itraconazole, posaconazole, voriconazole)** are predicted to increase the exposure to **mefloquine**. [\[Moderate\]](#) Theoretical
- ▶ **Antifungals, azoles (ketoconazole)** increase the exposure to **mefloquine**. [\[Moderate\]](#) Study
- ▶ **Antimalarials (proguanil)** are predicted to increase the risk of adverse effects when given with antimalarials (**pyrimethamine**). [\[Severe\]](#) Theoretical
- ▶ **Mefloquine** is predicted to increase the risk of bradycardia when given with **beta blockers, non-selective**. [\[Severe\]](#) Theoretical
- ▶ **Mefloquine** is predicted to increase the risk of bradycardia when given with **beta blockers, selective**. [\[Severe\]](#) Theoretical
- ▶ **Mefloquine** is predicted to increase the risk of bradycardia when given with **calcium channel blockers**. [\[Severe\]](#) Theoretical
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the concentration of **piperazine**. [\[Severe\]](#) Theoretical
- ▶ **Calcium salts (calcium carbonate)** decrease the absorption of **chloroquine**. Separate administration by at least 4 hours. [\[Moderate\]](#) Study
- ▶ **Calcium salts (calcium carbonate)** are predicted to decrease the absorption of **proguanil**. Separate administration by at least 2 hours. [\[Moderate\]](#) Study
- ▶ **Chloroquine** decreases the efficacy of oral **cholera vaccine**. [\[Moderate\]](#) Study
- ▶ **Cobicistat** is predicted to increase the concentration of **piperazine**. [\[Severe\]](#) Theoretical
- ▶ **Crizotinib** is predicted to increase the concentration of **piperazine**. [\[Severe\]](#) Theoretical
- ▶ **Antimalarials (chloroquine, primaquine)** are predicted to increase the risk of methaemoglobinemia when given with **dapsone**. [\[Severe\]](#) Theoretical
- ▶ **Mefloquine** is predicted to increase the risk of bradycardia when given with **digoxin**. [\[Severe\]](#) Theoretical
- ▶ **Quinine** increases the concentration of **digoxin**. Monitor and adjust **digoxin** dose, p. 117. [\[Severe\]](#) Anecdotal
- ▶ **Grapefruit** juice increases the exposure to **artemether**. [\[Unknown\]](#) Study
- ▶ **Grapefruit** juice is predicted to increase the concentration of **piperazine**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **H₂ receptor antagonists (cimetidine)** decrease the clearance of **chloroquine**. [\[Moderate\]](#) Study
- ▶ **H₂ receptor antagonists (cimetidine)** slightly increase the exposure to **quinine**. [\[Moderate\]](#) Study
- ▶ **HIV-protease inhibitors** decrease the exposure to **atovaquone**. Avoid if boosted with ritonavir. [\[Moderate\]](#) Study
- ▶ **HIV-protease inhibitors** are predicted to increase the concentration of **piperazine**. [\[Severe\]](#) Theoretical
- ▶ **HIV-protease inhibitors** are predicted to decrease the exposure to **proguanil**. Avoid. [\[Moderate\]](#) Study
- ▶ **HIV-protease inhibitors** are predicted to affect the exposure to **quinine**. [\[Severe\]](#) Study
- ▶ **Idelalisib** is predicted to increase the concentration of **piperazine**. [\[Severe\]](#) Theoretical
- ▶ **Imatinib** is predicted to increase the concentration of **piperazine**. [\[Severe\]](#) Theoretical
- ▶ **Lanthanum** is predicted to decrease the absorption of **chloroquine**. Separate administration by at least 2 hours. [\[Moderate\]](#) Theoretical
- ▶ **Chloroquine** is predicted to decrease the exposure to **laronidase**. Avoid simultaneous administration. [\[Severe\]](#) Theoretical
- ▶ **Letermovir** is predicted to increase the concentration of **piperazine**. [\[Severe\]](#) Theoretical
- ▶ **Macrolides (clarithromycin, erythromycin)** are predicted to increase the concentration of **piperazine**. [\[Severe\]](#) Theoretical
- ▶ **Mepacrine** is predicted to increase the concentration of **primaquine**. Avoid. [\[Moderate\]](#) Theoretical
- ▶ **Pyrimethamine** is predicted to increase the risk of adverse effects when given with **methotrexate**. [\[Severe\]](#) Theoretical
- ▶ **Metoclopramide** decreases the concentration of **atovaquone**. Avoid. [\[Moderate\]](#) Study
- ▶ **Mitotane** is predicted to decrease the exposure to **artemether** with lumefantrine. Avoid. [\[Severe\]](#) Study
- ▶ **Mitotane** is predicted to decrease the concentration of **piperazine**. Avoid. [\[Moderate\]](#) Theoretical
- ▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to increase the concentration of **piperazine**. [\[Severe\]](#) Theoretical
- ▶ **Nilotinib** is predicted to increase the concentration of **piperazine**. [\[Severe\]](#) Theoretical
- ▶ **NNRTIs (efavirenz)** decrease the concentration of **artemether**. [\[Severe\]](#) Study → Also see TABLE 9 p. 1449
- ▶ **NNRTIs (efavirenz)** moderately decrease the exposure to **atovaquone**. Avoid. [\[Moderate\]](#) Study
- ▶ **NNRTIs (efavirenz)** affect the exposure to **proguanil**. Avoid. [\[Moderate\]](#) Study
- ▶ **NNRTIs (etravirine)** decrease the exposure to **artemether**. [\[Moderate\]](#) Study
- ▶ **Pyrimethamine** is predicted to increase the risk of adverse effects when given with **NRTIs (zidovudine)**. [\[Severe\]](#) Theoretical
- ▶ **Pyrimethamine** is predicted to increase the risk of adverse effects when given with **pemetrexed**. [\[Severe\]](#) Theoretical
- ▶ **Chloroquine** is predicted to increase the risk of haematological toxicity when given with **penicillamine**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Chloroquine** moderately decreases the exposure to **praziquantel**. Use with caution and adjust dose. [\[Moderate\]](#) Study
- ▶ **Chloroquine** decreases the efficacy of **rabies vaccine** (intradermal). Avoid. [\[Moderate\]](#) Study
- ▶ **Chloroquine** potentially decrease the effects of **remdesivir**. Avoid. [\[Moderate\]](#) Theoretical
- ▶ **Rifamycins (rifabutin)** slightly decrease the exposure to **atovaquone**. Avoid. [\[Moderate\]](#) Study
- ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **artemether** with lumefantrine. Avoid. [\[Severe\]](#) Study
- ▶ **Rifamycins (rifampicin)** moderately decrease the exposure to **atovaquone** and **atovaquone** slightly increase the exposure to **rifamycins (rifampicin)**. Avoid. [\[Moderate\]](#) Study
- ▶ **Rifamycins (rifampicin)** moderately decrease the exposure to **mefloquine**. [\[Severe\]](#) Study
- ▶ **Rifamycins (rifampicin)** are predicted to decrease the concentration of **piperazine**. Avoid. [\[Moderate\]](#) Theoretical
- ▶ **Rifamycins (rifampicin)** decrease the exposure to **quinine**. [\[Severe\]](#) Study
- ▶ **St John's wort** is predicted to decrease the concentration of **piperazine**. Avoid. [\[Moderate\]](#) Theoretical
- ▶ **Pyrimethamine** increases the risk of adverse effects when given with **sulfonamides**. [\[Severe\]](#) Study
- ▶ **Tetracyclines (tetracycline)** decrease the concentration of **atovaquone**. [\[Moderate\]](#) Study
- ▶ **Pyrimethamine** increases the risk of adverse effects when given with **trimethoprim**. [\[Severe\]](#) Study

Antipsychotics, second generation → see TABLE 8 p. 1448

(hypotension), TABLE 9 p. 1449 (QT-interval prolongation), TABLE 11 p. 1449 (CNS depressant effects), TABLE 10 p. 1449 (antimuscarinics)

amisulpride · aripiprazole · asenapine · cariprazine · clozapine · lurasidone · olanzapine · paliperidone · quetiapine · risperidone

- ▶ **Clozapine** and **olanzapine** dose adjustment might be necessary if smoking started or stopped during treatment.
- ▶ Avoid concomitant use of **clozapine** with drugs that have a substantial potential for causing agranulocytosis.

- ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to moderately decrease the exposure to **aripiprazole**. Adjust **aripiprazole** dose, p. 418. [Moderate] Study
- ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to **cariprazine**. Avoid. [Severe] Theoretical
- ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to **lurasidone**. Avoid. [Moderate] Study
- ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to **paliperidone**. Monitor and adjust dose. [Severe] Study → Also see TABLE 9 p. 1449
- ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to **quetiapine**. [Moderate] Study
- ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to **risperidone**. Adjust dose. [Moderate] Study → Also see TABLE 9 p. 1449
- ▶ **Anti-androgens (enzalutamide)** are predicted to decrease the exposure to **clozapine**. [Moderate] Theoretical
- ▶ **Antiarrhythmics (dronedaron)** are predicted to increase the exposure to **cariprazine**. Avoid. [Severe] Study
- ▶ **Antiarrhythmics (dronedaron)** are predicted to increase the exposure to **lurasidone**. Adjust **lurasidone** dose, p. 422. [Moderate] Study
- ▶ **Antiarrhythmics (dronedaron)** are predicted to increase the exposure to **quetiapine**. Avoid. [Moderate] Study
- ▶ **Antiepileptics (carbamazepine)** are predicted to increase the risk of myelosuppression when given with **clozapine**. Avoid. [Severe] Anecdotal
- ▶ **Antiepileptics (carbamazepine)** potentially decrease the exposure to **olanzapine**. Monitor and adjust dose. [Moderate] Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to moderately decrease the exposure to **aripiprazole**. Adjust **aripiprazole** dose, p. 418. [Moderate] Study → Also see TABLE 11 p. 1449
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **cariprazine**. Avoid. [Severe] Theoretical → Also see TABLE 11 p. 1449
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **lurasidone**. Avoid. [Moderate] Study → Also see TABLE 11 p. 1449
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **paliperidone**. Monitor and adjust dose. [Severe] Study → Also see TABLE 11 p. 1449
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **quetiapine**. [Moderate] Study → Also see TABLE 11 p. 1449
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **risperidone**. Adjust dose. [Moderate] Study → Also see TABLE 11 p. 1449
- ▶ **Antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **clozapine**. [Moderate] Anecdotal → Also see TABLE 11 p. 1449
- ▶ **Antiepileptics (phenytoin)** are predicted to decrease the exposure to **olanzapine**. Monitor and adjust dose. [Moderate] Study
- ▶ **Antiepileptics (valproate)** increase the risk of adverse effects when given with **olanzapine**. [Severe] Study
- ▶ **Antiepileptics (valproate)** slightly increase the exposure to **paliperidone**. Adjust dose. [Moderate] Study
- ▶ **Antiepileptics (valproate)** potentially increase the risk of neutropenia when given with **quetiapine**. [Moderate] Study
- ▶ **Antifungals, azoles (fluconazole, isavuconazole)** are predicted to increase the exposure to **lurasidone**. Adjust **lurasidone** dose, p. 422. [Moderate] Study
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **cariprazine**. Avoid. [Severe] Study
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **quetiapine**. Avoid. [Moderate] Study
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to slightly increase the exposure to **aripiprazole**. Adjust **aripiprazole** dose, p. 418. [Moderate] Study
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to moderately increase the exposure to **cariprazine**. Avoid. [Severe] Study
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **risperidone**. Adjust dose. [Moderate] Study → Also see TABLE 9 p. 1449
- ▶ **Antifungals, azoles (posaconazole)** moderately increase the exposure to **lurasidone**. Avoid. [Severe] Study
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to antipsychotics, second generation (**lurasidone, quetiapine**). Avoid. [Severe] Study
- ▶ **Axitinib** is predicted to increase the exposure to antipsychotics, second generation (**clozapine, olanzapine**). [Moderate] Theoretical
- ▶ **Bupropion** is predicted to moderately increase the exposure to **aripiprazole**. Adjust **aripiprazole** dose, p. 418. [Moderate] Study
- ▶ **Bupropion** is predicted to increase the exposure to **risperidone**. Adjust dose. [Moderate] Study
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **cariprazine**. Avoid. [Severe] Study → Also see TABLE 8 p. 1448
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **lurasidone**. Adjust **lurasidone** dose, p. 422. [Moderate] Study → Also see TABLE 8 p. 1448
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **quetiapine**. Avoid. [Moderate] Study → Also see TABLE 8 p. 1448
- ▶ **Cinacalcet** is predicted to moderately increase the exposure to **aripiprazole**. Adjust **aripiprazole** dose, p. 418. [Moderate] Study
- ▶ **Cinacalcet** is predicted to increase the exposure to **risperidone**. Adjust dose. [Moderate] Study
- ▶ **Cobicistat** is predicted to increase the exposure to antipsychotics, second generation (**lurasidone, quetiapine**). Avoid. [Severe] Study
- ▶ **Cobicistat** is predicted to slightly increase the exposure to **aripiprazole**. Adjust **aripiprazole** dose, p. 418. [Moderate] Study
- ▶ **Cobicistat** is predicted to moderately increase the exposure to **cariprazine**. Avoid. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **risperidone**. Adjust dose. [Moderate] Study
- ▶ **Combined hormonal contraceptives** increases the concentration of **clozapine**. Monitor adverse effects and adjust dose. [Severe] Study
- ▶ **Combined hormonal contraceptives** is predicted to increase the exposure to **olanzapine**. Adjust dose. [Moderate] Anecdotal
- ▶ **Crizotinib** is predicted to increase the exposure to **cariprazine**. Avoid. [Severe] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **lurasidone**. Adjust **lurasidone** dose, p. 422. [Moderate] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **quetiapine**. Avoid. [Moderate] Study
- ▶ **Dabrafenib** is predicted to decrease the exposure to **cariprazine**. Avoid. [Severe] Theoretical
- ▶ **Dabrafenib** is predicted to decrease the exposure to **lurasidone**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Dabrafenib** is predicted to decrease the exposure to **quetiapine**. [Moderate] Study
- ▶ Antipsychotics, second generation (**amisulpride, olanzapine, paliperidone, quetiapine, risperidone**) are predicted to decrease the effects of **dopamine receptor agonists**. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 1448 → Also see TABLE 9 p. 1449
- ▶ Antipsychotics, second generation (**aripiprazole, clozapine**) are predicted to decrease the effects of **dopamine receptor**

- agonists.** [Moderate] Theoretical → Also see TABLE 8 p. 1448 → Also see TABLE 10 p. 1449
- ▶ **Asenapine** is predicted to decrease the effects of **dopamine receptor agonists**. Adjust dose. [Moderate] Theoretical → Also see TABLE 8 p. 1448
 - ▶ **Endothelin receptor antagonists (bosentan)** are predicted to decrease the exposure to **cariprazine**. Avoid. [Severe] Theoretical
 - ▶ **Endothelin receptor antagonists (bosentan)** are predicted to decrease the exposure to **lurasidone**. Monitor and adjust dose. [Moderate] Theoretical
 - ▶ **Endothelin receptor antagonists (bosentan)** are predicted to decrease the exposure to **quetiapine**. [Moderate] Study
 - ▶ **Grapefruit** juice is predicted to increase the exposure to antipsychotics, second generation (**lurasidone, quetiapine**). Avoid. [Severe] Theoretical
 - ▶ **Grapefruit** juice is predicted to increase the exposure to **cariprazine**. Avoid. [Moderate] Study
 - ▶ **HIV-protease inhibitors (ritonavir)** are predicted to affect the exposure to **clozapine**. Avoid. [Severe] Theoretical
 - ▶ **HIV-protease inhibitors (ritonavir)** are predicted to decrease the exposure to **olanzapine**. Monitor and adjust dose. [Moderate] Study
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to antipsychotics, second generation (**lurasidone, quetiapine**). Avoid. [Severe] Study
 - ▶ **HIV-protease inhibitors** are predicted to slightly increase the exposure to **aripiprazole**. Adjust aripiprazole dose, p. 418. [Moderate] Study
 - ▶ **HIV-protease inhibitors** are predicted to moderately increase the exposure to **cariprazine**. Avoid. [Severe] Study
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **risperidone**. Adjust dose. [Moderate] Study
 - ▶ **Idelalisib** is predicted to increase the exposure to antipsychotics, second generation (**lurasidone, quetiapine**). Avoid. [Severe] Study
 - ▶ **Idelalisib** is predicted to slightly increase the exposure to **aripiprazole**. Adjust aripiprazole dose, p. 418. [Moderate] Study
 - ▶ **Idelalisib** is predicted to moderately increase the exposure to **cariprazine**. Avoid. [Severe] Study
 - ▶ **Idelalisib** is predicted to increase the exposure to **risperidone**. Adjust dose. [Moderate] Study
 - ▶ **Imatinib** is predicted to increase the exposure to **cariprazine**. Avoid. [Severe] Study
 - ▶ **Imatinib** is predicted to increase the exposure to **lurasidone**. Adjust **lurasidone** dose, p. 422. [Moderate] Study
 - ▶ **Imatinib** is predicted to increase the exposure to **quetiapine**. Avoid. [Moderate] Study
 - ▶ **Iron chelators (deferasirox)** are predicted to increase the exposure to **clozapine**. Avoid. [Moderate] Theoretical
 - ▶ **Leflunomide** is predicted to decrease the exposure to **clozapine**. [Moderate] Theoretical
 - ▶ **Leflunomide** is predicted to decrease the exposure to **olanzapine**. Monitor and adjust dose. [Moderate] Study
 - ▶ **Letermovir** is predicted to increase the exposure to **cariprazine**. Avoid. [Severe] Study
 - ▶ **Letermovir** is predicted to increase the exposure to **quetiapine**. Avoid. [Moderate] Study
 - ▶ **Amisulpride** is predicted to decrease the effects of **levodopa**. Avoid. [Severe] Theoretical
 - ▶ Antipsychotics, second generation (**aripiprazole, clozapine, lurasidone, paliperidone**) are predicted to decrease the effects of **levodopa**. [Severe] Theoretical → Also see TABLE 8 p. 1448
 - ▶ **Asenapine** is predicted to decrease the effects of **levodopa**. Adjust dose. [Severe] Theoretical → Also see TABLE 8 p. 1448
 - ▶ **Olanzapine** decreases the effects of **levodopa**. Avoid or monitor worsening parkinsonian symptoms. [Severe] Anecdotal → Also see TABLE 8 p. 1448
 - ▶ **Quetiapine** decreases the effects of **levodopa**. [Severe] Anecdotal → Also see TABLE 8 p. 1448
 - ▶ **Risperidone** is predicted to decrease the effects of **levodopa**. Avoid or adjust dose. [Severe] Anecdotal → Also see TABLE 8 p. 1448
 - ▶ Antipsychotics, second generation (**quetiapine, risperidone**) potentially increase the risk of neurotoxicity when given with **lithium**. [Severe] Anecdotal → Also see TABLE 9 p. 1449
 - ▶ **Macrolides (clarithromycin)** are predicted to slightly increase the exposure to **aripiprazole**. Adjust aripiprazole dose, p. 418. [Moderate] Study
 - ▶ **Macrolides (clarithromycin)** are predicted to moderately increase the exposure to **cariprazine**. Avoid. [Severe] Study
 - ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **risperidone**. Adjust dose. [Moderate] Study → Also see TABLE 9 p. 1449
 - ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **cariprazine**. Avoid. [Severe] Study
 - ▶ **Macrolides (erythromycin)** potentially increase the risk of toxicity when given with **clozapine**. [Severe] Anecdotal
 - ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **lurasidone**. Adjust **lurasidone** dose, p. 422. [Moderate] Study
 - ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **quetiapine**. Avoid. [Moderate] Study
 - ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to antipsychotics, second generation (**lurasidone, quetiapine**). Avoid. [Severe] Study
 - ▶ **Methyphenidate** increases the risk of dyskinesias when given with **paliperidone**. [Severe] Theoretical
 - ▶ **Risperidone** increases the risk of dyskinesias when given with **methyphenidate**. [Severe] Anecdotal
 - ▶ **Mexiletine** increases the concentration of **clozapine**. Monitor adverse effects and adjust dose. [Severe] Study
 - ▶ **Mexiletine** is predicted to increase the exposure to **olanzapine**. Adjust dose. [Moderate] Anecdotal
 - ▶ **Mitotane** is predicted to moderately decrease the exposure to **aripiprazole**. Adjust aripiprazole dose, p. 418. [Moderate] Study
 - ▶ **Mitotane** is predicted to decrease the exposure to **cariprazine**. Avoid. [Severe] Theoretical
 - ▶ **Mitotane** is predicted to decrease the exposure to **lurasidone**. Avoid. [Moderate] Study
 - ▶ **Mitotane** is predicted to decrease the exposure to **paliperidone**. Monitor and adjust dose. [Severe] Study
 - ▶ **Mitotane** is predicted to decrease the exposure to **quetiapine**. [Moderate] Study
 - ▶ **Mitotane** is predicted to decrease the exposure to **risperidone**. Adjust dose. [Moderate] Study
 - ▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to increase the exposure to **cariprazine**. Avoid. [Severe] Study
 - ▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to increase the exposure to **lurasidone**. Adjust **lurasidone** dose, p. 422. [Moderate] Study
 - ▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to increase the exposure to **quetiapine**. Avoid. [Moderate] Study
 - ▶ **Nilotinib** is predicted to increase the exposure to **cariprazine**. Avoid. [Severe] Study
 - ▶ **Nilotinib** is predicted to increase the exposure to **lurasidone**. Adjust **lurasidone** dose, p. 422. [Moderate] Study
 - ▶ **Nilotinib** is predicted to increase the exposure to **quetiapine**. Avoid. [Moderate] Study
 - ▶ **NNRTIs (efavirenz, nevirapine)** are predicted to decrease the exposure to **cariprazine**. Avoid. [Severe] Theoretical
 - ▶ **NNRTIs (efavirenz, nevirapine)** are predicted to decrease the exposure to **lurasidone**. Monitor and adjust dose. [Moderate] Theoretical
 - ▶ **NNRTIs (efavirenz, nevirapine)** are predicted to decrease the exposure to **quetiapine**. [Moderate] Study
 - ▶ **Olaparib** might alter the exposure to **quetiapine**. [Moderate] Theoretical
 - ▶ **Quinolones (ciprofloxacin)** increase the concentration of **clozapine**. Monitor adverse effects and adjust dose. [Severe] Study
 - ▶ **Quinolones (ciprofloxacin)** are predicted to increase the exposure to **olanzapine**. Adjust dose. [Moderate] Anecdotal
 - ▶ **Ribociclib** (high-dose) is predicted to increase the exposure to **quetiapine**. Avoid. [Moderate] Theoretical
 - ▶ **Rifamycins (rifampicin)** are predicted to moderately decrease the exposure to **aripiprazole**. Adjust aripiprazole dose, p. 418. [Moderate] Study

Antipsychotics, second generation (continued)

- ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **cariprazine**. Avoid. [\[Severe\]](#) Theoretical
 - ▶ **Rifamycins (rifampicin)** decrease the exposure to **clozapine**. [\[Severe\]](#) Anecdotal
 - ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **lurasidone**. Avoid. [\[Moderate\]](#) Study
 - ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **olanzapine**. Monitor and adjust dose. [\[Moderate\]](#) Study
 - ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **paliperidone**. Monitor and adjust dose. [\[Severe\]](#) Study
 - ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **quetiapine**. [\[Moderate\]](#) Study
 - ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **risperidone**. Adjust dose. [\[Moderate\]](#) Study
 - ▶ **Rucaparib** increases the concentration of **clozapine**. Monitor adverse effects and adjust dose. [\[Severe\]](#) Study
 - ▶ **Rucaparib** is predicted to increase the exposure to **olanzapine**. Adjust dose. [\[Moderate\]](#) Anecdotal
 - ▶ **SSRIs (fluoxetine, paroxetine)** are predicted to moderately increase the exposure to **aripiprazole**. Adjust aripiprazole dose, p. 418. [\[Moderate\]](#) Study
 - ▶ **SSRIs (fluoxetine, paroxetine)** are predicted to increase the exposure to **risperidone**. Adjust dose. [\[Moderate\]](#) Study
 - ▶ **SSRIs (fluvoxamine)** increase the exposure to **asenapine**. [\[Moderate\]](#) Study
 - ▶ **SSRIs (fluvoxamine)** increase the concentration of **clozapine**. Monitor adverse effects and adjust dose. [\[Severe\]](#) Study
 - ▶ **SSRIs (fluvoxamine)** moderately increase the exposure to **olanzapine**. Adjust dose. [\[Severe\]](#) Anecdotal
 - ▶ **SSRIs (paroxetine)** moderately increase the exposure to **asenapine**. [\[Moderate\]](#) Study
 - ▶ **St John's wort** is predicted to decrease the exposure to **cariprazine**. Avoid. [\[Severe\]](#) Theoretical
 - ▶ **St John's wort** is predicted to decrease the exposure to **lurasidone**. Monitor and adjust dose. [\[Moderate\]](#) Theoretical
 - ▶ **St John's wort** is predicted to decrease the exposure to **paliperidone**. [\[Severe\]](#) Theoretical
 - ▶ **St John's wort** is predicted to decrease the exposure to **quetiapine**. [\[Moderate\]](#) Study
 - ▶ **Terbinafine** is predicted to moderately increase the exposure to **aripiprazole**. Adjust aripiprazole dose, p. 418. [\[Moderate\]](#) Study
 - ▶ **Terbinafine** is predicted to increase the exposure to **risperidone**. Adjust dose. [\[Moderate\]](#) Study
 - ▶ **Terflunomide** is predicted to decrease the exposure to **clozapine**. [\[Moderate\]](#) Theoretical
 - ▶ **Terflunomide** is predicted to decrease the exposure to **olanzapine**. Monitor and adjust dose. [\[Moderate\]](#) Study
 - ▶ **Vemurafenib** increases the concentration of **clozapine**. Monitor adverse effects and adjust dose. [\[Severe\]](#) Study
 - ▶ **Vemurafenib** is predicted to increase the exposure to **olanzapine**. Adjust dose. [\[Moderate\]](#) Anecdotal
- Antithymocyte immunoglobulin (rabbit)** → see immunoglobulins
- Apalutamide** → see anti-androgens
- Apixaban** → see factor XA inhibitors
- Apomorphine** → see dopamine receptor agonists
- Apraclonidine** → see TABLE 6 p. 1448 (bradycardia), TABLE 8 p. 1448 (hypotension), TABLE 11 p. 1449 (CNS depressant effects)
- ▶ **Amfetamines** are predicted to decrease the effects of **apraclonidine**. Avoid. [\[Severe\]](#) Theoretical
 - ▶ **Methylphenidate** is predicted to decrease the effects of **apraclonidine**. Avoid. [\[Severe\]](#) Theoretical
 - ▶ **Sympathomimetics, inotropic** are predicted to decrease the effects of **apraclonidine**. Avoid. [\[Severe\]](#) Theoretical
 - ▶ **Sympathomimetics, vasoconstrictor** are predicted to decrease the effects of **apraclonidine**. Avoid. [\[Severe\]](#) Theoretical
- Apremilast** → see phosphodiesterase type-4 inhibitors
- Aprepitant** → see neurokinin-1 receptor antagonists
- Argatroban** → see thrombin inhibitors
- Aripiprazole** → see antipsychotics, second generation
- Arsenic trioxide** → see TABLE 15 p. 1450 (myelosuppression), TABLE 9 p. 1449 (QT-interval prolongation)
- Artemether** → see antimalarials
- Artemisol** → see antimalarials
- Articaine** → see TABLE 11 p. 1449 (CNS depressant effects)

Ascorbic acid

- ▶ **Ascorbic acid** is predicted to increase the risk of cardiovascular adverse effects when given with **iron chelators (deferiprone)**. [\[Severe\]](#) Theoretical
 - ▶ **Ascorbic acid** might increase the risk of cardiovascular adverse effects when given with **iron chelators (desferrioxamine)**. Manufacturer advises caution or adjust ascorbic acid dose; monitor cardiac function and avoid concurrent use in those with cardiac failure. [\[Severe\]](#) Theoretical
- Asenapine** → see antipsychotics, second generation
- Asparaginase** → see TABLE 1 p. 1447 (hepatotoxicity), TABLE 15 p. 1450 (myelosuppression)
- ▶ **Asparaginase** is predicted to increase the risk of hepatotoxicity when given with **imatinib**. [\[Severe\]](#) Theoretical → Also see TABLE 15 p. 1450
 - ▶ **Asparaginase** affects the efficacy of **methotrexate**. [\[Severe\]](#) Anecdotal → Also see TABLE 1 p. 1447 → Also see TABLE 15 p. 1450
 - ▶ **Asparaginase** potentially increases the risk of neurotoxicity when given with **vinca alkaloids (vincristine)**. Vincristine should be taken 3 to 24 hours before **asparaginase**. [\[Severe\]](#) Anecdotal → Also see TABLE 1 p. 1447 → Also see TABLE 15 p. 1450
- Aspirin** → see TABLE 4 p. 1447 (antiplatelet effects)
- ▶ **Acetazolamide** increases the risk of severe toxic reaction when given with **aspirin** (high-dose). [\[Severe\]](#) Study
 - ▶ Oral **antacids** decrease the absorption of oral **aspirin** (high-dose). [\[Moderate\]](#) Study
 - ▶ **Bismuth subsalicylate** is predicted to increase the risk of adverse effects when given with **aspirin**. Avoid. [\[Moderate\]](#) Theoretical
 - ▶ **Aspirin** (high-dose) is predicted to increase the risk of gastrointestinal irritation when given with **bisphosphonates (alendronate, ibandronate)**. [\[Moderate\]](#) Study
 - ▶ **Aspirin** (high-dose) is predicted to increase the risk of renal impairment when given with **bisphosphonates (clodronate)**. [\[Severe\]](#) Theoretical
 - ▶ **Corticosteroids** are predicted to decrease the concentration of **aspirin** (high-dose) and **aspirin** (high-dose) increases the risk of gastrointestinal bleeding when given with **corticosteroids**. [\[Moderate\]](#) Study
 - ▶ **Aspirin** (high-dose) increases the risk of renal impairment when given with **daptomycin**. [\[Moderate\]](#) Theoretical
 - ▶ **Erlotinib** is predicted to increase the risk of gastrointestinal perforation when given with **aspirin** (high-dose). [\[Severe\]](#) Theoretical
 - ▶ **Aspirin** (high-dose) increases the exposure to **factor XA inhibitors (edoxaban)**. Avoid. [\[Severe\]](#) Study
 - ▶ **Aspirin** (high-dose) is predicted to increase the risk of gastrointestinal bleeds when given with **iron chelators (deferiprone)**. [\[Severe\]](#) Theoretical
 - ▶ **Aspirin** (high-dose) is predicted to increase the risk of toxicity when given with **methotrexate**. [\[Severe\]](#) Study
 - ▶ **Aspirin** is predicted to increase the risk of gastrointestinal perforation when given with **nicorandil**. [\[Severe\]](#) Theoretical
 - ▶ **NRTIs (zidovudine)** increase the risk of haematological toxicity when given with **aspirin** (high-dose). [\[Severe\]](#) Study
 - ▶ **Aspirin** (high-dose) potentially increases the exposure to **pemetrexed**. Use with caution or avoid. [\[Severe\]](#) Theoretical
 - ▶ **Aspirin** (high-dose) increases the risk of acute renal failure when given with **thiazide diuretics**. [\[Severe\]](#) Theoretical
- Ataluren**
- ▶ **Ataluren** is predicted to increase the risk of nephrotoxicity when given with intravenous **aminoglycosides**. Avoid. [\[Severe\]](#) Study
 - ▶ **Rifamycins (rifampicin)** decrease the exposure to **ataluren**. [\[Moderate\]](#) Study
- Atazanavir** → see HIV-protease inhibitors
- Atenolol** → see beta blockers, selective
- Atezolizumab** → see monoclonal antibodies
- Atomoxetine**
- ▶ **Amfetamines** are predicted to increase the risk of adverse effects when given with **atomoxetine**. [\[Severe\]](#) Theoretical
 - ▶ **Atomoxetine** is predicted to increase the risk of cardiovascular adverse effects when given with **beta₂ agonists** (high-dose). [\[Moderate\]](#) Study

- ▶ **Bupropion** is predicted to markedly increase the exposure to **atomoxetine**. Adjust dose. [Severe] Study
 - ▶ **Cinacalcet** is predicted to markedly increase the exposure to **atomoxetine**. Adjust dose. [Severe] Study
 - ▶ **Dacomitinib** is predicted to markedly increase the exposure to **atomoxetine**. Avoid or adjust dose. [Severe] Study
 - ▶ **Eliglustat** is predicted to increase the exposure to **atomoxetine**. Adjust dose. [Moderate] Theoretical
 - ▶ **MAOIs, irreversible** are predicted to increase the risk of adverse effects when given with **atomoxetine**. Avoid and for 2 weeks after stopping the MAOI. [Severe] Theoretical
 - ▶ **Panobinostat** is predicted to increase the exposure to **atomoxetine**. Monitor and adjust dose. [Severe] Theoretical
 - ▶ **SSRIs (fluoxetine, paroxetine)** are predicted to markedly increase the exposure to **atomoxetine**. Adjust dose. [Severe] Study
 - ▶ **Terbinafine** is predicted to markedly increase the exposure to **atomoxetine**. Adjust dose. [Severe] Study
 - Atorvastatin** → see statins
 - Atovaquone** → see antimalarials
 - Atracurium** → see neuromuscular blocking drugs, non-depolarising
 - Atropine** → see TABLE 10 p. 1449 (antimuscarinics)
- ROUTE-SPECIFIC INFORMATION** Since systemic absorption can follow topical application of **atropine**, the possibility of interactions should be borne in mind.
- ▶ **Atropine** increases the risk of severe hypertension when given with **sympathomimetics, vasoconstrictor (phenylephrine)**. [Severe] Study
 - Avanafil** → see phosphodiesterase type-5 inhibitors
 - Avapritinib**
 - ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to **avapritinib**. Avoid. [Severe] Study
 - ▶ **Antiarrhythmics (dronedaron)** are predicted to increase the exposure to **avapritinib**. Avoid or adjust **avapritinib** dose, p. 1019. [Moderate] Study
 - ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **avapritinib**. Avoid. [Severe] Study
 - ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **avapritinib**. Avoid or adjust **avapritinib** dose, p. 1019. [Moderate] Study
 - ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **avapritinib**. Avoid. [Moderate] Study
 - ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **avapritinib**. Avoid or adjust **avapritinib** dose, p. 1019. [Moderate] Study
 - ▶ **Cobicistat** is predicted to increase the exposure to **avapritinib**. Avoid. [Moderate] Study
 - ▶ **Corticosteroids (dexamethasone)** are predicted to decrease the exposure to **avapritinib**. Avoid. [Severe] Theoretical
 - ▶ **Crizotinib** is predicted to increase the exposure to **avapritinib**. Avoid or adjust **avapritinib** dose, p. 1019. [Moderate] Study
 - ▶ **Dabrafenib** is predicted to decrease the exposure to **avapritinib**. Avoid. [Severe] Study
 - ▶ **Endothelin receptor antagonists (bosentan)** are predicted to decrease the exposure to **avapritinib**. Avoid. [Severe] Study
 - ▶ **Grapefruit** juice is predicted to increase the exposure to **avapritinib**. Avoid. [Moderate] Theoretical
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **avapritinib**. Avoid. [Moderate] Study
 - ▶ **Idelalisib** is predicted to increase the exposure to **avapritinib**. Avoid. [Moderate] Study
 - ▶ **Imatinib** is predicted to increase the exposure to **avapritinib**. Avoid or adjust **avapritinib** dose, p. 1019. [Moderate] Study
 - ▶ **Letermovir** is predicted to increase the exposure to **avapritinib**. Avoid or adjust **avapritinib** dose, p. 1019. [Moderate] Study
 - ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **avapritinib**. Avoid. [Moderate] Study
 - ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **avapritinib**. Avoid or adjust **avapritinib** dose, p. 1019. [Moderate] Study
 - ▶ **Mitotane** is predicted to decrease the exposure to **avapritinib**. Avoid. [Severe] Study
 - ▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to increase the exposure to **avapritinib**. Avoid or adjust **avapritinib** dose, p. 1019. [Moderate] Study
 - ▶ **Nilotinib** is predicted to increase the exposure to **avapritinib**. Avoid or adjust **avapritinib** dose, p. 1019. [Moderate] Study
 - ▶ **NNRTIs (efavirenz, nevirapine)** are predicted to decrease the exposure to **avapritinib**. Avoid. [Severe] Study
 - ▶ **NNRTIs (etravirine)** are predicted to decrease the exposure to **avapritinib**. Avoid. [Severe] Theoretical
 - ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **avapritinib**. Avoid. [Severe] Study
 - ▶ **St John's wort** is predicted to decrease the exposure to **avapritinib**. Avoid. [Severe] Study
- Avelumab** → see monoclonal antibodies
- Axitinib** → see TABLE 15 p. 1450 (myelosuppression), TABLE 4 p. 1447 (antiplatelet effects)
- ▶ **Axitinib** is predicted to increase the exposure to **agomelatine**. [Moderate] Theoretical
 - ▶ **Axitinib** is predicted to increase the exposure to **aminophylline**. [Moderate] Theoretical
 - ▶ **Axitinib** is predicted to increase the exposure to **anaesthetics, local (ropivacaine)**. [Moderate] Theoretical
 - ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to **axitinib**. Avoid or adjust dose. [Moderate] Study
 - ▶ **Antiarrhythmics (dronedaron)** are predicted to increase the exposure to **axitinib**. [Moderate] Study
 - ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **axitinib**. Avoid or adjust dose. [Moderate] Study
 - ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **axitinib**. [Moderate] Study
 - ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **axitinib**. Avoid or adjust dose. [Moderate] Study
 - ▶ **Axitinib** is predicted to increase the exposure to **antipsychotics, second generation (clozapine, olanzapine)**. [Moderate] Theoretical
 - ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **axitinib**. [Moderate] Study
 - ▶ **Cobicistat** is predicted to increase the exposure to **axitinib**. Avoid or adjust dose. [Moderate] Study
 - ▶ **Crizotinib** is predicted to increase the exposure to **axitinib**. [Moderate] Study
 - ▶ **Dabrafenib** is predicted to decrease the exposure to **axitinib**. [Moderate] Study
 - ▶ **Axitinib** is predicted to increase the exposure to **dopamine receptor agonists (ropinirole)**. [Moderate] Theoretical
 - ▶ **Axitinib** is predicted to increase the exposure to **duloxetine**. [Moderate] Theoretical → Also see TABLE 4 p. 1447
 - ▶ **Endothelin receptor antagonists (bosentan)** are predicted to decrease the exposure to **axitinib**. [Moderate] Study
 - ▶ **Grapefruit** juice is predicted to increase the exposure to **axitinib**. [Moderate] Theoretical
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **axitinib**. Avoid or adjust dose. [Moderate] Study
 - ▶ **Idelalisib** is predicted to increase the exposure to **axitinib**. Avoid or adjust dose. [Moderate] Study
 - ▶ **Imatinib** is predicted to increase the exposure to **axitinib**. [Moderate] Study → Also see TABLE 15 p. 1450
 - ▶ **Letermovir** is predicted to increase the exposure to **axitinib**. [Moderate] Study
 - ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **axitinib**. Avoid or adjust dose. [Moderate] Study
 - ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **axitinib**. [Moderate] Study
 - ▶ **Axitinib** is predicted to increase the exposure to **MAO-B inhibitors (rasagiline)**. [Moderate] Theoretical
 - ▶ **Axitinib** is predicted to increase the exposure to **melatonin**. [Moderate] Theoretical
 - ▶ **Mitotane** is predicted to decrease the exposure to **axitinib**. Avoid or adjust dose. [Moderate] Study → Also see TABLE 15 p. 1450
 - ▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to increase the exposure to **axitinib**. [Moderate] Study

Axitinib (continued)

- ▶ **Nilotinib** is predicted to increase the exposure to **axitinib**. [\[Moderate\]](#) Study → Also see [TABLE 15 p. 1450](#)
- ▶ **NNRTIs (efavirenz, nevirapine)** are predicted to decrease the exposure to **axitinib**. [\[Moderate\]](#) Study
- ▶ **Axitinib** is predicted to increase the exposure to **pirfenidone**. [\[Moderate\]](#) Theoretical
- ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **axitinib**. Avoid or adjust dose. [\[Moderate\]](#) Study
- ▶ **St John's wort** is predicted to decrease the exposure to **axitinib**. Avoid or adjust dose. [\[Moderate\]](#) Study
- ▶ **Axitinib** is predicted to increase the exposure to **theophylline**. [\[Moderate\]](#) Theoretical
- ▶ **Axitinib** is predicted to increase the exposure to **tizanidine**. [\[Moderate\]](#) Theoretical
- Azacitidine** → see [TABLE 15 p. 1450](#) (myelosuppression)
- Azathioprine** → see [TABLE 15 p. 1450](#) (myelosuppression)
- ▶ **ACE inhibitors** are predicted to increase the risk of anaemia and/or leucopenia when given with **azathioprine**. [\[Severe\]](#) Anecdotal
- ▶ **Allopurinol** potentially increases the risk of haematological toxicity when given with **azathioprine**. Adjust **azathioprine** dose, p. 886. [\[Severe\]](#) Study
- ▶ **Azathioprine** decreases the anticoagulant effect of **coumarins**. [\[Moderate\]](#) Study
- ▶ **Febuxostat** is predicted to increase the exposure to **azathioprine**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Filgotinib** is predicted to increase the risk of immunosuppression when given with **azathioprine**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **azathioprine** (high-dose). Public Health England advises avoid (refer to Green Book). [\[Severe\]](#) Theoretical
- Azelastine** → see antihistamines, non-sedating
- Azilsartan** → see angiotensin-II receptor antagonists
- Azithromycin** → see macrolides
- Bacillus Calmette-Guérin vaccine** → see live vaccines
- Bacitracin** → see [TABLE 2 p. 1447](#) (nephrotoxicity)
- Baclofen** → see [TABLE 8 p. 1448](#) (hypotension), [TABLE 11 p. 1449](#) (CNS depressant effects), [TABLE 10 p. 1449](#) (antimuscarinics)
- ▶ **Baclofen** is predicted to increase the risk of adverse effects when given with **levodopa**. [\[Severe\]](#) Anecdotal → Also see [TABLE 8 p. 1448](#)
- Balsalazide**
 - ▶ **Balsalazide** is predicted to decrease the concentration of **digoxin**. [\[Moderate\]](#) Theoretical
- Bambuterol** → see beta₂ agonists
- Baricitinib**
 - ▶ **Filgotinib** is predicted to increase the risk of immunosuppression when given with **baricitinib**. Avoid. [\[Severe\]](#) Theoretical
 - ▶ **Leflunomide** is predicted to increase the exposure to **baricitinib**. [\[Moderate\]](#) Study
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **baricitinib**. Avoid. [\[Severe\]](#) Theoretical
 - ▶ **Teriflunomide** is predicted to increase the exposure to **baricitinib**. [\[Moderate\]](#) Study
- Basiliximab** → see monoclonal antibodies
- Bazedoxifene**
 - ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **bazedoxifene**. [\[Moderate\]](#) Theoretical
 - ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **bazedoxifene**. [\[Moderate\]](#) Theoretical
- Beclomethasone** → see corticosteroids
- Bedaquiline** → see [TABLE 1 p. 1447](#) (hepatotoxicity), [TABLE 9 p. 1449](#) (QT-interval prolongation)
 - ▶ **Anti-androgens (apalutamide, enzalutamide)** decrease the exposure to **bedaquiline**. Avoid. [\[Severe\]](#) Study → Also see [TABLE 9 p. 1449](#)
 - ▶ **Antiarrhythmics (dronedaron)** are predicted to increase the exposure to **bedaquiline**. Avoid prolonged use. [\[Mild\]](#) Theoretical → Also see [TABLE 9 p. 1449](#)

- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** decrease the exposure to **bedaquiline**. Avoid. [\[Severe\]](#) Study → Also see [TABLE 1 p. 1447](#)
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **bedaquiline**. Avoid prolonged use. [\[Mild\]](#) Theoretical → Also see [TABLE 1 p. 1447](#) → Also see [TABLE 9 p. 1449](#)
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **bedaquiline**. Avoid prolonged use. [\[Mild\]](#) Study → Also see [TABLE 1 p. 1447](#) → Also see [TABLE 9 p. 1449](#)
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **bedaquiline**. Avoid prolonged use. [\[Mild\]](#) Theoretical
- ▶ **Clofazimine** potentially increases the risk of QT-prolongation when given with **bedaquiline**. [\[Severe\]](#) Study
- ▶ **Cobicistat** is predicted to increase the exposure to **bedaquiline**. Avoid prolonged use. [\[Mild\]](#) Study
- ▶ **Crizotinib** is predicted to increase the exposure to **bedaquiline**. Avoid prolonged use. [\[Mild\]](#) Theoretical → Also see [TABLE 9 p. 1449](#)
- ▶ **Dabrafenib** is predicted to decrease the exposure to **bedaquiline**. Avoid. [\[Severe\]](#) Study
- ▶ **Endothelin receptor antagonists (bosentan)** are predicted to decrease the exposure to **bedaquiline**. Avoid. [\[Severe\]](#) Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **bedaquiline**. Avoid prolonged use. [\[Mild\]](#) Study
- ▶ **Idelalisib** is predicted to increase the exposure to **bedaquiline**. Avoid prolonged use. [\[Mild\]](#) Study
- ▶ **Imatinib** is predicted to increase the exposure to **bedaquiline**. Avoid prolonged use. [\[Mild\]](#) Theoretical
- ▶ **Letermovir** is predicted to increase the exposure to **bedaquiline**. Avoid prolonged use. [\[Mild\]](#) Theoretical
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **bedaquiline**. Avoid prolonged use. [\[Mild\]](#) Study → Also see [TABLE 9 p. 1449](#)
- ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **bedaquiline**. Avoid prolonged use. [\[Mild\]](#) Theoretical → Also see [TABLE 9 p. 1449](#)
- ▶ **Mitotane** decreases the exposure to **bedaquiline**. Avoid. [\[Severe\]](#) Study
- ▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to increase the exposure to **bedaquiline**. Avoid prolonged use. [\[Mild\]](#) Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to **bedaquiline**. Avoid prolonged use. [\[Mild\]](#) Theoretical → Also see [TABLE 9 p. 1449](#)
- ▶ **NNRTIs (efavirenz, nevirapine)** are predicted to decrease the exposure to **bedaquiline**. Avoid. [\[Severe\]](#) Study → Also see [TABLE 9 p. 1449](#)
- ▶ **NNRTIs (etravirine)** are predicted to decrease the exposure to **bedaquiline**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Rifamycins (rifampicin)** decrease the exposure to **bedaquiline**. Avoid. [\[Severe\]](#) Study
- ▶ **St John's wort** is predicted to decrease the exposure to **bedaquiline**. Avoid. [\[Severe\]](#) Study

Bees venom extract

GENERAL INFORMATION Desensitising vaccines should be avoided in patients taking beta-blockers (adrenaline might be ineffective in case of a hypersensitivity reaction) or ACE inhibitors (risk of severe anaphylactoid reactions).

- Belatacept** → see [TABLE 15 p. 1450](#) (myelosuppression)
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **belatacept**. Public Health England advises avoid (refer to Green Book). [\[Severe\]](#) Theoretical
- Belimumab** → see monoclonal antibodies
- Bempedoic acid**
 - ▶ **Bempedoic acid** increases the exposure to **statins (pravastatin)**. [\[Moderate\]](#) Study
 - ▶ **Bempedoic acid** increases the exposure to **statins (simvastatin)**. Adjust **simvastatin** dose, p. 221. [\[Moderate\]](#) Study
- Bendamustine** → see alkylating agents
- Bendroflumethiazide** → see thiazide diuretics
- Benperidol** → see [TABLE 8 p. 1448](#) (hypotension), [TABLE 11 p. 1449](#) (CNS depressant effects)

- ▶ **Benperidol** is predicted to decrease the effects of **dopamine receptor agonists**. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 1448
 - ▶ **Benperidol** is predicted to decrease the effects of **levodopa**. [Severe] Study → Also see TABLE 8 p. 1448
 - ▶ **Benzathine benzylpenicillin** → see penicillins
 - ▶ **Benzodiazepines** → see TABLE 11 p. 1449 (CNS depressant effects)
- alprazolam • chlordiazepoxide • clobazam • clonazepam • diazepam • flurazepam • loprazolam • lorazepam • lormetazepam • midazolam • nitrazepam • oxazepam • temazepam
- ▶ **Anti-androgens (apalutamide)** are predicted to decrease the exposure to **diazepam**. Avoid or monitor. [Mild] Study
 - ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to **alprazolam**. Adjust dose. [Moderate] Theoretical
 - ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to **midazolam**. Monitor and adjust dose. [Moderate] Study
 - ▶ **Antiarrhythmics (dronedaron)** are predicted to increase the exposure to **alprazolam**. [Severe] Study
 - ▶ **Antiarrhythmics (dronedaron)** are predicted to increase the exposure to **midazolam**. Monitor adverse effects and adjust dose. [Severe] Study
 - ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **alprazolam**. Adjust dose. [Moderate] Theoretical → Also see TABLE 11 p. 1449
 - ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **midazolam**. Monitor and adjust dose. [Moderate] Study → Also see TABLE 11 p. 1449
 - ▶ **Antiepileptics (stiripentol)** increase the concentration of **clobazam**. [Severe] Study
 - ▶ **Chlordiazepoxide** affects the concentration of **antiepileptics (fosphenytoin, phenytoin)**. [Severe] Study
 - ▶ **Diazepam** potentially affects the concentration of **antiepileptics (fosphenytoin, phenytoin)**. Monitor concentration and adjust dose. [Severe] Study
 - ▶ Benzodiazepines (**clobazam, clonazepam**) potentially affect the concentration of **antiepileptics (fosphenytoin, phenytoin)**. [Severe] Anecdotal
 - ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **alprazolam**. [Severe] Study
 - ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **midazolam**. Monitor adverse effects and adjust dose. [Severe] Study
 - ▶ **Antifungals, azoles (fluconazole, voriconazole)** potentially increase the exposure to **clobazam**. Adjust dose. [Moderate] Theoretical
 - ▶ **Antifungals, azoles (fluconazole, voriconazole)** moderately increase the exposure to **diazepam**. Monitor and adjust dose. [Moderate] Study
 - ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** moderately increase the exposure to **alprazolam**. Avoid. [Moderate] Study
 - ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to markedly to very markedly increase the exposure to **midazolam**. Avoid or adjust dose. [Severe] Study
 - ▶ **Antifungals, azoles (miconazole)** are predicted to increase the exposure to **alprazolam**. Use with caution and adjust dose. [Moderate] Theoretical
 - ▶ **Antifungals, azoles (miconazole)** are predicted to increase the exposure to intravenous **midazolam**. Use with caution and adjust dose. [Moderate] Theoretical
 - ▶ **Antifungals, azoles (miconazole)** are predicted to increase the exposure to oral **midazolam**. Avoid. [Moderate] Theoretical
 - ▶ **Cabozantinib** is predicted to increase the exposure to **midazolam**. [Moderate] Theoretical
 - ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **alprazolam**. [Severe] Study
 - ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **midazolam**. Monitor adverse effects and adjust dose. [Severe] Study
 - ▶ **Cannabidiol** increases the exposure to the active metabolite of **clobazam** and **clobazam** increases the exposure to the active metabolite of **cannabidiol**. Adjust dose. [Moderate] Study → Also see TABLE 11 p. 1449
 - ▶ **Cobicistat** moderately increases the exposure to **alprazolam**. Avoid. [Moderate] Study
 - ▶ **Cobicistat** is predicted to markedly to very markedly increase the exposure to **midazolam**. Avoid or adjust dose. [Severe] Study
 - ▶ **Crizotinib** is predicted to increase the exposure to **alprazolam**. [Severe] Study
 - ▶ **Crizotinib** is predicted to increase the exposure to **midazolam**. Monitor adverse effects and adjust dose. [Severe] Study
 - ▶ **Dabrafenib** decreases the exposure to **midazolam**. Monitor and adjust dose. [Moderate] Study
 - ▶ **Endothelin receptor antagonists (bosentan)** are predicted to decrease the concentration of **midazolam**. Monitor and adjust dose. [Moderate] Theoretical
 - ▶ **Entrectinib** slightly increases the exposure to **midazolam**. [Mild] Study
 - ▶ **HIV-protease inhibitors** moderately increase the exposure to **alprazolam**. Avoid. [Moderate] Study
 - ▶ **HIV-protease inhibitors (ritonavir)** are predicted to increase the exposure to benzodiazepines (**diazepam, flurazepam**). Avoid. [Moderate] Theoretical
 - ▶ **HIV-protease inhibitors** are predicted to markedly to very markedly increase the exposure to **midazolam**. Avoid or adjust dose. [Severe] Study
 - ▶ **Idelalisib** moderately increases the exposure to **alprazolam**. Avoid. [Moderate] Study
 - ▶ **Idelalisib** is predicted to markedly to very markedly increase the exposure to **midazolam**. Avoid or adjust dose. [Severe] Study
 - ▶ **Imatinib** is predicted to increase the exposure to **alprazolam**. [Severe] Study
 - ▶ **Imatinib** is predicted to increase the exposure to **midazolam**. Monitor adverse effects and adjust dose. [Severe] Study
 - ▶ **Larotrectinib** slightly increases the exposure to **midazolam**. Use with caution and adjust dose. [Mild] Study
 - ▶ **Letermovir** is predicted to increase the exposure to **alprazolam**. [Severe] Study
 - ▶ **Letermovir** is predicted to increase the exposure to **midazolam**. Monitor adverse effects and adjust dose. [Severe] Study
 - ▶ **Alprazolam** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
 - ▶ **Lorlatinib** moderately decreases the exposure to **midazolam**. Avoid. [Moderate] Study
 - ▶ **Lumacaftor** is predicted to decrease the exposure to **midazolam**. Avoid. [Severe] Theoretical
 - ▶ **Macrolides (clarithromycin)** moderately increase the exposure to **alprazolam**. Avoid. [Moderate] Study
 - ▶ **Macrolides (clarithromycin)** are predicted to markedly to very markedly increase the exposure to **midazolam**. Avoid or adjust dose. [Severe] Study
 - ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **alprazolam**. [Severe] Study
 - ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **midazolam**. Monitor adverse effects and adjust dose. [Severe] Study
 - ▶ **Mitotane** is predicted to decrease the exposure to **alprazolam**. Adjust dose. [Moderate] Theoretical
 - ▶ **Mitotane** is predicted to decrease the exposure to **midazolam**. Monitor and adjust dose. [Moderate] Study
 - ▶ **Moclobemide** potentially increases the exposure to **clobazam**. Adjust dose. [Moderate] Theoretical
 - ▶ **Monoclonal antibodies (tocilizumab)** are predicted to decrease the exposure to benzodiazepines (**alprazolam, diazepam, midazolam**). Monitor and adjust dose. [Moderate] Theoretical
 - ▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to increase the exposure to **alprazolam**. [Severe] Study
 - ▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to increase the exposure to **midazolam**. Monitor adverse effects and adjust dose. [Severe] Study
 - ▶ **Neurokinin-1 receptor antagonists (fosaprepitant)** are predicted to increase the exposure to **alprazolam**. [Moderate] Study
 - ▶ **Neurokinin-1 receptor antagonists (fosaprepitant)** slightly increase the exposure to **midazolam**. [Moderate] Study

Benzodiazepines (continued)

- ▶ **Nilotinib** is predicted to increase the exposure to **alprazolam**. [\[Severe\]](#) Study
- ▶ **Nilotinib** is predicted to increase the exposure to **midazolam**. Monitor adverse effects and adjust dose. [\[Severe\]](#) Study
- ▶ **NNR1Ts (efavirenz)** are predicted to alter the effects of **midazolam**. Avoid. [\[Moderate\]](#) Theoretical
- ▶ **NNR1Ts (nevirapine)** decrease the concentration of **midazolam**. Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ **Palbociclib** increases the exposure to **midazolam**. [\[Moderate\]](#) Study
- ▶ **Proton pump inhibitors (esomeprazole, omeprazole)** potentially increase the exposure to **clobazam**. Adjust dose. [\[Moderate\]](#) Theoretical
- ▶ **Ribociclib** moderately increases the exposure to **midazolam**. Avoid. [\[Moderate\]](#) Study
- ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **alprazolam**. Adjust dose. [\[Moderate\]](#) Theoretical
- ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **chlordiazepoxide**. [\[Moderate\]](#) Theoretical
- ▶ **Rifamycins (rifampicin)** moderately decrease the exposure to **diazepam**. Avoid. [\[Moderate\]](#) Study
- ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **midazolam**. Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ **Rifamycins (rifampicin)** increase the clearance of benzodiazepines (**lorazepam, nitrazepam**). [\[Moderate\]](#) Study
- ▶ **Rucaparib** slightly increases the exposure to **midazolam**. Monitor and adjust dose. [\[Severe\]](#) Study
- ▶ **SSR1s (fluoxetine, fluvoxamine)** potentially increase the exposure to **clobazam**. Adjust dose. [\[Moderate\]](#) Theoretical
- ▶ **SSR1s (fluvoxamine)** moderately increase the exposure to **alprazolam**. Adjust dose. [\[Moderate\]](#) Study
- ▶ **SSR1s (fluvoxamine)** moderately increase the exposure to **diazepam**. [\[Moderate\]](#) Study
- ▶ **St John's wort** moderately decreases the exposure to **alprazolam**. [\[Moderate\]](#) Study
- ▶ **St John's wort** moderately decreases the exposure to **midazolam**. Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ **Telotristat ethyl** decreases the exposure to **midazolam**. [\[Moderate\]](#) Study
- ▶ **Vemurafenib** slightly to moderately decreases the exposure to **midazolam**. [\[Moderate\]](#) Study

Benzylamine → see NSAIDs

Benzylpenicillin → see penicillins

Beta blockers, non-selective → see TABLE 6 p. 1448 (bradycardia), TABLE 8 p. 1448 (hypotension), TABLE 9 p. 1449 (QT-interval prolongation)

carvedilol · labetalol · levobunolol · nadolol · pindolol · propranolol · sotalol · timolol

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application of **levobunolol** and **timolol**, the possibility of interactions should be borne in mind.

- ▶ **Beta blockers, non-selective** are predicted to increase the risk of bronchospasm when given with **aminophylline**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Antiarrhythmics (amiodarone, disopyramide, dronedarone, flecainide, lidocaine)** are predicted to increase the risk of cardiovascular adverse effects when given with **beta blockers, non-selective**. Use with caution or avoid. [\[Severe\]](#) Study → Also see TABLE 6 p. 1448 → Also see TABLE 9 p. 1449
- ▶ **Antiarrhythmics (propafenone)** increase the risk of cardiovascular adverse effects when given with **propranolol**. Use with caution or avoid. [\[Severe\]](#) Study
- ▶ **Antiarrhythmics (propafenone)** are predicted to increase the exposure to **timolol** and **timolol** is predicted to increase the risk of cardiodepression when given with **antiarrhythmics (propafenone)**. [\[Severe\]](#) Anecdotal
- ▶ **Antiarrhythmics (propafenone)** are predicted to increase the risk of cardiovascular adverse effects when given with **beta blockers, non-selective (labetalol, levobunolol, nadolol, pindolol, sotalol)**. Use with caution or avoid. [\[Severe\]](#) Study
- ▶ **Antiepileptics (phenobarbital, primidone)** are predicted to decrease the exposure to **propranolol**. [\[Moderate\]](#) Study
- ▶ **Antiepileptics (phenobarbital, primidone)** are predicted to decrease the exposure to **beta blockers, non-selective (carvedilol, labetalol)**. [\[Moderate\]](#) Theoretical
- ▶ **Antifungals, azoles (itraconazole, ketoconazole)** are predicted to increase the exposure to **nadolol**. [\[Moderate\]](#) Study
- ▶ **Antimalarials (mefloquine)** are predicted to increase the risk of bradycardia when given with **beta blockers, non-selective**. [\[Severe\]](#) Theoretical
- ▶ **Calcium channel blockers (diltiazem)** are predicted to increase the risk of cardiodepression when given with **beta blockers, non-selective**. [\[Severe\]](#) Study → Also see TABLE 6 p. 1448 → Also see TABLE 8 p. 1448
- ▶ **Calcium channel blockers (verapamil)** increase the risk of cardiovascular adverse effects when given with **beta blockers, non-selective**. Avoid intravenous verapamil. [\[Severe\]](#) Study → Also see TABLE 6 p. 1448 → Also see TABLE 8 p. 1448
- ▶ **Chlorprocaine** is predicted to increase the risk of cardiovascular adverse effects when given with **sotalol**. [\[Severe\]](#) Theoretical
- ▶ **Ciclosporin** is predicted to increase the exposure to **nadolol**. [\[Moderate\]](#) Study
- ▶ **Dacomitinib** is predicted to markedly increase the exposure to **propranolol**. Avoid. [\[Severe\]](#) Study
- ▶ **Eliglustat** is predicted to increase the exposure to **propranolol**. Adjust dose. [\[Moderate\]](#) Study
- ▶ **Beta blockers, non-selective** are predicted to increase the risk of peripheral vasoconstriction when given with **ergometrine**. [\[Severe\]](#) Study
- ▶ **Beta blockers, non-selective** are predicted to increase the risk of peripheral vasoconstriction when given with **ergotamine**. [\[Severe\]](#) Study
- ▶ **HIV-protease inhibitors (lopinavir, ritonavir)** are predicted to increase the exposure to **nadolol**. [\[Moderate\]](#) Study
- ▶ **Beta blockers, non-selective** are predicted to increase the risk of bradycardia when given with **lanreotide**. [\[Moderate\]](#) Theoretical
- ▶ **Lapatinib** is predicted to increase the exposure to **nadolol**. [\[Moderate\]](#) Study
- ▶ **Macrolides** are predicted to increase the exposure to **nadolol**. [\[Moderate\]](#) Study
- ▶ **Mexiletine** potentially increases the risk of cardiovascular adverse effects when given with **beta blockers, non-selective**. Avoid or monitor. [\[Severe\]](#) Theoretical
- ▶ **Omega-3-acid ethyl esters** might enhance the blood pressure-lowering effects of **beta blockers, non-selective**. [\[Moderate\]](#) Study
- ▶ **Ranolazine** is predicted to increase the exposure to **nadolol**. [\[Moderate\]](#) Study
- ▶ **Rifamycins (rifampicin)** moderately decrease the exposure to **carvedilol**. [\[Moderate\]](#) Study
- ▶ **Rifamycins (rifampicin)** decrease the exposure to **propranolol**. Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ **SSR1s (fluvoxamine)** moderately increase the concentration of **propranolol**. [\[Moderate\]](#) Study
- ▶ **Beta blockers, non-selective** increase the risk of hypertension and bradycardia when given with **sympathomimetics, inotropic (dobutamine)**. [\[Severe\]](#) Theoretical
- ▶ **Beta blockers, non-selective** are predicted to increase the risk of hypertension and bradycardia when given with **sympathomimetics, vasoconstrictor (adrenaline/epinephrine, noradrenaline/norepinephrine)**. [\[Severe\]](#) Study
- ▶ **Carvedilol** causes a small increase in the bioavailability of **talazoparib**. Avoid or adjust **talazoparib** dose, p. 1059. [\[Moderate\]](#) Study
- ▶ **Beta blockers, non-selective** are predicted to increase the risk of bronchospasm when given with **theophylline**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Propranolol** slightly to moderately increases the exposure to **triptans (rizatriptan)**. Adjust **rizatriptan** dose and separate administration by at least 2 hours, p. 505. [\[Moderate\]](#) Study
- ▶ **Vemurafenib** is predicted to increase the exposure to **nadolol**. [\[Moderate\]](#) Study

Beta blockers, selective → see TABLE 6 p. 1448 (bradycardia), TABLE 8 p. 1448 (hypotension)

acebutolol · atenolol · betaxolol · bisoprolol · celioprolol · esmolol · metoprolol · nebivolol

- ▶ Since systemic absorption can follow topical application of **betaxolol**, the possibility of interactions should be borne in mind.
 - ▶ Orange juice greatly decreases the exposure to **celiprolol**.
 - ▶ **Beta blockers, selective** are predicted to increase the risk of bronchospasm when given with **aminophylline**. Avoid. [\[Severe\]](#) Theoretical
 - ▶ **Anti-androgens (abiraterone)** are predicted to increase the exposure to **metoprolol**. [\[Moderate\]](#) Study
 - ▶ **Antiarrhythmics (amiodarone, disopyramide, dronedarone, flecainide, lidocaine)** are predicted to increase the risk of cardiovascular adverse effects when given with **beta blockers, selective**. Use with caution or avoid. [\[Severe\]](#) Study → Also see TABLE 6 p. 1448
 - ▶ **Antiarrhythmics (propafenone)** are predicted to increase the exposure to **metoprolol**. [\[Moderate\]](#) Study
 - ▶ **Antiarrhythmics (propafenone)** are predicted to increase the exposure to **nebivolol** and **nebivolol** is predicted to increase the risk of cardiodepression when given with **antiarrhythmics (propafenone)**. Avoid. [\[Severe\]](#) Theoretical
 - ▶ **Antiarrhythmics (propafenone)** are predicted to increase the risk of cardiovascular adverse effects when given with beta blockers, selective (**acebutolol, atenolol, betaxolol, bisoprolol, celiprolol, esmolol**). Use with caution or avoid. [\[Severe\]](#) Study
 - ▶ **Antiepileptics (phenobarbital, primidone)** are predicted to decrease the exposure to beta blockers, selective (**acebutolol, bisoprolol, metoprolol, nebivolol**). [\[Moderate\]](#) Study
 - ▶ **Antimalarials (mefloquine)** are predicted to increase the risk of bradycardia when given with **beta blockers, selective**. [\[Severe\]](#) Theoretical
 - ▶ **Bupropion** is predicted to increase the exposure to beta blockers, selective (**metoprolol, nebivolol**). [\[Moderate\]](#) Study
 - ▶ **Calcium channel blockers (diltiazem)** are predicted to increase the risk of cardiodepression when given with **beta blockers, selective**. [\[Severe\]](#) Study → Also see TABLE 6 p. 1448 → Also see TABLE 8 p. 1448
 - ▶ **Calcium channel blockers (verapamil)** increase the risk of cardiovascular adverse effects when given with **beta blockers, selective**. Avoid intravenous verapamil. [\[Severe\]](#) Study → Also see TABLE 6 p. 1448 → Also see TABLE 8 p. 1448
 - ▶ **Cinacalcet** is predicted to increase the exposure to beta blockers, selective (**metoprolol, nebivolol**). [\[Moderate\]](#) Study
 - ▶ **Dacomitinib** is predicted to markedly increase the exposure to beta blockers, selective (**metoprolol, nebivolol**). Avoid. [\[Severe\]](#) Study
 - ▶ **Duloxetine** is predicted to increase the exposure to **metoprolol**. [\[Moderate\]](#) Study
 - ▶ **Eliquis** is predicted to increase the exposure to **metoprolol**. Adjust dose. [\[Moderate\]](#) Study
 - ▶ **Beta blockers, selective** are predicted to increase the risk of peripheral vasoconstriction when given with **ergometrine**. [\[Severe\]](#) Study
 - ▶ **Beta blockers, selective** are predicted to increase the risk of peripheral vasoconstriction when given with **ergotamine**. [\[Severe\]](#) Study
 - ▶ **Grapefruit** juice greatly decreases the exposure to **celiprolol**. [\[Moderate\]](#) Study
 - ▶ **HIV-protease inhibitors (ritonavir)** are predicted to increase the exposure to **metoprolol**. [\[Moderate\]](#) Study
 - ▶ **Beta blockers, selective** are predicted to increase the risk of bradycardia when given with **lanreotide**. [\[Moderate\]](#) Theoretical
 - ▶ **Mexiletine** potentially increases the risk of cardiovascular adverse effects when given with **beta blockers, selective**. Avoid or monitor. [\[Severe\]](#) Theoretical
 - ▶ **Mirabegron** is predicted to increase the exposure to **metoprolol**. [\[Moderate\]](#) Study
 - ▶ **Omega-3-acid ethyl esters** might enhance the blood pressure-lowering effects of **beta blockers, selective**. [\[Moderate\]](#) Study
 - ▶ **Panobinostat** is predicted to increase the exposure to **metoprolol**. Monitor and adjust dose. [\[Moderate\]](#) Theoretical
 - ▶ **Panobinostat** is predicted to increase the exposure to **nebivolol**. Monitor and adjust dose. [\[Mild\]](#) Theoretical
 - ▶ **Rifamycins (rifampicin)** moderately decrease the exposure to **celiprolol**. [\[Moderate\]](#) Study
 - ▶ **Rifamycins (rifampicin)** slightly decrease the exposure to beta blockers, selective (**bisoprolol, metoprolol**). [\[Mild\]](#) Study
 - ▶ **SSRIs (fluoxetine, paroxetine)** are predicted to increase the exposure to beta blockers, selective (**metoprolol, nebivolol**). [\[Moderate\]](#) Study
 - ▶ **Beta blockers, selective** increase the risk of hypertension and bradycardia when given with **sympathomimetics, inotropic (dobutamine)**. [\[Moderate\]](#) Theoretical
 - ▶ **Beta blockers, selective** are predicted to increase the risk of hypertension and bradycardia when given with **sympathomimetics, vasoconstrictor (adrenaline/epinephrine, noradrenaline/norepinephrine)**. [\[Severe\]](#) Study
 - ▶ **Terbinafine** is predicted to increase the exposure to beta blockers, selective (**metoprolol, nebivolol**). [\[Moderate\]](#) Study
 - ▶ **Beta blockers, selective** are predicted to increase the risk of bronchospasm when given with **theophylline**. Avoid. [\[Severe\]](#) Theoretical
 - ▶ **Vaborbactam** is predicted to increase the concentration of **metoprolol**. [\[Unknown\]](#) Theoretical
- Beta₂ agonists** → see TABLE 17 p. 1451 (reduced serum potassium)
- bambuterol · formoterol · indacaterol · olodaterol · salbutamol · salmeterol · terbutaline · vilanterol
- ▶ **Anti-androgens (apalutamide)** are predicted to decrease the exposure to **salmeterol**. Avoid or monitor. [\[Moderate\]](#) Study
 - ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **salmeterol**. Avoid. [\[Severe\]](#) Study
 - ▶ **Atomoxetine** is predicted to increase the risk of cardiovascular adverse effects when given with **beta₂ agonists (high-dose)**. [\[Moderate\]](#) Study
 - ▶ **Cobicistat** is predicted to increase the exposure to **salmeterol**. Avoid. [\[Severe\]](#) Study
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **salmeterol**. Avoid. [\[Severe\]](#) Study
 - ▶ **Idelalisib** is predicted to increase the exposure to **salmeterol**. Avoid. [\[Severe\]](#) Study
 - ▶ **Beta₂ agonists** are predicted to increase the risk of glaucoma when given with **ipratropium**. [\[Moderate\]](#) Anecdotal
 - ▶ **Beta₂ agonists** are predicted to increase the risk of elevated blood pressure when given with **linezolid**. Avoid. [\[Severe\]](#) Theoretical
 - ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **salmeterol**. Avoid. [\[Severe\]](#) Study
 - ▶ **MAO-B inhibitors (rasagiline, selegiline)** are predicted to increase the risk of severe hypertension when given with **beta₂ agonists**. Avoid. [\[Severe\]](#) Theoretical
 - ▶ **MAO-B inhibitors (safinamide)** are predicted to increase the risk of severe hypertension when given with **beta₂ agonists**. [\[Severe\]](#) Theoretical
 - ▶ **MAOIs, irreversible** are predicted to increase the risk of cardiovascular adverse effects when given with **beta₂ agonists**. [\[Moderate\]](#) Anecdotal
 - ▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to increase the exposure to **salmeterol**. [\[Moderate\]](#) Study
- Betahistine**
- ▶ **Antihistamines, non-sedating** are predicted to decrease the effects of **betahistine**. [\[Moderate\]](#) Theoretical
 - ▶ **Antihistamines, sedating** are predicted to decrease the effects of **betahistine**. [\[Moderate\]](#) Theoretical
- Betamethasone** → see corticosteroids
- Betaxolol** → see beta blockers, selective
- Bevacizumab** → see monoclonal antibodies
- Bexarotene** → see retinoids
- Befazibrate** → see fibrates
- Bicalutamide** → see anti-androgens
- Bictegravir**
- ▶ Oral **antacids** decrease the exposure to oral **bictegravir**. Separate administration by at least 2 hours. [\[Moderate\]](#) Study
 - ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to **bictegravir**. Avoid. [\[Moderate\]](#) Study
 - ▶ **Antiarrhythmics (amiodarone, dronedarone)** are predicted to increase the exposure to **bictegravir**. Use with caution or avoid. [\[Moderate\]](#) Theoretical

Bictegravir (continued)

- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **bictegravir**. Avoid. [Moderate] Study
- ▶ Antiepileptics (**oxcarbazepine**) are predicted to decrease the exposure to **bictegravir**. Avoid. [Moderate] Theoretical
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**) are predicted to increase the exposure to **bictegravir**. Use with caution or avoid. [Moderate] Theoretical
- ▶ Antifungals, azoles (**posaconazole**) are predicted to increase the exposure to **bictegravir**. [Moderate] Theoretical
- ▶ Calcium channel blockers (**verapamil**) are predicted to increase the exposure to **bictegravir**. Use with caution or avoid. [Moderate] Theoretical
- ▶ **Ciclosporin** is predicted to increase the exposure to **bictegravir**. Use with caution or avoid. [Moderate] Theoretical
- ▶ HIV-protease inhibitors (**atazanavir**) moderately increase the exposure to **bictegravir**. Avoid. [Severe] Study
- ▶ HIV-protease inhibitors (**lopinavir**, **ritonavir**) are predicted to increase the exposure to **bictegravir**. Use with caution or avoid. [Moderate] Theoretical
- ▶ Oral **iron** decreases the exposure to oral **bictegravir**. Manufacturer advises bictegravir should be taken 2 hours before iron. [Moderate] Study
- ▶ **Ivacaftor** is predicted to increase the exposure to **bictegravir**. Use with caution or avoid. [Moderate] Theoretical
- ▶ **Lapatinib** is predicted to increase the exposure to **bictegravir**. Use with caution or avoid. [Moderate] Theoretical
- ▶ **Macrolides** are predicted to increase the exposure to **bictegravir**. Use with caution or avoid. [Moderate] Theoretical
- ▶ **Bictegravir** slightly increases the exposure to **metformin**. [Moderate] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **bictegravir**. Avoid. [Moderate] Study
- ▶ **Neratinib** is predicted to increase the exposure to **bictegravir**. Use with caution or avoid. [Moderate] Theoretical
- ▶ **Bictegravir** is predicted to increase the exposure to **opioids** (**methadone**). [Moderate] Theoretical
- ▶ **Ranolazine** is predicted to increase the exposure to **bictegravir**. Use with caution or avoid. [Moderate] Theoretical
- ▶ **Rifamycins** (**rifabutin**) slightly decrease the exposure to **bictegravir**. Avoid. [Moderate] Study
- ▶ **Rifamycins** (**rifampicin**) are predicted to decrease the exposure to **bictegravir**. Avoid. [Moderate] Study
- ▶ **Rucaparib** is predicted to increase the exposure to **bictegravir**. Use with caution or avoid. [Moderate] Theoretical
- ▶ **St John's wort** is predicted to decrease the exposure to **bictegravir**. Avoid. [Moderate] Theoretical
- ▶ **Sucralfate** is predicted to decrease the exposure to **bictegravir**. Avoid. [Moderate] Theoretical
- ▶ **Vandetanib** is predicted to increase the exposure to **bictegravir**. Use with caution or avoid. [Moderate] Theoretical
- ▶ **Vemurafenib** is predicted to increase the exposure to **bictegravir**. Use with caution or avoid. [Moderate] Theoretical
- Bilastine** → see antihistamines, non-sedating
- Bismuth**
- ▶ **Bismuth** subsalicylate is predicted to increase the risk of adverse effects when given with **aspirin**. Avoid. [Moderate] Theoretical
- ▶ **Bismuth** subsalicylate is predicted to increase the risk of bleeding events when given with **drugs with anticoagulant effects** (see TABLE 3 p. 1447). [Moderate] Theoretical
- ▶ **Bismuth** greatly decreases the efficacy of **tetracyclines**. Separate administration by 2 hours. [Moderate] Study
- Bisoprolol** → see beta blockers, selective
- Bisphosphonates** → see TABLE 2 p. 1447 (nephrotoxicity)

alendronate · clodronate · ibandronate · pamidronate · risedronate · zoledronate

- ▶ **Aminoglycosides** increase the risk of hypocalcaemia when given with **bisphosphonates**. [Moderate] Anecdotal → Also see TABLE 2 p. 1447
- ▶ Oral **antacids** decrease the absorption of oral **alendronate**. **Alendronate** should be taken at least 30 minutes before antacids. [Moderate] Study

- ▶ Oral **antacids** decrease the absorption of oral **clodronate**. Avoid antacids for 2 hours before or 1 hour after **clodronate**. [Moderate] Study
- ▶ Oral **antacids** are predicted to decrease the absorption of oral **ibandronate**. Avoid antacids for at least 6 hours before or 1 hour after **ibandronate**. [Moderate] Theoretical
- ▶ Oral **antacids** decrease the absorption of oral **risedronate**. Separate administration by at least 2 hours. [Moderate] Study
- ▶ **Aspirin** (high-dose) is predicted to increase the risk of gastrointestinal irritation when given with bisphosphonates (**alendronate**, **ibandronate**). [Moderate] Study
- ▶ **Aspirin** (high-dose) is predicted to increase the risk of renal impairment when given with **clodronate**. [Severe] Theoretical
- ▶ Oral **calcium salts** decrease the absorption of **alendronate**. **Alendronate** should be taken at least 30 minutes before calcium salts. [Moderate] Study
- ▶ Oral **calcium salts** decrease the absorption of **clodronate**. Avoid calcium salts for 2 hours before or 1 hour after **clodronate**. [Moderate] Study
- ▶ Oral **calcium salts** are predicted to decrease the absorption of oral **ibandronate**. Avoid calcium salts for at least 6 hours before or 1 hour after **ibandronate**. [Moderate] Theoretical
- ▶ Oral **calcium salts** decrease the absorption of **risedronate**. Separate administration by at least 2 hours. [Moderate] Study
- ▶ Oral **iron** decreases the absorption of oral **clodronate**. **Clodronate** should be taken 1 hour before or 2 hours after iron. [Moderate] Study
- ▶ Oral **iron** is predicted to decrease the absorption of oral **ibandronate**. **Ibandronate** should be taken 1 hour before or 6 hours after iron. [Moderate] Theoretical
- ▶ Oral **iron** decreases the absorption of oral **risedronate**. Separate administration by at least 2 hours. [Moderate] Study
- ▶ **Bisphosphonates** are predicted to increase the risk of gastrointestinal bleeding when given with **iron chelators** (**deferasirox**). [Severe] Theoretical
- ▶ Oral **magnesium** decreases the absorption of oral **alendronate**. **Alendronate** should be taken at least 30 minutes before magnesium. [Moderate] Study
- ▶ Oral **magnesium** decreases the absorption of oral **clodronate**. Avoid magnesium for 2 hours before or 1 hour after **clodronate**. [Moderate] Study
- ▶ Oral **magnesium** is predicted to decrease the absorption of oral **ibandronate**. Avoid for at least 6 hours before or 1 hour after **ibandronate**. [Moderate] Theoretical
- ▶ Oral **magnesium** decreases the absorption of oral **risedronate**. Separate administration by at least 2 hours. [Moderate] Study
- ▶ **NSAIDs** are predicted to increase the risk of gastrointestinal irritation when given with bisphosphonates (**alendronate**, **ibandronate**). [Moderate] Study
- ▶ **NSAIDs** are predicted to increase the risk of renal impairment when given with **clodronate**. [Moderate] Study
- ▶ **Bisphosphonates** are predicted to decrease the effects of **parathyroid hormone**. Avoid. [Moderate] Study
- ▶ Oral **zinc** decreases the absorption of oral **alendronate**. **Alendronate** should be taken at least 30 minutes before **zinc**. [Moderate] Study
- ▶ Oral **zinc** decreases the absorption of oral **clodronate**. Avoid **zinc** for 2 hours before or 1 hour after **clodronate**. [Moderate] Study
- ▶ Oral **zinc** is predicted to decrease the absorption of oral **ibandronate**. Avoid **zinc** for at least 6 hours before or 1 hour after **ibandronate**. [Moderate] Theoretical
- ▶ Oral **zinc** decreases the absorption of oral **risedronate**. Separate administration by at least 2 hours. [Moderate] Study
- Bivalirudin** → see thrombin inhibitors
- Bleomycin** → see TABLE 15 p. 1450 (myelosuppression), TABLE 5 p. 1448 (thromboembolism)
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **bleomycin**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Monoclonal antibodies** (**brentuximab vedotin**) increase the risk of pulmonary toxicity when given with **bleomycin**. Avoid. [Severe] Study → Also see TABLE 15 p. 1450

- ▶ **Platinum compounds (cisplatin)** increase the risk of pulmonary toxicity when given with **bleomycin**. [\[Severe\]](#) Study → Also see TABLE 15 p. 1450

Blinatumomab → see monoclonal antibodies

Bortezomib → see TABLE 8 p. 1448 (hypotension), TABLE 15 p. 1450 (myelosuppression), TABLE 12 p. 1450 (peripheral neuropathy)

- ▶ **Anti-androgens (apalutamide, enzalutamide)** slightly decrease the exposure to **bortezomib**. Avoid. [\[Severe\]](#) Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** slightly decrease the exposure to **bortezomib**. Avoid. [\[Severe\]](#) Study → Also see TABLE 12 p. 1450
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** slightly increase the exposure to **bortezomib**. [\[Moderate\]](#) Study
- ▶ **Cobicistat** slightly increases the exposure to **bortezomib**. [\[Moderate\]](#) Study
- ▶ **HIV-protease inhibitors** slightly increase the exposure to **bortezomib**. [\[Moderate\]](#) Study
- ▶ **Idelalisib** slightly increases the exposure to **bortezomib**. [\[Moderate\]](#) Study
- ▶ **Macrolides (clarithromycin)** slightly increase the exposure to **bortezomib**. [\[Moderate\]](#) Study
- ▶ **Mitotane** slightly decreases the exposure to **bortezomib**. Avoid. [\[Severe\]](#) Study → Also see TABLE 15 p. 1450
- ▶ **Rifamycins (rifampicin)** slightly decrease the exposure to **bortezomib**. Avoid. [\[Severe\]](#) Study

Bosentan → see endothelin receptor antagonists

Bosutinib → see TABLE 15 p. 1450 (myelosuppression), TABLE 9 p. 1449 (QT-interval prolongation), TABLE 4 p. 1447 (antiplatelet effects)

- ▶ Oral **antacids** are predicted to decrease the absorption of oral **bosutinib**. **Bosutinib** should be taken at least 12 hours before antacids. [\[Moderate\]](#) Theoretical
- ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to very markedly decrease the exposure to **bosutinib**. Avoid. [\[Severe\]](#) Study → Also see TABLE 9 p. 1449
- ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to **bosutinib**. Avoid or adjust dose. [\[Severe\]](#) Study → Also see TABLE 9 p. 1449
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to very markedly decrease the exposure to **bosutinib**. Avoid. [\[Severe\]](#) Study
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole)** are predicted to increase the exposure to **bosutinib**. Avoid or adjust dose. [\[Severe\]](#) Study → Also see TABLE 9 p. 1449
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **bosutinib**. Avoid or adjust dose. [\[Severe\]](#) Study
- ▶ Oral **calcium salts (calcium carbonate)** -containing antacids are predicted to decrease the absorption of oral **bosutinib**. **Bosutinib** should be taken at least 12 hours before antacids. [\[Moderate\]](#) Theoretical
- ▶ **Cobicistat** is predicted to increase the exposure to **bosutinib**. Avoid or adjust dose. [\[Severe\]](#) Study
- ▶ **Crizotinib** is predicted to increase the exposure to **bosutinib**. Avoid or adjust dose. [\[Severe\]](#) Study → Also see TABLE 9 p. 1449
- ▶ **Dabrafenib** is predicted to decrease the exposure to **bosutinib**. Avoid. [\[Severe\]](#) Study
- ▶ **Endothelin receptor antagonists (bosentan)** are predicted to decrease the exposure to **bosutinib**. Avoid. [\[Severe\]](#) Study
- ▶ **Grapefruit** juice is predicted to increase the exposure to **bosutinib**. Avoid. [\[Moderate\]](#) Theoretical
- ▶ **H₂ receptor antagonists** are predicted to decrease the absorption of **bosutinib**. [\[Moderate\]](#) Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **bosutinib**. Avoid or adjust dose. [\[Severe\]](#) Study
- ▶ **Idelalisib** is predicted to increase the exposure to **bosutinib**. Avoid or adjust dose. [\[Severe\]](#) Study
- ▶ **Imatinib** is predicted to increase the exposure to **bosutinib**. Avoid or adjust dose. [\[Severe\]](#) Study → Also see TABLE 15 p. 1450
- ▶ **Letermovir** is predicted to increase the exposure to **bosutinib**. Avoid or adjust dose. [\[Severe\]](#) Study
- ▶ **Macrolides (clarithromycin, erythromycin)** are predicted to increase the exposure to **bosutinib**. Avoid or adjust dose. [\[Severe\]](#) Study → Also see TABLE 9 p. 1449

- ▶ **Mitotane** is predicted to very markedly decrease the exposure to **bosutinib**. Avoid. [\[Severe\]](#) Study → Also see TABLE 15 p. 1450
- ▶ **Modafinil** is predicted to decrease the exposure to **bosutinib**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to increase the exposure to **bosutinib**. Avoid or adjust dose. [\[Severe\]](#) Study
- ▶ **Neurokinin-1 receptor antagonists (fosaprepitant)** are predicted to increase the exposure to **bosutinib**. [\[Severe\]](#) Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to **bosutinib**. Avoid or adjust dose. [\[Severe\]](#) Study → Also see TABLE 15 p. 1450 → Also see TABLE 9 p. 1449
- ▶ **NNRTIs (efavirenz, nevirapine)** are predicted to decrease the exposure to **bosutinib**. Avoid. [\[Severe\]](#) Study → Also see TABLE 9 p. 1449
- ▶ **NNRTIs (etravirine)** are predicted to decrease the exposure to **bosutinib**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Pitolisant** is predicted to decrease the exposure to **bosutinib**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Proton pump inhibitors** are predicted to decrease the absorption of **bosutinib**. [\[Moderate\]](#) Study
- ▶ **Rifamycins (rifampicin)** are predicted to very markedly decrease the exposure to **bosutinib**. Avoid. [\[Severe\]](#) Study
- ▶ Oral **sodium bicarbonate**-containing antacids are predicted to decrease the absorption of oral **bosutinib**. **Bosutinib** should be taken at least 12 hours before antacids. [\[Moderate\]](#) Theoretical
- ▶ **St John's wort** is predicted to decrease the exposure to **bosutinib**. Avoid. [\[Severe\]](#) Study

Botulinum toxin type A → see botulinum toxins

Botulinum toxin type B → see botulinum toxins

Botulinum toxins → see TABLE 20 p. 1451 (neuromuscular blocking effects)

botulinum toxin type A - botulinum toxin type B

Bowel cleansing preparations

SEPARATION OF ADMINISTRATION Other oral drugs should not be taken 1 hour before, or after, administration of bowel cleansing preparations because absorption might be impaired. Consider withholding ACE inhibitors, angiotensin-II receptor antagonists, and NSAIDs on the day that bowel cleansing preparations are given and for up to 72 hours after the procedure. Also consider withholding diuretics on the day that bowel cleansing preparations are given.

Brentuximab vedotin → see monoclonal antibodies

Brigatinib

- ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to **brigatinib**. Avoid. [\[Severe\]](#) Study
- ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to **brigatinib**. [\[Moderate\]](#) Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **brigatinib**. Avoid. [\[Severe\]](#) Study
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **brigatinib**. [\[Moderate\]](#) Study
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **brigatinib**. Avoid or adjust **brigatinib** dose, p. 1022. [\[Severe\]](#) Study
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **brigatinib**. [\[Moderate\]](#) Study
- ▶ **Cobicistat** is predicted to increase the exposure to **brigatinib**. Avoid or adjust **brigatinib** dose, p. 1022. [\[Severe\]](#) Study
- ▶ **Brigatinib** is predicted to decrease the exposure to **combined hormonal contraceptives**. Use additional contraceptive precautions. [\[Severe\]](#) Theoretical
- ▶ **Crizotinib** is predicted to increase the exposure to **brigatinib**. [\[Moderate\]](#) Study
- ▶ **Dabrafenib** is predicted to decrease the exposure to **brigatinib**. Avoid. [\[Moderate\]](#) Study
- ▶ **Endothelin receptor antagonists (bosentan)** are predicted to decrease the exposure to **brigatinib**. Avoid. [\[Moderate\]](#) Study
- ▶ **Grapefruit** juice is predicted to increase the concentration of **brigatinib**. Avoid. [\[Severe\]](#) Study

Brigatinib (continued)

- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to brigatinib. Avoid or adjust brigatinib dose, p. 1022. [\[Severe\]](#) Study
 - ▶ **Idealalisib** is predicted to increase the exposure to brigatinib. Avoid or adjust brigatinib dose, p. 1022. [\[Severe\]](#) Study
 - ▶ **Imatinib** is predicted to increase the exposure to brigatinib. [\[Moderate\]](#) Study
 - ▶ **Letermovir** is predicted to increase the exposure to brigatinib. [\[Moderate\]](#) Study
 - ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to brigatinib. Avoid or adjust brigatinib dose, p. 1022. [\[Severe\]](#) Study
 - ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to brigatinib. [\[Moderate\]](#) Study
 - ▶ **Mitotane** is predicted to decrease the exposure to brigatinib. Avoid. [\[Severe\]](#) Study
 - ▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to increase the exposure to brigatinib. [\[Moderate\]](#) Study
 - ▶ **Nilotinib** is predicted to increase the exposure to brigatinib. [\[Moderate\]](#) Study
 - ▶ **NNR1s (efavirenz, nevirapine)** are predicted to decrease the exposure to brigatinib. Avoid. [\[Moderate\]](#) Study
 - ▶ **Brigatinib** potentially decreases the concentration of **opioids (alfentanil, fentanyl)**. Avoid. [\[Moderate\]](#) Theoretical
 - ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to brigatinib. Avoid. [\[Severe\]](#) Study
 - ▶ **Brigatinib** potentially decreases the concentration of **sirolimus**. Avoid. [\[Moderate\]](#) Theoretical
 - ▶ **St John's wort** is predicted to decrease the exposure to brigatinib. Avoid. [\[Moderate\]](#) Study
 - ▶ **Brigatinib** potentially decreases the concentration of **tacrolimus**. Avoid. [\[Moderate\]](#) Theoretical
- Brimonidide** → see TABLE 6 p. 1448 (bradycardia), TABLE 8 p. 1448 (hypotension), TABLE 11 p. 1449 (CNS depressant effects)

Brinzolamide

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application of **brinzolamide**, the possibility of interactions should be borne in mind.

- Brivaracetam** → see antiepileptics
- Brodalumab** → see monoclonal antibodies
- Bromfenac** → see NSAIDs
- Bromocriptine** → see dopamine receptor agonists
- Buclicline** → see antihistamines, sedating
- Budesonide** → see corticosteroids
- Bumetanide** → see loop diuretics
- Bupivacaine** → see anaesthetics, local
- Buprenorphine** → see opioids
- Bupropion**
 - ▶ **Alpelisib** is predicted to decrease the efficacy of bupropion. [\[Mild\]](#) Theoretical
 - ▶ **Bupropion** is predicted to increase the exposure to anticholinesterases, centrally acting (**galantamine**). Monitor and adjust dose. [\[Moderate\]](#) Study
 - ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to markedly decrease the exposure to bupropion. [\[Severe\]](#) Study
 - ▶ **Antiepileptics (valproate)** increase the exposure to bupropion. [\[Severe\]](#) Study
 - ▶ **Antifungals, azoles (isavuconazole)** slightly increase the exposure to bupropion. Adjust dose. [\[Moderate\]](#) Study
 - ▶ **Bupropion** is predicted to moderately increase the exposure to antipsychotics, second generation (**aripiprazole**). Adjust aripiprazole dose, p. 418. [\[Moderate\]](#) Study
 - ▶ **Bupropion** is predicted to increase the exposure to antipsychotics, second generation (**risperidone**). Adjust dose. [\[Moderate\]](#) Study
 - ▶ **Bupropion** is predicted to markedly increase the exposure to **atomoxetine**. Adjust dose. [\[Severe\]](#) Study
 - ▶ **Bupropion** is predicted to increase the exposure to **beta blockers, selective (metoprolol, nebivolol)**. [\[Moderate\]](#) Study
 - ▶ **Bupropion** is predicted to slightly increase the exposure to **darifenacin**. [\[Mild\]](#) Study

- ▶ **Bupropion** increases the risk of adverse effects when given with **dopamine receptor agonists (amantadine)**. [\[Moderate\]](#) Study
- ▶ **Bupropion** might enhance the risk of serotonin syndrome when given with **drugs that cause serotonin syndrome** (see TABLE 13 p. 1450). [\[Severe\]](#) Anecdotal
- ▶ **Bupropion** is predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [\[Severe\]](#) Study
- ▶ **Bupropion** is predicted to increase the exposure to **fesoterodine**. Use with caution and adjust dose. [\[Mild\]](#) Theoretical
- ▶ **Bupropion** is predicted to increase the exposure to **gefitinib**. [\[Moderate\]](#) Theoretical
- ▶ **HIV-protease inhibitors (ritonavir)** are predicted to decrease the exposure to bupropion. [\[Moderate\]](#) Study
- ▶ **Bupropion** increases the risk of adverse effects when given with **levodopa**. [\[Moderate\]](#) Study
- ▶ **Bupropion** is predicted to increase the risk of intraoperative hypertension when given with **linezolid**. [\[Severe\]](#) Anecdotal
- ▶ **Lumacaftor** is predicted to decrease the exposure to bupropion. Adjust dose. [\[Moderate\]](#) Theoretical
- ▶ **Bupropion** is predicted to increase the risk of severe hypertension when given with **MAO-B inhibitors**. Avoid. [\[Moderate\]](#) Theoretical
- ▶ **Bupropion** is predicted to increase the risk of severe hypertension when given with **MAOIs, irreversible**. Avoid and for 14 days after stopping the MAOI. [\[Severe\]](#) Theoretical
- ▶ **Methylthioninium chloride** is predicted to increase the risk of severe hypertension when given with bupropion. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Bupropion** is predicted to increase the exposure to **mexiletine**. [\[Moderate\]](#) Study
- ▶ **Bupropion** is predicted to increase the risk of severe hypertension when given with **moclobemide**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **NNR1s (efavirenz)** are predicted to decrease the exposure to bupropion. [\[Moderate\]](#) Study
- ▶ **Bupropion** is predicted to decrease the efficacy of **opioids (codeine)**. [\[Moderate\]](#) Theoretical
- ▶ **Bupropion** is predicted to decrease the efficacy of **opioids (tramadol)**. [\[Severe\]](#) Study
- ▶ **Bupropion** is predicted to moderately increase the exposure to **pitolisant**. Use with caution and adjust dose. [\[Moderate\]](#) Study
- ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to bupropion. [\[Moderate\]](#) Study
- ▶ **Bupropion** is predicted to increase the exposure to **SSRIs (dapoxetine)**. [\[Moderate\]](#) Theoretical
- ▶ **Bupropion** is predicted to decrease the efficacy of **tamoxifen**. Avoid. [\[Severe\]](#) Study
- ▶ **Bupropion** is predicted to increase the exposure to the active metabolite of **tetrabenazine**. [\[Moderate\]](#) Study
- ▶ **Bupropion** is predicted to increase the exposure to **tricyclic antidepressants**. Monitor for toxicity and adjust dose. [\[Severe\]](#) Study
- ▶ **Vemurafenib** is predicted to decrease the concentration of bupropion. [\[Moderate\]](#) Theoretical
- ▶ **Bupropion** is predicted to increase the exposure to **vortioxetine**. Monitor and adjust dose. [\[Moderate\]](#) Study

Bupropion

- ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to bupropion. Use with caution and adjust dose. [\[Severe\]](#) Study
- ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to bupropion. Use with caution and adjust dose. [\[Moderate\]](#) Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to bupropion. Use with caution and adjust dose. [\[Severe\]](#) Study
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to bupropion. Use with caution and adjust dose. [\[Moderate\]](#) Study
- ▶ **Antifungals, azoles (itraconazole, ketonazole, voriconazole)** are predicted to increase the exposure to bupropion. Adjust bupropion dose, p. 364. [\[Severe\]](#) Study
- ▶ **Antifungals, azoles (miconazole)** are predicted to increase the concentration of bupropion. Use with caution and adjust dose. [\[Moderate\]](#) Theoretical

- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **buspirone**. Use with caution and adjust dose. [Moderate] Study
 - ▶ **Cobicistat** is predicted to increase the exposure to **buspirone**. Adjust **buspirone** dose, p. 364. [Severe] Study
 - ▶ **Crizotinib** is predicted to increase the exposure to **buspirone**. Use with caution and adjust dose. [Moderate] Study
 - ▶ **Grapefruit** juice increases the exposure to **buspirone**. Avoid. [Mid] Study
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **buspirone**. Adjust **buspirone** dose, p. 364. [Severe] Study
 - ▶ **Idelalisib** is predicted to increase the exposure to **buspirone**. Adjust **buspirone** dose, p. 364. [Severe] Study
 - ▶ **Imatinib** is predicted to increase the exposure to **buspirone**. Use with caution and adjust dose. [Moderate] Study
 - ▶ **Letermovir** is predicted to increase the exposure to **buspirone**. Use with caution and adjust dose. [Moderate] Study
 - ▶ **Buspirone** is predicted to increase the risk of elevated blood pressure when given with **linezolid**. Avoid. [Severe] Theoretical
 - ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **buspirone**. Adjust **buspirone** dose, p. 364. [Severe] Study
 - ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **buspirone**. Use with caution and adjust dose. [Moderate] Study
 - ▶ **Buspirone** is predicted to increase the risk of elevated blood pressure when given with **MAOIs, irreversible**. Avoid. [Severe] Anecdotal
 - ▶ **Mitotane** is predicted to decrease the exposure to **buspirone**. Use with caution and adjust dose. [Severe] Study
 - ▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to increase the exposure to **buspirone**. Use with caution and adjust dose. [Moderate] Study
 - ▶ **Nilotinib** is predicted to increase the exposure to **buspirone**. Use with caution and adjust dose. [Moderate] Study
 - ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **buspirone**. Use with caution and adjust dose. [Severe] Study
- Busulfan** → see alkylating agents
- Cabazitaxel** → see taxanes
- Cabergoline** → see dopamine receptor agonists
- Cabozantinib** → see TABLE 15 p. 1450 (myelosuppression), TABLE 9 p. 1449 (QT-interval prolongation), TABLE 4 p. 1447 (antiplatelet effects)
- ▶ **Anti-androgens (apalutamide, enzalutamide)** moderately decrease the exposure to **cabozantinib**. Avoid. [Moderate] Study → Also see TABLE 9 p. 1449
 - ▶ **Antiarrhythmics (dronedaron)** are predicted to increase the exposure to **cabozantinib**. [Moderate] Study → Also see TABLE 9 p. 1449
 - ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** moderately decrease the exposure to **cabozantinib**. Avoid. [Moderate] Study
 - ▶ **Antifungals, azoles (fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole)** are predicted to increase the exposure to **cabozantinib**. [Moderate] Study → Also see TABLE 9 p. 1449
 - ▶ **Cabozantinib** is predicted to increase the exposure to benzodiazepines (**midazolam**). [Moderate] Theoretical
 - ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **cabozantinib**. [Moderate] Study
 - ▶ **Cobicistat** is predicted to increase the exposure to **cabozantinib**. [Moderate] Study
 - ▶ **Crizotinib** is predicted to increase the exposure to **cabozantinib**. [Moderate] Study → Also see TABLE 9 p. 1449
 - ▶ **Dabrafenib** is predicted to decrease the exposure to **cabozantinib**. [Moderate] Study
 - ▶ **Endothelin receptor antagonists (bosentan)** are predicted to decrease the exposure to **cabozantinib**. [Moderate] Study
 - ▶ **Grapefruit** juice is predicted to increase the exposure to **cabozantinib**. [Moderate] Theoretical
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **cabozantinib**. [Moderate] Study
 - ▶ **Idelalisib** is predicted to increase the exposure to **cabozantinib**. [Moderate] Study
 - ▶ **Imatinib** is predicted to increase the exposure to **cabozantinib**. [Moderate] Study → Also see TABLE 15 p. 1450
- ▶ **Letermovir** is predicted to increase the exposure to **cabozantinib**. [Moderate] Study
 - ▶ **Macrolides (clarithromycin, erythromycin)** are predicted to increase the exposure to **cabozantinib**. [Moderate] Study → Also see TABLE 9 p. 1449
 - ▶ **Mitotane** moderately decreases the exposure to **cabozantinib**. Avoid. [Moderate] Study → Also see TABLE 15 p. 1450
 - ▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to increase the exposure to **cabozantinib**. [Moderate] Study
 - ▶ **Nilotinib** is predicted to increase the exposure to **cabozantinib**. [Moderate] Study → Also see TABLE 15 p. 1450 → Also see TABLE 9 p. 1449
 - ▶ **NNRTIs (efavirenz, nevirapine)** are predicted to decrease the exposure to **cabozantinib**. [Moderate] Study → Also see TABLE 9 p. 1449
 - ▶ **Rifamycins (rifampicin)** moderately decrease the exposure to **cabozantinib**. Avoid. [Moderate] Study
 - ▶ **St John's wort** is predicted to decrease the exposure to **cabozantinib**. [Moderate] Study
- Caffeine citrate**
- ▶ **Caffeine citrate** decreases the efficacy of **antiarrhythmics (adenosine)**. Separate administration by 24 hours. [Mid] Study
 - ▶ **Antiepileptics (fosphenytoin, phenytoin)** are predicted to moderately increase the clearance of **caffeine citrate**. Monitor and adjust dose. [Moderate] Study
 - ▶ **HIV-protease inhibitors (ritonavir)** are predicted to moderately increase the clearance of **caffeine citrate**. Monitor and adjust dose. [Moderate] Study
 - ▶ **Leflunomide** is predicted to moderately increase the clearance of **caffeine citrate**. Monitor and adjust dose. [Moderate] Study
 - ▶ **Rifamycins (rifampicin)** are predicted to moderately increase the clearance of **caffeine citrate**. Monitor and adjust dose. [Moderate] Study
 - ▶ **SSRIs (fluvoxamine)** markedly decrease the clearance of **caffeine citrate**. Monitor and adjust dose. [Severe] Study
 - ▶ **Teriflunomide** is predicted to moderately increase the clearance of **caffeine citrate**. Monitor and adjust dose. [Moderate] Study
 - ▶ **Caffeine citrate** decreases the clearance of **theophylline**. [Moderate] Study
- Calcipotriol** → see vitamin D substances
- Calcitonins**
- ▶ **Calcitonins** decrease the concentration of **lithium**. Adjust dose. [Moderate] Study
- Calcitriol** → see vitamin D substances
- Calcium acetate** → see calcium salts
- Calcium carbonate** → see calcium salts
- Calcium channel blockers** → see TABLE 6 p. 1448 (bradycardia), TABLE 8 p. 1448 (hypotension)
- amlodipine · diltiazem · felodipine · lacidipine · lercanidipine · nicardipine · nifedipine · nimodipine · verapamil
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **abemaciclib**. [Moderate] Study
 - ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **acalabrutinib**. Avoid or monitor. [Severe] Study
 - ▶ **Verapamil** is predicted to increase the exposure to **afatinib**. Separate administration by 12 hours. [Moderate] Study
 - ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **aldosterone antagonists (eplerenone)**. Adjust **eplerenone** dose, p. 209. [Severe] Study → Also see TABLE 8 p. 1448
 - ▶ **Verapamil** moderately increases the exposure to **aliskiren**. [Moderate] Study → Also see TABLE 8 p. 1448
 - ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **alpha blockers (tamsulosin)**. [Moderate] Theoretical → Also see TABLE 8 p. 1448
 - ▶ **Verapamil** moderately increases the exposure to **anthracyclines (doxorubicin)**. [Moderate] Study
 - ▶ **Anti-androgens (enzalutamide)** are predicted to decrease the exposure to calcium channel blockers (**amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine**). Monitor and adjust dose. [Moderate] Study

Calcium channel blockers (continued)

- ▶ **Anti-androgens (apalutamide)** are predicted to decrease the exposure to calcium channel blockers (**amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine**). Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ **Anti-androgens (enzalutamide)** are predicted to decrease the exposure to calcium channel blockers (**diltiazem, verapamil**). [\[Severe\]](#) Study
- ▶ **Antiarrhythmics (disopyramide)** are predicted to increase the risk of cardiodepression when given with **verapamil**. [\[Severe\]](#) Theoretical
- ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to calcium channel blockers (**amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine**). Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ **Antiarrhythmics (amiodarone)** are predicted to increase the risk of cardiodepression when given with calcium channel blockers (**diltiazem, verapamil**). Avoid. [\[Severe\]](#) Theoretical → Also see TABLE 6 p. 1448
- ▶ Calcium channel blockers (**diltiazem, verapamil**) increase the exposure to **antiarrhythmics (dronedarone)** and **antiarrhythmics (dronedarone)** increase the exposure to calcium channel blockers (**diltiazem, verapamil**). [\[Moderate\]](#) Study
- ▶ **Verapamil** increases the risk of cardiodepression when given with **antiarrhythmics (flecainide)**. [\[Severe\]](#) Anecdotal → Also see TABLE 6 p. 1448
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **antiarrhythmics (propafenone)**. Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ **Antiepileptics (valproate)** increase the exposure to **nimodipine**. Adjust dose. [\[Moderate\]](#) Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to calcium channel blockers (**amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine**). Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ **Diltiazem** increases the concentration of **antiepileptics (carbamazepine)** and **antiepileptics (carbamazepine)** are predicted to decrease the exposure to **diltiazem**. Monitor concentration and adjust dose. [\[Severe\]](#) Anecdotal
- ▶ **Verapamil** increases the concentration of **antiepileptics (carbamazepine)** and **antiepileptics (carbamazepine)** are predicted to decrease the exposure to **verapamil**. [\[Severe\]](#) Anecdotal
- ▶ **Antiepileptics (phenobarbital, primidone)** are predicted to decrease the exposure to calcium channel blockers (**diltiazem, verapamil**). [\[Severe\]](#) Study
- ▶ Calcium channel blockers (**diltiazem, verapamil**) potentially increase the concentration of **antiepileptics (fosphenytoin, phenytoin)** and **antiepileptics (fosphenytoin, phenytoin)** are predicted to decrease the exposure to calcium channel blockers (**diltiazem, verapamil**). [\[Severe\]](#) Study
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to markedly increase the exposure to **lercanidipine**. Avoid. [\[Severe\]](#) Study
- ▶ **Antifungals, azoles (miconazole)** are predicted to increase the exposure to **diltiazem**. [\[Moderate\]](#) Theoretical
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to calcium channel blockers (**amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine**). Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ **Antifungals, azoles (miconazole)** are predicted to increase the exposure to calcium channel blockers (**amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine, verapamil**). Use with caution and adjust dose. [\[Moderate\]](#) Theoretical
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to calcium channel blockers (**amlodipine, felodipine, lacidipine, nicardipine, nifedipine, nimodipine**). Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ **Antifungals, azoles (fluconazole)** (high-dose) are predicted to increase the exposure to calcium channel blockers (**diltiazem, verapamil**). [\[Moderate\]](#) Theoretical
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to calcium channel blockers (**diltiazem, verapamil**). [\[Severe\]](#) Study
- ▶ **Antifungals, azoles (posaconazole)** are predicted to increase the exposure to calcium channel blockers (**diltiazem, verapamil**). [\[Severe\]](#) Study → Also see TABLE 8 p. 1448
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the concentration of **antimalarials (piperaquine)**. [\[Severe\]](#) Theoretical
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **antipsychotics, second generation (cariprazine)**. Avoid. [\[Severe\]](#) Study → Also see TABLE 8 p. 1448
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **antipsychotics, second generation (lurasidone)**. Adjust **lurasidone** dose. [\[Moderate\]](#) Study → Also see TABLE 8 p. 1448
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **antipsychotics, second generation (quetiapine)**. Avoid. [\[Moderate\]](#) Study → Also see TABLE 8 p. 1448
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **avapritinib**. Avoid or adjust **avapritinib** dose, p. 1019. [\[Moderate\]](#) Study
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **axitinib**. [\[Moderate\]](#) Study
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **bedaquiline**. Avoid prolonged use. [\[Mild\]](#) Theoretical
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **benzodiazepines (alprazolam)**. [\[Severe\]](#) Study
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **benzodiazepines (midazolam)**. Monitor adverse effects and adjust dose. [\[Severe\]](#) Study
- ▶ **Diltiazem** is predicted to increase the risk of cardiodepression when given with **beta blockers, non-selective**. [\[Severe\]](#) Study → Also see TABLE 6 p. 1448 → Also see TABLE 8 p. 1448
- ▶ **Verapamil** increases the risk of cardiovascular adverse effects when given with **beta blockers, non-selective**. Avoid intravenous **verapamil**, p. 179. [\[Severe\]](#) Study → Also see TABLE 6 p. 1448 → Also see TABLE 8 p. 1448
- ▶ **Diltiazem** is predicted to increase the risk of cardiodepression when given with **beta blockers, selective**. [\[Severe\]](#) Study → Also see TABLE 6 p. 1448 → Also see TABLE 8 p. 1448
- ▶ **Verapamil** increases the risk of cardiovascular adverse effects when given with **beta blockers, selective**. Avoid intravenous **verapamil**, p. 179. [\[Severe\]](#) Study → Also see TABLE 6 p. 1448 → Also see TABLE 8 p. 1448
- ▶ **Verapamil** is predicted to increase the exposure to **bictegravir**. Use with caution or avoid. [\[Moderate\]](#) Theoretical
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **bosutinib**. Avoid or adjust dose. [\[Severe\]](#) Study
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **brigatinib**. [\[Moderate\]](#) Study
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **buspirone**. Use with caution and adjust dose. [\[Moderate\]](#) Study
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **cabozantinib**. [\[Moderate\]](#) Study
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to calcium channel blockers (**amlodipine**). Monitor and adjust dose. [\[Moderate\]](#) Study → Also see TABLE 8 p. 1448

- ▶ Calcium channel blockers (**verapamil**) are predicted to increase the exposure to calcium channel blockers (**amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine**). Monitor and adjust dose. [Moderate] Study → Also see TABLE 8 p. 1448
- ▶ Calcium channel blockers (**diltiazem**) are predicted to increase the exposure to calcium channel blockers (**felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine**). Monitor and adjust dose. [Moderate] Study → Also see TABLE 8 p. 1448
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **ceritinib**. [Moderate] Study → Also see TABLE 6 p. 1448
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the concentration of **ciclosporin**. [Severe] Study
- ▶ **Ciclosporin** moderately increases the exposure to lercanidipine. Use with caution or avoid. [Severe] Study
- ▶ **Nicardipine** increases the concentration of **ciclosporin**. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to calcium channel blockers (**amlodipine, felodipine, lacidipine, nicardipine, nifedipine, nimodipine**). Monitor and adjust dose. [Moderate] Study
- ▶ **Cobicistat** is predicted to increase the exposure to calcium channel blockers (**diltiazem, verapamil**). [Severe] Study
- ▶ **Cobicistat** is predicted to markedly increase the exposure to lercanidipine. Avoid. [Severe] Study
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **cobimetinib**. [Severe] Study
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **colchicine**. Adjust colchicine dose with moderate CYP3A4 inhibitors, p. 1175. [Severe] Study
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **corticosteroids (methylprednisolone)**. Monitor and adjust dose. [Moderate] Study
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **crizotinib**. Avoid. [Moderate] Study → Also see TABLE 6 p. 1448
- ▶ **Crizotinib** is predicted to increase the exposure to calcium channel blockers (**amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine**). Monitor and adjust dose. [Moderate] Study
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **dabrafenib**. [Moderate] Study
- ▶ **Dabrafenib** is predicted to decrease the exposure to calcium channel blockers (**amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine**). Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Dabrafenib** is predicted to decrease the exposure to calcium channel blockers (**diltiazem, verapamil**). [Moderate] Theoretical
- ▶ Intravenous **dantrolene** potentially increases the risk of acute hyperkalaemia and cardiovascular collapse when given with calcium channel blockers (**diltiazem, verapamil**). Avoid. [Severe] Anecdotal
- ▶ **Diltiazem** is predicted to increase the exposure to **darifenacin**. [Moderate] Study
- ▶ **Verapamil** is predicted to increase the exposure to **darifenacin**. Avoid. [Moderate] Study
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **dasatinib**. [Severe] Study
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to slightly increase the exposure to **dienogest**. [Moderate] Study
- ▶ Calcium channel blockers (**diltiazem, verapamil**) increase the concentration of **digoxin**. Monitor and adjust dose. [Severe] Study → Also see TABLE 6 p. 1448
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **dipeptidylpeptidase-4 inhibitors (saxagliptin)**. [Mild] Study
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **domperidone**. Avoid. [Severe] Study
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **dopamine receptor agonists (bromocriptine)**. [Severe] Theoretical → Also see TABLE 8 p. 1448
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the concentration of **dopamine receptor agonists (cabergoline)**. [Moderate] Anecdotal → Also see TABLE 8 p. 1448
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to moderately increase the exposure to **dutasteride**. [Mild] Study
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **elxacaftor**. Adjust tezacaftor with ivacaftor and elxacaftor p. 314 dose with moderate CYP3A4 inhibitors. [Severe] Theoretical
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to moderately increase the exposure to **encorafenib**. [Moderate] Study
- ▶ **Endothelin receptor antagonists (bosentan)** are predicted to decrease the exposure to calcium channel blockers (**amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine**). Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Endothelin receptor antagonists (bosentan)** are predicted to decrease the exposure to calcium channel blockers (**diltiazem, verapamil**). [Moderate] Theoretical
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **entrectinib**. Avoid moderate CYP3A4 inhibitors or adjust entrectinib dose, p. 1030. [Severe] Theoretical
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the risk of ergotism when given with **ergometrine**. [Severe] Theoretical
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the risk of ergotism when given with **ergotamine**. [Severe] Theoretical
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **erlotinib**. [Moderate] Study
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the concentration of **everolimus**. Avoid or adjust dose. [Moderate] Study
- ▶ **Verapamil** is predicted to increase the exposure to **factor XA inhibitors (apixaban)**. [Moderate] Theoretical
- ▶ **Verapamil** slightly increases the exposure to **factor XA inhibitors (edoxaban)**. [Severe] Study
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **fesoterodine**. Adjust fesoterodine dose with moderate CYP3A4 inhibitors in hepatic and renal impairment, p. 824. [Mild] Study
- ▶ **Verapamil** is predicted to increase the exposure to **fidaxomicin**. Avoid. [Moderate] Study
- ▶ **Diltiazem** is predicted to increase the exposure to **fostamatinib**. Monitor adverse effects and adjust dose. [Moderate] Theoretical
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **gefitinib**. [Moderate] Study
- ▶ **Verapamil** is predicted to increase the exposure to **gilteritinib**. [Moderate] Theoretical
- ▶ **Grapefruit** juice very slightly increases the exposure to **amlodipine**. Avoid. [Mild] Study
- ▶ **Grapefruit** juice increases the exposure to calcium channel blockers (**nifedipine, verapamil**). Avoid. [Mild] Study
- ▶ **Grapefruit** juice increases the exposure to **felodipine**. Avoid. [Moderate] Study
- ▶ **Grapefruit** juice is predicted to increase the exposure to lercanidipine. Avoid. [Moderate] Theoretical
- ▶ **Grapefruit** juice increases the exposure to nicardipine. [Mild] Study
- ▶ **Graptoprevir** is predicted to increase the concentration of calcium channel blockers. [Moderate] Theoretical
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the concentration of **guanfacine**. Adjust guanfacine dose, p. 375. [Moderate] Theoretical → Also see TABLE 8 p. 1448
- ▶ **H₂ receptor antagonists (cimetidine)** (high-dose) are predicted to increase the exposure to lercanidipine. [Moderate] Theoretical
- ▶ **H₂ receptor antagonists (cimetidine)** moderately increase the exposure to nifedipine. Monitor and adjust dose. [Severe] Study
- ▶ **H₂ receptor antagonists (cimetidine)** increase the exposure to verapamil. [Moderate] Study
- ▶ **H₂ receptor antagonists (cimetidine)** slightly increase the exposure to calcium channel blockers (**diltiazem, nimodipine**). Monitor and adjust dose. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to calcium channel blockers (**amlodipine, felodipine, lacidipine,**

Calcium channel blockers (continued)

- nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to calcium channel blockers (**diltiazem, verapamil**). [\[Severe\]](#) Study
 - ▶ **HIV-protease inhibitors** are predicted to markedly increase the exposure to **lercanidipine**. Avoid. [\[Severe\]](#) Study
 - ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **ibrutinib**. Adjust ibrutinib dose with moderate CYP3A4 inhibitors, p. 1034. [\[Severe\]](#) Study
 - ▶ **Idelalisib** is predicted to increase the exposure to calcium channel blockers (**amlodipine, felodipine, lacidipine, nicardipine, nifedipine, nimodipine**). Monitor and adjust dose. [\[Moderate\]](#) Study
 - ▶ **Idelalisib** is predicted to increase the exposure to calcium channel blockers (**diltiazem, verapamil**). [\[Severe\]](#) Study
 - ▶ **Idelalisib** is predicted to markedly increase the exposure to **lercanidipine**. Avoid. [\[Severe\]](#) Study
 - ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **imatinib**. [\[Moderate\]](#) Theoretical
 - ▶ **Imatinib** is predicted to increase the exposure to calcium channel blockers (**amlodipine, felodipine, lacidipine, nicardipine, nifedipine, nimodipine**). Monitor and adjust dose. [\[Moderate\]](#) Study
 - ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **ivabradine**. Avoid. [\[Moderate\]](#) Study → Also see TABLE 6 p. 1448
 - ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **ivacaftor**. Adjust dose with moderate CYP3A4 inhibitors, see ivacaftor p. 312, tezacaftor with ivacaftor p. 314, and tezacaftor with ivacaftor and elexacaftor p. 314. [\[Moderate\]](#) Study
 - ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **lapatinib**. [\[Moderate\]](#) Study
 - ▶ **Verapamil** is predicted to increase the exposure to **larotrectinib**. [\[Mild\]](#) Theoretical
 - ▶ **Letermovir** is predicted to increase the exposure to calcium channel blockers (**amlodipine, felodipine, lacidipine, nicardipine, nifedipine, nimodipine**). Monitor and adjust dose. [\[Moderate\]](#) Study
 - ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the risk of neurotoxicity when given with **lithium**. [\[Severe\]](#) Anecdotal
 - ▶ Calcium channel blockers (**amlodipine, lacidipine**) are predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [\[Moderate\]](#) Theoretical
 - ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **lomitapide**. Avoid. [\[Moderate\]](#) Theoretical
 - ▶ **Macrolides (clarithromycin)** are predicted to markedly increase the exposure to **lercanidipine**. Avoid. [\[Severe\]](#) Study
 - ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **diltiazem**. [\[Severe\]](#) Theoretical
 - ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **verapamil**. [\[Severe\]](#) Study
 - ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to calcium channel blockers (**amlodipine, felodipine, lacidipine, nicardipine, nifedipine, nimodipine**). Monitor and adjust dose. [\[Moderate\]](#) Study
 - ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to calcium channel blockers (**amlodipine, felodipine, lacidipine, nicardipine, nifedipine, nimodipine**). Monitor and adjust dose. [\[Moderate\]](#) Study
 - ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to calcium channel blockers (**diltiazem, verapamil**). [\[Severe\]](#) Study
 - ▶ Intravenous **magnesium** potentially increases the risk of hypotension when given with calcium channel blockers (**amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine, verapamil**) in pregnant women. [\[Severe\]](#) Anecdotal
 - ▶ **Mexiletine** increases the risk of cardiovascular adverse effects when given with **diltiazem**. Avoid or monitor. [\[Severe\]](#) Theoretical
 - ▶ **Mexiletine** potentially increases the risk of cardiovascular adverse effects when given with **verapamil**. Avoid or monitor. [\[Severe\]](#) Theoretical
 - ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **midostaurin**. [\[Moderate\]](#) Theoretical
 - ▶ **Mitotane** is predicted to decrease the exposure to calcium channel blockers (**amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine**). Monitor and adjust dose. [\[Moderate\]](#) Study
 - ▶ **Mitotane** is predicted to decrease the exposure to **diltiazem**. [\[Severe\]](#) Study
 - ▶ **Monoclonal antibodies (tocilizumab)** are predicted to decrease the exposure to calcium channel blockers. Monitor and adjust dose. [\[Moderate\]](#) Theoretical
 - ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **naldemedine**. [\[Moderate\]](#) Study
 - ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **naloxegol**. Adjust naloxegol dose and monitor adverse effects, p. 71. [\[Moderate\]](#) Study
 - ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **neratinib**. Avoid moderate CYP3A4 inhibitors or adjust neratinib dose and monitor for gastrointestinal adverse effects, p. 1041. [\[Severe\]](#) Study
 - ▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to increase the exposure to calcium channel blockers (**amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine**). Monitor and adjust dose. [\[Moderate\]](#) Study
 - ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **neurokinin-1 receptor antagonists (aprepitant)** and **neurokinin-1 receptor antagonists (aprepitant)** are predicted to increase the exposure to calcium channel blockers (**diltiazem, verapamil**). [\[Moderate\]](#) Study
 - ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **nilotinib**. [\[Moderate\]](#) Theoretical
 - ▶ **Nilotinib** is predicted to increase the exposure to calcium channel blockers (**amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine**). Monitor and adjust dose. [\[Moderate\]](#) Study
 - ▶ **Verapamil** is predicted to increase the exposure to **nintedanib**. [\[Moderate\]](#) Study
 - ▶ **NNRTIs (efavirenz, nevirapine)** are predicted to decrease the exposure to calcium channel blockers (**amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine**). Monitor and adjust dose. [\[Moderate\]](#) Theoretical
 - ▶ **NNRTIs (efavirenz, nevirapine)** are predicted to decrease the exposure to calcium channel blockers (**diltiazem, verapamil**). [\[Moderate\]](#) Theoretical
 - ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **olaparib**. Avoid moderate CYP3A4 inhibitors or adjust olaparib dose, p. 1057. [\[Moderate\]](#) Theoretical
 - ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **opioids (alfentanil, buprenorphine, fentanyl, oxycodone)**. Monitor and adjust dose. [\[Moderate\]](#) Study → Also see TABLE 6 p. 1448
 - ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **opioids (methadone)**. [\[Moderate\]](#) Theoretical → Also see TABLE 6 p. 1448
 - ▶ **Verapamil** is predicted to increase the exposure to **panobinostat**. Adjust dose. [\[Moderate\]](#) Theoretical
 - ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **pazopanib**. [\[Moderate\]](#) Study
 - ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (avanafil)**. Adjust avanafil dose, p. 862. [\[Moderate\]](#) Theoretical → Also see TABLE 8 p. 1448
 - ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (sildenafil)**. Monitor or adjust sildenafil dose with moderate CYP3A4 inhibitors, p. 863. [\[Moderate\]](#) Study → Also see TABLE 8 p. 1448
 - ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (tadalafil)**. [\[Severe\]](#) Theoretical → Also see TABLE 8 p. 1448
 - ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (vardenafil)**. Adjust dose. [\[Severe\]](#) Theoretical → Also see TABLE 8 p. 1448

- ▶ **Verapamil** is predicted to increase the exposure to **pibrentasvir**. [Moderate] Theoretical
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **pimozide**. Avoid. [Severe] Theoretical → Also see TABLE 8 p. 1448
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **ponatinib**. [Moderate] Study
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **ranolazine**. [Severe] Study
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **regorafenib**. [Moderate] Study
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **ribociclib**. [Moderate] Study
- ▶ **Rifamycins (rifampicin)** moderately decrease the exposure to **nifedipine**. Avoid. [Severe] Study
- ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to calcium channel blockers (**amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nimodipine**). Monitor and adjust dose. [Moderate] Study
- ▶ **Rifamycins (rifampicin)** greatly decrease the exposure to calcium channel blockers (**diltiazem, verapamil**). [Severe] Study
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **ruxolitinib**. [Moderate] Study
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **siponimod**. Avoid depending on other drugs taken—consult product literature. [Severe] Study → Also see TABLE 6 p. 1448
- ▶ Calcium channel blockers (**diltiazem, verapamil**) increase the concentration of **sirolimus**. Monitor and adjust dose. [Moderate] Study
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **SSRIs (dapoxetine)**. Adjust **dapoxetine** dose with moderate CYP3A4 inhibitors, p. 870. [Moderate] Theoretical
- ▶ **St John's wort** is predicted to decrease the exposure to calcium channel blockers (**amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine**). Monitor and adjust dose. [Moderate] Theoretical
- ▶ **St John's wort** is predicted to decrease the exposure to calcium channel blockers (**diltiazem, verapamil**). [Moderate] Theoretical
- ▶ **Diltiazem** slightly increases the exposure to **statins (atorvastatin)**. Monitor and adjust dose. [Severe] Study
- ▶ **Verapamil** is predicted to slightly to moderately increase the exposure to **statins (atorvastatin)**. Monitor and adjust dose. [Severe] Theoretical
- ▶ **Amlodipine** slightly increases the exposure to **statins (simvastatin)**. Adjust **simvastatin** dose, p. 221. [Mild] Study
- ▶ Calcium channel blockers (**diltiazem, verapamil**) moderately increase the exposure to **statins (simvastatin)**. Monitor and adjust dose. [Severe] Study
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **sunitinib**. [Moderate] Study
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the concentration of **tacrolimus**. [Severe] Study
- ▶ **Nicardipine** potentially increases the concentration of **tacrolimus**. Monitor concentration and adjust dose. [Severe] Anecdotal
- ▶ Calcium channel blockers (**diltiazem, felodipine**) very slightly increase the exposure to **talazoparib**. [Moderate] Study
- ▶ **Verapamil** is predicted to slightly increase the exposure to **talazoparib**. Avoid or adjust **talazoparib** dose, p. 1059. [Severe] Study
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **taxanes (cabazitaxel)**. [Moderate] Theoretical
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the concentration of and the risk of angioedema when given with **temsirolimus**. Use with caution or avoid. [Moderate] Theoretical
- ▶ **Temsirolimus** is predicted to increase the risk of angioedema when given with calcium channel blockers (**amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine**). [Moderate] Theoretical
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **tezacaftor**. Adjust dose with

moderate CYP3A4 inhibitors, see **tezacaftor** with **ivacaftor** p. 314 and **tezacaftor** with **ivacaftor** and **elxacaftor** p. 314.

- [Severe] Study
- ▶ **Verapamil** increases the exposure to **thrombin inhibitors (dabigatran)**. Monitor and adjust dose. [Severe] Study
- ▶ **Verapamil** might increase the exposure to **tigecycline**. [Mild] Anecdotal
- ▶ Calcium channel blockers (**diltiazem, verapamil**) given with a potent CYP2C19 inhibitor are predicted to increase the exposure to **tofacinib**. Adjust **tofacinib** dose, p. 1163. [Moderate] Study
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **tolvaptan**. Manufacturer advises caution or adjust **tolvaptan** dose with moderate CYP3A4 inhibitors, p. 711. [Moderate] Study
- ▶ **Verapamil** is predicted to increase the exposure to **topotecan**. [Severe] Study
- ▶ **Verapamil** is predicted to increase the concentration of **trametinib**. [Moderate] Theoretical
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **trazodone**. [Moderate] Theoretical
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [Moderate] Study
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **vemurafenib**. [Severe] Theoretical
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **venetoclax**. Avoid or adjust dose—consult product literature. [Severe] Study
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **vinca alkaloids**. [Severe] Theoretical
- ▶ Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **zopiclone**. Adjust dose. [Moderate] Study

Calcium chloride → see calcium salts

Calcium gluconate → see calcium salts

Calcium lactate → see calcium salts

Calcium phosphate → see calcium salts

Calcium salts

calcium acetate · calcium carbonate · calcium chloride · calcium gluconate · calcium lactate · calcium phosphate

SEPARATION OF ADMINISTRATION **Calcium carbonate-containing antacids** should preferably not be taken at the same time as other drugs since they might impair absorption. **Antacids** might damage enteric coatings designed to prevent dissolution in the stomach.

- ▶ Oral **calcium carbonate** -containing antacids modestly decreases the exposure to oral **acalabrutinib**. Separate administration by at least 2 hours. [Moderate] Study
- ▶ Oral **calcium salts** decrease the absorption of **alkylating agents (estramustine)**. [Severe] Study
- ▶ **Calcium carbonate** decreases the absorption of **antimalarials (chloroquine)**. Separate administration by at least 4 hours. [Moderate] Study
- ▶ **Calcium carbonate** is predicted to decrease the absorption of **antimalarials (proguanil)**. Separate administration by at least 2 hours. [Moderate] Study
- ▶ Oral **calcium salts** decrease the absorption of **bisphosphonates (alendronate)**. **Alendronate** should be taken at least 30 minutes before calcium salts. [Moderate] Study
- ▶ Oral **calcium salts** decrease the absorption of **bisphosphonates (clodronate)**. Avoid **calcium salts** for 2 hours before or 1 hour after **clodronate**. [Moderate] Study
- ▶ Oral **calcium salts** are predicted to decrease the absorption of oral **bisphosphonates (ibandronate)**. Avoid **calcium salts** for at least 6 hours before or 1 hour after **ibandronate**. [Moderate] Theoretical
- ▶ Oral **calcium salts** decrease the absorption of **bisphosphonates (risedronate)**. Separate administration by at least 2 hours. [Moderate] Study
- ▶ Oral **calcium carbonate**-containing antacids are predicted to decrease the absorption of oral **bosutinib**. **Bosutinib** should be taken at least 12 hours before antacids. [Moderate] Theoretical

Calcium salts (continued)

- ▶ **Cephalosporins (ceftriaxone)** increase the risk of cardio-respiratory arrest when given with calcium chloride. Avoid. [\[Severe\]](#) Anecdotal
- ▶ **Cephalosporins (ceftriaxone)** increase the risk of cardio-respiratory arrest when given with intravenous calcium gluconate. Avoid. [\[Severe\]](#) Anecdotal
- ▶ Oral calcium carbonate-containing antacids are predicted to decrease the exposure to oral **dasatinib**. Separate administration by at least 2 hours. [\[Moderate\]](#) Study
- ▶ Intravenous calcium salts increase the effects of **digoxin**. Avoid. [\[Moderate\]](#) Anecdotal
- ▶ Oral calcium salts decrease the absorption of **dolutegravir**. **Dolutegravir** should be taken 2 hours before or 6 hours after calcium salts. [\[Moderate\]](#) Study
- ▶ Oral calcium salts decrease the absorption of **eltrombopag**. **Eltrombopag** should be taken 2 hours before or 4 hours after calcium salts. [\[Severe\]](#) Study
- ▶ Oral calcium carbonate-containing antacids are predicted to decrease the absorption of oral **erlotinib**. **Erlotinib** should be taken 2 hours before or 4 hours after antacids. [\[Moderate\]](#) Theoretical
- ▶ Oral calcium carbonate-containing antacids are predicted to decrease the exposure to oral **gefitinib**. [\[Moderate\]](#) Theoretical
- ▶ Calcium carbonate decreases the absorption of **hydroxychloroquine**. Separate administration by at least 4 hours. [\[Moderate\]](#) Study
- ▶ Oral calcium carbonate decreases the absorption of oral **iron**. Calcium carbonate should be taken 1 hour before or 2 hours after iron. [\[Moderate\]](#) Study
- ▶ Oral calcium carbonate-containing antacids are predicted to decrease the absorption of oral **lapatinib**. Avoid. [\[Moderate\]](#) Theoretical
- ▶ Calcium carbonate is predicted to decrease the exposure to **ledipasvir**. Separate administration by 4 hours. [\[Moderate\]](#) Theoretical
- ▶ Oral calcium carbonate-containing antacids are predicted to decrease the exposure to oral **neratinib**. Separate administration by at least 3 hours. [\[Mild\]](#) Theoretical
- ▶ Oral calcium carbonate-containing antacids might affect the exposure to oral **nilotinib**. Separate administration by at least 2 hours. [\[Moderate\]](#) Study
- ▶ Calcium carbonate is predicted to slightly decrease the exposure to **NRTIs (rilpivirine)**. Calcium carbonate should be taken 2 hours before or 4 hours after rilpivirine. [\[Severe\]](#) Theoretical
- ▶ Oral calcium carbonate-containing antacids might decrease the absorption of oral **pazopanib**. **Pazopanib** should be taken 1 hour before or 2 hours after antacids. [\[Moderate\]](#) Theoretical
- ▶ Calcium carbonate decreases the absorption of **quinolones (ciprofloxacin)**. Separate administration by 2 hours. [\[Moderate\]](#) Study
- ▶ Calcium carbonate greatly decreases the exposure to **raltegravir** (high-dose). Avoid. [\[Severe\]](#) Study
- ▶ Oral calcium salts decrease the exposure to **strontium**. Separate administration by 2 hours. [\[Moderate\]](#) Study
- ▶ Calcium carbonate is predicted to decrease the absorption of **tetracyclines**. Separate administration by 2 to 3 hours. [\[Moderate\]](#) Theoretical
- ▶ **Thiazide diuretics** increase the risk of hypercalcaemia when given with calcium salts. [\[Severe\]](#) Anecdotal
- ▶ Oral calcium salts are predicted to decrease the absorption of **thyroid hormones (levothyroxine)**. Separate administration by at least 4 hours. [\[Moderate\]](#) Anecdotal
- ▶ Calcium carbonate is predicted to decrease the concentration of **velpatasvir**. Separate administration by 4 hours. [\[Moderate\]](#) Anecdotal
- ▶ Oral calcium salts decrease the absorption of **zinc**. [\[Moderate\]](#) Study

Canagliflozin → see sodium glucose co-transporter 2 inhibitors

Canakinumab → see monoclonal antibodies

Candesartan → see angiotensin-II receptor antagonists

Cangrelor → see TABLE 4 p. 1447 (antiplatelet effects)

Cannabidiol → see TABLE 11 p. 1449 (CNS depressant effects)

- ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to **cannabidiol**. Adjust dose. [\[Moderate\]](#) Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **cannabidiol**. Adjust dose. [\[Moderate\]](#) Study → Also see TABLE 11 p. 1449
- ▶ **Cannabidiol** increases the risk of increased ALT concentrations when given with **antiepileptics (valproate)**. Avoid or adjust dose. [\[Severe\]](#) Study
- ▶ **Antifungals, azoles (fluconazole)** are predicted to increase the exposure to **cannabidiol**. [\[Moderate\]](#) Theoretical
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **cannabidiol**. Avoid or adjust dose. [\[Mild\]](#) Study
- ▶ **Cannabidiol** increases the exposure to the active metabolite of **benzodiazepines (clobazam)** and **benzodiazepines (clobazam)** increase the exposure to the active metabolite of **cannabidiol**. Adjust dose. [\[Moderate\]](#) Study → Also see TABLE 11 p. 1449
- ▶ **Cobicistat** is predicted to increase the exposure to **cannabidiol**. Avoid or adjust dose. [\[Mild\]](#) Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **cannabidiol**. Avoid or adjust dose. [\[Mild\]](#) Study
- ▶ **Idelalisib** is predicted to increase the exposure to **cannabidiol**. Avoid or adjust dose. [\[Mild\]](#) Study
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **cannabidiol**. Avoid or adjust dose. [\[Mild\]](#) Study
- ▶ **Mitotane** is predicted to decrease the exposure to **cannabidiol**. Adjust dose. [\[Moderate\]](#) Study
- ▶ **Moclobemide** is predicted to increase the exposure to **cannabidiol**. [\[Moderate\]](#) Theoretical
- ▶ **Proton pump inhibitors (esomeprazole)** are predicted to increase the exposure to **cannabidiol**. [\[Moderate\]](#) Theoretical
- ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **cannabidiol**. Adjust dose. [\[Moderate\]](#) Study
- ▶ **SSRIs (fluoxetine, fluvoxamine)** are predicted to increase the exposure to **cannabidiol**. [\[Moderate\]](#) Theoretical
- ▶ **St John's wort** is predicted to decrease the exposure to **cannabidiol**. Adjust dose. [\[Mild\]](#) Study

Capecitabine → see TABLE 15 p. 1450 (myelosuppression)

- ▶ **Allopurinol** is predicted to decrease the effects of **capecitabine**. Avoid. [\[Severe\]](#) Study
- ▶ **Capecitabine** increases the concentration of **antiepileptics (fosphenytoin, phenytoin)**. [\[Severe\]](#) Anecdotal
- ▶ **Capecitabine** increases the effects of **coumarins**. Monitor INR and adjust dose. [\[Moderate\]](#) Anecdotal
- ▶ **Folates** are predicted to increase the risk of toxicity when given with **capecitabine**. [\[Severe\]](#) Anecdotal
- ▶ **H₂ receptor antagonists (cimetidine)** are predicted to slightly increase the exposure to **capecitabine**. [\[Severe\]](#) Theoretical
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **capecitabine**. Public Health England advises avoid (refer to Green Book). [\[Severe\]](#) Theoretical
- ▶ **Metronidazole** is predicted to increase the risk of capecitabine toxicity when given with **capecitabine**. [\[Severe\]](#) Theoretical

Caplacizumab

- ▶ **Caplacizumab** is predicted to increase the risk of bleeding events when given with **drugs with anticoagulant effects** (see TABLE 3 p. 1447). [\[Severe\]](#) Theoretical
- ▶ **Caplacizumab** is predicted to increase the risk of bleeding events when given with **drugs with antiplatelet effects** (see TABLE 4 p. 1447). [\[Severe\]](#) Theoretical

Capreomycin → see TABLE 2 p. 1447 (nephrotoxicity), TABLE 19 p. 1451 (ototoxicity)

Captopril → see ACE inhibitors

Carbamazepine → see antiepileptics

Carbapenems

ertapenem · imipenem · meropenem

- ▶ **Carbapenems** decrease the concentration of **antiepileptics (valproate)**. Avoid. [\[Severe\]](#) Anecdotal
- ▶ **Ganciclovir** is predicted to increase the risk of seizures when given with **imipenem**. Avoid. [\[Severe\]](#) Anecdotal
- ▶ **Valganciclovir** is predicted to increase the risk of seizures when given with **imipenem**. Avoid. [\[Severe\]](#) Anecdotal

Carbidopa

- ▶ Oral **iron** is predicted to decrease the exposure to oral **carbidopa**. [Moderate] Theoretical

Carbimazole

- ▶ **Carbimazole** affects the concentration of **digoxin**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Carbimazole** decreases the effects of **metyrapone**. Avoid. [Moderate] Theoretical
- ▶ **Carbimazole** given with a potent CYP3A4 inhibitor is predicted to increase the exposure to **propiverine**. Adjust starting dose. [Moderate] Theoretical

Carboplatin → see platinum compounds

Carfilzomib → see TABLE 15 p. 1450 (myelosuppression)

- ▶ **Carfilzomib** potentially decreases the efficacy of **combined hormonal contraceptives**. Use additional contraceptive precautions. [Severe] Theoretical

Cariprazine → see antipsychotics, second generation

Carmustine → see alkylating agents

Carvedilol → see beta blockers, non-selective

Caspofungin

- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenytoin)** are predicted to decrease the concentration of **caspofungin**. Adjust **caspofungin** dose, p. 637. [Moderate] Theoretical
- ▶ **Ciclosporin** slightly increases the exposure to **caspofungin**. [Severe] Study
- ▶ **Corticosteroids (dexamethasone)** are predicted to decrease the concentration of **caspofungin**. Adjust **caspofungin** dose, p. 637. [Moderate] Theoretical
- ▶ **NNRTIs (efavirenz)** are predicted to decrease the concentration of **caspofungin**. Adjust dose. [Moderate] Study
- ▶ **NNRTIs (nevirapine)** are predicted to decrease the concentration of **caspofungin**. Adjust dose. [Moderate] Theoretical
- ▶ **Rifamycins (rifampicin)** decrease the concentration of **caspofungin**. Adjust **caspofungin** dose, p. 637. [Moderate] Study

Cefaclor → see cephalosporins

Cefadroxil → see cephalosporins

Cefalexin → see cephalosporins

Cefazolin → see cephalosporins

Cefepime → see cephalosporins

Cefiderocol → see cephalosporins

Cefixime → see cephalosporins

Cefotaxime → see cephalosporins

Cefoxitin → see cephalosporins

Cefradine → see cephalosporins

Ceftaroline → see cephalosporins

Ceftazidime → see cephalosporins

Ceftobiprole → see cephalosporins

Ceftolozane → see cephalosporins

Ceftriaxone → see cephalosporins

Cefuroxime → see cephalosporins

Celecoxib → see NSAIDs

Celiprolol → see beta blockers, selective

Cemiplimab → see monoclonal antibodies

Cephalosporins → see TABLE 2 p. 1447 (nephrotoxicity)

cefaclor · cefadroxil · cefalexin · cefazolin · cefepime · cefiderocol · cefixime · cefotaxime · cefoxitin · cefradine · ceftaroline · ceftazidime · ceftobiprole · ceftolozane · ceftriaxone · cefuroxime

ROUTE-SPECIFIC INFORMATION Interactions do not generally apply to topical use of **cefuroxime** unless specified.

- ▶ **Ceftriaxone** increases the risk of cardio-respiratory arrest when given with **calcium salts (calcium chloride)**. Avoid. [Severe] Anecdotal
- ▶ **Ceftriaxone** increases the risk of cardio-respiratory arrest when given with intravenous **calcium salts (calcium gluconate)**. Avoid. [Severe] Anecdotal
- ▶ Cephalosporins (**cefazolin, ceftriaxone**) potentially increase the risk of bleeding events when given with **coumarins**. [Severe] Theoretical
- ▶ **Ceftobiprole** is predicted to increase the exposure to **endothelin receptor antagonists (bosentan)**. [Moderate] Theoretical
- ▶ **Leflunomide** is predicted to increase the exposure to **cefaclor**. [Moderate] Theoretical
- ▶ **Nitisinone** is predicted to increase the exposure to **cefaclor**. [Moderate] Study
- ▶ Cephalosporins (**cefazolin, ceftriaxone**) potentially increase the risk of bleeding events when given with **phenindione**. [Severe] Anecdotal
- ▶ **Ceftobiprole** is predicted to increase the concentration of **statins**. [Moderate] Theoretical
- ▶ **Ceftobiprole** is predicted to increase the concentration of **sulfonylureas (glibenclamide)**. [Moderate] Theoretical
- ▶ **Teriflunomide** is predicted to increase the exposure to **cefaclor**. [Moderate] Study
- ▶ **Ceritinib** → see TABLE 6 p. 1448 (bradycardia), TABLE 15 p. 1450 (myelosuppression), TABLE 9 p. 1449 (QT-interval prolongation)
- ▶ **Ceritinib** is predicted to increase the exposure to **aliskiren**. [Moderate] Theoretical
- ▶ Oral **antacids** are predicted to decrease the absorption of oral **ceritinib**. Separate administration by 2 hours. [Moderate] Theoretical
- ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to **ceritinib**. Avoid. [Severe] Study → Also see TABLE 9 p. 1449
- ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to **ceritinib**. [Moderate] Study → Also see TABLE 9 p. 1449
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **ceritinib**. Avoid. [Severe] Study
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **ceritinib**. [Moderate] Study → Also see TABLE 9 p. 1449
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **ceritinib**. Avoid or adjust **ceritinib** dose, p. 1024. [Severe] Study → Also see TABLE 9 p. 1449
- ▶ **Ceritinib** is predicted to increase the exposure to **antihistamines, non-sedating (fexofenadine)**. [Moderate] Theoretical
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **ceritinib**. [Moderate] Study → Also see TABLE 6 p. 1448
- ▶ **Ceritinib** is predicted to increase the exposure to **ciclosporin**. Avoid. [Severe] Theoretical
- ▶ **Cobicistat** is predicted to increase the exposure to **ceritinib**. Avoid or adjust **ceritinib** dose, p. 1024. [Severe] Study
- ▶ **Ceritinib** is predicted to increase the exposure to **colchicine**. [Moderate] Theoretical
- ▶ **Ceritinib** is predicted to increase the exposure to **coumarins (acenocoumarol)**. [Severe] Theoretical
- ▶ **Ceritinib** is predicted to increase the exposure to **coumarins (warfarin)**. Avoid. [Severe] Theoretical
- ▶ **Crizotinib** is predicted to increase the exposure to **ceritinib**. [Moderate] Study → Also see TABLE 6 p. 1448 → Also see TABLE 9 p. 1449
- ▶ **Dabrafenib** is predicted to decrease the exposure to **ceritinib**. [Severe] Study
- ▶ **Ceritinib** is predicted to increase the risk of bradycardia when given with **digoxin**. Avoid. [Severe] Theoretical → Also see TABLE 6 p. 1448
- ▶ **Endothelin receptor antagonists (bosentan)** are predicted to decrease the exposure to **ceritinib**. [Severe] Study
- ▶ **Ceritinib** is predicted to increase the exposure to **ergotamine**. Avoid. [Severe] Theoretical
- ▶ **Ceritinib** is predicted to increase the exposure to **everolimus**. [Moderate] Theoretical
- ▶ **Ceritinib** is predicted to increase the exposure to **factor XA inhibitors (edoxaban)**. [Moderate] Theoretical
- ▶ **Grapefruit juice** is predicted to increase the exposure to **ceritinib**. Avoid. [Severe] Theoretical
- ▶ **H₂ receptor antagonists** are predicted to decrease the absorption of **ceritinib**. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **ceritinib**. Avoid or adjust **ceritinib** dose, p. 1024. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **ceritinib**. Avoid or adjust **ceritinib** dose, p. 1024. [Severe] Study
- ▶ **Imatinib** is predicted to increase the exposure to **ceritinib**. [Moderate] Study → Also see TABLE 15 p. 1450
- ▶ **Lapatinib** is predicted to increase the exposure to **ceritinib**. [Moderate] Theoretical → Also see TABLE 9 p. 1449
- ▶ **Letermovir** is predicted to increase the exposure to **ceritinib**. [Moderate] Study

Ceritinib (continued)

- ▶ **Ceritinib** is predicted to increase the exposure to **loperamide**. [Moderate] Theoretical
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **ceritinib**. Avoid or adjust **ceritinib** dose, p. 1024. [Severe] Study → Also see TABLE 9 p. 1449
- ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **ceritinib**. [Moderate] Study → Also see TABLE 9 p. 1449
- ▶ **Mitotane** is predicted to decrease the exposure to **ceritinib**. Avoid. [Severe] Study → Also see TABLE 15 p. 1450
- ▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to increase the exposure to **ceritinib**. [Moderate] Study
- ▶ **Neurokinin-1 receptor antagonists (fosaprepitant)** are predicted to increase the exposure to **ceritinib**. [Severe] Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to **ceritinib**. [Moderate] Study → Also see TABLE 15 p. 1450 → Also see TABLE 9 p. 1449
- ▶ **NNRTIs (efavirenz, nevirapine)** are predicted to decrease the exposure to **ceritinib**. [Severe] Study → Also see TABLE 9 p. 1449
- ▶ **Ceritinib** is predicted to increase the exposure to **NSAIDs (celecoxib, diclofenac)**. Adjust dose. [Moderate] Theoretical
- ▶ **Ceritinib** is predicted to increase the exposure to **opioids (alfentanil, fentanyl)**. Avoid. [Severe] Theoretical → Also see TABLE 6 p. 1448
- ▶ **Ceritinib** is predicted to increase the exposure to **phenindione**. [Severe] Theoretical
- ▶ **Ceritinib** is predicted to increase the exposure to **pimozide**. Avoid. [Severe] Theoretical → Also see TABLE 9 p. 1449
- ▶ **Proton pump inhibitors** are predicted to decrease the absorption of **ceritinib**. [Moderate] Theoretical
- ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **ceritinib**. Avoid. [Severe] Study
- ▶ **Ceritinib** is predicted to increase the exposure to **sirolimus**. Avoid. [Severe] Theoretical
- ▶ **St John's wort** is predicted to decrease the exposure to **ceritinib**. Avoid. [Severe] Theoretical
- ▶ **Ceritinib** is predicted to increase the exposure to **sulfonylureas (glimepiride)**. Adjust dose. [Moderate] Theoretical
- ▶ **Ceritinib** is predicted to increase the exposure to **tacrolimus**. Avoid. [Severe] Theoretical
- ▶ **Ceritinib** is predicted to increase the exposure to **taxanes (paclitaxel)**. [Moderate] Theoretical → Also see TABLE 15 p. 1450
- ▶ **Ceritinib** is predicted to increase the exposure to **thrombin inhibitors (dabigatran)**. [Moderate] Theoretical
- ▶ **Ceritinib** is predicted to increase the exposure to **topotecan**. [Moderate] Theoretical → Also see TABLE 15 p. 1450

Certalizumab pegol → see monoclonal antibodies

Cetirizine → see antihistamines, non-sedating

Cetuximab → see monoclonal antibodies

Chenodeoxycholic acid

- ▶ Oral **aluminium hydroxide** decreases the absorption of **chenodeoxycholic acid**. [Moderate] Study
- ▶ **Antiepileptics (phenobarbital, primidone)** are predicted to affect the efficacy of **chenodeoxycholic acid**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Ciclosporin** is predicted to affect the efficacy of **chenodeoxycholic acid**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ Oral **combined hormonal contraceptives** potentially decrease the efficacy of oral **chenodeoxycholic acid**. Avoid. [Moderate] Theoretical
- ▶ **Sirolimus** is predicted to affect the efficacy of **chenodeoxycholic acid**. Monitor and adjust dose. [Moderate] Theoretical

Chloral hydrate → see TABLE 11 p. 1449 (CNS depressant effects)

- ▶ Intravenous **loop diuretics (furosemide)** potentially increase the risk of sweating, variable blood pressure, and tachycardia when given after **chloral hydrate**. [Moderate] Anecdotal

Chlorambucil → see alkylating agents

Chloramphenicol

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

- ▶ **Antiepileptics (phenobarbital, primidone)** decrease the concentration of **chloramphenicol**. [Moderate] Study

- ▶ Intravenous **chloramphenicol** increases the concentration of **antiepileptics (fosphenytoin, phenytoin)** and **antiepileptics (fosphenytoin, phenytoin)** affect the concentration of intravenous **chloramphenicol**. Monitor concentration and adjust dose. [Severe] Study
- ▶ **Chloramphenicol** potentially increases the anticoagulant effect of **coumarins**. [Moderate] Anecdotal
- ▶ **Chloramphenicol** is predicted to increase the exposure to **guanfacine**. Adjust **guanfacine** dose, p. 375. [Moderate] Theoretical
- ▶ **Chloramphenicol** decreases the efficacy of **iron**. [Moderate] Anecdotal
- ▶ **Rifamycins (rifampicin)** decrease the concentration of **chloramphenicol**. [Moderate] Study
- ▶ **Chloramphenicol** is predicted to increase the exposure to **sulfonylureas**. [Severe] Study
- ▶ **Chloramphenicol** increases the concentration of **tacrolimus**. [Severe] Study

Chlordiazepoxide → see benzodiazepines

Chlormethine

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

Chloroprocaine → see TABLE 11 p. 1449 (CNS depressant effects)

- ▶ **Chloroprocaine** is predicted to increase the risk of cardiovascular adverse effects when given with **antiarrhythmics (amiodarone, dronedarone, vernakalant)**. [Severe] Theoretical
- ▶ **Chloroprocaine** is predicted to increase the risk of cardiovascular adverse effects when given with **beta blockers, non-selective (sotalol)**. [Severe] Theoretical
- ▶ **Chloroprocaine** is predicted to decrease the effects of **sulfonamides**. Avoid. [Severe] Theoretical

Chloroquine → see antimalarials

Chlorothiazide → see thiazide diuretics

Chlorphenamine → see antihistamines, sedating

Chlorpromazine → see phenothiazines

Chlortalidone → see thiazide diuretics

Cholera vaccine

- ▶ **Antimalarials (chloroquine)** decrease the efficacy of oral **cholera vaccine**. [Moderate] Study
- ▶ **Hydroxychloroquine** is predicted to decrease the efficacy of oral **cholera vaccine**. [Moderate] Theoretical

Cholic acid

- ▶ Oral **antacids** are predicted to decrease the absorption of oral **cholic acid**. Separate administration by 5 hours. [Mil] Theoretical
- ▶ **Antiepileptics (phenobarbital)** decrease the effects of **cholic acid**. Avoid. [Moderate] Study
- ▶ **Ciclosporin** affects the concentration of **cholic acid**. Avoid. [Moderate] Study

Choline salicylate

- ▶ **Corticosteroids** are predicted to decrease the concentration of **choline salicylate**. [Moderate] Study

Ciclesonide → see corticosteroids

Ciclosporin → see TABLE 2 p. 1447 (nephrotoxicity), TABLE 16 p. 1451 (increased serum potassium)

- ▶ Pomelo juice is predicted to increase ciclosporin exposure, and purple grape juice is predicted to decrease ciclosporin exposure.
- ▶ Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

- ▶ **Ciclosporin** is predicted to increase the exposure to **afatinib**. Separate administration by 12 hours. [Moderate] Study
- ▶ **Ciclosporin** markedly increases the exposure to **aliskiren**. Avoid. [Severe] Study → Also see TABLE 16 p. 1451
- ▶ **Ciclosporin** is predicted to increase the exposure to **alpelisib**. [Moderate] Theoretical
- ▶ **Ciclosporin** increases the concentration of **anthracyclines (daunorubicin, doxorubicin, epirubicin, idarubicin, mitoxantrone)**. [Severe] Study
- ▶ **Anti-androgens (apalutamide, enzalutamide)** decrease the concentration of **ciclosporin**. [Severe] Study
- ▶ **Antiarrhythmics (amiodarone)** increase the concentration of **ciclosporin**. Monitor concentration and adjust dose. [Severe] Study

- ▶ **Antiarrhythmics (dronedaron)** are predicted to increase the concentration of **ciclosporin**. [\[Severe\]](#) Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** decrease the concentration of **ciclosporin**. [\[Severe\]](#) Study
- ▶ **Antiepileptics (oxcarbazepine)** decrease the concentration of **ciclosporin**. [\[Severe\]](#) Anecdotal
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the concentration of **ciclosporin**. [\[Severe\]](#) Study
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** increase the concentration of **ciclosporin**. [\[Severe\]](#) Study
- ▶ **Antifungals, azoles (miconazole)** increase the concentration of **ciclosporin**. Monitor and adjust dose. [\[Severe\]](#) Anecdotal
- ▶ **Ciclosporin** is predicted to increase the exposure to **beta blockers, non-selective (nadolol)**. [\[Moderate\]](#) Study
- ▶ **Ciclosporin** is predicted to increase the exposure to **bictegravir**. Use with caution or avoid. [\[Moderate\]](#) Theoretical
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the concentration of **ciclosporin**. [\[Severe\]](#) Study
- ▶ **Calcium channel blockers (nicardipine)** increase the concentration of **ciclosporin**. [\[Severe\]](#) Study
- ▶ **Ciclosporin** moderately increases the exposure to **calcium channel blockers (lercanidipine)**. Use with caution or avoid. [\[Severe\]](#) Study
- ▶ **Ciclosporin** slightly increases the exposure to **caspofungin**. [\[Severe\]](#) Study
- ▶ **Ceritinib** is predicted to increase the exposure to **ciclosporin**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Ciclosporin** is predicted to affect the efficacy of **chenodeoxycholic acid**. Monitor and adjust dose. [\[Moderate\]](#) Theoretical
- ▶ **Ciclosporin** affects the concentration of **cholic acid**. Avoid. [\[Moderate\]](#) Study
- ▶ **Cobicistat** increases the concentration of **ciclosporin**. [\[Severe\]](#) Study
- ▶ **Ciclosporin** increases the exposure to **colchicine**. Avoid P-glycoprotein inhibitors or adjust **colchicine** dose, p. 1175. [\[Severe\]](#) Study
- ▶ **Crizotinib** is predicted to increase the concentration of **ciclosporin**. [\[Severe\]](#) Study
- ▶ **Ciclosporin** is predicted to increase the risk of rhabdomyolysis when given with **daptomycin**. [\[Severe\]](#) Theoretical
- ▶ **Ciclosporin** is predicted to increase the exposure to **darifenacin**. Avoid. [\[Moderate\]](#) Theoretical
- ▶ **Ciclosporin** increases the concentration of **digoxin**. Monitor and adjust dose. [\[Severe\]](#) Theoretical
- ▶ **Ciclosporin** causes a small decrease in the exposure to **eltrombopag**. Monitor platelet count and adjust dose. [\[Moderate\]](#) Study
- ▶ **Endothelin receptor antagonists (bosentan)** moderately decrease the exposure to **ciclosporin** and **ciclosporin** moderately increases the exposure to **endothelin receptor antagonists (bosentan)**. Avoid. [\[Severe\]](#) Study
- ▶ **Ciclosporin** moderately increases the exposure to **endothelin receptor antagonists (ambrisentan)**. Adjust **ambrisentan** dose, p. 198. [\[Moderate\]](#) Study
- ▶ **Entrectinib** is predicted to increase the exposure to **ciclosporin**. [\[Mild\]](#) Theoretical
- ▶ **Ciclosporin** is predicted to increase the exposure to **erlotinib**. [\[Moderate\]](#) Theoretical
- ▶ **Ciclosporin** increases the exposure to **etoposide**. Monitor and adjust dose. [\[Severe\]](#) Study
- ▶ **Ciclosporin** moderately increases the exposure to **everolimus**. Avoid or adjust dose. [\[Severe\]](#) Study
- ▶ **Ciclosporin** moderately increases the exposure to **ezetimibe** and **ezetimibe** slightly increases the exposure to **ciclosporin**. [\[Moderate\]](#) Study
- ▶ **Ciclosporin** is predicted to increase the exposure to **factor XA inhibitors (apixaban)**. [\[Moderate\]](#) Theoretical
- ▶ **Ciclosporin** slightly increases the exposure to **factor XA inhibitors (edoxaban)**. Adjust **edoxaban** dose, p. 138. [\[Severe\]](#) Study
- ▶ **Ciclosporin** slightly increases the exposure to **factor XA inhibitors (rivaroxaban)**. [\[Moderate\]](#) Study
- ▶ **Fibrates (bezafibrate)** are predicted to increase the risk of nephrotoxicity when given with **ciclosporin**. [\[Severe\]](#) Theoretical
- ▶ **Fibrates (fenofibrate)** increase the risk of nephrotoxicity when given with **ciclosporin**. [\[Severe\]](#) Study
- ▶ **Ciclosporin** is predicted to increase the exposure to **fidaxomicin**. Avoid. [\[Moderate\]](#) Study
- ▶ **Filgotinib** is predicted to increase the risk of immunosuppression when given with **ciclosporin**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Ciclosporin** is predicted to increase the exposure to **gilteritinib**. [\[Moderate\]](#) Theoretical
- ▶ **Ciclosporin** increases the exposure to **glecaprevir**. Avoid or monitor. [\[Severe\]](#) Study
- ▶ **Grapefruit juice** increases the concentration of **ciclosporin**. Avoid. [\[Severe\]](#) Study
- ▶ **Ciclosporin** greatly increases the exposure to **grazoprevir**. Avoid. [\[Severe\]](#) Study
- ▶ **H₂ receptor antagonists (cimetidine)** increase the concentration of **ciclosporin**. [\[Mild\]](#) Study
- ▶ **HIV-protease inhibitors** increase the concentration of **ciclosporin**. [\[Severe\]](#) Study
- ▶ **Idelalisib** increases the concentration of **ciclosporin**. [\[Severe\]](#) Study
- ▶ **Imatinib** is predicted to increase the concentration of **ciclosporin**. [\[Severe\]](#) Study
- ▶ **Ivacaftor** is predicted to increase the exposure to **ciclosporin**. [\[Moderate\]](#) Theoretical
- ▶ **Lanreotide** is predicted to decrease the absorption of oral **ciclosporin**. Adjust dose. [\[Severe\]](#) Theoretical
- ▶ **Ciclosporin** might increase the concentration of **lapatinib**. [\[Severe\]](#) Theoretical
- ▶ **Ciclosporin** is predicted to increase the exposure to **larotrectinib**. [\[Mild\]](#) Study
- ▶ **Letermovir** increases the exposure to **ciclosporin** and **ciclosporin** increases the exposure to **letermovir**. Monitor and adjust **letermovir** dose, p. 682. [\[Severe\]](#) Study
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **ciclosporin**. Public Health England advises avoid (refer to Green Book). [\[Severe\]](#) Theoretical
- ▶ **Ciclosporin** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [\[Moderate\]](#) Theoretical
- ▶ **Lorlatinib** is predicted to decrease the exposure to **ciclosporin**. Avoid. [\[Moderate\]](#) Theoretical
- ▶ **Lumacaftor** is predicted to decrease the exposure to **ciclosporin**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Macrolides (clarithromycin)** increase the concentration of **ciclosporin**. [\[Severe\]](#) Study
- ▶ **Macrolides (erythromycin)** are predicted to increase the concentration of **ciclosporin**. [\[Severe\]](#) Study
- ▶ **Ciclosporin** moderately increases the exposure to **meglitinides (repaglinide)**. [\[Moderate\]](#) Study
- ▶ **Metreleptin** might alter the exposure to **ciclosporin**. Monitor concentration and adjust dose. [\[Severe\]](#) Theoretical
- ▶ **Ciclosporin** is predicted to decrease the efficacy of **mifamurtide**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Mitotane** decreases the concentration of **ciclosporin**. [\[Severe\]](#) Study
- ▶ **Monoclonal antibodies (blinatumomab)** are predicted to transiently increase the exposure to **ciclosporin**. Monitor and adjust dose. [\[Moderate\]](#) Theoretical
- ▶ **Monoclonal antibodies (sarilumab)** potentially affect the exposure to **ciclosporin**. Monitor and adjust dose. [\[Moderate\]](#) Theoretical
- ▶ **Monoclonal antibodies (tocilizumab)** are predicted to decrease the exposure to **ciclosporin**. Monitor and adjust dose. [\[Moderate\]](#) Theoretical
- ▶ **Ciclosporin** is predicted to increase the exposure to **naldemedine**. [\[Moderate\]](#) Study
- ▶ **Ciclosporin** is predicted to increase the exposure to **neratinib**. Avoid or adjust **neratinib** dose and monitor for gastrointestinal adverse effects, p. 1041. [\[Severe\]](#) Theoretical
- ▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to increase the concentration of **ciclosporin**. [\[Severe\]](#) Study

Cyclosporin (continued)

- ▶ **Nilotinib** is predicted to increase the concentration of cyclosporin. [Severe] Study
- ▶ **Cyclosporin** is predicted to increase the exposure to **nintedanib**. [Moderate] Study
- ▶ **NNRTIs (efavirenz)** decrease the concentration of cyclosporin. Monitor concentration and adjust dose. [Moderate] Study
- ▶ **NNRTIs (nevirapine)** are predicted to decrease the concentration of cyclosporin. [Moderate] Study
- ▶ **Cyclosporin** increases the concentration of **NSAIDs (diclofenac)**. [Severe] Study → Also see TABLE 2 p. 1447 → Also see TABLE 16 p. 1451
- ▶ **Octreotide** decreases the absorption of oral cyclosporin. Adjust cyclosporin dose, p. 888. [Severe] Anecdotal
- ▶ **Olaparib** might alter the exposure to cyclosporin. [Moderate] Theoretical
- ▶ **Cyclosporin** is predicted to increase the exposure to the active metabolites of **ozanimod**. Avoid. [Moderate] Study
- ▶ **Palbociclib** is predicted to increase the exposure to cyclosporin. Adjust dose. [Moderate] Theoretical
- ▶ **Cyclosporin** is predicted to increase the exposure to **panobinostat**. Adjust dose. [Moderate] Theoretical
- ▶ **Pasireotide** is predicted to decrease the absorption of oral cyclosporin. Adjust dose. [Severe] Theoretical
- ▶ **Pitolisant** is predicted to decrease the exposure to cyclosporin. Avoid. [Severe] Theoretical
- ▶ **Cyclosporin** is predicted to increase the concentration of **ranolazine** and **ranolazine** is predicted to increase the concentration of cyclosporin. [Moderate] Theoretical
- ▶ **Ribociclib** is predicted to increase the exposure to cyclosporin. Use with caution and adjust dose. [Moderate] Theoretical
- ▶ **Rifamycins (rifampicin)** decrease the concentration of cyclosporin. [Severe] Study
- ▶ **Cyclosporin** very markedly increases the exposure to **rifaximin**. [Severe] Study
- ▶ **Cyclosporin** is predicted to increase the exposure to **riociguat**. [Moderate] Theoretical
- ▶ **Rucaparib** is predicted to increase the exposure to cyclosporin. Monitor and adjust dose. [Moderate] Study
- ▶ **Cyclosporin** moderately increases the exposure to **sirolimus**. Separate administration by 4 hours. [Severe] Study
- ▶ **St John's wort** decreases the concentration of cyclosporin. Avoid. [Moderate] Study
- ▶ **Cyclosporin** markedly to very markedly increases the exposure to **statins (atorvastatin)**. Avoid or adjust atorvastatin dose, p. 218. [Severe] Study
- ▶ **Cyclosporin** moderately increases the exposure to **statins (fluvastatin)**. [Severe] Study
- ▶ **Cyclosporin** markedly to very markedly increases the exposure to **statins (pravastatin)**. Adjust dose. [Severe] Study
- ▶ **Cyclosporin** markedly increases the exposure to **statins (rosuvastatin)**. Avoid. [Severe] Study
- ▶ **Cyclosporin** markedly to very markedly increases the exposure to **statins (simvastatin)**. Avoid. [Severe] Study
- ▶ **Cyclosporin** increases the concentration of **tacrolimus**. Avoid. [Severe] Study → Also see TABLE 2 p. 1447 → Also see TABLE 16 p. 1451
- ▶ **Cyclosporin** is predicted to slightly increase the exposure to **talazoparib**. Avoid or adjust talazoparib dose, p. 1059. [Severe] Study
- ▶ **Cyclosporin** is predicted to increase the exposure to **tenofovir alafenamide**. [Moderate] Theoretical
- ▶ **Cyclosporin** is predicted to increase the exposure to **tenofovir disoproxil**. [Moderate] Theoretical → Also see TABLE 2 p. 1447
- ▶ **Tetracyclines (doxycycline)** are predicted to increase the concentration of cyclosporin. [Severe] Theoretical
- ▶ **Cyclosporin** is predicted to increase the exposure to **thrombin inhibitors (dabigatran)**. Avoid. [Severe] Study
- ▶ **Cyclosporin** is predicted to increase the exposure to **ticagrelor**. Use with caution or avoid. [Severe] Study
- ▶ **Cyclosporin** might increase the exposure to **tigecycline** and **tigecycline** has been reported to increase the concentration of cyclosporin. [Severe] Anecdotal
- ▶ **Cyclosporin** increases the exposure to **tofacitinib**. Avoid. [Severe] Study
- ▶ **Cyclosporin** is predicted to increase the exposure to **topotecan**. [Severe] Study

- ▶ **Cyclosporin** is predicted to increase the concentration of **trametinib**. [Moderate] Theoretical
- ▶ **Ursodeoxycholic acid** affects the concentration of cyclosporin. Use with caution and adjust dose. [Severe] Anecdotal
- ▶ **Cyclosporin** might affect the exposure to **vemurafenib**. [Severe] Theoretical
- ▶ **Cyclosporin** is predicted to increase the exposure to **venetoclax**. Avoid or monitor for toxicity. [Severe] Theoretical
- ▶ **Cyclosporin** might increase the exposure to **vinca alkaloids**. [Severe] Theoretical
- ▶ **Vitamin E substances** affect the exposure to cyclosporin. [Moderate] Study
- ▶ **Cyclosporin** increases the concentration of **voxilaprevir**. Avoid. [Severe] Study

Cidofovir → see TABLE 2 p. 1447 (nephrotoxicity)

Cilostazol → see TABLE 4 p. 1447 (antiplatelet effects)

GENERAL INFORMATION Concurrent use with 2 or more antiplatelets or anticoagulants is contra-indicated.

- ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to alter the effects of cilostazol. [Moderate] Theoretical
 - ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to alter the effects of cilostazol. [Moderate] Theoretical
 - ▶ **Antifungals, azoles (fluconazole)** are predicted to increase the exposure to cilostazol. Adjust cilostazol dose, p. 249. [Moderate] Theoretical
 - ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to moderately increase the exposure to cilostazol. Adjust cilostazol dose, p. 249. [Moderate] Study
 - ▶ **Antifungals, azoles (micronazole)** are predicted to increase the exposure to cilostazol. Use with caution and adjust dose. [Moderate] Theoretical
 - ▶ **Cobicistat** is predicted to moderately increase the exposure to cilostazol. Adjust cilostazol dose, p. 249. [Moderate] Study
 - ▶ **HIV-protease inhibitors** are predicted to moderately increase the exposure to cilostazol. Adjust cilostazol dose, p. 249. [Moderate] Study
 - ▶ **Idelalisib** is predicted to moderately increase the exposure to cilostazol. Adjust cilostazol dose, p. 249. [Moderate] Study
 - ▶ **Cilostazol** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
 - ▶ **Macrolides (clarithromycin)** are predicted to moderately increase the exposure to cilostazol. Adjust cilostazol dose, p. 249. [Moderate] Study
 - ▶ **Macrolides (erythromycin)** slightly increase the exposure to cilostazol. Adjust cilostazol dose, p. 249. [Moderate] Study
 - ▶ **Mitotane** is predicted to alter the effects of cilostazol. [Moderate] Theoretical
 - ▶ **Moclobemide** is predicted to increase the exposure to cilostazol. [Moderate] Theoretical
 - ▶ **Proton pump inhibitors (esomeprazole)** are predicted to increase the exposure to cilostazol. [Moderate] Theoretical
 - ▶ **Proton pump inhibitors (omeprazole)** are predicted to increase the exposure to cilostazol. Adjust cilostazol dose, p. 249. [Moderate] Study
 - ▶ **Rifamycins (rifampicin)** are predicted to alter the effects of cilostazol. [Moderate] Theoretical
 - ▶ **SSRIs (fluoxetine, fluvoxamine)** are predicted to increase the exposure to cilostazol. Adjust cilostazol dose, p. 249. [Moderate] Theoretical → Also see TABLE 4 p. 1447
 - ▶ **St John's wort** is predicted to alter the effects of cilostazol. [Moderate] Theoretical
 - ▶ **Cilostazol** is predicted to increase the exposure to **statins (atorvastatin)**. [Moderate] Theoretical
 - ▶ **Cilostazol** slightly increases the exposure to **statins (simvastatin)**. [Moderate] Study
- Cimetidine** → see H₂ receptor antagonists
- Cinacalcet**
- FOOD AND LIFESTYLE** Dose adjustment might be necessary if smoking started or stopped during treatment.
- ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to cinacalcet. Monitor and adjust dose. [Moderate] Study

- ▶ **Cinacalcet** is predicted to increase the exposure to anticholinesterases, centrally acting (**galantamine**). Monitor and adjust dose. [Moderate] Study
 - ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **cinacalcet**. Monitor and adjust dose. [Moderate] Study
 - ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to moderately increase the exposure to **cinacalcet**. Adjust dose. [Moderate] Study
 - ▶ **Cinacalcet** is predicted to moderately increase the exposure to **antipsychotics, second generation (aripiprazole)**. Adjust **aripiprazole** dose, p. 418. [Moderate] Study
 - ▶ **Cinacalcet** is predicted to increase the exposure to **antipsychotics, second generation (risperidone)**. Adjust dose. [Moderate] Study
 - ▶ **Cinacalcet** is predicted to markedly increase the exposure to **atomoxetine**. Adjust dose. [Severe] Study
 - ▶ **Cinacalcet** is predicted to increase the exposure to **beta blockers, selective (metoprolol, nebivolol)**. [Moderate] Study
 - ▶ **Cobicistat** is predicted to moderately increase the exposure to **cinacalcet**. Adjust dose. [Moderate] Study
 - ▶ **Cinacalcet** is predicted to slightly increase the exposure to **darifenacin**. [Mild] Study
 - ▶ **Cinacalcet** might increase the risk of hypocalcaemia when given with **denosumab**. [Severe] Theoretical
 - ▶ **Cinacalcet** is predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
 - ▶ **Cinacalcet** increases the risk of hypocalcaemia when given with **etelcalcetide**. Avoid. [Severe] Theoretical
 - ▶ **Cinacalcet** is predicted to increase the exposure to **fesoterodine**. Use with caution and adjust dose. [Mild] Theoretical
 - ▶ **Cinacalcet** is predicted to increase the exposure to **gefitinib**. [Moderate] Theoretical
 - ▶ **HIV-protease inhibitors** are predicted to moderately increase the exposure to **cinacalcet**. Adjust dose. [Moderate] Study
 - ▶ **Idealisib** is predicted to moderately increase the exposure to **cinacalcet**. Adjust dose. [Moderate] Study
 - ▶ **Macrolides (clarithromycin)** are predicted to moderately increase the exposure to **cinacalcet**. Adjust dose. [Moderate] Study
 - ▶ **Cinacalcet** is predicted to increase the exposure to **mexiletine**. [Moderate] Study
 - ▶ **Mitotane** is predicted to decrease the exposure to **cinacalcet**. Monitor and adjust dose. [Moderate] Study
 - ▶ **Cinacalcet** is predicted to decrease the efficacy of **opioids (codeine)**. [Moderate] Theoretical
 - ▶ **Cinacalcet** is predicted to decrease the efficacy of **opioids (tramadol)**. [Severe] Study
 - ▶ **Cinacalcet** is predicted to moderately increase the exposure to **pitolisant**. Use with caution and adjust dose. [Moderate] Study
 - ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **cinacalcet**. Monitor and adjust dose. [Moderate] Study
 - ▶ **SSRIs (fluvoxamine)** are predicted to increase the exposure to **cinacalcet**. Adjust dose. [Moderate] Theoretical
 - ▶ **Cinacalcet** is predicted to increase the exposure to **SSRIs (dapoxetine)**. [Moderate] Theoretical
 - ▶ **Cinacalcet** is predicted to decrease the efficacy of **tamoxifen**. Avoid. [Severe] Study
 - ▶ **Cinacalcet** is predicted to increase the exposure to the active metabolite of **tetrabenazine**. [Moderate] Study
 - ▶ **Cinacalcet** is predicted to increase the exposure to **tricyclic antidepressants**. Monitor for toxicity and adjust dose. [Severe] Study
 - ▶ **Cinacalcet** is predicted to increase the exposure to **vortioxetine**. Monitor and adjust dose. [Moderate] Study
 - Cinnarizine** → see antihistamines, sedating
 - Ciprofibrate** → see fibrates
 - Ciprofloxacin** → see quinolones
 - Cisartacurium** → see neuromuscular blocking drugs, non-depolarising
 - Cisplatin** → see platinum compounds
 - Citalopram** → see SSRIs
 - Cladribine** → see TABLE 15 p. 1450 (myelosuppression)
 - ▶ **Antiepileptics (carbamazepine)** are predicted to increase the risk of haematological toxicity when given with oral **cladribine**. [Moderate] Theoretical
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **cladribine**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
 - Clarithromycin** → see macrolides
 - Clavulanate** → see TABLE 1 p. 1447 (hepatotoxicity)
 - Clemastine** → see antihistamines, sedating
 - Clindamycin**
- ROUTE-SPECIFIC INFORMATION** Since systemic absorption can follow topical application of **clindamycin**, the possibility of interactions should be borne in mind.
- ▶ **Clindamycin** increases the effects of **neuromuscular blocking drugs, non-depolarising**. [Severe] Anecdotal
 - ▶ **Clindamycin** increases the effects of **suxamethonium**. [Severe] Anecdotal
 - Clobazam** → see benzodiazepines
 - Clodronate** → see bisphosphonates
 - Clofarabine** → see TABLE 15 p. 1450 (myelosuppression)
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **clofarabine**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
 - Clofazimine**
 - ▶ **Clofazimine** potentially increases the risk of QT-prolongation when given with **bedaquiline**. [Severe] Study
 - Clomethiazole** → see TABLE 11 p. 1449 (CNS depressant effects)
 - ▶ **Alcohol** causes serious, potentially fatal, CNS depression when given with **clomethiazole**. Avoid. [Severe] Study → Also see TABLE 11 p. 1449
 - ▶ **Anti-androgens (apalutamide, enzalutamide)** decrease the exposure to **clomethiazole**. Monitor and adjust dose. [Moderate] Study
 - ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** decrease the exposure to **clomethiazole**. Monitor and adjust dose. [Moderate] Study → Also see TABLE 11 p. 1449
 - ▶ **Mitotane** decreases the exposure to **clomethiazole**. Monitor and adjust dose. [Moderate] Study
 - ▶ **Rifamycins (rifampicin)** decrease the exposure to **clomethiazole**. Monitor and adjust dose. [Moderate] Study
 - Clomipramine** → see tricyclic antidepressants
 - Clonazepam** → see benzodiazepines
 - Clonidine** → see TABLE 6 p. 1448 (bradycardia), TABLE 8 p. 1448 (hypotension), TABLE 11 p. 1449 (CNS depressant effects)
 - ▶ **Tricyclic antidepressants** decrease the antihypertensive effects of **clonidine**. Monitor and adjust dose. [Moderate] Anecdotal → Also see TABLE 8 p. 1448 → Also see TABLE 11 p. 1449
 - Clopidogrel** → see TABLE 4 p. 1447 (antiplatelet effects)
 - ▶ **Clopidogrel** is predicted to increase the exposure to **anti-androgens (apalutamide)**. [Mild] Study
 - ▶ **Clopidogrel** moderately increases the exposure to **anti-androgens (enzalutamide)**. Avoid or adjust enzalutamide dose, p. 997. [Severe] Study
 - ▶ **Antifungals, azoles (fluconazole)** are predicted to decrease the efficacy of **clopidogrel**. Avoid. [Severe] Theoretical
 - ▶ **Antifungals, azoles (voriconazole)** are predicted to decrease the efficacy of **clopidogrel**. Avoid. [Moderate] Study
 - ▶ **Cobicistat** is predicted to decrease the concentration of the active metabolite of **clopidogrel**. Avoid. [Severe] Theoretical
 - ▶ **Clopidogrel** is predicted to increase the exposure to **dabrafenib**. [Moderate] Theoretical
 - ▶ **Grapefruit** juice markedly decreases the exposure to **clopidogrel**. [Severe] Study
 - ▶ **Clopidogrel** increases the exposure to **meglitinides (repaglinide)**. Avoid. [Severe] Study
 - ▶ **Moclobemide** is predicted to decrease the efficacy of **clopidogrel**. Avoid. [Moderate] Study
 - ▶ **Clopidogrel** is predicted to moderately increase the exposure to **montelukast**. [Moderate] Study
 - ▶ **Clopidogrel** is predicted to increase the exposure to the active metabolites of **ozanimod**. [Moderate] Study

SEPARATION OF ADMINISTRATION Oral cladribine might affect the absorption of concurrently administered drugs—consider separating administration by at least 3 hours.

Clopidogrel (continued)

- ▶ Clopidogrel increases the exposure to **pioglitazone**. Monitor blood glucose and adjust dose. [Severe] Study
- ▶ Proton pump inhibitors (**esomeprazole**, **omeprazole**) are predicted to decrease the efficacy of clopidogrel. Avoid. [Moderate] Study
- ▶ Clopidogrel is predicted to increase the exposure to **retinoids (alitretinoin)**. Adjust alitretinoin dose, p. 1315. [Moderate] Theoretical
- ▶ Clopidogrel is predicted to increase the exposure to **selexipag**. Adjust selexipag dose, p. 197. [Moderate] Study
- ▶ SSRIs (**fluoxetine**, **fluvoxamine**) are predicted to decrease the efficacy of clopidogrel. Avoid. [Severe] Theoretical → Also see TABLE 4 p. 1447
- ▶ Clopidogrel increases the exposure to **statins (rosuvastatin)**. Adjust rosuvastatin dose, p. 220. [Moderate] Study
- ▶ Clopidogrel is predicted to increase the concentration of **taxanes (paclitaxel)**. [Severe] Anecdotal
- ▶ Clopidogrel is predicted to increase the exposure to **treprostinil**. Adjust dose. [Moderate] Theoretical → Also see TABLE 4 p. 1447

Clotrimazole → see antifungals, azoles

Clozapine → see antipsychotics, second generation

Cobicistat

- ▶ Cobicistat is predicted to increase the exposure to **abemaciclib**. Avoid or adjust abemaciclib dose, p. 1015. [Severe] Study
- ▶ Cobicistat is predicted to increase the exposure to **acalabrutinib**. Avoid. [Severe] Study
- ▶ Cobicistat is predicted to markedly increase the exposure to **aldosterone antagonists (eplerenone)**. Avoid. [Severe] Study
- ▶ Cobicistat is predicted to moderately increase the exposure to **alpha blockers (alfuzosin, tamsulosin)**. Use with caution or avoid. [Moderate] Study
- ▶ Cobicistat is predicted to increase the exposure to **alpha blockers (doxazosin)**. [Moderate] Study
- ▶ Anti-androgens (**apalutamide**, **enzalutamide**) are predicted to decrease the exposure to cobicistat. Avoid. [Severe] Theoretical
- ▶ Cobicistat is predicted to increase the exposure to **anti-androgens (apalutamide)**. [Mild] Study
- ▶ Cobicistat potentially increases the concentration of **antiarrhythmics (amiodarone, disopyramide, flecainide, lidocaine)**. [Severe] Theoretical
- ▶ Cobicistat very markedly increases the exposure to **antiarrhythmics (dronedarone)**. Avoid. [Severe] Study
- ▶ Cobicistat is predicted to increase the exposure to **antiarrhythmics (propafenone)**. Monitor and adjust dose. [Severe] Study
- ▶ Cobicistat is predicted to increase the exposure to **anticholinesterases, centrally acting (galantamine)**. Monitor and adjust dose. [Moderate] Study
- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to cobicistat. Avoid. [Severe] Theoretical
- ▶ Antiepileptics (**oxcarbazepine**) are predicted to decrease the concentration of cobicistat. [Severe] Theoretical
- ▶ Cobicistat is predicted to very slightly increase the exposure to antiepileptics (**perampnel**). [Mild] Study
- ▶ Cobicistat is predicted to increase the exposure to **antifungals, azoles (fluconazole, posaconazole)**. [Moderate] Theoretical
- ▶ Cobicistat is predicted to increase the exposure to **antifungals, azoles (isavuconazole)**. Avoid or monitor adverse effects. [Severe] Study
- ▶ Cobicistat is predicted to increase the exposure to **antifungals, azoles (itraconazole, ketoconazole)**. Adjust dose. [Moderate] Theoretical
- ▶ Cobicistat is predicted to affect the exposure to **antifungals, azoles (voriconazole)**. Avoid. [Moderate] Theoretical
- ▶ Cobicistat is predicted to increase the exposure to **antihistamines, non-sedating (mizolastine)**. Avoid. [Severe] Study
- ▶ Cobicistat is predicted to increase the exposure to **antihistamines, non-sedating (rupatadine)**. Avoid. [Moderate] Study
- ▶ Cobicistat is predicted to increase the concentration of **antimalarials (piperazine)**. [Severe] Theoretical
- ▶ Cobicistat is predicted to slightly increase the exposure to **antipsychotics, second generation (aripiprazole)**. Adjust aripiprazole dose, p. 418. [Moderate] Study
- ▶ Cobicistat is predicted to moderately increase the exposure to **antipsychotics, second generation (cariprazine)**. Avoid. [Severe] Study
- ▶ Cobicistat is predicted to increase the exposure to **antipsychotics, second generation (lurasidone, quetiapine)**. Avoid. [Severe] Study
- ▶ Cobicistat is predicted to increase the exposure to **antipsychotics, second generation (risperidone)**. Adjust dose. [Moderate] Study
- ▶ Cobicistat is predicted to increase the exposure to **avapritinib**. Avoid. [Moderate] Study
- ▶ Cobicistat is predicted to increase the exposure to **axitinib**. Avoid or adjust dose. [Moderate] Study
- ▶ Cobicistat is predicted to increase the exposure to **bedaquiline**. Avoid prolonged use. [Mild] Study
- ▶ Cobicistat moderately increases the exposure to **benzodiazepines (alprazolam)**. Avoid. [Moderate] Study
- ▶ Cobicistat is predicted to markedly to very markedly increase the exposure to **benzodiazepines (midazolam)**. Avoid or adjust dose. [Severe] Study
- ▶ Cobicistat is predicted to increase the exposure to **beta₂ agonists (salmeterol)**. Avoid. [Severe] Study
- ▶ Cobicistat slightly increases the exposure to **bortezomib**. [Moderate] Study
- ▶ Cobicistat is predicted to increase the exposure to **bosutinib**. Avoid or adjust dose. [Severe] Study
- ▶ Cobicistat is predicted to increase the exposure to **brigatinib**. Avoid or adjust brigatinib dose, p. 1022. [Severe] Study
- ▶ Cobicistat is predicted to increase the exposure to **buspirone**. Adjust buspirone dose, p. 364. [Severe] Study
- ▶ Cobicistat is predicted to increase the exposure to **cabozantinib**. [Moderate] Study
- ▶ Cobicistat is predicted to increase the exposure to **calcium channel blockers (amlodipine, felodipine, lacidipine, nicardipine, nifedipine, nimodipine)**. Monitor and adjust dose. [Moderate] Study
- ▶ Cobicistat is predicted to increase the exposure to **calcium channel blockers (diltiazem, verapamil)**. [Severe] Study
- ▶ Cobicistat is predicted to markedly increase the exposure to **calcium channel blockers (lercanidipine)**. Avoid. [Severe] Study
- ▶ Cobicistat is predicted to increase the exposure to **cannabidiol**. Avoid or adjust dose. [Mild] Study
- ▶ Cobicistat is predicted to increase the exposure to **ceritinib**. Avoid or adjust ceritinib dose, p. 1024. [Severe] Study
- ▶ Cobicistat increases the concentration of **ciclosporin**. [Severe] Study
- ▶ Cobicistat is predicted to moderately increase the exposure to **cilostazol**. Adjust cilostazol dose, p. 249. [Moderate] Study
- ▶ Cobicistat is predicted to moderately increase the exposure to **cinacalcet**. Adjust dose. [Moderate] Study
- ▶ Cobicistat is predicted to decrease the concentration of the active metabolite of **clopidogrel**. Avoid. [Severe] Theoretical
- ▶ Cobicistat is predicted to increase the exposure to **cobimetinib**. Avoid or monitor for toxicity. [Severe] Study
- ▶ Cobicistat is predicted to increase the exposure to **colchicine**. Avoid potent CYP3A4 inhibitors or adjust colchicine dose, p. 1175. [Severe] Study
- ▶ Cobicistat is predicted to decrease the efficacy of **combined hormonal contraceptives**. Avoid. [Severe] Study
- ▶ Cobicistat is predicted to increase the exposure to **corticosteroids (beclometasone)** (risk with beclometasone is likely to be lower than with other corticosteroids). [Moderate] Theoretical
- ▶ Cobicistat is predicted to increase the exposure to **corticosteroids (betamethasone, budesonide, ciclesonide, deflazacort, dexamethasone, fludrocortisone, fluticasone, hydrocortisone, methylprednisolone, mometasone, prednisolone, triamcinolone)**. Avoid or monitor adverse effects. [Severe] Study
- ▶ Cobicistat is predicted to increase the exposure to **crizotinib**. Avoid. [Moderate] Study

- ▶ **Dabrafenib** is predicted to decrease the exposure to **cobicistat**. Avoid. [Severe] Theoretical
- ▶ **Cobicistat** is predicted to increase the exposure to **dabrafenib**. Use with caution or avoid. [Moderate] Study
- ▶ **Cobicistat** is predicted to markedly to very markedly increase the exposure to **darifenacin**. Avoid. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **dasatinib**. Avoid or adjust dose—consult product literature. [Severe] Study
- ▶ **Cobicistat** very slightly increases the exposure to **delamanid**. [Severe] Study
- ▶ **Cobicistat** is predicted to moderately increase the exposure to **dienogest**. [Moderate] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **dipeptidylpeptidase-4 inhibitors (saxagliptin)**. [Moderate] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **domperidone**. Avoid. [Severe] Study
- ▶ **Cobicistat** increases the exposure to **dopamine receptor agonists (bromocriptine)**. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the concentration of **dopamine receptor agonists (cabergoline)**. [Moderate] Anecdotal
- ▶ **Cobicistat** is predicted to increase the exposure to **dronabinol**. Adjust dose. [Mild] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **drospirenone**. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **dutasteride**. Monitor adverse effects and adjust dose. [Moderate] Theoretical
- ▶ **Cobicistat** is predicted to increase the exposure to **elxacaftor**. Adjust tezacaftor with ivacaftor and elxacaftor p. 314 dose with potent CYP3A4 inhibitors. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **encorafenib**. Avoid or monitor. [Severe] Study
- ▶ **Endothelin receptor antagonists (bosentan)** are predicted to decrease the exposure to **cobicistat**. Avoid. [Severe] Theoretical
- ▶ **Cobicistat** is predicted to increase the exposure to **endothelin receptor antagonists (macitentan)**. [Moderate] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **entrectinib**. Avoid potent CYP3A4 inhibitors or adjust entrectinib dose, p. 1030. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the risk of ergotism when given with **ergometrine**. Avoid. [Severe] Theoretical
- ▶ **Cobicistat** is predicted to increase the risk of ergotism when given with **ergotamine**. Avoid. [Severe] Theoretical
- ▶ **Cobicistat** is predicted to increase the exposure to **erlotinib**. Use with caution and adjust dose. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **esketamine**. Adjust dose. [Moderate] Study
- ▶ **Cobicistat** is predicted to increase the concentration of **everolimus**. Avoid. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **factor XA inhibitors (apixaban, edoxaban, rivaroxaban)**. Avoid. [Severe] Theoretical
- ▶ **Cobicistat** is predicted to moderately increase the exposure to **fesoterodine**. Adjust fesoterodine dose with potent CYP3A4 inhibitors; avoid in hepatic and renal impairment, p. 824. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **fostamatinib**. Monitor adverse effects and adjust dose. [Moderate] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **gefitinib**. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **gilteritinib**. [Moderate] Study
- ▶ **Cobicistat** is predicted to moderately increase the exposure to **glasdegib**. Use with caution or avoid. [Moderate] Study
- ▶ **Cobicistat** potentially increases the exposure to **glecaprevir**. [Moderate] Theoretical
- ▶ **Cobicistat** is predicted to moderately to markedly increase the exposure to **grazoprevir**. Avoid. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **guanfacine**. Adjust guanfacine dose, p. 375. [Moderate] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **ibrutinib**. Avoid potent CYP3A4 inhibitors or adjust ibrutinib dose, p. 1034. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **imatinib**. [Moderate] Study
- ▶ **Cobicistat** is predicted to increase the risk of toxicity when given with **irinotecan**. Avoid. [Moderate] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **ivabradine**. Avoid. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **ivacaftor**. Adjust dose with potent CYP3A4 inhibitors, see ivacaftor p. 312, lumacaftor with ivacaftor p. 312, tezacaftor with ivacaftor p. 314, and tezacaftor with ivacaftor and elxacaftor p. 314. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **lapatinib**. Avoid. [Moderate] Study
- ▶ **Cobicistat** is predicted to moderately increase the exposure to **larotrectinib**. Avoid or adjust larotrectinib dose, p. 1038. [Moderate] Study
- ▶ **Cobicistat** is predicted to markedly increase the exposure to **lomitapide**. Avoid. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **lorlatinib**. Avoid or adjust lorlatinib dose, p. 1040. [Severe] Study
- ▶ **Cobicistat** markedly increases the exposure to **maraviroc**. Refer to specialist literature. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **meglitinides (repaglinide)**. [Moderate] Study
- ▶ **Cobicistat** potentially increases the exposure to **mexiletine**. [Severe] Theoretical
- ▶ **Cobicistat** is predicted to very markedly increase the exposure to **midostaurin**. Avoid or monitor for toxicity. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **mirabegron**. Adjust mirabegron dose in hepatic and renal impairment, p. 828. [Moderate] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **mirtazapine**. [Moderate] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **cobicistat**. Avoid. [Severe] Theoretical
- ▶ **Cobicistat** is predicted to increase the exposure to **modafinil**. [Mild] Theoretical
- ▶ **Cobicistat** is predicted to increase the exposure to **monoclonal antibodies (polatuzumab vedotin)**. [Moderate] Theoretical
- ▶ **Cobicistat** is predicted to increase the exposure to **monoclonal antibodies (trastuzumab emtansine)**. Avoid. [Severe] Theoretical
- ▶ **Cobicistat** is predicted to increase the exposure to **naldemedine**. Avoid or monitor. [Moderate] Study
- ▶ **Cobicistat** is predicted to markedly increase the exposure to **naloxegol**. Avoid. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **neratinib**. Avoid potent CYP3A4 inhibitors or adjust neratinib dose, p. 1041. [Severe] Study
- ▶ **Cobicistat** is predicted to markedly increase the exposure to **neurokinin-1 receptor antagonists (aprepitant)**. [Moderate] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **neurokinin-1 receptor antagonists (fosaprepitant)**. [Moderate] Theoretical
- ▶ **Cobicistat** is predicted to increase the exposure to **neurokinin-1 receptor antagonists (netupitant)**. [Moderate] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **nilotinib**. Avoid. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **nintedanib**. [Moderate] Theoretical
- ▶ **Cobicistat** is predicted to increase the exposure to **nitisinone**. Adjust dose. [Moderate] Theoretical
- ▶ **NNRTIs (efavirenz, nevirapine)** are predicted to decrease the exposure to **cobicistat**. Avoid. [Severe] Theoretical
- ▶ **Cobicistat** is predicted to increase the exposure to **NNRTIs (doravirine)**. [Mild] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **olaparib**. Avoid potent CYP3A4 inhibitors or adjust olaparib dose, p. 1057. [Moderate] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **opioids (alfentanil, buprenorphine, fentanyl, oxycodone)**. Monitor and adjust dose. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **ospemifene**. Avoid in poor CYP2C9 metabolisers. [Moderate] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **oxybutynin**. [Mild] Study

Cobicistat (continued)

- ▶ **Cobicistat** is predicted to increase the exposure to **palbociclib**. Avoid or adjust **palbociclib** dose, p. 1045. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **panobinostat**. Adjust **panobinostat** dose; in hepatic impairment avoid, p. 984. [Moderate] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **pazopanib**. Avoid or adjust **pazopanib** dose, p. 1045. [Moderate] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (avanafil, vardenafil)**. Avoid. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (sildenafil)**. Avoid potent CYP3A4 inhibitors or adjust **sildenafil** dose, p. 863. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (tadalafil)**. Use with caution or avoid. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **pimozide**. Avoid. [Severe] Study
- ▶ **Cobicistat** is predicted to slightly increase the exposure to **ponatinib**. Monitor and adjust **ponatinib** dose, p. 1046. [Moderate] Study
- ▶ **Cobicistat** is predicted to moderately increase the exposure to **praziquantel**. [Mild] Study
- ▶ **Cobicistat** given with carbimazole is predicted to increase the exposure to **propiverine**. Adjust starting dose. [Moderate] Theoretical
- ▶ **Cobicistat** is predicted to increase the exposure to **ranolazine**. Avoid. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **reboxetine**. Avoid. [Moderate] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **regorafenib**. Avoid. [Moderate] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **retinoids (alitretinoin)**. Adjust **alitretinoin** dose, p. 1315. [Moderate] Theoretical
- ▶ **Cobicistat** is predicted to increase the exposure to **ribociclib**. Avoid or adjust **ribociclib** dose, p. 1048. [Moderate] Study
- ▶ **Rifamycins (rifabutin)** decrease the concentration of **cobicistat** and **cobicistat** increases the exposure to **rifamycins (rifabutin)**. Avoid or adjust dose. [Severe] Study
- ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **cobicistat**. Avoid. [Severe] Theoretical
- ▶ **Cobicistat** is predicted to increase the exposure to **ruxolitinib**. Adjust dose and monitor adverse effects. [Moderate] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **siponimod**. Avoid depending on other drugs taken—consult product literature. [Severe] Theoretical
- ▶ **Cobicistat** is predicted to increase the concentration of **sirolimus**. Avoid. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **solifenacin**. Adjust **solifenacin** p. 826 or **tamsulosin** with **solifenacin** p. 832 dose; avoid in hepatic and renal impairment. [Severe] Study
- ▶ **Cobicistat** is predicted to moderately increase the exposure to **SSRIs (dapoxetine)**. Avoid potent CYP3A4 inhibitors or adjust **dapoxetine** dose, p. 870. [Severe] Study
- ▶ **St John's wort** is predicted to decrease the exposure to **cobicistat**. Avoid. [Severe] Theoretical
- ▶ **Cobicistat** is predicted to increase the exposure to **statins (atorvastatin)**. Avoid or adjust dose and monitor rhabdomyolysis. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **statins (simvastatin)**. Avoid. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **sunitinib**. Avoid or adjust **sunitinib** dose, p. 1051. [Moderate] Study
- ▶ **Cobicistat** is predicted to increase the concentration of **tacrolimus**. Monitor and adjust dose. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **talazoparib**. Avoid or adjust **talazoparib** dose, p. 1059. [Moderate] Theoretical
- ▶ **Cobicistat** is predicted to increase the exposure to **taxanes (cabazitaxel)**. Avoid. [Severe] Study
- ▶ **Cobicistat** is predicted to moderately increase the exposure to **taxanes (docetaxel)**. Avoid or adjust dose. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **taxanes (paclitaxel)**. [Severe] Theoretical

- ▶ **Cobicistat** is predicted to increase the concentration of **temsirolimus**. Avoid. [Severe] Theoretical
- ▶ **Cobicistat** is predicted to increase the exposure to **tezacaftor**. Adjust dose with potent CYP3A4 inhibitors, see **tezacaftor** with **ivacaftor** p. 314 and **tezacaftor** with **ivacaftor** and **elxacaftor** p. 314. [Severe] Study
- ▶ **Cobicistat** moderately increases the exposure to **thrombin inhibitors (dabigatran)**. Avoid. [Severe] Study
- ▶ **Cobicistat** is predicted to markedly increase the exposure to **ticagrelor**. Avoid. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **tofacinib**. Adjust **tofacinib** dose, p. 1163. [Moderate] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **tolterodine**. Avoid. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **tolvaptan**. Manufacturer advises caution or adjust **tolvaptan** dose with potent CYP3A4 inhibitors, p. 711. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **toremifene**. [Moderate] Theoretical
- ▶ **Cobicistat** is predicted to increase the exposure to **trabectedin**. Avoid or adjust dose. [Severe] Theoretical
- ▶ **Cobicistat** is predicted to moderately increase the exposure to **trazodone**. Avoid or adjust dose. [Moderate] Study
- ▶ **Cobicistat** is predicted to slightly increase the exposure to **tricyclic antidepressants**. [Mild] Study
- ▶ **Cobicistat** increases the exposure to **triptans (almotriptan)**. [Mild] Study
- ▶ **Cobicistat** is predicted to markedly increase the exposure to **triptans (eletriptan)**. Avoid. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **upadacitinib**. Use with caution or avoid. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **vemurafenib**. [Severe] Theoretical
- ▶ **Cobicistat** is predicted to increase the exposure to **venetoclax**. Avoid or adjust dose—consult product literature. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **venlafaxine**. [Moderate] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **vinca alkaloids**. [Severe] Theoretical
- ▶ **Cobicistat** is predicted to increase the exposure to **vitamin D substances (paricalcitol)**. [Moderate] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **zopiclone**. Adjust dose. [Moderate] Theoretical

Cobimetinib

- ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to **cobimetinib**. Avoid. [Severe] Theoretical
- ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to **cobimetinib**. [Severe] Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **cobimetinib**. Avoid. [Severe] Theoretical
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **cobimetinib**. [Severe] Study
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **cobimetinib**. Avoid or monitor for toxicity. [Severe] Study
- ▶ **Antifungals, azoles (miconazole)** are predicted to increase the exposure to **cobimetinib**. [Severe] Theoretical
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **cobimetinib**. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **cobimetinib**. Avoid or monitor for toxicity. [Severe] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **cobimetinib**. [Severe] Study
- ▶ **Dabrafenib** is predicted to decrease the exposure to **cobimetinib**. Avoid. [Severe] Theoretical
- ▶ **Cobimetinib** is predicted to increase the risk of bleeding when given with **drugs with anticoagulant effects** (see TABLE 3 p. 1447). [Severe] Theoretical
- ▶ **Cobimetinib** is predicted to increase the risk of bleeding when given with **drugs with antiplatelet effects** (see TABLE 4 p. 1447). [Severe] Theoretical

- ▶ **Endothelin receptor antagonists (bosentan)** are predicted to decrease the exposure to **cobimetinib**. Avoid. [Severe] Theoretical
 - ▶ **Grapefruit** juice is predicted to increase the exposure to **cobimetinib**. Avoid. [Severe] Theoretical
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **cobimetinib**. Avoid or monitor for toxicity. [Severe] Study
 - ▶ **Idealalisib** is predicted to increase the exposure to **cobimetinib**. Avoid or monitor for toxicity. [Severe] Study
 - ▶ **Imatinib** is predicted to increase the exposure to **cobimetinib**. [Severe] Study
 - ▶ **Letermovir** is predicted to increase the exposure to **cobimetinib**. [Severe] Study
 - ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **cobimetinib**. Avoid or monitor for toxicity. [Severe] Study
 - ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **cobimetinib**. [Severe] Study
 - ▶ **Mitotane** is predicted to decrease the exposure to **cobimetinib**. Avoid. [Severe] Theoretical
 - ▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to increase the exposure to **cobimetinib**. [Severe] Study
 - ▶ **Nilotinib** is predicted to increase the exposure to **cobimetinib**. [Severe] Study
 - ▶ **NNRTIs (efavirenz, nevirapine)** are predicted to decrease the exposure to **cobimetinib**. Avoid. [Severe] Theoretical
 - ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **cobimetinib**. Avoid. [Severe] Theoretical
 - ▶ **St John's wort** is predicted to decrease the exposure to **cobimetinib**. Avoid. [Severe] Theoretical
- Codeine** → see opioids
- Colchicine**
- ▶ **Anti-androgens (apalutamide)** are predicted to decrease the exposure to **colchicine**. [Mild] Study
 - ▶ **Antiarrhythmics (amiodarone)** are predicted to increase the exposure to **colchicine**. Avoid P-glycoprotein inhibitors or adjust **colchicine** dose, p. 1175. [Severe] Theoretical
 - ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to **colchicine**. Adjust **colchicine** dose with moderate CYP3A4 inhibitors, p. 1175. [Severe] Study
 - ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **colchicine**. Adjust **colchicine** dose with moderate CYP3A4 inhibitors, p. 1175. [Severe] Study
 - ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **colchicine**. Avoid potent CYP3A4 inhibitors or adjust **colchicine** dose, p. 1175. [Severe] Study
 - ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **colchicine**. Adjust **colchicine** dose with moderate CYP3A4 inhibitors, p. 1175. [Severe] Study
 - ▶ **Ceritinib** is predicted to increase the exposure to **colchicine**. [Moderate] Theoretical
 - ▶ **Ciclosporin** increases the exposure to **colchicine**. Avoid P-glycoprotein inhibitors or adjust **colchicine** dose, p. 1175. [Severe] Study
 - ▶ **Cobicistat** is predicted to increase the exposure to **colchicine**. Avoid potent CYP3A4 inhibitors or adjust **colchicine** dose, p. 1175. [Severe] Study
 - ▶ **Crizotinib** is predicted to increase the exposure to **colchicine**. Adjust **colchicine** dose with moderate CYP3A4 inhibitors, p. 1175. [Severe] Study
 - ▶ **Eliglustat** is predicted to increase the exposure to **colchicine**. Avoid or adjust **colchicine** dose, p. 1175. [Severe] Theoretical
 - ▶ **Colchicine** increases the risk of rhabdomyolysis when given with **fibrates**. [Severe] Anecdotal
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **colchicine**. Avoid potent CYP3A4 inhibitors or adjust **colchicine** dose, p. 1175. [Severe] Study
 - ▶ **Ibrutinib** is predicted to increase the exposure to **colchicine**. Separate administration by at least 6 hours. [Moderate] Theoretical
 - ▶ **Idealalisib** is predicted to increase the exposure to **colchicine**. Avoid potent CYP3A4 inhibitors or adjust **colchicine** dose, p. 1175. [Severe] Study
 - ▶ **Imatinib** is predicted to increase the exposure to **colchicine**. Adjust **colchicine** dose with moderate CYP3A4 inhibitors, p. 1175. [Severe] Study
 - ▶ **Ivacaftor** is predicted to increase the exposure to **colchicine**. [Moderate] Study
 - ▶ **Lapatinib** is predicted to increase the exposure to **colchicine**. Avoid P-glycoprotein inhibitors or adjust **colchicine** dose, p. 1175. [Moderate] Theoretical
 - ▶ **Letermovir** is predicted to increase the exposure to **colchicine**. Adjust **colchicine** dose with moderate CYP3A4 inhibitors, p. 1175. [Severe] Study
 - ▶ **Lorlatinib** is predicted to decrease the exposure to **colchicine**. [Moderate] Study
 - ▶ **Macrolides (azithromycin)** are predicted to increase the exposure to **colchicine**. Avoid P-glycoprotein inhibitors or adjust **colchicine** dose, p. 1175. [Severe] Theoretical
 - ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **colchicine**. Avoid potent CYP3A4 inhibitors or adjust **colchicine** dose, p. 1175. [Severe] Study
 - ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **colchicine**. Adjust **colchicine** dose with moderate CYP3A4 inhibitors, p. 1175. [Severe] Study
 - ▶ **Mirabegron** is predicted to increase the exposure to **colchicine**. [Mild] Theoretical
 - ▶ **Neratinib** is predicted to increase the exposure to **colchicine**. [Moderate] Study
 - ▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to increase the exposure to **colchicine**. Adjust **colchicine** dose with moderate CYP3A4 inhibitors, p. 1175. [Severe] Study
 - ▶ **Nilotinib** is predicted to increase the exposure to **colchicine**. Adjust **colchicine** dose with moderate CYP3A4 inhibitors, p. 1175. [Severe] Study
 - ▶ **Olaparib** might increase the exposure to **colchicine**. [Moderate] Theoretical
 - ▶ **Osimertinib** is predicted to increase the exposure to **colchicine**. [Moderate] Study
 - ▶ **Pibrentasvir** with glecaprevir is predicted to increase the exposure to **colchicine**. [Moderate] Study
 - ▶ **Pitolisant** is predicted to decrease the exposure to **colchicine**. [Mild] Theoretical
 - ▶ **Ranolazine** is predicted to increase the exposure to **colchicine**. Avoid P-glycoprotein inhibitors or adjust **colchicine** dose, p. 1175. [Severe] Theoretical
 - ▶ **Colchicine** has been reported to cause rhabdomyolysis when given with **statins**. [Severe] Anecdotal
 - ▶ **Vandetanib** is predicted to increase the exposure to **colchicine**. [Moderate] Study
 - ▶ **Velpatasvir** is predicted to increase the exposure to **colchicine**. [Severe] Theoretical
 - ▶ **Vemurafenib** is predicted to increase the exposure to **colchicine**. Avoid P-glycoprotein inhibitors or adjust **colchicine** dose, p. 1175. [Severe] Theoretical
- Colecalciferol** → see vitamin D substances
- Colesevelam**
- SEPARATION OF ADMINISTRATION Manufacturer advises take 4 hours before, or after, other drugs.
- Colestipol**
- SEPARATION OF ADMINISTRATION Manufacturer advises take other drugs at least 1 hour before, or 4 hours after, colestipol.
- Colestyramine**
- SEPARATION OF ADMINISTRATION Manufacturer advises take other drugs at least 1 hour before, or 4–6 hours after, colestyramine.
- Colistimethate** → see TABLE 2 p. 1447 (nephrotoxicity), TABLE 20 p. 1451 (neuromuscular blocking effects)
- Combined hormonal contraceptives**
- ▶ **Combined hormonal contraceptives** is predicted to increase the exposure to **agomelatine**. [Moderate] Study
 - ▶ **Combined hormonal contraceptives** is predicted to increase the exposure to **aminophylline**. Adjust dose. [Moderate] Theoretical

Combined hormonal contraceptives (continued)

- ▶ **Combined hormonal contraceptives** is predicted to increase the exposure to **anaesthetics, local (ropivacaine)**. [Moderate] Theoretical
- ▶ **Combined hormonal contraceptives** is predicted to increase the exposure to **anagrelide**. [Moderate] Theoretical
- ▶ **Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate)** are predicted to decrease the efficacy of **combined hormonal contraceptives**. For FSRH guidance, see Contraceptives, interactions p. 843. [Severe] Study
- ▶ **Combined hormonal contraceptives** alter the exposure to **antiepileptics (lamotrigine)**. Adjust dose. [Moderate] Study
- ▶ **Combined hormonal contraceptives** increases the concentration of **antipsychotics, second generation (clozapine)**. Monitor adverse effects and adjust dose. [Severe] Study
- ▶ **Combined hormonal contraceptives** is predicted to increase the exposure to **antipsychotics, second generation (olanzapine)**. Adjust dose. [Moderate] Anecdotal
- ▶ **Brigatinib** is predicted to decrease the exposure to **combined hormonal contraceptives**. Use additional contraceptive precautions. [Severe] Theoretical
- ▶ **Carfilzomib** potentially decreases the efficacy of **combined hormonal contraceptives**. Use additional contraceptive precautions. [Severe] Theoretical
- ▶ **Oral combined hormonal contraceptives** potentially decrease the efficacy of oral **chenodeoxycholic acid**. Avoid. [Moderate] Theoretical
- ▶ **Cobicistat** is predicted to decrease the efficacy of **combined hormonal contraceptives**. Avoid. [Severe] Study
- ▶ **Combined hormonal contraceptives** is predicted to increase the exposure to **dopamine receptor agonists (ropinirole)**. Adjust dose. [Moderate] Study
- ▶ **Encorafenib** is predicted to affect the exposure to **combined hormonal contraceptives**. [Severe] Theoretical
- ▶ **Endothelin receptor antagonists (bosentan)** are predicted to decrease the efficacy of **combined hormonal contraceptives**. For FSRH guidance, see Contraceptives, interactions p. 843. [Severe] Study
- ▶ **Combined hormonal contraceptives** are predicted to increase the exposure to **erlotinib**. Monitor adverse effects and adjust dose. [Moderate] Study
- ▶ **Combined hormonal contraceptives** (containing ethinylestradiol) are predicted to increase the risk of increased ALT concentrations when given with **glecaprevir**. Avoid. [Severe] Study
- ▶ **Griseofulvin** potentially decreases the efficacy of **combined hormonal contraceptives**. For FSRH guidance, see Contraceptives, interactions p. 843. [Severe] Anecdotal
- ▶ **HIV-protease inhibitors (atazanavir)** (unboosted) increase the exposure to **combined hormonal contraceptives**. Adjust dose. [Severe] Study
- ▶ **HIV-protease inhibitors (ritonavir)** are predicted to decrease the efficacy of **combined hormonal contraceptives**. For FSRH guidance, see Contraceptives, interactions p. 843. [Severe] Study
- ▶ **Larotrectinib** potentially decreases the efficacy of **combined hormonal contraceptives**. Use additional contraceptive precautions. [Severe] Theoretical
- ▶ **Combined hormonal contraceptives** are predicted to increase the risk of venous thromboembolism when given with **lenalidomide**. Avoid. [Severe] Theoretical
- ▶ **Oral combined hormonal contraceptives** slightly increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
- ▶ **Lorlatinib** is predicted to decrease the exposure to **combined hormonal contraceptives**. Avoid. [Moderate] Theoretical
- ▶ **Combined hormonal contraceptives** is predicted to increase the exposure to **loxapine**. Avoid. [Unknown] Theoretical
- ▶ **Lumacaftor** is predicted to decrease the exposure to **combined hormonal contraceptives**. Use additional contraceptive precautions. [Severe] Theoretical
- ▶ **Combined hormonal contraceptives** slightly increases the exposure to **MAO-B inhibitors (rasagiline)**. [Moderate] Study
- ▶ **Combined hormonal contraceptives** increase the exposure to **MAO-B inhibitors (selegiline)**. Avoid. [Severe] Study
- ▶ **Combined hormonal contraceptives** is predicted to increase the exposure to **melatonin**. [Moderate] Theoretical
- ▶ **Metreleptin** might decrease the efficacy of **combined hormonal contraceptives**. Use additional contraceptive precautions. [Severe] Theoretical
- ▶ **Combined hormonal contraceptives** decrease the effects of **metyrapone**. Avoid. [Moderate] Theoretical
- ▶ **Modafinil** is predicted to decrease the efficacy of **combined hormonal contraceptives**. For FSRH guidance, see Contraceptives, interactions p. 843. [Severe] Study
- ▶ **Monoclonal antibodies (sarilumab)** potentially decrease the exposure to **combined hormonal contraceptives**. [Severe] Theoretical
- ▶ **Neurokinin-1 receptor antagonists (aprepitant, fosaprepitant)** are predicted to decrease the efficacy of **combined hormonal contraceptives**. For FSRH guidance, see Contraceptives, interactions p. 843. [Severe] Study
- ▶ **NNRTIs (efavirenz, nevirapine)** are predicted to decrease the efficacy of **combined hormonal contraceptives**. For FSRH guidance, see Contraceptives, interactions p. 843. [Severe] Study
- ▶ **NSAIDs (etoricoxib)** increase the exposure to **combined hormonal contraceptives**. [Moderate] Study
- ▶ **Olaparib** potentially affects the efficacy of **combined hormonal contraceptives**. Use additional contraceptive precautions. [Moderate] Theoretical
- ▶ **Combined hormonal contraceptives** potentially oppose the effects of **ospemifene**. Avoid. [Severe] Theoretical
- ▶ **Combined hormonal contraceptives** is predicted to increase the exposure to **phenothiazines (chlorpromazine)**. [Moderate] Theoretical
- ▶ **Combined hormonal contraceptives** is predicted to increase the exposure to **phosphodiesterase type-4 inhibitors (roflumilast)**. [Moderate] Theoretical
- ▶ **Combined hormonal contraceptives** (containing ethinylestradiol) are predicted to increase the risk of increased ALT concentrations when given with **pibrentasvir**. Avoid. [Severe] Study
- ▶ **Combined hormonal contraceptives** is predicted to increase the exposure to **pirfenidone**. Use with caution and adjust dose. [Moderate] Study
- ▶ **Pitolisant** is predicted to decrease the efficacy of **combined hormonal contraceptives**. Avoid. [Severe] Theoretical
- ▶ **Combined hormonal contraceptives** are predicted to increase the risk of venous thromboembolism when given with **pomalidomide**. Avoid. [Severe] Theoretical
- ▶ **Combined hormonal contraceptives** potentially oppose the effects of **raloxifene**. Avoid. [Severe] Theoretical
- ▶ **Rifamycins** are predicted to decrease the efficacy of **combined hormonal contraceptives**. For FSRH guidance, see Contraceptives, interactions p. 843. [Severe] Study
- ▶ **Combined hormonal contraceptives** is predicted to increase the exposure to **riluzole**. [Moderate] Theoretical
- ▶ **St John's wort** decreases the efficacy of **combined hormonal contraceptives**. MHRA advises avoid. For FSRH guidance, see Contraceptives, interactions p. 843. [Severe] Anecdotal
- ▶ **Sugammadex** is predicted to decrease the exposure to **combined hormonal contraceptives**. Refer to patient information leaflet for missed pill advice. [Severe] Theoretical
- ▶ **Combined hormonal contraceptives** might exacerbate skin pigmentation when given with **tetracyclines (minocycline)**. [Moderate] Anecdotal
- ▶ **Combined hormonal contraceptives** are predicted to increase the risk of venous thromboembolism when given with **thalidomide**. Avoid. [Severe] Study
- ▶ **Combined hormonal contraceptives** is predicted to increase the exposure to **theophylline**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Combined hormonal contraceptives** increases the exposure to **tizanidine**. Avoid. [Moderate] Study
- ▶ **Combined hormonal contraceptives** is predicted to increase the exposure to **triptans (zolmitriptan)**. Adjust **zolmitriptan** dose, p. 507. [Moderate] Theoretical
- ▶ **Ulipristal** is predicted to decrease the efficacy of **combined hormonal contraceptives**. Avoid. [Severe] Theoretical

- ▶ **Vemurafenib** might decrease the efficacy of **combined hormonal contraceptives**. Use additional contraceptive precautions. [\[Severe\]](#) Theoretical
 - ▶ **Combined hormonal contraceptives** (containing ethinylestradiol) are predicted to increase the risk of increased ALT concentrations when given with **voxilaprevir** with sofosbuvir and velpatasvir. Avoid. [\[Severe\]](#) Study
- Corticosteroids** → see TABLE 17 p. 1451 (reduced serum potassium)
- beclomethasone · betamethasone · budesonide · ciclesonide · deflazacort · dexamethasone · fludrocortisone · fluticasone · hydrocortisone · methylprednisolone · mometasone · prednisolone · triamcinolone
- ▶ With intravitreal use of **dexamethasone** in adults: caution with concurrent administration of anticoagulant or antiplatelet drugs—increased risk of haemorrhagic events.
 - ▶ Interactions do not generally apply to corticosteroids (except budesonide and fluticasone) used for topical action (including inhalation) unless specified. However, as systemic absorption might occur with **hydrocortisone eye drops**, the possibility of interactions should be borne in mind.
- ▶ Oral **antacids** are predicted to decrease the absorption of oral **deflazacort**. Separate administration by 2 hours. [\[Moderate\]](#) Theoretical
 - ▶ Oral **antacids** decrease the absorption of oral **dexamethasone**. [\[Moderate\]](#) Study
 - ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to **fluticasone**. [\[Unknown\]](#) Theoretical
 - ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to corticosteroids (**budesonide, deflazacort, dexamethasone, fludrocortisone, hydrocortisone, methylprednisolone, prednisolone, triamcinolone**). Monitor and adjust dose. [\[Moderate\]](#) Study
 - ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to **methylprednisolone**. Monitor and adjust dose. [\[Moderate\]](#) Study
 - ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **fluticasone**. [\[Unknown\]](#) Theoretical
 - ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to corticosteroids (**budesonide, deflazacort, dexamethasone, fludrocortisone, hydrocortisone, methylprednisolone, prednisolone, triamcinolone**). Monitor and adjust dose. [\[Moderate\]](#) Study
 - ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **methylprednisolone**. Monitor and adjust dose. [\[Moderate\]](#) Study
 - ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **beclomethasone** (risk with beclomethasone is likely to be lower than with other corticosteroids). [\[Moderate\]](#) Theoretical
 - ▶ **Antifungals, azoles (miconazole)** are predicted to increase the concentration of **methylprednisolone**. Monitor and adjust dose. [\[Moderate\]](#) Theoretical
 - ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to corticosteroids (**betamethasone, budesonide, ciclesonide, deflazacort, dexamethasone, fludrocortisone, fluticasone, hydrocortisone, methylprednisolone, mometasone, prednisolone, triamcinolone**). Avoid or monitor adverse effects. [\[Severe\]](#) Study
 - ▶ **Corticosteroids** are predicted to decrease the concentration of **aspirin** (high-dose) and **aspirin** (high-dose) increases the risk of gastrointestinal bleeding when given with **corticosteroids**. [\[Moderate\]](#) Study
 - ▶ **Dexamethasone** is predicted to decrease the exposure to **avapritinib**. Avoid. [\[Severe\]](#) Theoretical
 - ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **methylprednisolone**. Monitor and adjust dose. [\[Moderate\]](#) Study
 - ▶ **Dexamethasone** is predicted to decrease the concentration of **caspofungin**. Adjust caspofungin dose, p. 637. [\[Moderate\]](#) Theoretical
 - ▶ **Corticosteroids** are predicted to decrease the concentration of **choline salicylate**. [\[Moderate\]](#) Study
 - ▶ **Cobicistat** is predicted to increase the exposure to **beclomethasone** (risk with beclomethasone is likely to be lower than with other corticosteroids). [\[Moderate\]](#) Theoretical
 - ▶ **Cobicistat** is predicted to increase the exposure to corticosteroids (**betamethasone, budesonide, ciclesonide, deflazacort, dexamethasone, fludrocortisone, fluticasone, hydrocortisone, methylprednisolone, mometasone, prednisolone, triamcinolone**). Avoid or monitor adverse effects. [\[Severe\]](#) Study
 - ▶ **Corticosteroids** are predicted to increase the effects of **coumarins**. [\[Moderate\]](#) Study
 - ▶ **Crizotinib** is predicted to increase the exposure to **methylprednisolone**. Monitor and adjust dose. [\[Moderate\]](#) Study
 - ▶ **Erlotinib** is predicted to increase the risk of gastrointestinal perforation when given with **corticosteroids**. [\[Severe\]](#) Theoretical
 - ▶ **Corticosteroids** potentially oppose the effects of **glycerol phenylbutyrate**. [\[Moderate\]](#) Theoretical
 - ▶ **Grapefruit** juice moderately increases the exposure to oral **budesonide**. Avoid. [\[Moderate\]](#) Study
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **beclomethasone** (risk with beclomethasone is likely to be lower than with other corticosteroids). [\[Moderate\]](#) Theoretical
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to corticosteroids (**betamethasone, budesonide, ciclesonide, deflazacort, dexamethasone, fludrocortisone, fluticasone, hydrocortisone, methylprednisolone, mometasone, prednisolone, triamcinolone**). Avoid or monitor adverse effects. [\[Severe\]](#) Study
 - ▶ **Idelalisib** is predicted to increase the exposure to **beclomethasone** (risk with beclomethasone is likely to be lower than with other corticosteroids). [\[Moderate\]](#) Theoretical
 - ▶ **Idelalisib** is predicted to increase the exposure to corticosteroids (**betamethasone, budesonide, ciclesonide, deflazacort, dexamethasone, fludrocortisone, fluticasone, hydrocortisone, methylprednisolone, mometasone, prednisolone, triamcinolone**). Avoid or monitor adverse effects. [\[Severe\]](#) Study
 - ▶ **Imatinib** is predicted to increase the exposure to **methylprednisolone**. Monitor and adjust dose. [\[Moderate\]](#) Study
 - ▶ **Corticosteroids** are predicted to increase the risk of gastrointestinal bleeding when given with **iron chelators (deferasirox)**. [\[Severe\]](#) Theoretical
 - ▶ **Letemovir** is predicted to increase the exposure to **methylprednisolone**. Monitor and adjust dose. [\[Moderate\]](#) Study
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **corticosteroids** (high-dose). Public Health England advises avoid (refer to Green Book). [\[Severe\]](#) Theoretical
 - ▶ **Lumacaftor** is predicted to decrease the exposure to **methylprednisolone**. Adjust dose. [\[Severe\]](#) Theoretical
 - ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **beclomethasone** (risk with beclomethasone is likely to be lower than with other corticosteroids). [\[Moderate\]](#) Theoretical
 - ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **methylprednisolone**. Monitor and adjust dose. [\[Moderate\]](#) Study
 - ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to corticosteroids (**betamethasone, budesonide, ciclesonide, deflazacort, dexamethasone, fludrocortisone, fluticasone, hydrocortisone, methylprednisolone, mometasone, prednisolone, triamcinolone**). Avoid or monitor adverse effects. [\[Severe\]](#) Study
 - ▶ **Corticosteroids** are predicted to decrease the efficacy of **mifamurtide**. Avoid. [\[Severe\]](#) Theoretical
 - ▶ **Mifepristone** is predicted to decrease the efficacy of **corticosteroids**. Use with caution and adjust dose. [\[Moderate\]](#) Theoretical
 - ▶ **Mitotane** is predicted to decrease the exposure to corticosteroids (**budesonide, deflazacort, dexamethasone, fludrocortisone, hydrocortisone, methylprednisolone, prednisolone, triamcinolone**). Monitor and adjust dose. [\[Moderate\]](#) Study

Corticosteroids (continued)

- ▶ **Mitotane** is predicted to decrease the exposure to **fluticasone**. [Unknown] Theoretical
- ▶ Corticosteroids (**betamethasone**, **deflazacort**, **dexamethasone**, **hydrocortisone**, **methylprednisolone**, **prednisolone**) are predicted to decrease the efficacy of **monoclonal antibodies (atezolizumab, ipilimumab, nivolumab, pembrolizumab)**. Use with caution or avoid. [Severe] Theoretical
- ▶ **Monoclonal antibodies (tocilizumab)** are predicted to decrease the exposure to corticosteroids (**dexamethasone**, **methylprednisolone**). Monitor and adjust dose. [Moderate] Theoretical
- ▶ Corticosteroids are predicted to increase the risk of immunosuppression when given with **monoclonal antibodies (dinutuximab)**. Avoid except in life-threatening situations. [Severe] Theoretical
- ▶ **Neurokinin-1 receptor antagonists (aprepitant)** moderately increase the exposure to **dexamethasone**. Monitor and adjust dose. [Moderate] Study
- ▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to increase the exposure to oral **budesonide**. [Moderate] Study
- ▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to increase the exposure to **fluticasone**. [Moderate] Study
- ▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to increase the exposure to **methylprednisolone**. Monitor and adjust dose. [Moderate] Study
- ▶ **Neurokinin-1 receptor antagonists (netupitant)** are predicted to increase the exposure to **dexamethasone**. Adjust dose. [Moderate] Study
- ▶ Corticosteroids are predicted to decrease the effects of **neuromuscular blocking drugs, non-depolarising**. [Severe] Anecdotal
- ▶ Corticosteroids increase the risk of gastrointestinal perforation when given with **nicorandil**. [Severe] Anecdotal
- ▶ **Nilotinib** is predicted to increase the exposure to **methylprednisolone**. Monitor and adjust dose. [Moderate] Study
- ▶ **Dexamethasone** is predicted to decrease the concentration of **NNRTIs (rilpivirine)**. Avoid multiple-dose dexamethasone. [Severe] Theoretical
- ▶ **NSAIDs** increase the risk of gastrointestinal bleeding when given with **corticosteroids**. [Severe] Study
- ▶ Corticosteroids are predicted to increase the effects of **phenindione**. [Moderate] Anecdotal
- ▶ **Dexamethasone** decreases the exposure to **praziquantel**. [Moderate] Study
- ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **fluticasone**. [Unknown] Theoretical
- ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to corticosteroids (**budesonide**, **deflazacort**, **dexamethasone**, **fludrocortisone**, **hydrocortisone**, **methylprednisolone**, **prednisolone**, **triamcinolone**). Monitor and adjust dose. [Moderate] Study
- ▶ Corticosteroids potentially decrease the effects of **sodium phenylbutyrate**. [Moderate] Anecdotal
- ▶ Corticosteroids are predicted to decrease the effects of **somatropin**. [Moderate] Theoretical
- ▶ Corticosteroids are predicted to decrease the effects of **suxamethonium**. [Severe] Anecdotal

Coumarins → see TABLE 3 p. 1447 (anticoagulant effects)

acenocoumarol - warfarin

FOOD AND LIFESTYLE The effects of coumarins can be reduced or abolished by vitamin K, including that found in health foods, food supplements, enteral feeds, or large amounts of some green vegetables or green tea. Major changes in diet (especially involving salads and vegetables) and in alcohol consumption can affect anticoagulant control. Pomegranate juice is predicted to increase the INR in response to **acenocoumarol** and **warfarin**.

- ▶ **Alcohol** (in those who drink heavily) potentially decreases the anticoagulant effect of **coumarins**. [Severe] Study
- ▶ **Alpelisib** is predicted to decrease the efficacy of **warfarin**. [Moderate] Theoretical

- ▶ **Anti-androgens (apalutamide)** are predicted to decrease the exposure to **coumarins**. Avoid or monitor. [Mid] Study
- ▶ **Anti-androgens (enzalutamide)** potentially decrease the exposure to **coumarins**. Avoid or adjust dose and monitor INR. [Severe] Study
- ▶ **Antiarrhythmics (amiodarone)** increase the anticoagulant effect of **coumarins**. [Severe] Study
- ▶ **Antiarrhythmics (propafenone)** increase the anticoagulant effect of **coumarins**. Monitor INR and adjust dose. [Moderate] Study
- ▶ **Antiepileptics (carbamazepine)** decrease the effects of **coumarins**. Monitor and adjust dose. [Severe] Study
- ▶ **Antiepileptics (fosphenytoin, phenytoin)** are predicted to alter the anticoagulant effect of **coumarins**. [Moderate] Anecdotal
- ▶ **Antiepileptics (phenobarbital, primidone)** decrease the anticoagulant effect of **coumarins**. Monitor INR and adjust dose. [Moderate] Study
- ▶ **Antifungals, azoles (fluconazole)** increase the anticoagulant effect of **coumarins**. Monitor INR and adjust dose. [Severe] Study
- ▶ **Antifungals, azoles (itraconazole)** potentially increase the anticoagulant effect of **coumarins**. [Severe] Anecdotal
- ▶ **Antifungals, azoles (ketoconazole)** potentially increase the anticoagulant effect of **warfarin**. Monitor INR and adjust dose. [Severe] Anecdotal
- ▶ **Antifungals, azoles (miconazole)** greatly increase the anticoagulant effect of **coumarins**. MHRA advises avoid unless INR can be monitored closely; monitor for signs of bleeding. [Severe] Study
- ▶ **Antifungals, azoles (voriconazole)** increase the anticoagulant effect of **coumarins**. Monitor INR and adjust dose. [Moderate] Study
- ▶ **Azathioprine** decreases the anticoagulant effect of **coumarins**. [Moderate] Study
- ▶ **Capcitabine** increases the effects of **coumarins**. Monitor INR and adjust dose. [Moderate] Anecdotal
- ▶ **Cephalosporins (cefazolin, ceftriaxone)** potentially increase the risk of bleeding events when given with **coumarins**. [Severe] Anecdotal
- ▶ **Ceritinib** is predicted to increase the exposure to **acenocoumarol**. [Severe] Theoretical
- ▶ **Ceritinib** is predicted to increase the exposure to **warfarin**. Avoid. [Severe] Theoretical
- ▶ **Chloramphenicol** potentially increases the anticoagulant effect of **coumarins**. [Moderate] Anecdotal
- ▶ **Corticosteroids** are predicted to increase the effects of **coumarins**. [Moderate] Study
- ▶ **Cranberry** juice potentially increases the anticoagulant effect of **warfarin**. Avoid. [Severe] Anecdotal
- ▶ **Crizotinib** is predicted to increase the risk of bleeding events when given with **coumarins**. [Severe] Theoretical
- ▶ **Dabrafenib** is predicted to decrease the anticoagulant effect of **coumarins**. [Severe] Theoretical
- ▶ **Disulfiram** increases the anticoagulant effect of **coumarins**. Monitor and adjust dose. [Severe] Study
- ▶ **Elvitegravir** is predicted to decrease the anticoagulant effect of **coumarins**. [Moderate] Theoretical
- ▶ **Endothelin receptor antagonists (bosentan)** decrease the anticoagulant effect of **coumarins**. [Moderate] Study
- ▶ **Enteral feeds** (vitamin-K containing) potentially decrease the anticoagulant effect of **coumarins**. [Severe] Anecdotal
- ▶ **Erlotinib** increases the anticoagulant effect of **coumarins**. [Severe] Anecdotal
- ▶ **Fibrates** are predicted to increase the anticoagulant effect of **coumarins**. Monitor INR and adjust dose. [Severe] Study
- ▶ **Fluorouracil** increases the anticoagulant effect of **coumarins**. [Severe] Anecdotal
- ▶ **Fostamatinib** potentially alters the anticoagulant effect of **warfarin**. [Moderate] Theoretical
- ▶ **Gefitinib** is predicted to increase the anticoagulant effect of **coumarins**. [Severe] Anecdotal
- ▶ **Glucagon** increases the anticoagulant effect of **warfarin**. [Severe] Study
- ▶ **Glucosamine** potentially decreases the anticoagulant effect of **acenocoumarol**. [Moderate] Anecdotal

- ▶ **Glucosamine** potentially increases the anticoagulant effect of **warfarin**. Avoid. [Moderate] Anecdotal
 - ▶ **Griseofulvin** potentially decreases the anticoagulant effect of **coumarins**. [Moderate] Anecdotal
 - ▶ **H₂ receptor antagonists (cimetidine)** increase the anticoagulant effect of **coumarins**. [Severe] Study
 - ▶ **HIV-protease inhibitors** are predicted to affect the anticoagulant effect of **coumarins**. [Moderate] Study
 - ▶ **Imatinib** is predicted to increase the risk of bleeding events when given with **coumarins**. [Severe] theoretical
 - ▶ **Ivacaftor** is predicted to increase the exposure to **warfarin**. [Moderate] Theoretical
 - ▶ **Ivermectin** potentially increases the anticoagulant effect of **coumarins**. [Severe] Anecdotal
 - ▶ **Lapatinib** is predicted to increase the risk of bleeding events when given with **coumarins**. [Severe] Theoretical
 - ▶ **Leflunomide** increases the anticoagulant effect of **coumarins**. [Severe] Anecdotal
 - ▶ **Letermovir** is predicted to decrease the concentration of **warfarin**. Monitor and adjust dose. [Moderate] Theoretical
 - ▶ **Lomitapide** increases the exposure to **warfarin**. Monitor INR and adjust dose. [Severe] Study
 - ▶ **Lorlatinib** is predicted to decrease the exposure to **coumarins**. [Moderate] Theoretical
 - ▶ **Macrolides (clarithromycin, erythromycin)** increase the anticoagulant effect of **coumarins**. Monitor INR and adjust dose. [Severe] Anecdotal
 - ▶ **Mercaptopurine** decreases the anticoagulant effect of **coumarins**. [Moderate] Anecdotal
 - ▶ **Metreleptin** might alter the exposure to **warfarin**. Monitor INR and adjust dose. [Severe] Theoretical
 - ▶ **Metronidazole** increases the anticoagulant effect of **coumarins**. Monitor INR and adjust dose. [Severe] Study
 - ▶ **Mexiletine** potentially affects the exposure to **warfarin**. Avoid. [Unknown] Theoretical
 - ▶ **Monoclonal antibodies (bimatimumab)** are predicted to transiently increase the exposure to **warfarin**. Monitor and adjust dose. [Moderate] Theoretical
 - ▶ **Monoclonal antibodies (sarilumab)** potentially affect the exposure to **warfarin**. Monitor and adjust dose. [Severe] Theoretical
 - ▶ **Monoclonal antibodies (tocilizumab)** are predicted to decrease the exposure to **warfarin**. Monitor and adjust dose. [Moderate] Theoretical
 - ▶ **Nandrolone** is predicted to increase the anticoagulant effect of **coumarins**. Monitor and adjust dose. [Severe] Theoretical
 - ▶ **Neurokinin-1 receptor antagonists (aprepitant)** decrease the anticoagulant effect of **coumarins**. [Moderate] Study
 - ▶ **Neurokinin-1 receptor antagonists (fosaprepitant)** are predicted to decrease the anticoagulant effect of **coumarins**. [Moderate] Theoretical
 - ▶ **Nilotinib** is predicted to increase the risk of bleeding events when given with **coumarins**. [Severe] theoretical
 - ▶ **Nitisinone** is predicted to increase the exposure to **warfarin**. [Moderate] Study
 - ▶ **NNRTIs (efavirenz)** are predicted to affect the concentration of **coumarins**. Adjust dose. [Moderate] Theoretical
 - ▶ **NNRTIs (etravirine)** increase the anticoagulant effect of **coumarins**. [Moderate] Theoretical
 - ▶ **NNRTIs (nevirapine)** potentially alter the anticoagulant effect of **coumarins**. [Severe] Anecdotal
 - ▶ **Obeticholic acid** decreases the anticoagulant effect of **warfarin**. [Severe] Study
 - ▶ **Oxymetholone** increases the anticoagulant effect of **coumarins**. [Severe] Anecdotal
 - ▶ **Paracetamol** increases the anticoagulant effect of **coumarins**. [Moderate] Study
 - ▶ **Pazopanib** is predicted to increase the risk of bleeding events when given with **coumarins**. [Severe] Theoretical
 - ▶ **Penicillins** potentially alter the anticoagulant effect of **coumarins**. Monitor INR and adjust dose. [Severe] Anecdotal
 - ▶ **Pitolisant** is predicted to decrease the exposure to **warfarin**. [Mild] Theoretical
 - ▶ **Quinolones** increase the anticoagulant effect of **coumarins**. [Severe] Anecdotal
 - ▶ **Ranibizumab** increases the risk of bleeding events when given with **coumarins**. [Severe] Theoretical
 - ▶ **Rifamycins (rifampicin)** decrease the anticoagulant effect of **coumarins**. [Severe] Study
 - ▶ **Rucaparib** slightly increases the exposure to **warfarin**. Monitor and adjust dose. [Severe] Study
 - ▶ **Sorafenib** increases the anticoagulant effect of **coumarins**. [Severe] Anecdotal
 - ▶ **St John's wort** decreases the anticoagulant effect of **coumarins**. Avoid. [Severe] Anecdotal
 - ▶ **Statins (fluvastatin, rosuvastatin)** increase the anticoagulant effect of **coumarins**. Monitor INR and adjust dose. [Severe] Study
 - ▶ **Sucralfate** potentially decreases the effects of **warfarin**. Separate administration by 2 hours. [Moderate] Anecdotal
 - ▶ **Sulfonamides (sulfadiazine)** are predicted to increase the anticoagulant effect of **coumarins**. [Severe] Theoretical
 - ▶ **Sulfonamides (sulfamethoxazole)** increase the anticoagulant effect of **coumarins**. [Severe] Study
 - ▶ **Tamoxifen** increases the anticoagulant effect of **coumarins**. [Severe] Study
 - ▶ **Tegafur** increases the anticoagulant effect of **coumarins**. [Moderate] Theoretical
 - ▶ **Terflunomide** affects the anticoagulant effect of **coumarins**. [Severe] Study
 - ▶ **Tetracyclines** increase the anticoagulant effect of **coumarins**. [Severe] Anecdotal
 - ▶ **Tigecycline** is predicted to alter the anticoagulant effect of **coumarins**. [Moderate] Anecdotal
 - ▶ **Tinidazole** is predicted to increase the anticoagulant effect of **coumarins**. Monitor INR and adjust dose. [Severe] Theoretical
 - ▶ **Tofacitinib** is predicted to increase the risk of bleeding when given with **coumarins**. [Severe] Theoretical
 - ▶ **Toremifene** is predicted to increase the anticoagulant effect of **coumarins**. [Severe] Theoretical
 - ▶ **Trimethoprim** is predicted to increase the anticoagulant effect of **coumarins**. [Severe] Study
 - ▶ **Vemurafenib** is predicted to increase the exposure to **coumarins**. [Moderate] Study
 - ▶ **Venetoclax** slightly increases the exposure to **warfarin**. [Moderate] Study
- Cranberry**
- ▶ **Cranberry** juice potentially increases the anticoagulant effect of **coumarins (warfarin)**. Avoid. [Severe] Anecdotal
- Crisantaspase** → see TABLE 1 p. 1447 (hepatotoxicity), TABLE 15 p. 1450 (myelosuppression)
- ▶ **Crisantaspase** is predicted to increase the risk of hepatotoxicity when given with **imatinib**. [Severe] Theoretical → Also see TABLE 15 p. 1450
 - ▶ **Crisantaspase** affects the efficacy of **methotrexate**. [Severe] Anecdotal → Also see TABLE 1 p. 1447 → Also see TABLE 15 p. 1450
 - ▶ **Crisantaspase** potentially increases the risk of neurotoxicity when given with **vinca alkaloids (vincristine)**. Vincristine should be taken 3 to 24 hours before **crisantaspase**. [Severe] Anecdotal → Also see TABLE 1 p. 1447 → Also see TABLE 15 p. 1450
- Crizotinib** → see TABLE 6 p. 1448 (bradycardia), TABLE 9 p. 1449 (QT-interval prolongation)
- GENERAL INFORMATION** Caution with concurrent use of drugs that cause gastrointestinal perforation—discontinue treatment if gastrointestinal perforation occurs.
- ▶ **Crizotinib** is predicted to increase the exposure to **abemaciclib**. [Moderate] Study
 - ▶ **Crizotinib** is predicted to increase the exposure to **acalabrutinib**. Avoid or monitor. [Severe] Study
 - ▶ **Crizotinib** is predicted to increase the exposure to **aldosterone antagonists (eplerenone)**. Adjust eplerenone dose, p. 209. [Severe] Study
 - ▶ **Crizotinib** is predicted to increase the exposure to **alpha blockers (tamsulosin)**. [Moderate] Theoretical
 - ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to markedly decrease the exposure to **crizotinib**. Avoid. [Severe] Study → Also see TABLE 9 p. 1449
 - ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to **crizotinib**. [Moderate] Study → Also see TABLE 9 p. 1449

Crizotinib (continued)

- ▶ **Crizotinib** is predicted to increase the exposure to antiarrhythmics (**propafenone**). Monitor and adjust dose. [Moderate] Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to markedly decrease the exposure to **crizotinib**. Avoid. [Severe] Study
- ▶ **Antifungals, azoles (fluconazole, isavuconazole)** are predicted to increase the exposure to **crizotinib**. [Moderate] Study → Also see TABLE 9 p. 1449
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, posaconazole, voriconazole)** are predicted to increase the exposure to **crizotinib**. Avoid. [Moderate] Study → Also see TABLE 9 p. 1449
- ▶ **Crizotinib** is predicted to increase the exposure to **antihistamines, non-sedating (mizolastine)**. [Severe] Theoretical
- ▶ **Crizotinib** is predicted to increase the exposure to **antihistamines, non-sedating (rupatadine)**. Avoid. [Moderate] Study
- ▶ **Crizotinib** is predicted to increase the concentration of **antimalarials (piperaquine)**. [Severe] Theoretical
- ▶ **Crizotinib** is predicted to increase the exposure to **antipsychotics, second generation (cariprazine)**. Avoid. [Severe] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **antipsychotics, second generation (lurasidone)**. Adjust lurasidone dose. [Moderate] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **antipsychotics, second generation (quetiapine)**. Avoid. [Moderate] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **avapritinib**. Avoid or adjust **avapritinib** dose, p. 1019. [Moderate] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **axitinib**. [Moderate] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **bedaquiline**. Avoid prolonged use. [Mild] Theoretical → Also see TABLE 9 p. 1449
- ▶ **Crizotinib** is predicted to increase the exposure to **benzodiazepines (alprazolam)**. [Severe] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **benzodiazepines (midazolam)**. Monitor adverse effects and adjust dose. [Severe] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **bosutinib**. Avoid or adjust dose. [Severe] Study → Also see TABLE 9 p. 1449
- ▶ **Crizotinib** is predicted to increase the exposure to **brigatinib**. [Moderate] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **bupirone**. Use with caution and adjust dose. [Moderate] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **cabozantinib**. [Moderate] Study → Also see TABLE 9 p. 1449
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **crizotinib**. Avoid. [Moderate] Study → Also see TABLE 6 p. 1448
- ▶ **Crizotinib** is predicted to increase the exposure to **calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nifedipine, nimodipine)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **ceritinib**. [Moderate] Study → Also see TABLE 6 p. 1448 → Also see TABLE 9 p. 1449
- ▶ **Crizotinib** is predicted to increase the concentration of **ciclosporin**. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **crizotinib**. Avoid. [Moderate] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **cobimetinib**. [Severe] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **colchicine**. Adjust **colchicine** dose with moderate CYP3A4 inhibitors, p. 1175. [Severe] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **corticosteroids (methylprednisolone)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Crizotinib** is predicted to increase the risk of bleeding events when given with **coumarins**. [Severe] Theoretical
- ▶ **Dabrafenib** is predicted to decrease the exposure to **crizotinib**. Avoid. [Severe] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **dabrafenib**. [Moderate] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **darifenacin**. [Moderate] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **dasatinib**. [Severe] Study → Also see TABLE 9 p. 1449
- ▶ **Crizotinib** is predicted to slightly increase the exposure to **dienogest**. [Moderate] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **dipeptidylpeptidase-4 inhibitors (saxagliptin)**. [Mild] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **domperidone**. Avoid. [Severe] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **dopamine receptor agonists (bromocriptine)**. [Severe] Theoretical
- ▶ **Crizotinib** is predicted to increase the concentration of **dopamine receptor agonists (cabergoline)**. [Moderate] Anecdotal
- ▶ **Crizotinib** is predicted to moderately increase the exposure to **dutasteride**. [Mild] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **ellexacaftor**. Adjust tezacaftor with ivacaftor and ellexacaftor p. 314 dose with moderate CYP3A4 inhibitors. [Severe] Theoretical
- ▶ **Crizotinib** is predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
- ▶ **Crizotinib** is predicted to moderately increase the exposure to **encorafenib**. [Moderate] Study → Also see TABLE 9 p. 1449
- ▶ **Endothelin receptor antagonists (bosentan)** are predicted to decrease the exposure to **crizotinib**. Avoid. [Severe] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **entrectinib**. Avoid moderate CYP3A4 inhibitors or adjust **entrectinib** dose, p. 1030. [Severe] Theoretical → Also see TABLE 9 p. 1449
- ▶ **Crizotinib** is predicted to increase the risk of ergotism when given with **ergometrine**. [Severe] Theoretical
- ▶ **Crizotinib** is predicted to increase the risk of ergotism when given with **ergotamine**. [Severe] Theoretical
- ▶ **Crizotinib** is predicted to increase the exposure to **ertotinib**. [Moderate] Study
- ▶ **Crizotinib** is predicted to increase the concentration of **everolimus**. Avoid or adjust dose. [Moderate] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **fesoterodine**. Adjust **fesoterodine** dose with moderate CYP3A4 inhibitors in hepatic and renal impairment, p. 824. [Mild] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **gefitinib**. [Moderate] Study
- ▶ **Crizotinib** potentially decreases the exposure to **glecaprevir**. Avoid. [Severe] Theoretical
- ▶ **Grapefruit juice** is predicted to increase the exposure to **crizotinib**. Avoid. [Moderate] Theoretical
- ▶ **Crizotinib** is predicted to increase the concentration of **guanfacine**. Adjust **guanfacine** dose, p. 375. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **crizotinib**. Avoid. [Moderate] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **ibrutinib**. Adjust **ibrutinib** dose with moderate CYP3A4 inhibitors, p. 1034. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **crizotinib**. Avoid. [Moderate] Study
- ▶ **Imatinib** is predicted to increase the exposure to **crizotinib**. [Moderate] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **ivabradine**. Adjust **ivabradine** dose, p. 228. [Severe] Theoretical → Also see TABLE 6 p. 1448
- ▶ **Crizotinib** is predicted to increase the exposure to **ivacaftor**. Adjust dose with moderate CYP3A4 inhibitors, see ivacaftor p. 312, tezacaftor with ivacaftor p. 314, and tezacaftor with ivacaftor and ellexacaftor p. 314. [Moderate] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **lapatinib**. [Moderate] Study → Also see TABLE 9 p. 1449
- ▶ **Letermovir** is predicted to increase the exposure to **crizotinib**. [Moderate] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **lomitapide**. Avoid. [Moderate] Theoretical
- ▶ **Macrolides (clarithromycin, erythromycin)** are predicted to increase the exposure to **crizotinib**. Avoid. [Moderate] Study → Also see TABLE 9 p. 1449
- ▶ **Crizotinib** is predicted to increase the exposure to **midostaurin**. [Moderate] Theoretical

- ▶ **Mitotane** is predicted to markedly decrease the exposure to **crizotinib**. Avoid. [Severe] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **naldemedine**. [Moderate] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **naloxegol**. Adjust **naloxegol** dose and monitor adverse effects, p. 71. [Moderate] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **neratinib**. Avoid moderate CYP3A4 inhibitors or adjust **neratinib** dose and monitor for gastrointestinal adverse effects, p. 1041. [Severe] Study
- ▶ **Neurokinin-1 receptor antagonists (netupitant)** are predicted to increase the exposure to **crizotinib**. [Moderate] Study
- ▶ **NNRTIs (efavirenz, nevirapine)** are predicted to decrease the exposure to **crizotinib**. Avoid. [Severe] Study → Also see TABLE 9 p. 1449
- ▶ **Crizotinib** is predicted to increase the exposure to **olaparib**. Avoid moderate CYP3A4 inhibitors or adjust **olaparib** dose, p. 1057. [Moderate] Theoretical
- ▶ **Crizotinib** is predicted to increase the exposure to **opioids (alfentanil, buprenorphine, fentanyl, oxycodone)**. Monitor and adjust dose. [Moderate] Study → Also see TABLE 6 p. 1448
- ▶ **Crizotinib** is predicted to increase the exposure to **opioids (methadone)**. [Moderate] Theoretical → Also see TABLE 6 p. 1448 → Also see TABLE 9 p. 1449
- ▶ **Crizotinib** is predicted to increase the exposure to **pazopanib**. [Moderate] Study → Also see TABLE 9 p. 1449
- ▶ **Crizotinib** is predicted to increase the risk of bleeding events when given with **phenindione**. [Severe] Theoretical
- ▶ **Crizotinib** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (avanafil)**. Adjust **avanafil** dose, p. 862. [Moderate] Theoretical
- ▶ **Crizotinib** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (sildenafil)**. Monitor or adjust **sildenafil** dose with moderate CYP3A4 inhibitors, p. 863. [Moderate] Study → Also see TABLE 9 p. 1449
- ▶ **Crizotinib** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (tadalafil)**. [Severe] Theoretical
- ▶ **Crizotinib** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (vardenafil)**. Adjust dose. [Severe] Theoretical → Also see TABLE 9 p. 1449
- ▶ **Crizotinib** potentially decreases the exposure to **pibrentasvir**. Avoid. [Severe] Theoretical
- ▶ **Crizotinib** is predicted to increase the exposure to **pimozide**. Avoid. [Severe] Theoretical → Also see TABLE 9 p. 1449
- ▶ **Pitolisant** is predicted to decrease the exposure to **crizotinib**. Avoid. [Severe] Theoretical
- ▶ **Crizotinib** is predicted to increase the exposure to **ponatinib**. [Moderate] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **ranolazine**. [Severe] Study → Also see TABLE 9 p. 1449
- ▶ **Crizotinib** is predicted to increase the exposure to **regorafenib**. [Moderate] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **ribiciclib**. [Moderate] Study → Also see TABLE 9 p. 1449
- ▶ **Rifamycins (rifampicin)** are predicted to markedly decrease the exposure to **crizotinib**. Avoid. [Severe] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **ruxolitinib**. [Moderate] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **siponimod**. Avoid depending on other drugs taken—consult product literature. [Severe] Study → Also see TABLE 6 p. 1448
- ▶ **Crizotinib** increases the concentration of **sirolimus**. Monitor and adjust dose. [Moderate] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **SSRIs (dapoxetine)**. Adjust **dapoxetine** dose with moderate CYP3A4 inhibitors, p. 870. [Moderate] Theoretical
- ▶ **St John's wort** is predicted to decrease the exposure to **crizotinib**. Avoid. [Severe] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **statins (atorvastatin)**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Crizotinib** is predicted to increase the exposure to **statins (pravastatin)**. [Moderate] Theoretical
- ▶ **Crizotinib** is predicted to increase the exposure to **statins (simvastatin)**. Monitor and adjust dose. [Severe] Theoretical
- ▶ **Crizotinib** is predicted to increase the exposure to **sunitinib**. [Moderate] Study → Also see TABLE 9 p. 1449
- ▶ **Crizotinib** is predicted to increase the concentration of **tacrolimus**. [Severe] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **taxanes (cabazitaxel)**. [Moderate] Theoretical
- ▶ **Crizotinib** is predicted to increase the concentration of **temsirolimus**. Use with caution or avoid. [Moderate] Theoretical
- ▶ **Crizotinib** is predicted to increase the exposure to **tezacaftor**. Adjust dose with moderate CYP3A4 inhibitors, see **tezacaftor** with **ivacaftor** p. 314 and **tezacaftor** with **ivacaftor** and **elxacaftor** p. 314. [Severe] Study
- ▶ **Crizotinib** given with a potent CYP2C19 inhibitor is predicted to increase the exposure to **tofacinib**. Adjust **tofacinib** dose, p. 1163. [Moderate] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **tolvaptan**. Manufacturer advises caution or adjust **tolvaptan** dose with moderate CYP3A4 inhibitors, p. 711. [Moderate] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **trazodone**. [Moderate] Theoretical
- ▶ **Crizotinib** is predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [Moderate] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **venurafenib**. [Severe] Theoretical → Also see TABLE 9 p. 1449
- ▶ **Crizotinib** is predicted to increase the exposure to **venetoclax**. Avoid or adjust dose—consult product literature. [Severe] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **vinca alkaloids**. [Severe] Theoretical → Also see TABLE 9 p. 1449
- ▶ **Crizotinib** is predicted to increase the exposure to **zopiclone**. Adjust dose. [Moderate] Study
- Cyclizine** → see antihistamines, sedating
- Cyclopentolate** → see TABLE 10 p. 1449 (antimuscarinics)
- Cyclophosphamide** → see alkylating agents
- Cycloserine**
- ▶ **Cycloserine** increases the risk of CNS toxicity when given with **isoniazid**. Monitor and adjust dose. [Moderate] Study
- Cyproheptadine** → see antihistamines, sedating
- Cyproterone** → see anti-androgens
- Cytarabine** → see TABLE 15 p. 1450 (myelosuppression)
- ▶ **Cytarabine** decreases the concentration of **flucytosine**. Avoid. [Severe] Study
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **cytarabine**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- Cytomegalovirus immunoglobulin** → see immunoglobulins
- Dabigatran** → see thrombin inhibitors
- Dabrafenib**
- ▶ **Dabrafenib** is predicted to decrease the exposure to **acalabrutinib**. [Severe] Study
- ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to **dabrafenib**. Avoid. [Moderate] Theoretical
- ▶ **Dabrafenib** is predicted to decrease the exposure to **anti-androgens (darolutamide)**. Avoid. [Moderate] Theoretical
- ▶ **Antiarrhythmics (dronedaronone)** are predicted to increase the exposure to **dabrafenib**. [Moderate] Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **dabrafenib**. Avoid. [Moderate] Theoretical
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **dabrafenib**. [Moderate] Study
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **dabrafenib**. Use with caution or avoid. [Moderate] Study
- ▶ **Dabrafenib** is predicted to decrease the exposure to **antifungals, azoles (isavuconazole)**. Avoid. [Severe] Theoretical
- ▶ **Dabrafenib** is predicted to decrease the exposure to **antipsychotics, second generation (cariprazine)**. Avoid. [Severe] Theoretical
- ▶ **Dabrafenib** is predicted to decrease the exposure to **antipsychotics, second generation (lurasidone)**. Monitor and adjust dose. [Moderate] Theoretical

Dabrafenib (continued)

- ▶ Dabrafenib is predicted to decrease the exposure to antipsychotics, second generation (quetiapine). [Moderate] Study
- ▶ Dabrafenib is predicted to decrease the exposure to avapritinib. Avoid. [Severe] Study
- ▶ Dabrafenib is predicted to decrease the exposure to axitinib. [Moderate] Study
- ▶ Dabrafenib is predicted to decrease the exposure to bedaquiline. Avoid. [Severe] Study
- ▶ Dabrafenib decreases the exposure to benzodiazepines (midazolam). Monitor and adjust dose. [Moderate] Study
- ▶ Dabrafenib is predicted to decrease the exposure to bosutinib. Avoid. [Severe] Study
- ▶ Dabrafenib is predicted to decrease the exposure to brigatinib. Avoid. [Moderate] Study
- ▶ Dabrafenib is predicted to decrease the exposure to cabozantinib. [Moderate] Study
- ▶ Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to dabrafenib. [Moderate] Study
- ▶ Dabrafenib is predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Theoretical
- ▶ Dabrafenib is predicted to decrease the exposure to calcium channel blockers (diltiazem, verapamil). [Moderate] Theoretical
- ▶ Dabrafenib is predicted to decrease the exposure to certitinib. [Severe] Study
- ▶ Clopidogrel is predicted to increase the exposure to dabrafenib. [Moderate] Theoretical
- ▶ Dabrafenib is predicted to decrease the exposure to cobicicstat. Avoid. [Severe] Theoretical
- ▶ Cobicicstat is predicted to increase the exposure to dabrafenib. Use with caution or avoid. [Moderate] Study
- ▶ Dabrafenib is predicted to decrease the exposure to cobimetinib. Avoid. [Severe] Theoretical
- ▶ Dabrafenib is predicted to decrease the anticoagulant effect of coumarins. [Severe] Theoretical
- ▶ Dabrafenib is predicted to decrease the exposure to crizotinib. Avoid. [Severe] Study
- ▶ Crizotinib is predicted to increase the exposure to dabrafenib. [Moderate] Study
- ▶ Dabrafenib is predicted to decrease the exposure to dasatinib. [Severe] Study
- ▶ Dabrafenib is predicted to decrease the exposure to digoxin. [Moderate] Theoretical
- ▶ Dabrafenib decreases the exposure to dolutegravir. Adjust dose. [Severe] Study
- ▶ Dabrafenib is predicted to moderately decrease the exposure to elbasvir. Avoid. [Severe] Study
- ▶ Dabrafenib is predicted to decrease the concentration of elvitegravir. Avoid. [Severe] Theoretical
- ▶ Endothelin receptor antagonists (bosentan) are predicted to decrease the exposure to dabrafenib. [Moderate] Study
- ▶ Dabrafenib is predicted to decrease the exposure to entrectinib. Avoid. [Severe] Theoretical
- ▶ Dabrafenib is predicted to decrease the effects of ergotamine. [Moderate] Theoretical
- ▶ Dabrafenib is predicted to decrease the exposure to erlotinib. [Severe] Study
- ▶ Dabrafenib is predicted to decrease the concentration of everolimus. Avoid or adjust dose. [Severe] Study
- ▶ Fibrates (gemfibrozil) are predicted to increase the exposure to dabrafenib. [Moderate] Theoretical
- ▶ Dabrafenib is predicted to decrease the exposure to gefitinib. Avoid. [Severe] Study
- ▶ Dabrafenib is predicted to decrease the exposure to glasdegib. Avoid or adjust glasdegib dose, p. 1056. [Severe] Theoretical
- ▶ Dabrafenib is predicted to decrease the exposure to glecaprevir. Avoid. [Severe] Study
- ▶ Dabrafenib is predicted to markedly decrease the exposure to grazoprevir. Avoid. [Severe] Study
- ▶ Dabrafenib is predicted to decrease the concentration of guanfacine. Adjust dose. [Moderate] Theoretical
- ▶ HIV-protease inhibitors are predicted to increase the exposure to dabrafenib. Use with caution or avoid. [Moderate] Study
- ▶ Dabrafenib is predicted to decrease the exposure to ibrutinib. Avoid or monitor. [Severe] Study
- ▶ Dabrafenib is predicted to decrease the exposure to idelalisib. Avoid. [Moderate] Theoretical
- ▶ Idelalisib is predicted to increase the exposure to dabrafenib. Use with caution or avoid. [Moderate] Study
- ▶ Imatinib is predicted to increase the exposure to dabrafenib. [Moderate] Study
- ▶ Dabrafenib is predicted to decrease the exposure to imatinib. [Moderate] Study
- ▶ Dabrafenib is predicted to decrease the exposure to ivacaftor. [Moderate] Study
- ▶ Dabrafenib is predicted to decrease the exposure to lapatinib. Avoid. [Severe] Study
- ▶ Dabrafenib is predicted to decrease the exposure to larotrectinib. Avoid. [Moderate] Study
- ▶ Letermovir is predicted to increase the exposure to dabrafenib. [Moderate] Study
- ▶ Macrolides (clarithromycin) are predicted to increase the exposure to dabrafenib. Use with caution or avoid. [Moderate] Study
- ▶ Macrolides (erythromycin) are predicted to increase the exposure to dabrafenib. [Moderate] Study
- ▶ Mitotane is predicted to decrease the exposure to dabrafenib. Avoid. [Moderate] Theoretical
- ▶ Neurokinin-1 receptor antagonists (aprepitant, netupitant) are predicted to increase the exposure to dabrafenib. [Moderate] Study
- ▶ Dabrafenib is predicted to decrease the exposure to neurokinin-1 receptor antagonists (netupitant). [Moderate] Theoretical
- ▶ Dabrafenib is predicted to decrease the exposure to nilotinib. Avoid. [Severe] Theoretical
- ▶ Nilotinib is predicted to increase the exposure to dabrafenib. [Moderate] Study
- ▶ NNRTIs (efavirenz, nevirapine) are predicted to decrease the exposure to dabrafenib. [Moderate] Study
- ▶ Dabrafenib is predicted to decrease the exposure to NNRTIs (doravirine). Avoid or adjust doravirine p. 686 or lamivudine with tenofovir disoproxil and doravirine p. 696 dose. [Severe] Theoretical
- ▶ Dabrafenib is predicted to decrease the exposure to NNRTIs (etravirine). Avoid. [Severe] Study
- ▶ Dabrafenib is predicted to decrease the exposure to NNRTIs (rilpivirine). Avoid. [Severe] Theoretical
- ▶ Dabrafenib is predicted to decrease the exposure to olaparib. Avoid. [Moderate] Theoretical
- ▶ Dabrafenib decreases the exposure to opioids (methadone). Monitor and adjust dose. [Severe] Study
- ▶ Dabrafenib is predicted to decrease the exposure to osimertinib. Use with caution or avoid. [Severe] Study
- ▶ Dabrafenib is predicted to decrease the exposure to ospemifene. [Moderate] Study
- ▶ Dabrafenib is predicted to decrease the exposure to pazopanib. [Severe] Study
- ▶ Dabrafenib is predicted to decrease the exposure to phenindione. [Moderate] Study
- ▶ Dabrafenib is predicted to decrease the exposure to pibrentasvir. Avoid. [Severe] Study
- ▶ Dabrafenib is predicted to decrease the exposure to ponatinib. [Severe] Study
- ▶ Dabrafenib is predicted to decrease the exposure to regorafenib. [Severe] Study
- ▶ Rifamycins (rifampicin) are predicted to decrease the exposure to dabrafenib. Avoid. [Moderate] Theoretical
- ▶ Dabrafenib is predicted to decrease the exposure to ruxolitinib. Monitor and adjust dose. [Moderate] Study
- ▶ Dabrafenib is predicted to decrease the exposure to siponimod. Manufacturer advises caution depending on genotype—consult product literature. [Severe] Theoretical
- ▶ Dabrafenib is predicted to decrease the exposure to sorafenib. [Moderate] Study
- ▶ St John's wort is predicted to decrease the exposure to dabrafenib. Avoid. [Moderate] Study
- ▶ Dabrafenib is predicted to decrease the exposure to statins (atorvastatin, simvastatin). [Moderate] Study

- ▶ **Dabrafenib** is predicted to decrease the exposure to **sunitinib**. [Moderate] Study
- ▶ **Dabrafenib** is predicted to decrease the exposure to **taxanes (cabazitaxel)**. Avoid. [Severe] Study
- ▶ **Dabrafenib** is predicted to decrease the concentration of **temsirolimus**. Avoid. [Severe] Theoretical
- ▶ **Dabrafenib** is predicted to decrease the exposure to **ticagrelor**. [Moderate] Theoretical
- ▶ **Dabrafenib** is predicted to decrease the exposure to **tofacitinib**. [Moderate] Study
- ▶ **Dabrafenib** is predicted to decrease the exposure to **vandetanib**. [Moderate] Study
- ▶ **Dabrafenib** is predicted to decrease the exposure to **velpatasvir**. Avoid. [Moderate] Theoretical
- ▶ **Dabrafenib** is predicted to decrease the exposure to **venurafenib**. [Severe] Study
- ▶ **Dabrafenib** is predicted to decrease the exposure to **venetoclax**. Avoid. [Severe] Study
- ▶ **Dabrafenib** is predicted to decrease the concentration of **voxilaprevir**. Avoid. [Severe] Theoretical
- Dacarbazine** → see alkylating agents
- Dacomitinib**
 - ▶ **Dacomitinib** is predicted to markedly increase the exposure to **atomoxetine**. Avoid or adjust dose. [Severe] Study
 - ▶ **Dacomitinib** is predicted to markedly increase the exposure to **beta blockers, non-selective (propranolol)**. Avoid. [Severe] Study
 - ▶ **Dacomitinib** is predicted to markedly increase the exposure to **beta blockers, selective (metoprolol, nebivolol)**. Avoid. [Severe] Study
 - ▶ **Dacomitinib** is predicted to markedly increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
 - ▶ **H₂ receptor antagonists** are predicted to decrease the concentration of **dacomitinib**. **Dacomitinib** should be taken 2 hours before or 10 hours after **H₂ receptor antagonists**. [Mild] Study
 - ▶ **Proton pump inhibitors** are predicted to decrease the exposure to **dacomitinib**. Avoid. [Moderate] Study
 - ▶ **Dacomitinib** is predicted to markedly increase the exposure to **tolterodine**. Avoid. [Severe] Study
 - ▶ **Dacomitinib** is predicted to markedly increase the exposure to **tricyclic antidepressants (imipramine, nortriptyline)**. Avoid. [Severe] Study
- Dactinomycin** → see TABLE 1 p. 1447 (hepatotoxicity), TABLE 15 p. 1450 (myelosuppression)
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **dactinomycin**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- Dalteparin** → see low molecular-weight heparins
- Danaparoid** → see TABLE 3 p. 1447 (anticoagulant effects)
- ▶ **Ranibizumab** is predicted to increase the risk of bleeding events when given with **danaparoid**. [Severe] Theoretical
- Dantrolene** → see TABLE 1 p. 1447 (hepatotoxicity)
- ▶ Intravenous **dantrolene** potentially increases the risk of acute hyperkalaemia and cardiovascular collapse when given with **calcium channel blockers (diltiazem, verapamil)**. Avoid. [Severe] Anecdotal
- Dapagliflozin** → see sodium glucose co-transporter 2 inhibitors
- Dapoxetine** → see SSRIs
- Dapsone**
 - ▶ **Aminosalicylic acid** is predicted to increase the risk of methaemoglobinaemia when given with **dapsone**. [Severe] Theoretical
 - ▶ **Dapsone** is predicted to increase the risk of methaemoglobinaemia when given with topical **anaesthetics, local (prilocaine)**. Use with caution or avoid. [Severe] Theoretical
 - ▶ **Antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to increase the risk of methaemoglobinaemia when given with **dapsone**. [Severe] Theoretical
 - ▶ **Antimalarials (chloroquine, primaquine)** are predicted to increase the risk of methaemoglobinaemia when given with **dapsone**. [Severe] Theoretical
- ▶ **Nitrates** are predicted to increase the risk of methaemoglobinaemia when given with **dapsone**. [Severe] Theoretical
- ▶ **Nitrofurantoin** is predicted to increase the risk of methaemoglobinaemia when given with **dapsone**. [Severe] Theoretical
- ▶ **Nitroprusside** is predicted to increase the risk of methaemoglobinaemia when given with **dapsone**. [Severe] Theoretical
- ▶ **Paracetamol** is predicted to increase the risk of methaemoglobinaemia when given with **dapsone**. [Severe] Theoretical
- ▶ **Rifamycins** decrease the exposure to **dapsone**. [Moderate] Study
- ▶ **Sulfonamides** are predicted to increase the risk of methaemoglobinaemia when given with **dapsone**. [Severe] Theoretical
- ▶ **Dapsone** increases the exposure to **trimethoprim and trimethoprim** increases the exposure to **dapsone**. [Severe] Study
- Daptomycin**
 - ▶ **Aspirin** (high-dose) increases the risk of renal impairment when given with **daptomycin**. [Moderate] Theoretical
 - ▶ **Ciclosporin** is predicted to increase the risk of rhabdomyolysis when given with **daptomycin**. [Severe] Theoretical
 - ▶ **Fibrates** are predicted to increase the risk of rhabdomyolysis when given with **daptomycin**. [Severe] Theoretical
 - ▶ **NSAIDs** increase the risk of renal impairment when given with **daptomycin**. [Moderate] Theoretical
 - ▶ **Statins** are predicted to increase the risk of rhabdomyolysis when given with **daptomycin**. [Severe] Theoretical
- Daratumumab** → see monoclonal antibodies
- Darbepoetin alfa** → see TABLE 5 p. 1448 (thromboembolism), TABLE 16 p. 1451 (increased serum potassium)
- Darifenacin** → see TABLE 10 p. 1449 (antimuscarinics)
 - ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to **darifenacin**. [Moderate] Theoretical
 - ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to **darifenacin**. [Moderate] Study
 - ▶ **Darifenacin** is predicted to increase the concentration of **antiarrhythmics (flecainide)**. [Moderate] Theoretical
 - ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **darifenacin**. [Moderate] Theoretical
 - ▶ **Antifungals, azoles (flucanazole)** slightly increase the exposure to **darifenacin**. [Moderate] Study
 - ▶ **Antifungals, azoles (isavuconazole, posaconazole)** are predicted to increase the exposure to **darifenacin**. [Moderate] Study
 - ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to markedly to very markedly increase the exposure to **darifenacin**. Avoid. [Severe] Study
 - ▶ **Bupropion** is predicted to slightly increase the exposure to **darifenacin**. [Mild] Study
 - ▶ **Calcium channel blockers (diltiazem)** are predicted to increase the exposure to **darifenacin**. [Moderate] Study
 - ▶ **Calcium channel blockers (verapamil)** are predicted to increase the exposure to **darifenacin**. Avoid. [Moderate] Study
 - ▶ **Ciclosporin** is predicted to increase the exposure to **darifenacin**. Avoid. [Moderate] Theoretical
 - ▶ **Cinacalcet** is predicted to slightly increase the exposure to **darifenacin**. [Mild] Study
 - ▶ **Cobicistat** is predicted to markedly to very markedly increase the exposure to **darifenacin**. Avoid. [Severe] Study
 - ▶ **Crizotinib** is predicted to increase the exposure to **darifenacin**. [Moderate] Study
 - ▶ **Grapefruit juice** is predicted to increase the exposure to **darifenacin**. [Moderate] Study
 - ▶ **H₂ receptor antagonists (cimetidine)** increase the exposure to **darifenacin**. [Mild] Study
 - ▶ **HIV-protease inhibitors** are predicted to markedly to very markedly increase the exposure to **darifenacin**. Avoid. [Severe] Study
 - ▶ **Idelalisib** is predicted to markedly to very markedly increase the exposure to **darifenacin**. Avoid. [Severe] Study
 - ▶ **Imatinib** is predicted to increase the exposure to **darifenacin**. [Moderate] Study

Darifenacin (continued)

- ▶ **Letermovir** is predicted to increase the exposure to **darifenacin**. [Moderate] Study
- ▶ **Macrolides (clarithromycin)** are predicted to markedly increase the exposure to **darifenacin**. Avoid. [Severe] Study
- ▶ **Macrolides (erythromycin)** slightly increase the exposure to **darifenacin**. [Moderate] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **darifenacin**. [Moderate] Theoretical
- ▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to increase the exposure to **darifenacin**. [Moderate] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **darifenacin**. [Moderate] Study
- ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **darifenacin**. [Moderate] Theoretical
- ▶ **SSRIs (fluoxetine, paroxetine)** are predicted to slightly increase the exposure to **darifenacin**. [Mid] Study
- ▶ **St John's wort** is predicted to decrease the exposure to **darifenacin**. [Moderate] Theoretical
- ▶ **Terbinafine** is predicted to slightly increase the exposure to **darifenacin**. [Mid] Study
- ▶ **Darifenacin (high-dose)** is predicted to increase the exposure to **tricyclic antidepressants**. [Moderate] Study → Also see TABLE 10 p. 1449

Darolutamide → see anti-androgens**Darunavir** → see HIV-protease inhibitors**Dasatinib** → see TABLE 15 p. 1450 (myelosuppression), TABLE 9 p. 1449

(QT-interval prolongation), TABLE 4 p. 1447 (antiplatelet effects)

▶ Oral **antacids** decrease the absorption of oral **dasatinib**.

Separate administration by at least 2 hours. [Moderate] Study

▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to markedly decrease the exposure to **dasatinib**. Avoid. [Severe] Study → Also see TABLE 9 p. 1449▶ **Antiarrhythmics (dronedaron)** are predicted to increase the exposure to **dasatinib**. [Severe] Study → Also see TABLE 9 p. 1449▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to markedly decrease the exposure to **dasatinib**. Avoid. [Severe] Study▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **dasatinib**. [Severe] Study → Also see TABLE 9 p. 1449▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **dasatinib**. Avoid or adjust dose—consult product literature. [Severe] Study → Also see TABLE 9 p. 1449▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **dasatinib**. [Severe] Study▶ Oral **calcium salts (calcium carbonate)** -containing antacids are predicted to decrease the exposure to oral **dasatinib**. Separate administration by at least 2 hours. [Moderate] Study▶ **Cobicistat** is predicted to increase the exposure to **dasatinib**. Avoid or adjust dose—consult product literature. [Severe] Study▶ **Crizotinib** is predicted to increase the exposure to **dasatinib**. [Severe] Study → Also see TABLE 9 p. 1449▶ **Dabrafenib** is predicted to decrease the exposure to **dasatinib**. [Severe] Study▶ **Endothelin receptor antagonists (bosentan)** are predicted to decrease the exposure to **dasatinib**. [Severe] Study▶ **Grapefruit juice** is predicted to increase the exposure to **dasatinib**. Avoid. [Moderate] Theoretical▶ **H₂ receptor antagonists** are predicted to decrease the exposure to **dasatinib**. Avoid. [Moderate] Study▶ **HIV-protease inhibitors** are predicted to increase the exposure to **dasatinib**. Avoid or adjust dose—consult product literature. [Severe] Study▶ **Idelalisib** is predicted to increase the exposure to **dasatinib**. Avoid or adjust dose—consult product literature. [Severe] Study▶ **Imatinib** is predicted to increase the exposure to **dasatinib**. [Severe] Study → Also see TABLE 15 p. 1450▶ **Letermovir** is predicted to increase the exposure to **dasatinib**. [Severe] Study▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **dasatinib**. Avoid or adjust dose—consult product literature. [Severe] Study → Also see TABLE 9 p. 1449▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **dasatinib**. [Severe] Study → Also see TABLE 9 p. 1449▶ **Mitotane** is predicted to markedly decrease the exposure to **dasatinib**. Avoid. [Severe] Study → Also see TABLE 15 p. 1450▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to increase the exposure to **dasatinib**. [Severe] Study▶ **Nilotinib** is predicted to increase the exposure to **dasatinib**. [Severe] Study → Also see TABLE 15 p. 1450 → Also see TABLE 9 p. 1449▶ **NNRTIs (efavirenz, nevirapine)** are predicted to decrease the exposure to **dasatinib**. [Severe] Study → Also see TABLE 9 p. 1449▶ **Pitolisant** is predicted to decrease the exposure to **dasatinib**. Avoid. [Severe] Theoretical▶ **Proton pump inhibitors** are predicted to decrease the exposure to **dasatinib**. Avoid. [Severe] Study▶ **Rifamycins (rifampicin)** are predicted to markedly decrease the exposure to **dasatinib**. Avoid. [Severe] Study▶ Oral **sodium bicarbonate** -containing antacids are predicted to decrease the exposure to oral **dasatinib**. Separate administration by at least 2 hours. [Moderate] Study▶ **Sodium zirconium cyclosilicate** is predicted to decrease the exposure to **dasatinib**. Separate administration by at least 2 hours. [Moderate] Theoretical▶ **St John's wort** is predicted to decrease the exposure to **dasatinib**. [Severe] Study▶ **Dasatinib** is predicted to increase the exposure to **statins (simvastatin)**. [Moderate] Theoretical**Daunorubicin** → see anthracyclines**Decitabine** → see TABLE 15 p. 1450 (myelosuppression)**Deferasirox** → see iron chelators**Deferiprone** → see iron chelators**Deflazacort** → see corticosteroids**Delaflaxacin** → see quinolones**Delamanid** → see TABLE 9 p. 1449 (QT-interval prolongation)▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to slightly decrease the exposure to **delamanid**. Avoid. [Moderate] Study → Also see TABLE 9 p. 1449▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to slightly decrease the exposure to **delamanid**. Avoid. [Moderate] Study▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** very slightly increase the exposure to **delamanid**. [Severe] Study → Also see TABLE 9 p. 1449▶ **Cobicistat** very slightly increases the exposure to **delamanid**. [Severe] Study▶ **HIV-protease inhibitors** very slightly increase the exposure to **delamanid**. [Severe] Study▶ **Idelalisib** very slightly increases the exposure to **delamanid**. [Severe] Study▶ **Macrolides (clarithromycin)** very slightly increase the exposure to **delamanid**. [Severe] Study → Also see TABLE 9 p. 1449▶ **Mitotane** is predicted to slightly decrease the exposure to **delamanid**. Avoid. [Moderate] Study▶ **Rifamycins (rifampicin)** are predicted to slightly decrease the exposure to **delamanid**. Avoid. [Moderate] Study**Demeclocycline** → see tetracyclines**Denosumab**▶ **Cinacalcet** might increase the risk of hypocalcaemia when given with **denosumab**. [Severe] Theoretical▶ **Etelcalcetide** might increase the risk of hypocalcaemia when given with **denosumab**. [Severe] Theoretical**Desferrioxamine** → see iron chelators**Desflurane** → see volatile halogenated anaesthetics**Desloratadine** → see antihistamines, non-sedating**Desmopressin** → see TABLE 18 p. 1451 (hyponatraemia)▶ **Antiepileptics (lamotrigine)** are predicted to increase the risk of hyponatraemia when given with **desmopressin**. [Severe] Theoretical▶ **Loperamide** greatly increases the absorption of oral **desmopressin** (and possibly sublingual). [Moderate] Study▶ **Phenothiazines (chlorpromazine)** are predicted to increase the risk of hyponatraemia when given with **desmopressin**. [Severe] Theoretical

Desogestrel

- ▶ Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampamil, phenobarbital, phenytoin, primidone, rufinamide, topiramate) are predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. 843. [\[Severe\]](#) Theoretical
- ▶ Desogestrel is predicted to increase the exposure to antiepileptics (lamotrigine). [\[Moderate\]](#) Study
- ▶ Endothelin receptor antagonists (bosentan) are predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. 843. [\[Severe\]](#) Theoretical
- ▶ Griseofulvin potentially decreases the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. 843. [\[Severe\]](#) Anecdotal
- ▶ HIV-protease inhibitors (ritonavir) are predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. 843. [\[Severe\]](#) Theoretical
- ▶ Modafinil is predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. 843. [\[Severe\]](#) Theoretical
- ▶ Neurokinin-1 receptor antagonists (aprepitant, fosaprepitant) are predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. 843. [\[Severe\]](#) Theoretical
- ▶ NNRTIs (efavirenz, nevirapine) are predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. 843. [\[Severe\]](#) Theoretical
- ▶ Rifamycins are predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. 843. [\[Severe\]](#) Theoretical
- ▶ St John's wort is predicted to decrease the efficacy of desogestrel. MHRSA advises avoid. For FSRH guidance, see Contraceptives, interactions p. 843. [\[Severe\]](#) Theoretical
- ▶ Sugammadex is predicted to decrease the exposure to desogestrel. Refer to patient information leaflet for missed pill advice. [\[Severe\]](#) Theoretical
- ▶ Ulipristal is predicted to decrease the efficacy of desogestrel. Avoid. [\[Severe\]](#) Theoretical
- Dexamethasone** → see corticosteroids
- Dexamfetamine** → see amfetamines
- Dexketoprofen** → see NSAIDs
- Dexmedetomidine** → see TABLE 11 p. 1449 (CNS depressant effects)
- Dextrazoxane** → see iron chelators
- Diamorphine** → see opioids
- Diazepam** → see benzodiazepines
- Diazoxide** → see TABLE 8 p. 1448 (hypotension)
- ▶ Diazoxide decreases the concentration of antiepileptics (fosphenytoin, phenytoin) and antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the effects of diazoxide. Monitor concentration and adjust dose. [\[Moderate\]](#) Anecdotal
- ▶ Diazoxide increases the risk of severe hypotension when given with hydralazine. [\[Severe\]](#) Study → Also see TABLE 8 p. 1448
- Diclofenac** → see NSAIDs
- Dicycloverine** → see TABLE 10 p. 1449 (antimuscarinics)
- Dienogest**
 - ▶ Anti-androgens (apalutamide, enzalutamide) are predicted to markedly decrease the exposure to dienogest. [\[Severe\]](#) Study
 - ▶ Antiarrhythmics (dronedarone) are predicted to slightly increase the exposure to dienogest. [\[Moderate\]](#) Study
 - ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to dienogest. [\[Severe\]](#) Study
 - ▶ Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to slightly increase the exposure to dienogest. [\[Moderate\]](#) Study
 - ▶ Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to dienogest. [\[Moderate\]](#) Study
 - ▶ Calcium channel blockers (diltiazem, verapamil) are predicted to slightly increase the exposure to dienogest. [\[Moderate\]](#) Study
 - ▶ Cobicistat is predicted to moderately increase the exposure to dienogest. [\[Moderate\]](#) Study
 - ▶ Crizotinib is predicted to slightly increase the exposure to dienogest. [\[Moderate\]](#) Study
- ▶ HIV-protease inhibitors are predicted to moderately increase the exposure to dienogest. [\[Moderate\]](#) Study
- ▶ Idelalisib is predicted to moderately increase the exposure to dienogest. [\[Moderate\]](#) Study
- ▶ Imatinib is predicted to slightly increase the exposure to dienogest. [\[Moderate\]](#) Study
- ▶ Letermovir is predicted to slightly increase the exposure to dienogest. [\[Moderate\]](#) Study
- ▶ Macrolides (clarithromycin) are predicted to moderately increase the exposure to dienogest. [\[Moderate\]](#) Study
- ▶ Macrolides (erythromycin) are predicted to slightly increase the exposure to dienogest. [\[Moderate\]](#) Study
- ▶ Mitotane is predicted to markedly decrease the exposure to dienogest. [\[Severe\]](#) Study
- ▶ Neurokinin-1 receptor antagonists (aprepitant, netupitant) are predicted to slightly increase the exposure to dienogest. [\[Moderate\]](#) Study
- ▶ Nilotinib is predicted to slightly increase the exposure to dienogest. [\[Moderate\]](#) Study
- ▶ Rifamycins (rifampicin) are predicted to markedly decrease the exposure to dienogest. [\[Severe\]](#) Study
- Digoxin** → see TABLE 6 p. 1448 (bradycardia)
- ▶ Acarbose decreases the concentration of digoxin. [\[Moderate\]](#) Study
- ▶ Aldosterone antagonists (eplerenone) very slightly increase the exposure to digoxin. [\[Mild\]](#) Study
- ▶ Aldosterone antagonists (spironolactone) increase the concentration of digoxin. Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ Aminoglycosides potentially increase the concentration of digoxin. Monitor and adjust dose. [\[Mild\]](#) Study
- ▶ Oral antacids decrease the absorption of oral digoxin. Separate administration by 2 hours. [\[Mild\]](#) Study
- ▶ Anti-androgens (apalutamide) are predicted to decrease the exposure to digoxin. [\[Mild\]](#) Study
- ▶ Antiarrhythmics (amiodarone, dronedarone) are predicted to moderately increase the exposure to digoxin. Monitor and adjust digoxin dose, p. 117. [\[Severe\]](#) Study → Also see TABLE 6 p. 1448
- ▶ Antiarrhythmics (propafenone) increase the concentration of digoxin. Monitor and adjust dose. [\[Severe\]](#) Study
- ▶ Antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the concentration of digoxin. [\[Moderate\]](#) Anecdotal
- ▶ Antifungals, azoles (isavuconazole) slightly increase the exposure to digoxin. Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ Antifungals, azoles (itraconazole) are predicted to markedly increase the concentration of digoxin. Monitor and adjust dose. [\[Severe\]](#) Study
- ▶ Antifungals, azoles (ketoconazole) are predicted to markedly increase the concentration of digoxin. [\[Severe\]](#) Study
- ▶ Antifungals, azoles (posaconazole) are predicted to increase the concentration of digoxin. [\[Severe\]](#) Study
- ▶ Antimalarials (mefloquine) are predicted to increase the risk of bradycardia when given with digoxin. [\[Severe\]](#) Theoretical
- ▶ Antimalarials (quinine) increase the concentration of digoxin. Monitor and adjust digoxin dose, p. 117. [\[Severe\]](#) Anecdotal
- ▶ Balsalazide is predicted to decrease the concentration of digoxin. [\[Moderate\]](#) Theoretical
- ▶ Calcium channel blockers (diltiazem, verapamil) increase the concentration of digoxin. Monitor and adjust dose. [\[Severe\]](#) Study → Also see TABLE 6 p. 1448
- ▶ Intravenous calcium salts increase the effects of digoxin. Avoid. [\[Moderate\]](#) Anecdotal
- ▶ Carbimazole affects the concentration of digoxin. Monitor and adjust dose. [\[Moderate\]](#) Theoretical
- ▶ Certinib is predicted to increase the risk of bradycardia when given with digoxin. Avoid. [\[Severe\]](#) Theoretical → Also see TABLE 6 p. 1448
- ▶ Ciclosporin increases the concentration of digoxin. Monitor and adjust dose. [\[Severe\]](#) Theoretical
- ▶ Dabrafenib is predicted to decrease the exposure to digoxin. [\[Moderate\]](#) Theoretical
- ▶ Drugs that reduce serum potassium (see TABLE 17 p. 1451) are predicted to increase the risk of digoxin toxicity when given with digoxin. [\[Severe\]](#) Study

Digoxin (continued)

- ▶ **Eliglustat** increases the exposure to **digoxin**. Adjust dose. [\[Moderate\]](#) Study
- ▶ **Fostamatinib** slightly increases the exposure to **digoxin**. Monitor **digoxin** concentration and adjust dose, p. 117. [\[Moderate\]](#) Study
- ▶ **Glecaprevir** with pibrentasvir increases the exposure to **digoxin**. [\[Moderate\]](#) Study
- ▶ **HIV-protease inhibitors (ritonavir)** increase the concentration of **digoxin**. Adjust dose and monitor concentration. [\[Severe\]](#) Study
- ▶ **Ibrutinib** is predicted to increase the exposure to **digoxin**. Separate administration by at least 6 hours. [\[Moderate\]](#) Theoretical
- ▶ **Ivacaftor** slightly increases the exposure to **digoxin**. [\[Moderate\]](#) Study
- ▶ **Lapatinib** is predicted to increase the exposure to **digoxin**. [\[Moderate\]](#) Theoretical
- ▶ **Ledipasvir** is predicted to increase the exposure to **digoxin**. Monitor and adjust dose. [\[Moderate\]](#) Theoretical
- ▶ **Lorlatinib** is predicted to decrease the exposure to **digoxin**. [\[Moderate\]](#) Study
- ▶ **Macrolides** increase the concentration of **digoxin**. [\[Severe\]](#) Anecdotal
- ▶ **Mirabegron** slightly increases the exposure to **digoxin**. Monitor concentration and adjust dose. [\[Severe\]](#) Study
- ▶ **Neomycin** decreases the absorption of **digoxin**. [\[Moderate\]](#) Study
- ▶ **Neratinib** slightly increases the exposure to **digoxin**. [\[Moderate\]](#) Study
- ▶ **Neuromuscular blocking drugs, non-depolarising (pancuronium)** are predicted to increase the risk of cardiovascular adverse effects when given with **digoxin**. [\[Severe\]](#) Anecdotal
- ▶ **NSAIDs (indometacin)** increase the concentration of **digoxin**. [\[Severe\]](#) Study
- ▶ **Olaparib** might increase the exposure to **digoxin**. [\[Moderate\]](#) Theoretical
- ▶ **Osimertinib** is predicted to increase the exposure to **digoxin**. [\[Moderate\]](#) Study
- ▶ **Penicillamine** potentially decreases the concentration of **digoxin**. Separate administration by 2 hours. [\[Severe\]](#) Anecdotal
- ▶ **Pibrentasvir** with glecaprevir increases the exposure to **digoxin**. [\[Moderate\]](#) Study
- ▶ **Pitolisant** is predicted to decrease the exposure to **digoxin**. [\[Mild\]](#) Theoretical
- ▶ **Ranolazine** increases the concentration of **digoxin**. [\[Moderate\]](#) Study
- ▶ **Ribociclib** is predicted to increase the exposure to **digoxin**. [\[Moderate\]](#) Theoretical
- ▶ **Rifamycins (rifampicin)** decrease the concentration of **digoxin**. [\[Moderate\]](#) Study
- ▶ **St John's wort** decreases the concentration of **digoxin**. Avoid. [\[Severe\]](#) Anecdotal
- ▶ **Sucralfate** decreases the absorption of **digoxin**. Separate administration by 2 hours. [\[Severe\]](#) Anecdotal
- ▶ **Sulfasalazine** decreases the concentration of **digoxin**. [\[Moderate\]](#) Study
- ▶ **Suxamethonium** is predicted to increase the risk of cardiovascular adverse effects when given with **digoxin**. [\[Severe\]](#) Anecdotal
- ▶ **Thyroid hormones** are predicted to affect the concentration of **digoxin**. Monitor and adjust dose. [\[Moderate\]](#) Theoretical
- ▶ **Ticagrelor** increases the concentration of **digoxin**. [\[Moderate\]](#) Study
- ▶ **Tolvaptan** increases the concentration of **digoxin**. [\[Mild\]](#) Study
- ▶ **Trimethoprim** increases the concentration of **digoxin**. [\[Moderate\]](#) Study
- ▶ **Vandetanib** slightly increases the exposure to **digoxin**. [\[Moderate\]](#) Study
- ▶ **Velpatasvir** is predicted to increase the exposure to **digoxin**. [\[Severe\]](#) Study
- ▶ **Vemurafenib** slightly increases the exposure to **digoxin**. Use with caution and adjust dose. [\[Severe\]](#) Study
- ▶ **Venetoclax** increases the exposure to **digoxin**. Avoid or adjust dose. [\[Severe\]](#) Study
- ▶ **Vitamin D substances** are predicted to increase the risk of toxicity when given with **digoxin**. [\[Severe\]](#) Theoretical

- ▶ **Voxilaprevir** with sofosbuvir and velpatasvir is predicted to increase the exposure to **digoxin**. Monitor and adjust dose. [\[Severe\]](#) Theoretical

Dihydrocodeine → see opioids

Diltiazem → see calcium channel blockers

Dimenhydrinate → see TABLE 10 p. 1449 (antimuscarinics)

Dimethyl fumarate

▶ **Alcohol** (excessive consumption) potentially increases the risk of gastrointestinal adverse effects when given with **dimethyl fumarate**. Avoid. [\[Moderate\]](#) Theoretical

▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **dimethyl fumarate**. Public Health England advises avoid (refer to Green Book). [\[Severe\]](#) Theoretical

Dinutuximab → see monoclonal antibodies

Dipeptidylpeptidase-4 inhibitors → see TABLE 14 p. 1450 (antidiabetic drugs)

alogliptin · linagliptin · saxagliptin · sitagliptin · vildagliptin

▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to **linagliptin**. [\[Moderate\]](#) Study

▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to moderately decrease the exposure to **saxagliptin**. [\[Moderate\]](#) Study

▶ **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to **saxagliptin**. [\[Mild\]](#) Study

▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **linagliptin**. [\[Moderate\]](#) Study

▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to moderately decrease the exposure to **saxagliptin**. [\[Moderate\]](#) Study

▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **saxagliptin**. [\[Mild\]](#) Study

▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **saxagliptin**. [\[Moderate\]](#) Study

▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **saxagliptin**. [\[Mild\]](#) Study

▶ **Cobicistat** is predicted to increase the exposure to **saxagliptin**. [\[Moderate\]](#) Study

▶ **Crizotinib** is predicted to increase the exposure to **saxagliptin**. [\[Mild\]](#) Study

▶ **Grapefruit** juice is predicted to increase the exposure to **saxagliptin**. [\[Mild\]](#) Theoretical

▶ **HIV-protease inhibitors** are predicted to increase the exposure to **saxagliptin**. [\[Moderate\]](#) Study

▶ **Idelalisib** is predicted to increase the exposure to **saxagliptin**. [\[Moderate\]](#) Study

▶ **Imatinib** is predicted to increase the exposure to **saxagliptin**. [\[Mild\]](#) Study

▶ **Letermovir** is predicted to increase the exposure to **saxagliptin**. [\[Mild\]](#) Study

▶ **Linagliptin** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [\[Moderate\]](#) Theoretical

▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **saxagliptin**. [\[Moderate\]](#) Study

▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **saxagliptin**. [\[Mild\]](#) Study

▶ **Mitotane** is predicted to decrease the exposure to **linagliptin**. [\[Moderate\]](#) Study

▶ **Mitotane** is predicted to moderately decrease the exposure to **saxagliptin**. [\[Moderate\]](#) Study

▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to increase the exposure to **saxagliptin**. [\[Mild\]](#) Study

▶ **Nilotinib** is predicted to increase the exposure to **saxagliptin**. [\[Mild\]](#) Study

▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **linagliptin**. [\[Moderate\]](#) Study

▶ **Rifamycins (rifampicin)** are predicted to moderately decrease the exposure to **saxagliptin**. [\[Moderate\]](#) Study

▶ **Vemurafenib** is predicted to increase the exposure to **sitagliptin**. Use with caution or avoid. [\[Moderate\]](#) Theoretical

Diphenoxylate → see opioids

Dipipanone → see opioids

Dipyridamole → see TABLE 8 p. 1448 (hypotension), TABLE 4 p. 1447 (antiplatelet effects)

- ▶ Oral **antacids** are predicted to decrease the absorption of oral dipyridamole (immediate release tablets). [Moderate] Theoretical
- ▶ **Dipyridamole** increases the exposure to **antiarrhythmics (adenosine)**. Avoid or adjust dose. [Severe] Study
- ▶ **H₂ receptor antagonists** are predicted to decrease the absorption of dipyridamole (immediate release tablets). [Moderate] Theoretical
- ▶ **Proton pump inhibitors** are predicted to decrease the absorption of dipyridamole (immediate release tablets). [Moderate] Theoretical

Disopyramide → see antiarrhythmics

Disulfiram → see TABLE 12 p. 1450 (peripheral neuropathy)

- ▶ **Alcohol** causes an extremely unpleasant systemic reaction when given with disulfiram. Avoid for at least 24 hours before and up to 14 days after stopping treatment. [Severe] Study
- ▶ **Disulfiram** increases the concentration of **antiepileptics (fosphenytoin, phenytoin)**. Monitor concentration and adjust dose. [Severe] Study → Also see TABLE 12 p. 1450
- ▶ **Disulfiram** increases the anticoagulant effect of **coumarins**. Monitor and adjust dose. [Severe] Study
- ▶ **Disulfiram** increases the risk of acute psychoses when given with **metronidazole**. [Severe] Study → Also see TABLE 12 p. 1450
- ▶ **Disulfiram** is predicted to increase the anticoagulant effect of **phenindione**. [Severe] Theoretical

Dobutamine → see sympathomimetics, inotropic

Docetaxel → see taxanes

Docusate sodium

ROUTE-SPECIFIC INFORMATION Interactions do not generally apply to topical use of **docusate** unless specified.

Dolutegravir

- ▶ Oral **antacids** decrease the exposure to oral dolutegravir. Dolutegravir should be taken 2 hours before or 6 hours after antacids. [Moderate] Study
- ▶ **Anti-androgens (apalutamide, enzalutamide)** decrease the exposure to dolutegravir. Adjust dose. [Severe] Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** decrease the exposure to dolutegravir. Adjust dose. [Severe] Study
- ▶ **Antiepileptics (oxcarbazepine)** are predicted to decrease the exposure to dolutegravir. Adjust dose. [Severe] Theoretical
- ▶ Oral **calcium salts** decrease the absorption of dolutegravir. Dolutegravir should be taken 2 hours before or 6 hours after calcium salts. [Moderate] Study
- ▶ **Dabrafenib** decreases the exposure to dolutegravir. Adjust dose. [Severe] Study
- ▶ **Dolutegravir** is predicted to increase the exposure to **dopamine receptor agonists (pramipexole)**. Adjust dose. [Moderate] Study
- ▶ **Encorafenib** is predicted to increase the exposure to dolutegravir. [Moderate] Theoretical
- ▶ **Endothelin receptor antagonists (bosentan)** decrease the exposure to dolutegravir. Adjust dose. [Severe] Study
- ▶ **Dolutegravir** might increase the concentration of **fampridine**. Avoid. [Severe] Theoretical
- ▶ **HIV-protease inhibitors (fosamprenavir)** boosted with ritonavir slightly decrease the exposure to dolutegravir. Avoid if resistant to HIV-integrase inhibitors. [Severe] Study
- ▶ **HIV-protease inhibitors (tipranavir)** moderately decrease the exposure to dolutegravir. Refer to specialist literature. [Severe] Study
- ▶ Oral **iron** decreases the absorption of oral dolutegravir. Dolutegravir should be taken 2 hours before or 6 hours after iron. [Moderate] Study
- ▶ **Dolutegravir** increases the exposure to **metformin**. Use with caution and adjust dose. [Severe] Study
- ▶ **Mitotane** decreases the exposure to dolutegravir. Adjust dose. [Severe] Study
- ▶ **NNRTIs (efavirenz, nevirapine)** decrease the exposure to dolutegravir. Adjust dose. [Severe] Study
- ▶ **NNRTIs (etravirine)** moderately decrease the exposure to dolutegravir. Avoid unless given with atazanavir, darunavir, or lopinavir (all boosted with ritonavir). [Severe] Study
- ▶ **Rifamycins (rifampicin)** decrease the exposure to dolutegravir. Adjust dose. [Severe] Study

▶ **St John's wort** decreases the exposure to **dolutegravir**. Adjust dose. [Severe] Study

▶ **Sucralfate** decreases the absorption of **dolutegravir**. [Moderate] Study

Domperidone → see TABLE 9 p. 1449 (QT-interval prolongation)

- ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to domperidone. Avoid. [Severe] Study
 - ▶ **Antifungals, azoles (fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole)** are predicted to increase the exposure to domperidone. Avoid. [Severe] Study
 - ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to domperidone. Avoid. [Severe] Study
 - ▶ **Cobicistat** is predicted to increase the exposure to domperidone. Avoid. [Severe] Study
 - ▶ **Crizotinib** is predicted to increase the exposure to domperidone. Avoid. [Severe] Study
 - ▶ **Domperidone** is predicted to decrease the prolactin-lowering effect of **dopamine receptor agonists (bromocriptine, cabergoline)**. [Moderate] Theoretical
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to domperidone. Avoid. [Severe] Study
 - ▶ **Idelalisib** is predicted to increase the exposure to domperidone. Avoid. [Severe] Study
 - ▶ **Imatinib** is predicted to increase the exposure to domperidone. Avoid. [Severe] Study
 - ▶ **Letermovir** is predicted to increase the exposure to domperidone. Avoid. [Severe] Study
 - ▶ **Macrolides (clarithromycin, erythromycin)** are predicted to increase the exposure to domperidone. Avoid. [Severe] Study
 - ▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to increase the exposure to domperidone. Avoid. [Severe] Study
 - ▶ **Nilotinib** is predicted to increase the exposure to domperidone. Avoid. [Severe] Study
 - ▶ **Donepezil** → see anticholinesterases, centrally acting
 - ▶ **Dopamine** → see sympathomimetics, inotropic
 - ▶ **Dopamine receptor agonists** → see TABLE 8 p. 1448 (hypotension), TABLE 9 p. 1449 (QT-interval prolongation), TABLE 10 p. 1449 (antimuscarinics)
- amantadine · apomorphine · bromocriptine · cabergoline · pramipexole · quinagolide · ropinirole · rotigotine

FOOD AND LIFESTYLE Dose adjustment might be necessary if smoking started or stopped during treatment with **ropinirole**.

- ▶ **Apomorphine** is predicted to increase the risk of severe hypotension when given with **5-HT₃-receptor antagonists (granisetron, palonosetron)**. [Severe] Theoretical
- ▶ **Apomorphine** increases the risk of severe hypotension when given with **5-HT₃-receptor antagonists (ondansetron)**. Avoid. [Severe] Study → Also see TABLE 9 p. 1449
- ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to **bromocriptine**. [Severe] Theoretical
- ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the concentration of **cabergoline**. [Severe] Anecdotal
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole)** are predicted to increase the concentration of **cabergoline**. [Moderate] Anecdotal
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **bromocriptine**. [Severe] Theoretical
- ▶ **Antifungals, azoles (isavuconazole)** are predicted to increase the exposure to **pramipexole**. Adjust dose. [Moderate] Study
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** increase the exposure to **bromocriptine**. [Severe] Study
- ▶ **Antipsychotics, second generation (amisulpride, olanzapine, paliperidone, quetiapine, risperidone)** are predicted to decrease the effects of **dopamine receptor agonists**. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 1448 → Also see TABLE 9 p. 1449
- ▶ **Antipsychotics, second generation (aripiprazole, clozapine)** are predicted to decrease the effects of **dopamine receptor agonists**. [Moderate] Theoretical → Also see TABLE 8 p. 1448 → Also see TABLE 10 p. 1449
- ▶ **Antipsychotics, second generation (asenapine)** are predicted to decrease the effects of **dopamine receptor agonists**. Adjust dose. [Moderate] Theoretical → Also see TABLE 8 p. 1448

Dopamine receptor agonists (continued)

- ▶ **Axitinib** is predicted to increase the exposure to **ropinirole**. [Moderate] Theoretical
- ▶ **Benperidol** is predicted to decrease the effects of **dopamine receptor agonists**. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 1448
- ▶ **Bupropion** increases the risk of adverse effects when given with **amantadine**. [Moderate] Study
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **bromocriptine**. [Severe] Theoretical → Also see TABLE 8 p. 1448
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the concentration of **cabergoline**. [Moderate] Anecdotal → Also see TABLE 8 p. 1448
- ▶ **Cobicicstat** increases the exposure to **bromocriptine**. [Severe] Study
- ▶ **Cobicicstat** is predicted to increase the concentration of **cabergoline**. [Moderate] Anecdotal
- ▶ **Combined hormonal contraceptives** is predicted to increase the exposure to **ropinirole**. Adjust dose. [Moderate] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **bromocriptine**. [Severe] Theoretical
- ▶ **Crizotinib** is predicted to increase the concentration of **cabergoline**. [Moderate] Anecdotal
- ▶ **Dolutegravir** is predicted to increase the exposure to **pramipexole**. Adjust dose. [Moderate] Study
- ▶ **Dopamiprone** is predicted to decrease the prolactin-lowering effect of dopamine receptor agonists (**bromocriptine, cabergoline**). [Moderate] Theoretical
- ▶ Dopamine receptor agonists (**cabergoline**) are predicted to increase the risk of ergotism when given with dopamine receptor agonists (**bromocriptine**). Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 1448
- ▶ Dopamine receptor agonists (**amantadine**) are predicted to increase the exposure to dopamine receptor agonists (**pramipexole**). Adjust dose. [Moderate] Theoretical → Also see TABLE 8 p. 1448
- ▶ **Droperidol** is predicted to decrease the effects of **dopamine receptor agonists**. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 1448 → Also see TABLE 9 p. 1449
- ▶ **Ergometrine** is predicted to increase the risk of ergotism when given with **cabergoline**. Avoid. [Moderate] Theoretical
- ▶ **Ergotamine** is predicted to increase the risk of ergotism when given with dopamine receptor agonists (**bromocriptine, cabergoline**). Avoid. [Moderate] Theoretical
- ▶ **Flupentixol** is predicted to decrease the effects of **dopamine receptor agonists**. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 1448
- ▶ **H₂ receptor antagonists (cimetidine)** are predicted to increase the exposure to **pramipexole**. Adjust dose. [Moderate] Study
- ▶ **Haloperidol** is predicted to decrease the effects of **dopamine receptor agonists**. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 1448 → Also see TABLE 9 p. 1449 → Also see TABLE 10 p. 1449
- ▶ **HIV-protease inhibitors** increase the exposure to **bromocriptine**. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the concentration of **cabergoline**. [Moderate] Anecdotal
- ▶ **Hormone replacement therapy** decreases the clearance of **ropinirole**. Monitor and adjust dose. [Moderate] Study
- ▶ **Idelalisib** increases the exposure to **bromocriptine**. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the concentration of **cabergoline**. [Moderate] Anecdotal
- ▶ **Imatinib** is predicted to increase the exposure to **bromocriptine**. [Severe] Theoretical
- ▶ **Imatinib** is predicted to increase the concentration of **cabergoline**. [Moderate] Anecdotal
- ▶ **Letermovir** is predicted to increase the exposure to **bromocriptine**. [Severe] Theoretical
- ▶ **Loxapine** is predicted to decrease the effects of **dopamine receptor agonists**. [Moderate] Theoretical → Also see TABLE 8 p. 1448 → Also see TABLE 10 p. 1449
- ▶ **Macrolides (clarithromycin)** increase the exposure to **bromocriptine**. [Severe] Study
- ▶ **Macrolides (clarithromycin, erythromycin)** are predicted to increase the concentration of **cabergoline**. Avoid. [Severe] Study
- ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **bromocriptine**. [Severe] Theoretical
- ▶ **Amantadine** increases the risk of CNS toxicity when given with **memantine**. Use with caution or avoid. [Severe] Theoretical
- ▶ **Memantine** is predicted to increase the effects of dopamine receptor agonists (**apomorphine, bromocriptine, cabergoline, pramipexole, quinagolide, ropinirole, rotigotine**). [Moderate] Theoretical
- ▶ **Metoclopramide** is predicted to decrease the effects of dopamine receptor agonists (**apomorphine, bromocriptine, cabergoline, pramipexole, quinagolide, ropinirole, rotigotine**). Avoid. [Moderate] Study
- ▶ **Mexiletine** is predicted to increase the exposure to **ropinirole**. Adjust dose. [Moderate] Study
- ▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to increase the exposure to **bromocriptine**. [Severe] Theoretical
- ▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to increase the concentration of **cabergoline**. [Moderate] Anecdotal
- ▶ **Nilotinib** is predicted to increase the exposure to **bromocriptine**. [Severe] Theoretical
- ▶ **Nilotinib** is predicted to increase the concentration of **cabergoline**. [Moderate] Anecdotal
- ▶ **Phenothiazines** are predicted to decrease the effects of **dopamine receptor agonists**. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 1448 → Also see TABLE 9 p. 1449 → Also see TABLE 10 p. 1449
- ▶ **Pimozide** is predicted to decrease the effects of **dopamine receptor agonists**. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 1448 → Also see TABLE 9 p. 1449 → Also see TABLE 10 p. 1449
- ▶ **Quinolones (ciprofloxacin)** are predicted to increase the exposure to **ropinirole**. Adjust dose. [Moderate] Study
- ▶ **Ranolazine** is predicted to increase the exposure to **pramipexole**. Adjust dose. [Moderate] Study
- ▶ **Rucaparib** is predicted to increase the exposure to **ropinirole**. Adjust dose. [Moderate] Study
- ▶ **SSRIs (fluvoxamine)** are predicted to increase the exposure to **ropinirole**. Adjust dose. [Moderate] Study
- ▶ **Sulpiride** is predicted to decrease the effects of **dopamine receptor agonists**. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 1448 → Also see TABLE 9 p. 1449
- ▶ **Sympathomimetics, vasoconstrictor (isometheptene)** potentially increase the risk of adverse effects when given with **bromocriptine**. Avoid. [Severe] Anecdotal
- ▶ **Trimethoprim** is predicted to increase the exposure to **pramipexole**. Adjust dose. [Moderate] Study
- ▶ **Vandetanib** is predicted to increase the exposure to **pramipexole**. Adjust dose. [Moderate] Study
- ▶ **Vemurafenib** is predicted to increase the exposure to **ropinirole**. Adjust dose. [Moderate] Study
- ▶ **Zuclophenthixol** is predicted to decrease the effects of **dopamine receptor agonists**. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 1448 → Also see TABLE 9 p. 1449

Doravirine → see NNRTIs

Dorzolamide

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application of **dorzolamide**, the possibility of interactions should be borne in mind.

Dosulepin → see tricyclic antidepressants

Doxapram

- ▶ **Aminophylline** increases the risk of agitation when given with doxapram. [Moderate] Study
- ▶ **MAOIs, irreversible** are predicted to increase the effects of doxapram. [Moderate] Theoretical
- ▶ **Theophylline** increases the risk of agitation when given with doxapram. [Moderate] Study
- ▶ **Doxazosin** → see alpha blockers
- ▶ **Doxepin** → see tricyclic antidepressants
- ▶ **Doxorubicin** → see antineoplastic drugs
- ▶ **Doxycycline** → see tetracyclines
- ▶ **Doxylamine** → see antihistamines, sedating
- ▶ **Dronabinol** → see TABLE 11 p. 1449 (CNS depressant effects)

- ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to **dronabinol**. Avoid or adjust dose. [Mid] Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **dronabinol**. Avoid or adjust dose. [Mid] Study → Also see TABLE 11 p. 1449
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **dronabinol**. Adjust dose. [Mid] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **dronabinol**. Adjust dose. [Mid] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **dronabinol**. Adjust dose. [Mid] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **dronabinol**. Adjust dose. [Mid] Study
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **dronabinol**. Adjust dose. [Mid] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **dronabinol**. Avoid or adjust dose. [Mid] Study
- ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **dronabinol**. Avoid or adjust dose. [Mid] Study
- ▶ **St John's wort** is predicted to decrease the exposure to **dronabinol**. Avoid or adjust dose. [Mid] Study

Dronedaron → see antiarrhythmics

- ▶ **Droperidol** → see TABLE 8 p. 1448 (hypotension), TABLE 9 p. 1449 (QT-interval prolongation), TABLE 11 p. 1449 (CNS depressant effects)
- ▶ **Droperidol** is predicted to decrease the effects of **dopamine receptor agonists**. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 1448 → Also see TABLE 9 p. 1449
- ▶ **Droperidol** decreases the effects of **levodopa**. [Severe] Study → Also see TABLE 8 p. 1448

Drospirenone → see TABLE 16 p. 1451 (increased serum potassium)

- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **drospirenone**. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **drospirenone**. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **drospirenone**. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **drospirenone**. [Severe] Study
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **drospirenone**. [Severe] Study

Drugs that cause serotonin syndrome

- ▶ **Bupropion** might enhance the risk of serotonin syndrome when given with **drugs that cause serotonin syndrome** (see TABLE 13 p. 1450). [Severe] Anecdotal
- ▶ **Opioids (tapentadol)** are predicted to increase the risk of serotonin syndrome when given with **drugs that cause serotonin syndrome** (see TABLE 13 p. 1450). [Severe] Theoretical

Drugs that reduce serum potassium

- ▶ **Drugs that reduce serum potassium** (see TABLE 17 p. 1451) are predicted to increase the risk of digoxin toxicity when given with **digoxin**. [Severe] Study

Drugs with anticoagulant effects

- ▶ **Bismuth** subsalicylate is predicted to increase the risk of bleeding events when given with **drugs with anticoagulant effects** (see TABLE 3 p. 1447). [Moderate] Theoretical
- ▶ **Caplacizumab** is predicted to increase the risk of bleeding events when given with **drugs with anticoagulant effects** (see TABLE 3 p. 1447). [Severe] Theoretical
- ▶ **Cobimetinib** is predicted to increase the risk of bleeding when given with **drugs with anticoagulant effects** (see TABLE 3 p. 1447). [Severe] Theoretical
- ▶ **Volanesorsen** potentially increases the risk of bleeding events when given with **drugs with anticoagulant effects** (see TABLE 3 p. 1447). Avoid depending on platelet count—consult product literature. [Severe] Theoretical

Drugs with antimuscarinic effects

- ▶ **Drugs with antimuscarinic effects** (see TABLE 10 p. 1449) decrease the absorption of **levodopa**. [Moderate] Theoretical

Drugs with antiplatelet effects

- ▶ **Caplacizumab** is predicted to increase the risk of bleeding events when given with **drugs with antiplatelet effects** (see TABLE 4 p. 1447). [Severe] Theoretical
 - ▶ **Cobimetinib** is predicted to increase the risk of bleeding when given with **drugs with antiplatelet effects** (see TABLE 4 p. 1447). [Severe] Theoretical
 - ▶ **Volanesorsen** potentially increases the risk of bleeding events when given with **drugs with antiplatelet effects** (see TABLE 4 p. 1447). Avoid depending on platelet count—consult product literature. [Severe] Theoretical
- Dulaglutide** → see glucagon-like peptide-1 receptor agonists
- Duloxetine** → see TABLE 18 p. 1451 (hyponatraemia), TABLE 13 p. 1450 (serotonin syndrome), TABLE 4 p. 1447 (antiplatelet effects)
- ▶ **Antiepileptics (phenytoin)** are predicted to decrease the exposure to **duloxetine**. [Moderate] Theoretical
 - ▶ **Axitinib** is predicted to increase the exposure to **duloxetine**. [Moderate] Theoretical → Also see TABLE 4 p. 1447
 - ▶ **Duloxetine** is predicted to increase the exposure to **beta blockers, selective (metoprolol)**. [Moderate] Study
 - ▶ **Duloxetine** is predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
 - ▶ **HIV-protease inhibitors (ritonavir)** are predicted to decrease the exposure to **duloxetine**. [Moderate] Theoretical
 - ▶ **Leflunomide** is predicted to decrease the exposure to **duloxetine**. [Moderate] Theoretical
 - ▶ **Mexiletine** is predicted to increase the exposure to **duloxetine**. [Moderate] Theoretical
 - ▶ **Duloxetine** is predicted to increase the exposure to **pitolisant**. Use with caution and adjust dose. [Moderate] Study
 - ▶ **Quinolones (ciprofloxacin)** are predicted to increase the exposure to **duloxetine**. Avoid. [Moderate] Theoretical
 - ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **duloxetine**. [Moderate] Theoretical
 - ▶ **Rucaparib** is predicted to increase the exposure to **duloxetine**. Monitor and adjust dose. [Moderate] Study
 - ▶ **SSRIs (fluvoxamine)** markedly increase the exposure to **duloxetine**. Avoid. [Severe] Study → Also see TABLE 18 p. 1451 → Also see TABLE 13 p. 1450 → Also see TABLE 4 p. 1447
 - ▶ **Teriflunomide** is predicted to decrease the exposure to **duloxetine**. [Moderate] Theoretical
 - ▶ **Vemurafenib** is predicted to increase the exposure to **duloxetine**. Use with caution or avoid. [Moderate] Theoretical
- Dupilumab** → see monoclonal antibodies
- Durvalumab** → see monoclonal antibodies
- Dutasteride**
- ▶ **Antiarrhythmics (dronedaron)** are predicted to moderately increase the exposure to **dutasteride**. [Mid] Study
 - ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to moderately increase the exposure to **dutasteride**. [Mid] Study
 - ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **dutasteride**. Monitor adverse effects and adjust dose. [Moderate] Theoretical
 - ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to moderately increase the exposure to **dutasteride**. [Mid] Study
 - ▶ **Cobicistat** is predicted to increase the exposure to **dutasteride**. Monitor adverse effects and adjust dose. [Moderate] Theoretical
 - ▶ **Crizotinib** is predicted to moderately increase the exposure to **dutasteride**. [Mid] Study
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **dutasteride**. Monitor adverse effects and adjust dose. [Moderate] Theoretical
 - ▶ **Idelalisib** is predicted to increase the exposure to **dutasteride**. Monitor adverse effects and adjust dose. [Moderate] Theoretical
 - ▶ **Imatinib** is predicted to moderately increase the exposure to **dutasteride**. [Mid] Study
 - ▶ **Letermovir** is predicted to moderately increase the exposure to **dutasteride**. [Mid] Study
 - ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **dutasteride**. Monitor adverse effects and adjust dose. [Moderate] Theoretical
 - ▶ **Macrolides (erythromycin)** are predicted to moderately increase the exposure to **dutasteride**. [Mid] Study

Dutasteride (continued)

- ▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to moderately increase the exposure to **dutasteride**. [\[Mild\]](#) Study
- ▶ **Nilotinib** is predicted to moderately increase the exposure to **dutasteride**. [\[Mild\]](#) Study

Eculizumab → see monoclonal antibodies

Edoxaban → see factor XA inhibitors

Efavirenz → see NNRTIs

Elbasvir

- ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to **elbasvir**. Avoid. [\[Severe\]](#) Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **elbasvir**. Avoid. [\[Severe\]](#) Study
- ▶ **Dabrafenib** is predicted to moderately decrease the exposure to **elbasvir**. Avoid. [\[Severe\]](#) Study
- ▶ **Endothelin receptor antagonists (bosentan)** are predicted to moderately decrease the exposure to **elbasvir**. Avoid. [\[Severe\]](#) Study
- ▶ **Mitotane** is predicted to decrease the exposure to **elbasvir**. Avoid. [\[Severe\]](#) Study
- ▶ **Modafinil** is predicted to decrease the exposure to **elbasvir**. Avoid. [\[Unknown\]](#) Theoretical
- ▶ **NNRTIs (efavirenz, nevirapine)** are predicted to moderately decrease the exposure to **elbasvir**. Avoid. [\[Severe\]](#) Study
- ▶ **NNRTIs (etravirine)** are predicted to decrease the exposure to **elbasvir**. Avoid. [\[Unknown\]](#) Theoretical
- ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **elbasvir**. Avoid. [\[Severe\]](#) Study
- ▶ **St John's wort** is predicted to moderately decrease the exposure to **elbasvir**. Avoid. [\[Severe\]](#) Study
- ▶ **Elbasvir** with grazoprevir slightly increases the exposure to **statins (atorvastatin)**. Adjust **atorvastatin** dose, p. 218. [\[Moderate\]](#) Study
- ▶ **Elbasvir** with grazoprevir is predicted to increase the exposure to **statins (fluvastatin)**. Adjust **fluvastatin** dose, p. 219. [\[Moderate\]](#) Theoretical
- ▶ **Elbasvir** with grazoprevir moderately increases the exposure to **statins (rosuvastatin)**. Adjust **rosuvastatin** dose, p. 220. [\[Moderate\]](#) Study
- ▶ **Elbasvir** with grazoprevir is predicted to increase the exposure to **statins (simvastatin)**. Adjust **simvastatin** dose, p. 221. [\[Moderate\]](#) Theoretical
- ▶ **Elbasvir** is predicted to increase the concentration of **sunitinib**. Use with caution and adjust dose. [\[Moderate\]](#) Theoretical
- ▶ **Elbasvir** is predicted to increase the concentration of **thrombin inhibitors (dabigatran)**. [\[Moderate\]](#) Theoretical

Elitriptan → see triptans

Elxacaftor

- ▶ **Anti-androgens (apalutamide, enzalutamide)** is predicted to decrease the exposure to **elxacaftor**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to **elxacaftor**. Adjust tezacaftor with ivacaftor and elxacaftor p. 314 dose with moderate CYP3A4 inhibitors. [\[Severe\]](#) Theoretical
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** is predicted to decrease the exposure to **elxacaftor**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **elxacaftor**. Adjust tezacaftor with ivacaftor and elxacaftor p. 314 dose with moderate CYP3A4 inhibitors. [\[Severe\]](#) Theoretical
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **elxacaftor**. Adjust tezacaftor with ivacaftor and elxacaftor p. 314 dose with potent CYP3A4 inhibitors. [\[Severe\]](#) Study
- ▶ **Elxacaftor** is predicted to increase the exposure to **antihistamines, non-sedating (fexofenadine)**. [\[Moderate\]](#) Theoretical
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **elxacaftor**. Adjust tezacaftor with ivacaftor and elxacaftor p. 314 dose with moderate CYP3A4 inhibitors. [\[Severe\]](#) Theoretical

- ▶ **Cobicistat** is predicted to increase the exposure to **elxacaftor**. Adjust tezacaftor with ivacaftor and elxacaftor p. 314 dose with potent CYP3A4 inhibitors. [\[Severe\]](#) Study
- ▶ **Crizotinib** is predicted to increase the exposure to **elxacaftor**. Adjust tezacaftor with ivacaftor and elxacaftor p. 314 dose with moderate CYP3A4 inhibitors. [\[Severe\]](#) Theoretical
- ▶ **Elxacaftor** is predicted to increase the exposure to **endothelin receptor antagonists (bosentan)**. [\[Moderate\]](#) Theoretical
- ▶ **Grapefruit** juice is predicted to increase the exposure to **elxacaftor**. Avoid. [\[Moderate\]](#) Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **elxacaftor**. Adjust tezacaftor with ivacaftor and elxacaftor p. 314 dose with potent CYP3A4 inhibitors. [\[Severe\]](#) Study
- ▶ **Idelalisib** is predicted to increase the exposure to **elxacaftor**. Adjust tezacaftor with ivacaftor and elxacaftor p. 314 dose with potent CYP3A4 inhibitors. [\[Severe\]](#) Study
- ▶ **Imatinib** is predicted to increase the exposure to **elxacaftor**. Adjust tezacaftor with ivacaftor and elxacaftor p. 314 dose with moderate CYP3A4 inhibitors. [\[Severe\]](#) Theoretical
- ▶ **Letermovir** is predicted to increase the exposure to **elxacaftor**. Adjust tezacaftor with ivacaftor and elxacaftor p. 314 dose with moderate CYP3A4 inhibitors. [\[Severe\]](#) Theoretical
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **elxacaftor**. Adjust tezacaftor with ivacaftor and elxacaftor p. 314 dose with potent CYP3A4 inhibitors. [\[Severe\]](#) Study
- ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **elxacaftor**. Adjust tezacaftor with ivacaftor and elxacaftor p. 314 dose with moderate CYP3A4 inhibitors. [\[Severe\]](#) Theoretical
- ▶ **Elxacaftor** is predicted to increase the exposure to **meglitinides (repaglinide)**. [\[Moderate\]](#) Theoretical
- ▶ **Mitotane** is predicted to decrease the exposure to **elxacaftor**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to increase the exposure to **elxacaftor**. Adjust tezacaftor with ivacaftor and elxacaftor p. 314 dose with moderate CYP3A4 inhibitors. [\[Severe\]](#) Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to **elxacaftor**. Adjust tezacaftor with ivacaftor and elxacaftor p. 314 dose with moderate CYP3A4 inhibitors. [\[Severe\]](#) Theoretical
- ▶ **Rifamycins (rifabutin)** are predicted to decrease the exposure to **elxacaftor**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Rifamycins (rifampicin)** is predicted to decrease the exposure to **elxacaftor**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **St John's wort** is predicted to decrease the exposure to **elxacaftor**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Elxacaftor** is predicted to increase the exposure to **statins (atorvastatin, pravastatin, rosuvastatin, simvastatin)**. [\[Moderate\]](#) Theoretical
- ▶ **Elxacaftor** is predicted to increase the exposure to **sulfonylureas (glibenclamide)**. [\[Moderate\]](#) Theoretical

Eliglustat

- ▶ **Eliglustat** is predicted to increase the exposure to **aliskiren**. Adjust dose. [\[Moderate\]](#) Study
- ▶ **Anti-androgens (abiraterone)** are predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [\[Severe\]](#) Study
- ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to **eliglustat**. Avoid. [\[Severe\]](#) Study
- ▶ **Antiarrhythmics (dronedarone, propafenone)** are predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [\[Severe\]](#) Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **eliglustat**. Avoid. [\[Severe\]](#) Study
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole)** are predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [\[Severe\]](#) Study
- ▶ **Eliglustat** is predicted to increase the exposure to **antihistamines, non-sedating (fexofenadine)**. Adjust dose. [\[Moderate\]](#) Study
- ▶ **Eliglustat** is predicted to increase the exposure to **atomoxetine**. Adjust dose. [\[Moderate\]](#) Theoretical

- ▶ **Eltiglustat** is predicted to increase the exposure to **beta blockers, non-selective (propranolol)**. Adjust dose. [Moderate] Study
 - ▶ **Eltiglustat** is predicted to increase the exposure to **beta blockers, selective (metoprolol)**. Adjust dose. [Moderate] Study
 - ▶ **Bupropion** is predicted to increase the exposure to **eltiglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
 - ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **eltiglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
 - ▶ **Cinacalcet** is predicted to increase the exposure to **eltiglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
 - ▶ **Cobicistat** is predicted to increase the exposure to **eltiglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
 - ▶ **Eltiglustat** is predicted to increase the exposure to **colchicine**. Avoid or adjust colchicine dose, p. 1175. [Severe] Theoretical
 - ▶ **Crizotinib** is predicted to increase the exposure to **eltiglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
 - ▶ **Dacomitinib** is predicted to markedly increase the exposure to **eltiglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
 - ▶ **Eltiglustat** increases the exposure to **digoxin**. Adjust dose. [Moderate] Study
 - ▶ **Duloxetine** is predicted to increase the exposure to **eltiglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
 - ▶ **Endothelin receptor antagonists (bosentan)** are predicted to decrease the exposure to **eltiglustat**. [Moderate] Theoretical
 - ▶ **Eltiglustat** is predicted to increase the exposure to **everolimus**. Adjust dose. [Moderate] Study
 - ▶ **Eltiglustat** is predicted to increase the exposure to **factor XA inhibitors (edoxaban)**. Adjust dose. [Moderate] Study
 - ▶ **Grapefruit** juice is predicted to increase the exposure to **eltiglustat**. Avoid. [Severe] Theoretical
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **eltiglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
 - ▶ **Idelalisib** is predicted to increase the exposure to **eltiglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
 - ▶ **Imatinib** is predicted to increase the exposure to **eltiglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
 - ▶ **Letermovir** is predicted to increase the exposure to **eltiglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
 - ▶ **Eltiglustat** is predicted to increase the exposure to **loperamide**. Adjust dose. [Moderate] Study
 - ▶ **Macrolides (clarithromycin, erythromycin)** are predicted to increase the exposure to **eltiglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
 - ▶ **Mirabegron** is predicted to increase the exposure to **eltiglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
 - ▶ **Mitotane** is predicted to decrease the exposure to **eltiglustat**. Avoid. [Severe] Study
 - ▶ **Moclobemide** is predicted to increase the exposure to **eltiglustat**. Avoid or adjust dose—consult product literature. [Severe] Theoretical
 - ▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to increase the exposure to **eltiglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
 - ▶ **Nilotinib** is predicted to increase the exposure to **eltiglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
 - ▶ **NNRTIs (efavirenz, nevirapine)** are predicted to decrease the exposure to **eltiglustat**. [Moderate] Theoretical
 - ▶ **Quinolones (ciprofloxacin)** are predicted to increase the exposure to **eltiglustat**. Avoid or adjust dose—consult product literature. [Severe] Theoretical
 - ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **eltiglustat**. Avoid. [Severe] Study
 - ▶ **Eltiglustat** is predicted to increase the exposure to **sirolimus**. Adjust dose. [Moderate] Study
 - ▶ **SSRIs (fluoxetine, paroxetine)** are predicted to increase the exposure to **eltiglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
 - ▶ **St John's wort** is predicted to increase the exposure to **eltiglustat**. Avoid. [Severe] Study
 - ▶ **Eltiglustat** is predicted to increase the exposure to **taxanes (paclitaxel)**. Adjust dose. [Moderate] Study
 - ▶ **Terbinafine** is predicted to increase the exposure to **eltiglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
 - ▶ **Eltiglustat** is predicted to increase the exposure to **thrombin inhibitors (dabigatran)**. Adjust dose. [Moderate] Study
 - ▶ **Eltiglustat** is predicted to increase the exposure to **tolterodine**. Adjust dose. [Moderate] Theoretical
 - ▶ **Eltiglustat** is predicted to increase the exposure to **topotecan**. Adjust dose. [Moderate] Study
 - ▶ **Eltiglustat** is predicted to increase the exposure to **tricyclic antidepressants (nortriptyline)**. Adjust dose. [Moderate] Theoretical
- Elotuzumab** → see monoclonal antibodies
- Eltrombopag**
- ▶ **Eltrombopag** is predicted to increase the exposure to **alpelisib**. [Moderate] Theoretical
 - ▶ Oral **antacids** decrease the absorption of oral **eltrombopag**. **Eltrombopag** should be taken 2 hours before or 4 hours after antacids. [Severe] Study
 - ▶ Oral **calcium salts** decrease the absorption of **eltrombopag**. **Eltrombopag** should be taken 2 hours before or 4 hours after calcium salts. [Severe] Study
 - ▶ **Ciclosporin** causes a small decrease in the exposure to **eltrombopag**. Monitor platelet count and adjust dose. [Moderate] Study
 - ▶ Oral **iron** is predicted to decrease the absorption of oral **eltrombopag**. **Eltrombopag** should be taken 2 hours before or 4 hours after iron. [Severe] Theoretical
 - ▶ **Eltrombopag** is predicted to increase the exposure to **larotrectinib**. [Mid] Study
 - ▶ **Eltrombopag** is predicted to increase the concentration of **letermovir**. [Moderate] Study
 - ▶ **Eltrombopag** is predicted to increase the concentration of **methotrexate**. [Moderate] Theoretical
 - ▶ **Eltrombopag** is predicted to increase the exposure to the active metabolites of **ozanimod**. Avoid. [Moderate] Study
 - ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **eltrombopag** and **eltrombopag** is predicted to increase the concentration of **rifamycins (rifampicin)**. [Moderate] Theoretical
 - ▶ Oral **selenium** is predicted to decrease the absorption of **eltrombopag**. **Eltrombopag** should be taken 2 hours before or 4 hours after **selenium**. [Severe] Theoretical
 - ▶ **SSRIs (fluvoxamine)** are predicted to increase the exposure to **eltrombopag**. [Moderate] Theoretical
 - ▶ **Eltrombopag** is predicted to increase the exposure to **statins**. Monitor and adjust dose. [Moderate] Study
 - ▶ **Eltrombopag** is predicted to increase the exposure to **talazoparib**. Avoid or monitor. [Moderate] Theoretical
 - ▶ **Eltrombopag** is predicted to increase the exposure to **tenofovir alafenamide**. [Moderate] Theoretical
 - ▶ **Eltrombopag** is predicted to increase the exposure to **tenofovir disoproxil**. [Moderate] Theoretical
 - ▶ Oral **zinc** is predicted to decrease the absorption of **eltrombopag**. **Eltrombopag** should be taken 2 hours before or 4 hours after **zinc**. [Severe] Theoretical
- Elvitegravir**
- ▶ Oral **antacids** decrease the exposure to oral **elvitegravir**. Separate administration by at least 4 hours. [Moderate] Study
 - ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the concentration of **elvitegravir**. Avoid. [Severe] Theoretical
 - ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the concentration of **elvitegravir**. Avoid. [Severe] Theoretical
 - ▶ **Elvitegravir** is predicted to decrease the anticoagulant effect of **coumarins**. [Moderate] Theoretical
 - ▶ **Dabrafenib** is predicted to decrease the concentration of **elvitegravir**. Avoid. [Severe] Theoretical
 - ▶ **Endothelin receptor antagonists (bosentan)** are predicted to decrease the concentration of **elvitegravir**. Avoid. [Severe] Theoretical
 - ▶ **Elvitegravir** markedly increases the exposure to **grazoprevir**. Avoid. [Severe] Study
 - ▶ **HIV-protease inhibitors (atazanavir, lopinavir)** boosted with ritonavir increase the concentration of **elvitegravir**. Refer to specialist literature. [Moderate] Study

Elvitegravir (continued)

- ▶ **Mitotane** is predicted to decrease the concentration of **elvitegravir**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **NNRTIs (efavirenz, nevirapine)** are predicted to decrease the concentration of **elvitegravir**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Rifamycins (rifampicin)** are predicted to decrease the concentration of **elvitegravir**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **St John's wort** is predicted to decrease the concentration of **elvitegravir**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Empagliflozin** → see sodium glucose co-transporter 2 inhibitors
- ▶ **Emtricitabine** → see NRTIs
- ▶ **Enalapril** → see ACE inhibitors
- ▶ **Encorafenib** → see TABLE 9 p. 1449 (QT-interval prolongation)
- ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to **encorafenib**. [\[Severe\]](#) Theoretical → Also see TABLE 9 p. 1449
- ▶ **Antiarrhythmics (dronedronone)** are predicted to moderately increase the exposure to **encorafenib**. [\[Moderate\]](#) Study → Also see TABLE 9 p. 1449
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **encorafenib**. [\[Severe\]](#) Theoretical
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to moderately increase the exposure to **encorafenib**. [\[Moderate\]](#) Study → Also see TABLE 9 p. 1449
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **encorafenib**. Avoid or monitor. [\[Severe\]](#) Study → Also see TABLE 9 p. 1449
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to moderately increase the exposure to **encorafenib**. [\[Moderate\]](#) Study
- ▶ **Cobicistat** is predicted to increase the exposure to **encorafenib**. Avoid or monitor. [\[Severe\]](#) Study
- ▶ **Encorafenib** is predicted to affect the exposure to **combined hormonal contraceptives**. [\[Severe\]](#) Theoretical
- ▶ **Crizotinib** is predicted to moderately increase the exposure to **encorafenib**. [\[Moderate\]](#) Study → Also see TABLE 9 p. 1449
- ▶ **Encorafenib** is predicted to increase the exposure to **dolutegravir**. [\[Moderate\]](#) Theoretical
- ▶ **Grapefruit juice** is predicted to increase the exposure to **encorafenib**. Avoid. [\[Moderate\]](#) Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **encorafenib**. Avoid or monitor. [\[Severe\]](#) Study
- ▶ **Idelalisib** is predicted to increase the exposure to **encorafenib**. Avoid or monitor. [\[Severe\]](#) Study
- ▶ **Imatinib** is predicted to moderately increase the exposure to **encorafenib**. [\[Moderate\]](#) Study
- ▶ **Letermovir** is predicted to moderately increase the exposure to **encorafenib**. [\[Moderate\]](#) Study
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **encorafenib**. Avoid or monitor. [\[Severe\]](#) Study → Also see TABLE 9 p. 1449
- ▶ **Macrolides (erythromycin)** are predicted to moderately increase the exposure to **encorafenib**. [\[Moderate\]](#) Study → Also see TABLE 9 p. 1449
- ▶ **Mitotane** is predicted to decrease the exposure to **encorafenib**. [\[Severe\]](#) Theoretical
- ▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to moderately increase the exposure to **encorafenib**. [\[Moderate\]](#) Study
- ▶ **Nilotinib** is predicted to moderately increase the exposure to **encorafenib**. [\[Moderate\]](#) Study → Also see TABLE 9 p. 1449
- ▶ **Encorafenib** is predicted to increase the exposure to **raltegravir**. [\[Moderate\]](#) Theoretical
- ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **encorafenib**. [\[Severe\]](#) Theoretical
- ▶ **St John's wort** is predicted to decrease the exposure to **encorafenib**. [\[Severe\]](#) Theoretical

Endothelin receptor antagonists

- ▶ ambrisentan · bosentan · macitentan
- ▶ **Bosentan** is predicted to decrease the exposure to **acalabrutinib**. [\[Severe\]](#) Study
- ▶ **Anti-androgens (apalutamide, enzalutamide)** affect the exposure to **bosentan**. Avoid. [\[Severe\]](#) Study

- ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to **macitentan**. Avoid. [\[Severe\]](#) Study
- ▶ **Bosentan** is predicted to decrease the exposure to **anti-androgens (darolutamide)**. Avoid. [\[Moderate\]](#) Theoretical
- ▶ **Bosentan** is predicted to decrease the exposure to **antiarrhythmics (dronedronone)**. [\[Severe\]](#) Theoretical
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** affect the exposure to **bosentan**. Avoid. [\[Severe\]](#) Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **macitentan**. Avoid. [\[Severe\]](#) Study
- ▶ **Antifungals, azoles (fluconazole)** are predicted to increase the exposure to **bosentan**. Avoid. [\[Severe\]](#) Study
- ▶ **Antifungals, azoles (itraconazole)** are predicted to increase the exposure to **bosentan**. [\[Moderate\]](#) Theoretical
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **macitentan**. [\[Moderate\]](#) Study
- ▶ **Antifungals, azoles (ketoconazole)** moderately increase the exposure to **bosentan**. [\[Moderate\]](#) Study
- ▶ **Antifungals, azoles (voriconazole)** are predicted to increase the exposure to **bosentan**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Bosentan** is predicted to decrease the exposure to **antifungals, azoles (isavuconazole)**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Bosentan** is predicted to decrease the exposure to **antipsychotics, second generation (cariprazine)**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Bosentan** is predicted to decrease the exposure to **antipsychotics, second generation (lurasidone)**. Monitor and adjust dose. [\[Moderate\]](#) Theoretical
- ▶ **Bosentan** is predicted to decrease the exposure to **antipsychotics, second generation (quetiapine)**. [\[Moderate\]](#) Study
- ▶ **Bosentan** is predicted to decrease the exposure to **avapritinib**. Avoid. [\[Severe\]](#) Study
- ▶ **Bosentan** is predicted to decrease the exposure to **axitinib**. [\[Moderate\]](#) Study
- ▶ **Bosentan** is predicted to decrease the exposure to **bedaquiline**. Avoid. [\[Severe\]](#) Study
- ▶ **Bosentan** is predicted to decrease the concentration of **benzodiazepines (midazolam)**. Monitor and adjust dose. [\[Moderate\]](#) Theoretical
- ▶ **Bosentan** is predicted to decrease the exposure to **bosutinib**. Avoid. [\[Severe\]](#) Study
- ▶ **Bosentan** is predicted to decrease the exposure to **brigatinib**. Avoid. [\[Moderate\]](#) Study
- ▶ **Bosentan** is predicted to decrease the exposure to **cabozantinib**. [\[Moderate\]](#) Study
- ▶ **Bosentan** is predicted to decrease the exposure to **calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nifedipine, nimodipine)**. Monitor and adjust dose. [\[Moderate\]](#) Theoretical
- ▶ **Bosentan** is predicted to decrease the exposure to **calcium channel blockers (diltiazem, verapamil)**. [\[Moderate\]](#) Theoretical
- ▶ **Cephalosporins (ceftobiprole)** are predicted to increase the exposure to **bosentan**. [\[Moderate\]](#) Theoretical
- ▶ **Bosentan** is predicted to decrease the exposure to **ceritinib**. [\[Severe\]](#) Study
- ▶ **Ciclosporin** moderately increases the exposure to **ambrisentan**. Adjust **ambrisentan** dose, p. 198. [\[Moderate\]](#) Study
- ▶ **Bosentan** moderately decreases the exposure to **ciclosporin** and **ciclosporin** moderately increases the exposure to **bosentan**. Avoid. [\[Severe\]](#) Study
- ▶ **Bosentan** is predicted to decrease the exposure to **cobicistat**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Cobicistat** is predicted to increase the exposure to **macitentan**. [\[Moderate\]](#) Study
- ▶ **Bosentan** is predicted to decrease the exposure to **cobimetinib**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Bosentan** is predicted to decrease the efficacy of **combined hormonal contraceptives**. For FSRH guidance, see Contraceptives, interactions p. 843. [\[Severe\]](#) Study
- ▶ **Bosentan** decreases the anticoagulant effect of **coumarins**. [\[Moderate\]](#) Study

- ▶ **Bosentan** is predicted to decrease the exposure to **crizotinib**. Avoid. [Severe] Study
- ▶ **Bosentan** is predicted to decrease the exposure to **dabrafenib**. [Moderate] Study
- ▶ **Bosentan** is predicted to decrease the exposure to **dasatinib**. [Severe] Study
- ▶ **Bosentan** is predicted to decrease the efficacy of **desogestrel**. For FSRH guidance, see Contraceptives, interactions p. 843. [Severe] Theoretical
- ▶ **Bosentan** decreases the exposure to **dolutegravir**. Adjust dose. [Severe] Study
- ▶ **Bosentan** is predicted to moderately decrease the exposure to **elbasvir**. Avoid. [Severe] Study
- ▶ **Elxacaftor** is predicted to increase the exposure to **bosentan**. [Moderate] Theoretical
- ▶ **Bosentan** is predicted to decrease the exposure to **eliglustat**. [Moderate] Theoretical
- ▶ **Bosentan** is predicted to decrease the concentration of **elvitegravir**. Avoid. [Severe] Theoretical
- ▶ **Bosentan** is predicted to decrease the exposure to **entrectinib**. Avoid. [Severe] Theoretical
- ▶ **Bosentan** is predicted to decrease the effects of **ergotamine**. [Moderate] Theoretical
- ▶ **Bosentan** is predicted to decrease the exposure to **erlotinib**. [Severe] Study
- ▶ **Bosentan** is predicted to decrease the efficacy of **etonogestrel**. For FSRH guidance, see Contraceptives, interactions p. 843. [Severe] Theoretical
- ▶ **Bosentan** is predicted to decrease the concentration of **everolimus**. Avoid or adjust dose. [Severe] Study
- ▶ **Filgotinib** is predicted to increase the exposure to **bosentan**. Avoid. [Moderate] Theoretical
- ▶ **Bosentan** is predicted to decrease the exposure to **gefitinib**. Avoid. [Severe] Study
- ▶ **Bosentan** is predicted to decrease the exposure to **glasdegib**. Avoid or adjust **glasdegib** dose, p. 1056. [Severe] Theoretical
- ▶ **Bosentan** is predicted to decrease the exposure to **glecaprevir**. Avoid. [Severe] Study
- ▶ **Bosentan** is predicted to markedly decrease the exposure to **grazoprevir**. Avoid. [Severe] Study
- ▶ **Bosentan** is predicted to decrease the concentration of **guanfacine**. Adjust dose. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **bosentan**. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **macitentan**. [Moderate] Study
- ▶ **Bosentan** is predicted to decrease the effects of **hormone replacement therapy**. [Moderate] Anecdotal
- ▶ **Bosentan** is predicted to decrease the exposure to **ibrutinib**. Avoid or monitor. [Severe] Study
- ▶ **Bosentan** is predicted to decrease the exposure to **idelalisib**. Avoid. [Moderate] Theoretical
- ▶ **Idelalisib** is predicted to increase the exposure to **macitentan**. [Moderate] Study
- ▶ **Bosentan** is predicted to decrease the exposure to **imatinitib**. [Moderate] Study
- ▶ **Bosentan** is predicted to decrease the exposure to **ivacaftor**. [Moderate] Study
- ▶ **Bosentan** is predicted to decrease the exposure to **lapatinib**. Avoid. [Severe] Study
- ▶ **Bosentan** is predicted to decrease the exposure to **larotrectinib**. Avoid. [Moderate] Study
- ▶ **Leflunomide** is predicted to increase the exposure to **bosentan**. [Moderate] Study
- ▶ **Letermovir** is predicted to increase the concentration of **bosentan**. [Moderate] Theoretical
- ▶ **Bosentan** is predicted to decrease the efficacy of **levonorgestrel**. For FSRH guidance, see Contraceptives, interactions p. 843. [Severe] Theoretical
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **bosentan**. [Moderate] Theoretical
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **macitentan**. [Moderate] Study
- ▶ **Bosentan** is predicted to decrease the exposure to **maraviroc**. Avoid. [Moderate] Theoretical
- ▶ **Mitotane** affects the exposure to **bosentan**. Avoid. [Severe] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **macitentan**. Avoid. [Severe] Study
- ▶ **Bosentan** is predicted to decrease the exposure to **neratinib**. [Severe] Study
- ▶ **Bosentan** is predicted to decrease the exposure to **neurokinin-1 receptor antagonists (aprepitant)**. [Moderate] Study
- ▶ **Bosentan** is predicted to decrease the exposure to **neurokinin-1 receptor antagonists (fosaprepitant, netupitant)**. [Moderate] Theoretical
- ▶ **Bosentan** is predicted to decrease the exposure to **nilotinib**. Avoid. [Severe] Theoretical
- ▶ **Bosentan** is predicted to decrease the exposure to **NNRTIs (doravirine)**. Avoid or adjust doravirine p. 686 or lamivudine with tenofovir disoproxil and doravirine p. 696 dose. [Severe] Theoretical
- ▶ **Bosentan** is predicted to decrease the exposure to **NNRTIs (etravirine)**. Avoid. [Severe] Study
- ▶ **Bosentan** is predicted to decrease the exposure to **NNRTIs (nevirapine)**. [Severe] Theoretical
- ▶ **Bosentan** is predicted to decrease the exposure to **NNRTIs (rilpivirine)**. Avoid. [Severe] Theoretical
- ▶ **Bosentan** is predicted to decrease the efficacy of **norethisterone**. For FSRH guidance, see Contraceptives, interactions p. 843. [Severe] Anecdotal
- ▶ **Bosentan** is predicted to decrease the exposure to **olaparib**. Avoid. [Moderate] Theoretical
- ▶ **Bosentan** decreases the exposure to **opioids (methadone)**. Monitor and adjust dose. [Severe] Study
- ▶ **Bosentan** is predicted to decrease the exposure to **osimertinib**. Use with caution or avoid. [Severe] Study
- ▶ **Bosentan** is predicted to decrease the exposure to **ospemifene**. [Moderate] Study
- ▶ **Bosentan** is predicted to decrease the exposure to **pazopanib**. [Severe] Study
- ▶ **Bosentan** decreases the exposure to **phosphodiesterase type-5 inhibitors**. [Moderate] Study
- ▶ **Bosentan** is predicted to decrease the exposure to **pibrentasvir**. Avoid. [Severe] Study
- ▶ **Bosentan** is predicted to decrease the exposure to **ponatinib**. [Severe] Study
- ▶ **Bosentan** is predicted to decrease the exposure to **regorafenib**. [Severe] Study
- ▶ **Bosentan** is predicted to decrease the exposure to **ribociclib**. [Moderate] Study
- ▶ **Rifamycins (rifampicin)** transiently increase the exposure to **ambriensin**. [Moderate] Study
- ▶ **Rifamycins (rifampicin)** affect the exposure to **bosentan**. Avoid. [Severe] Study
- ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **macitentan**. Avoid. [Severe] Study
- ▶ **Bosentan** is predicted to decrease the exposure to **ruxolitinib**. Monitor and adjust dose. [Moderate] Study
- ▶ **Bosentan** is predicted to decrease the exposure to **siponimod**. Manufacturer advises caution depending on genotype—consult product literature. [Severe] Theoretical
- ▶ **Bosentan** is predicted to decrease the concentration of **sirolimus** and **sirolimus** potentially increases the concentration of **bosentan**. Avoid. [Severe] Theoretical
- ▶ **Bosentan** is predicted to decrease the exposure to **sorafenib**. [Moderate] Study
- ▶ **St John's wort** is predicted to decrease the exposure to **bosentan**. Avoid. [Moderate] Theoretical
- ▶ **St John's wort** is predicted to decrease the exposure to **macitentan**. Avoid. [Severe] Theoretical
- ▶ **Bosentan** is predicted to decrease the exposure to **statins (atorvastatin, simvastatin)**. [Moderate] Study
- ▶ **Bosentan** increases the risk of hepatotoxicity when given with **sulfonylureas (glibenclamide)**. Avoid. [Severe] Study
- ▶ **Bosentan** is predicted to decrease the exposure to **sunitinib**. [Moderate] Study
- ▶ **Bosentan** is predicted to decrease the concentration of **tacrolimus** and **tacrolimus** potentially increases the concentration of **bosentan**. Avoid. [Severe] Theoretical

Endothelin receptor antagonists (continued)

- ▶ **Bosentan** is predicted to decrease the exposure to **taxanes (cabazitaxel)**. Avoid. [\[Severe\]](#) Study
- ▶ **Bosentan** is predicted to decrease the concentration of **temsirolimus**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Terflunomide** is predicted to increase the exposure to **bosentan**. [\[Moderate\]](#) Study
- ▶ **Bosentan** is predicted to decrease the exposure to **ticagrelor**. [\[Moderate\]](#) Theoretical
- ▶ **Bosentan** is predicted to decrease the exposure to **tofacinib**. [\[Moderate\]](#) Study
- ▶ **Bosentan** decreases the efficacy of **ulipristal**. For FSRH guidance, see Contraceptives, interactions p. 843. [\[Severe\]](#) Anecdotal
- ▶ **Bosentan** is predicted to decrease the exposure to **vandetanib**. [\[Moderate\]](#) Study
- ▶ **Bosentan** is predicted to decrease the exposure to **velpatasvir**. Avoid. [\[Moderate\]](#) Theoretical
- ▶ **Vemurafenib** is predicted to increase the exposure to **ambrisentan**. Use with caution or avoid. [\[Moderate\]](#) Theoretical
- ▶ **Bosentan** is predicted to decrease the exposure to **vemurafenib**. [\[Severe\]](#) Study
- ▶ **Bosentan** is predicted to decrease the exposure to **venetoclax**. Avoid. [\[Severe\]](#) Study
- ▶ **Venetoclax** is predicted to increase the exposure to **bosentan**. [\[Moderate\]](#) Theoretical
- ▶ **Bosentan** is predicted to decrease the concentration of **voxilaprevir**. Avoid. [\[Severe\]](#) Theoretical
- Enoxaparin** → see low molecular-weight heparins
- Entacapone**
 - ▶ Oral **entacapone** is predicted to decrease the absorption of oral **iron**. Separate administration by at least 2 hours. [\[Moderate\]](#) Theoretical
 - ▶ **Entacapone** increases the exposure to **levodopa**. Monitor adverse effects and adjust dose. [\[Moderate\]](#) Study
 - ▶ **Entacapone** is predicted to increase the risk of elevated blood pressure when given with **MAOIs, irreversible**. Avoid. [\[Severe\]](#) Theoretical
 - ▶ **Entacapone** is predicted to increase the exposure to **methyl dopa**. [\[Moderate\]](#) Theoretical
 - ▶ **Entacapone** is predicted to increase the risk of cardiovascular adverse effects when given with **sympathomimetics, inotropic**. [\[Moderate\]](#) Theoretical
 - ▶ **Entacapone** is predicted to increase the risk of cardiovascular adverse effects when given with **sympathomimetics, vasoconstrictor (adrenaline/epinephrine, noradrenaline/norepinephrine)**. [\[Moderate\]](#) Study
- Enteral feeds**
 - ▶ **Aluminium hydroxide** increases the risk of blocked enteral or nasogastric tubes when given with **enteral feeds**. [\[Moderate\]](#) Study
 - ▶ **Enteral feeds** decrease the absorption of **antiepileptics (phenytoin)**. [\[Severe\]](#) Study
 - ▶ **Enteral feeds** (vitamin-K containing) potentially decrease the anticoagulant effect of **coumarins**. [\[Severe\]](#) Anecdotal
 - ▶ **Enteral feeds** (vitamin-K containing) potentially decrease the effects of **phenindione**. [\[Severe\]](#) Theoretical
 - ▶ **Enteral feeds** decrease the exposure to **quinolones (ciprofloxacin)**. [\[Moderate\]](#) Study
 - ▶ **Sucralfate** increases the risk of blocked enteral or nasogastric tubes when given with **enteral feeds**. Separate administration by 1 hour. [\[Moderate\]](#) Study
 - ▶ **Enteral feeds** decrease the exposure to **theophylline**. [\[Moderate\]](#) Study
- Entrectinib** → see TABLE 9 p. 1449 (QT-interval prolongation)
 - ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to **entrectinib**. Avoid. [\[Severe\]](#) Study → Also see TABLE 9 p. 1449
 - ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to **entrectinib**. Avoid moderate CYP3A4 inhibitors or adjust **entrectinib** dose, p. 1030. [\[Severe\]](#) Theoretical → Also see TABLE 9 p. 1449
 - ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **entrectinib**. Avoid. [\[Severe\]](#) Study
 - ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **entrectinib**. Avoid moderate CYP3A4 inhibitors or adjust **entrectinib** dose, p. 1030. [\[Severe\]](#) Theoretical → Also see TABLE 9 p. 1449
 - ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **entrectinib**. Avoid potent CYP3A4 inhibitors or adjust **entrectinib** dose, p. 1030. [\[Severe\]](#) Study → Also see TABLE 9 p. 1449
 - ▶ **Entrectinib** slightly increases the exposure to **benzodiazepines (midazolam)**. [\[Mild\]](#) Study
 - ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **entrectinib**. Avoid moderate CYP3A4 inhibitors or adjust **entrectinib** dose, p. 1030. [\[Severe\]](#) Theoretical
 - ▶ **Entrectinib** is predicted to increase the exposure to **ciclosporin**. [\[Mild\]](#) Theoretical
 - ▶ **Cobicistat** is predicted to increase the exposure to **entrectinib**. Avoid potent CYP3A4 inhibitors or adjust **entrectinib** dose, p. 1030. [\[Severe\]](#) Study
 - ▶ **Crizotinib** is predicted to increase the exposure to **entrectinib**. Avoid moderate CYP3A4 inhibitors or adjust **entrectinib** dose, p. 1030. [\[Severe\]](#) Theoretical → Also see TABLE 9 p. 1449
 - ▶ **Dabrafenib** is predicted to decrease the exposure to **entrectinib**. Avoid. [\[Severe\]](#) Theoretical
 - ▶ **Endothelin receptor antagonists (bosentan)** are predicted to decrease the exposure to **entrectinib**. Avoid. [\[Severe\]](#) Theoretical
 - ▶ **Entrectinib** is predicted to increase the exposure to **ergotamine**. [\[Mild\]](#) Theoretical
 - ▶ **Entrectinib** is predicted to increase the exposure to **everolimus**. [\[Mild\]](#) Theoretical
 - ▶ **Grapefruit** is predicted to increase the exposure to **entrectinib**. Avoid. [\[Severe\]](#) Theoretical
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **entrectinib**. Avoid potent CYP3A4 inhibitors or adjust **entrectinib** dose, p. 1030. [\[Severe\]](#) Study
 - ▶ **Idelalisib** is predicted to increase the exposure to **entrectinib**. Avoid potent CYP3A4 inhibitors or adjust **entrectinib** dose, p. 1030. [\[Severe\]](#) Study
 - ▶ **Imatinib** is predicted to increase the exposure to **entrectinib**. Avoid moderate CYP3A4 inhibitors or adjust **entrectinib** dose, p. 1030. [\[Severe\]](#) Theoretical
 - ▶ **Letermovir** is predicted to increase the exposure to **entrectinib**. Avoid moderate CYP3A4 inhibitors or adjust **entrectinib** dose, p. 1030. [\[Severe\]](#) Theoretical
 - ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **entrectinib**. Avoid potent CYP3A4 inhibitors or adjust **entrectinib** dose, p. 1030. [\[Severe\]](#) Study → Also see TABLE 9 p. 1449
 - ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **entrectinib**. Avoid moderate CYP3A4 inhibitors or adjust **entrectinib** dose, p. 1030. [\[Severe\]](#) Theoretical → Also see TABLE 9 p. 1449
 - ▶ **Mitotane** is predicted to decrease the exposure to **entrectinib**. Avoid. [\[Severe\]](#) Study
 - ▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to increase the exposure to **entrectinib**. Avoid moderate CYP3A4 inhibitors or adjust **entrectinib** dose, p. 1030. [\[Severe\]](#) Theoretical
 - ▶ **Nilotinib** is predicted to increase the exposure to **entrectinib**. Avoid moderate CYP3A4 inhibitors or adjust **entrectinib** dose, p. 1030. [\[Severe\]](#) Theoretical → Also see TABLE 9 p. 1449
 - ▶ **NNRTIs (efavirenz, nevirapine)** are predicted to decrease the exposure to **entrectinib**. Avoid. [\[Severe\]](#) Theoretical → Also see TABLE 9 p. 1449
 - ▶ **Entrectinib** is predicted to increase the exposure to **opioids (alfentanil, fentanyl)**. [\[Mild\]](#) Theoretical
 - ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **entrectinib**. Avoid. [\[Severe\]](#) Study
 - ▶ **Entrectinib** is predicted to increase the exposure to **sirolimus**. [\[Mild\]](#) Theoretical
 - ▶ **St John's wort** is predicted to decrease the exposure to **entrectinib**. Avoid. [\[Severe\]](#) Theoretical
 - ▶ **Entrectinib** is predicted to increase the exposure to **temsirolimus**. [\[Mild\]](#) Theoretical
 - Enzalutamide** → see anti-androgens
 - Ephedrine** → see sympathomimetics, vasoconstrictor

Epirubicin → see anthracyclines

Eplerenone → see aldosterone antagonists

Epoetin alfa → see TABLE 5 p. 1448 (thromboembolism), TABLE 16 p. 1451 (increased serum potassium)

Epoetin beta → see TABLE 5 p. 1448 (thromboembolism), TABLE 16 p. 1451 (increased serum potassium)

Epoetin zeta → see TABLE 5 p. 1448 (thromboembolism), TABLE 16 p. 1451 (increased serum potassium)

Epoprostenol → see TABLE 8 p. 1448 (hypotension), TABLE 4 p. 1447 (antiplatelet effects)

Eprosartan → see angiotensin-II receptor antagonists

Eptifibatid → see TABLE 3 p. 1447 (anticoagulant effects)

Ergocalciferol → see vitamin D substances

Ergometrine

- ▶ **Antiarrhythmics (dronedaron)** are predicted to increase the risk of ergotism when given with **ergometrine**. [Severe] Theoretical
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the risk of ergotism when given with **ergometrine**. [Severe] Theoretical
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the risk of ergotism when given with **ergometrine**. Avoid. [Severe] Theoretical
- ▶ **Antifungals, azoles (miconazole)** are predicted to increase the exposure to **ergometrine**. Avoid. [Moderate] Theoretical
- ▶ **Beta blockers, non-selective** are predicted to increase the risk of peripheral vasoconstriction when given with **ergometrine**. [Severe] Study
- ▶ **Beta blockers, selective** are predicted to increase the risk of peripheral vasoconstriction when given with **ergometrine**. [Severe] Study
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the risk of ergotism when given with **ergometrine**. [Severe] Theoretical
- ▶ **Cobicistat** is predicted to increase the risk of ergotism when given with **ergometrine**. Avoid. [Severe] Theoretical
- ▶ **Crizotinib** is predicted to increase the risk of ergotism when given with **ergometrine**. [Severe] Theoretical
- ▶ **Ergometrine** is predicted to increase the risk of ergotism when given with **dopamine receptor agonists (cabergoline)**. Avoid. [Moderate] Theoretical
- ▶ **Esketamine** is predicted to increase the risk of elevated blood pressure when given with **ergometrine**. Avoid. [Severe] Theoretical
- ▶ **Grapefruit** juice is predicted to increase the exposure to **ergometrine**. [Severe] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the risk of ergotism when given with **ergometrine**. Avoid. [Severe] Theoretical
- ▶ **Idelalisib** is predicted to increase the risk of ergotism when given with **ergometrine**. Avoid. [Severe] Theoretical
- ▶ **Imatinib** is predicted to increase the risk of ergotism when given with **ergometrine**. [Severe] Theoretical
- ▶ **Ketamine** is predicted to increase the risk of elevated blood pressure when given with **ergometrine**. [Severe] Theoretical
- ▶ **Letermovir** is predicted to increase the risk of ergotism when given with **ergometrine**. [Severe] Theoretical
- ▶ **Macrolides (clarithromycin)** are predicted to increase the risk of ergotism when given with **ergometrine**. Avoid. [Severe] Theoretical
- ▶ **Macrolides (erythromycin)** are predicted to increase the risk of ergotism when given with **ergometrine**. [Severe] Theoretical
- ▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to increase the risk of ergotism when given with **ergometrine**. [Severe] Theoretical
- ▶ **Nilotinib** is predicted to increase the risk of ergotism when given with **ergometrine**. [Severe] Theoretical
- ▶ **Olaparib** might alter the exposure to **ergometrine**. [Moderate] Theoretical
- ▶ **Ergometrine** potentially increases the risk of peripheral vasoconstriction when given with **sympathomimetics, inotropic (dopamine)**. Avoid. [Severe] Anecdotal
- ▶ **Ergometrine** is predicted to increase the risk of peripheral vasoconstriction when given with **sympathomimetics, vasoconstrictor (noradrenaline/norepinephrine)**. [Severe] Anecdotal

Ergotamine

- ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the effects of **ergotamine**. [Moderate] Theoretical
- ▶ **Antiarrhythmics (dronedaron)** are predicted to increase the risk of ergotism when given with **ergotamine**. [Severe] Theoretical
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the effects of **ergotamine**. [Moderate] Theoretical
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the risk of ergotism when given with **ergotamine**. [Severe] Theoretical
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the risk of ergotism when given with **ergotamine**. Avoid. [Severe] Theoretical
- ▶ **Antifungals, azoles (miconazole)** are predicted to increase the exposure to **ergotamine**. Avoid. [Moderate] Theoretical
- ▶ **Beta blockers, non-selective** are predicted to increase the risk of peripheral vasoconstriction when given with **ergotamine**. [Severe] Study
- ▶ **Beta blockers, selective** are predicted to increase the risk of peripheral vasoconstriction when given with **ergotamine**. [Severe] Study
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the risk of ergotism when given with **ergotamine**. [Severe] Theoretical
- ▶ **Certinib** is predicted to increase the exposure to **ergotamine**. Avoid. [Severe] Theoretical
- ▶ **Cobicistat** is predicted to increase the risk of ergotism when given with **ergotamine**. Avoid. [Severe] Theoretical
- ▶ **Crizotinib** is predicted to increase the risk of ergotism when given with **ergotamine**. [Severe] Theoretical
- ▶ **Dabrafenib** is predicted to decrease the effects of **ergotamine**. [Moderate] Theoretical
- ▶ **Ergotamine** is predicted to increase the risk of ergotism when given with **dopamine receptor agonists (bromocriptine, cabergoline)**. Avoid. [Moderate] Theoretical
- ▶ **Endothelin receptor antagonists (bosentan)** are predicted to decrease the effects of **ergotamine**. [Moderate] Theoretical
- ▶ **Entrectinib** is predicted to increase the exposure to **ergotamine**. [Mild] Theoretical
- ▶ **Grapefruit** juice is predicted to increase the exposure to **ergotamine**. [Severe] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the risk of ergotism when given with **ergotamine**. Avoid. [Severe] Theoretical
- ▶ **Idelalisib** is predicted to increase the risk of ergotism when given with **ergotamine**. Avoid. [Severe] Theoretical
- ▶ **Imatinib** is predicted to increase the risk of ergotism when given with **ergotamine**. [Severe] Theoretical
- ▶ **Larotrectinib** is predicted to increase the exposure to **ergotamine**. Use with caution and adjust dose. [Mild] Theoretical
- ▶ **Letermovir** is predicted to increase the risk of ergotism when given with **ergotamine**. [Severe] Theoretical
- ▶ **Lorlatinib** is predicted to decrease the exposure to **ergotamine**. Avoid. [Moderate] Theoretical
- ▶ **Macrolides (clarithromycin)** are predicted to increase the risk of ergotism when given with **ergotamine**. Avoid. [Severe] Theoretical
- ▶ **Macrolides (erythromycin)** are predicted to increase the risk of ergotism when given with **ergotamine**. [Severe] Theoretical
- ▶ **Mitotane** is predicted to decrease the effects of **ergotamine**. [Moderate] Theoretical
- ▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to increase the risk of ergotism when given with **ergotamine**. [Severe] Theoretical
- ▶ **Nilotinib** is predicted to increase the risk of ergotism when given with **ergotamine**. [Severe] Theoretical
- ▶ **NNRTIs (efavirenz, nevirapine)** are predicted to decrease the effects of **ergotamine**. [Moderate] Theoretical
- ▶ **Olaparib** might alter the exposure to **ergotamine**. [Moderate] Theoretical
- ▶ **Palbociclib** is predicted to increase the exposure to **ergotamine**. Adjust dose. [Moderate] Theoretical
- ▶ **Ribociclib** (high-dose) is predicted to increase the exposure to **ergotamine**. Avoid. [Moderate] Theoretical
- ▶ **Rifamycins (rifampicin)** are predicted to decrease the effects of **ergotamine**. [Moderate] Theoretical

Ergotamine (continued)

- ▶ **Rucaparib** is predicted to increase the exposure to **ergotamine**. Monitor and adjust dose. [Moderate] Study
- ▶ **St John's wort** is predicted to decrease the effects of **ergotamine**. [Moderate] Theoretical
- ▶ **Ticagrelor** is predicted to increase the exposure to **ergotamine**. Avoid. [Severe] Theoretical
- ▶ **Triptans (almotriptan)** are predicted to increase the risk of vasoconstriction when given with **ergotamine**. **Ergotamine** should be taken at least 24 hours before or 6 hours after **almotriptan**. [Severe] Theoretical
- ▶ **Triptans (eletriptan)** increase the risk of vasoconstriction when given with **ergotamine**. Separate administration by 24 hours. [Severe] Study
- ▶ **Triptans (frovatriptan, naratriptan)** are predicted to increase the risk of vasoconstriction when given with **ergotamine**. Separate administration by 24 hours. [Severe] Theoretical
- ▶ **Triptans (rizatriptan)** are predicted to increase the risk of vasoconstriction when given with **ergotamine**. **Ergotamine** should be taken at least 24 hours before or 6 hours after **rizatriptan**. [Severe] Theoretical
- ▶ **Triptans (sumatriptan)** increase the risk of vasoconstriction when given with **ergotamine**. **Ergotamine** should be taken at least 24 hours before or 6 hours after **sumatriptan**. [Severe] Study
- ▶ **Triptans (zolmitriptan)** are predicted to increase the risk of vasoconstriction when given with **ergotamine**. **Ergotamine** should be taken at least 24 hours before or 6 hours after **zolmitriptan**. [Severe] Theoretical

Eribulin → see TABLE 15, p. 1450 (myelosuppression), TABLE 12, p. 1450 (peripheral neuropathy), TABLE 9, p. 1449 (QT-interval prolongation)

Erlotinib

FOOD AND LIFESTYLE Dose adjustment may be necessary if smoking started or stopped during treatment.

- ▶ Oral **antacids** are predicted to decrease the absorption of oral **erlotinib**. **Erlotinib** should be taken 2 hours before or 4 hours after antacids. [Moderate] Theoretical
- ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to **erlotinib**. Avoid or adjust **erlotinib** dose, p. 1030. [Severe] Study
- ▶ **Antiarrhythmics (amiodarone)** are predicted to increase the exposure to **erlotinib**. [Moderate] Theoretical
- ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to **erlotinib**. [Moderate] Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **erlotinib**. Avoid or adjust **erlotinib** dose, p. 1030. [Severe] Study
- ▶ **Antiepileptics (eslicarbazepine)** are predicted to decrease the exposure to **erlotinib**. [Severe] Theoretical
- ▶ **Antiepileptics (oxcarbazepine)** decrease the exposure to **erlotinib**. [Severe] Study
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **erlotinib**. [Moderate] Study
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **erlotinib**. Use with caution and adjust dose. [Severe] Study
- ▶ **Erlotinib** is predicted to increase the risk of gastrointestinal perforation when given with **aspirin** (high-dose). [Severe] Theoretical
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **erlotinib**. [Moderate] Study
- ▶ Oral **calcium salts (calcium carbonate)** -containing antacids are predicted to decrease the absorption of oral **erlotinib**. **Erlotinib** should be taken 2 hours before or 4 hours after antacids. [Moderate] Theoretical
- ▶ **Ciclosporin** is predicted to increase the exposure to **erlotinib**. [Moderate] Theoretical
- ▶ **Cobicistat** is predicted to increase the exposure to **erlotinib**. Use with caution and adjust dose. [Severe] Study
- ▶ **Combined hormonal contraceptives** are predicted to increase the exposure to **erlotinib**. Monitor adverse effects and adjust dose. [Moderate] Study
- ▶ **Erlotinib** is predicted to increase the risk of gastrointestinal perforation when given with **corticosteroids**. [Severe] Theoretical
- ▶ **Erlotinib** increases the anticoagulant effect of **coumarins**. [Severe] Anecdotal
- ▶ **Crizotinib** is predicted to increase the exposure to **erlotinib**. [Moderate] Study
- ▶ **Dabrafenib** is predicted to decrease the exposure to **erlotinib**. [Severe] Study
- ▶ **Endothelin receptor antagonists (bosentan)** are predicted to decrease the exposure to **erlotinib**. [Severe] Study
- ▶ **Grapefruit** juice is predicted to increase the exposure to **erlotinib**. [Moderate] Theoretical
- ▶ **H₂ receptor antagonists** are predicted to decrease the exposure to **erlotinib**. **Erlotinib** should be taken 2 hours before or 10 hours after **H₂ receptor antagonists**. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **erlotinib**. Use with caution and adjust dose. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **erlotinib**. Use with caution and adjust dose. [Severe] Study
- ▶ **Imatinib** is predicted to increase the exposure to **erlotinib**. [Moderate] Study
- ▶ **Ivacaftor** is predicted to increase the exposure to **erlotinib**. [Moderate] Theoretical
- ▶ **Lapatinib** is predicted to increase the exposure to **erlotinib**. [Moderate] Theoretical
- ▶ **Letermovir** is predicted to increase the exposure to **erlotinib**. [Moderate] Study
- ▶ **Macrolides (azithromycin)** are predicted to increase the exposure to **erlotinib**. [Moderate] Theoretical
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **erlotinib**. Use with caution and adjust dose. [Severe] Study
- ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **erlotinib**. [Moderate] Study
- ▶ **Mexiletine** are predicted to increase the exposure to **erlotinib**. Monitor adverse effects and adjust dose. [Moderate] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **erlotinib**. Avoid or adjust **erlotinib** dose, p. 1030. [Severe] Study
- ▶ **Neratinib** is predicted to increase the exposure to **erlotinib**. [Moderate] Theoretical
- ▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to increase the exposure to **erlotinib**. [Moderate] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **erlotinib**. [Moderate] Study
- ▶ **NNRTIs (efavirenz, nevirapine)** are predicted to decrease the exposure to **erlotinib**. [Severe] Study
- ▶ **Erlotinib** is predicted to increase the risk of gastrointestinal perforation when given with **NSAIDs**. [Severe] Theoretical
- ▶ **Erlotinib** is predicted to increase the risk of bleeding events when given with **phenindione**. [Severe] Theoretical
- ▶ **Proton pump inhibitors** are predicted to decrease the exposure to **erlotinib**. Avoid. [Moderate] Study
- ▶ **Quinolones (ciprofloxacin)** are predicted to increase the exposure to **erlotinib**. Monitor adverse effects and adjust dose. [Moderate] Study
- ▶ **Ranolazine** is predicted to increase the exposure to **erlotinib**. [Moderate] Theoretical
- ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **erlotinib**. Avoid or adjust **erlotinib** dose, p. 1030. [Severe] Study
- ▶ **Rucaparib** are predicted to increase the exposure to **erlotinib**. Monitor adverse effects and adjust dose. [Moderate] Study
- ▶ Oral **sodium bicarbonate**-containing antacids are predicted to decrease the absorption of oral **erlotinib**. **Erlotinib** should be taken 2 hours before or 4 hours after antacids. [Moderate] Theoretical
- ▶ **Sodium zirconium cyclosilicate** is predicted to decrease the exposure to **erlotinib**. Separate administration by at least 2 hours. [Moderate] Theoretical
- ▶ **SSRIs (fluvoxamine)** are predicted to increase the exposure to **erlotinib**. Monitor adverse effects and adjust dose. [Moderate] Theoretical
- ▶ **St John's wort** is predicted to decrease the exposure to **erlotinib**. [Severe] Study
- ▶ **Vandetanib** is predicted to increase the exposure to **erlotinib**. [Moderate] Theoretical

- ▶ **Vemurafenib** are predicted to increase the exposure to **erlotinib**. Monitor adverse effects and adjust dose. [Moderate] Study
- Ertapenem** → see carbapenems
- Ertugliflozin** → see sodium glucose co-transporter 2 inhibitors
- Erythromycin** → see macrolides
- Escitalopram** → see SSRIs
- Esketamine** → see TABLE 8 p. 1448 (hypotension), TABLE 11 p. 1449 (CNS depressant effects)
 - ▶ **Esketamine** is predicted to increase the risk of seizures when given with **aminophylline**. Avoid. [Severe] Theoretical
 - ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to **esketamine**. Adjust dose. [Moderate] Theoretical
 - ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **esketamine**. Adjust dose. [Moderate] Theoretical → Also see TABLE 11 p. 1449
 - ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **esketamine**. Adjust dose. [Moderate] Study
 - ▶ **Cobicistat** is predicted to increase the exposure to **esketamine**. Adjust dose. [Moderate] Study
 - ▶ **Esketamine** is predicted to increase the risk of elevated blood pressure when given with **ergometrine**. Avoid. [Severe] Theoretical
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **esketamine**. Adjust dose. [Moderate] Study
 - ▶ **Idealisib** is predicted to increase the exposure to **esketamine**. Adjust dose. [Moderate] Study
 - ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **esketamine**. Adjust dose. [Moderate] Study
 - ▶ **Mitotane** is predicted to decrease the exposure to **esketamine**. Adjust dose. [Moderate] Theoretical
 - ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **esketamine**. Adjust dose. [Moderate] Theoretical
 - ▶ **Esketamine** is predicted to increase the risk of seizures when given with **theophylline**. Avoid. [Severe] Theoretical
- Eslicarbazepine** → see antiepileptics
- Esmolol** → see beta blockers, selective
- Esomeprazole** → see proton pump inhibitors
- Estramustine** → see alkylating agents
- Etanercept**
 - ▶ **Anakinra** is predicted to increase the risk of generalised infection (possibly life-threatening) when given with **etanercept**. Avoid. [Severe] Theoretical
 - ▶ **Filgotinib** is predicted to increase the risk of immunosuppression when given with **etanercept**. Avoid. [Severe] Theoretical
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **etanercept**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- Etelcalcetide**
 - ▶ **Cinacalcet** increases the risk of hypocalcaemia when given with **etelcalcetide**. Avoid. [Severe] Theoretical
 - ▶ **Etelcalcetide** might increase the risk of hypocalcaemia when given with **denosumab**. [Severe] Theoretical
- Ethambutol**
 - ▶ **Isoniazid** increases the risk of optic neuropathy when given with **ethambutol**. [Severe] Anecdotal
- Ethosuximide** → see antiepileptics
- Etodolac** → see NSAIDs
- Etomidate** → see TABLE 8 p. 1448 (hypotension), TABLE 11 p. 1449 (CNS depressant effects)
- Etonogestrel**
 - ▶ **Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampamil, phenobarbital, phenytoin, primidone, rufinamide, topiramate)** are predicted to decrease the efficacy of **etonogestrel**. For FSRH guidance, see Contraceptives, interactions p. 843. [Severe] Theoretical
 - ▶ **Endothelin receptor antagonists (bosentan)** are predicted to decrease the efficacy of **etonogestrel**. For FSRH guidance, see Contraceptives, interactions p. 843. [Severe] Theoretical
- ▶ **Griseofulvin** decreases the efficacy of **etonogestrel**. For FSRH guidance, see Contraceptives, interactions p. 843. [Severe] Anecdotal
- ▶ **HIV-protease inhibitors (ritonavir)** are predicted to decrease the efficacy of **etonogestrel**. For FSRH guidance, see Contraceptives, interactions p. 843. [Severe] Theoretical
- ▶ **Lumacaftor** might decrease the efficacy of subdermal **etonogestrel**. Use additional contraceptive precautions. [Severe] Theoretical
- ▶ **Modafinil** is predicted to decrease the efficacy of **etonogestrel**. For FSRH guidance, see Contraceptives, interactions p. 843. [Severe] Theoretical
- ▶ **Neurokinin-1 receptor antagonists (aprepitant, fosaprepitant)** are predicted to decrease the efficacy of **etonogestrel**. For FSRH guidance, see Contraceptives, interactions p. 843. [Severe] Theoretical
- ▶ **NNRTIs (efavirenz, nevirapine)** are predicted to decrease the efficacy of **etonogestrel**. For FSRH guidance, see Contraceptives, interactions p. 843. [Severe] Theoretical
- ▶ **Rifamycins** are predicted to decrease the efficacy of **etonogestrel**. For FSRH guidance, see Contraceptives, interactions p. 843. [Severe] Theoretical
- ▶ **St John's wort** is predicted to decrease the efficacy of **etonogestrel**. MHRA advises avoid. For FSRH guidance, see Contraceptives, interactions p. 843. [Severe] Theoretical
- ▶ **Sugammadex** is predicted to decrease the efficacy of **etonogestrel**. Use additional contraceptive precautions. [Severe] Theoretical
- ▶ **Ulipristal** is predicted to decrease the efficacy of **etonogestrel**. Avoid. [Severe] Theoretical
- Etoposide** → see TABLE 15 p. 1450 (myelosuppression)
 - ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the efficacy of **etoposide**. [Moderate] Study
 - ▶ **Ciclosporin** increases the exposure to **etoposide**. Monitor and adjust dose. [Severe] Study
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **etoposide**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
 - ▶ **Neurokinin-1 receptor antagonists (netupitant)** slightly increase the exposure to **etoposide**. [Moderate] Study
- Etoricoxib** → see NSAIDs
- Etravirine** → see NNRTIs
- Everolimus**
 - ▶ **Everolimus** potentially increases the risk of angioedema when given with **ACE inhibitors**. [Severe] Anecdotal
 - ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the concentration of **everolimus**. Avoid or adjust dose. [Severe] Study
 - ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the concentration of **everolimus**. Avoid or adjust dose. [Moderate] Study
 - ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the concentration of **everolimus**. Avoid or adjust dose. [Severe] Study
 - ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the concentration of **everolimus**. Avoid or adjust dose. [Moderate] Study
 - ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the concentration of **everolimus**. Avoid. [Severe] Study
 - ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the concentration of **everolimus**. Avoid or adjust dose. [Moderate] Study
 - ▶ **Certinib** is predicted to increase the exposure to **everolimus**. [Moderate] Theoretical
 - ▶ **Ciclosporin** moderately increases the exposure to **everolimus**. Avoid or adjust dose. [Severe] Study
 - ▶ **Cobicistat** is predicted to increase the concentration of **everolimus**. Avoid. [Severe] Study
 - ▶ **Crizotinib** is predicted to increase the concentration of **everolimus**. Avoid or adjust dose. [Moderate] Study
 - ▶ **Dabrafenib** is predicted to decrease the concentration of **everolimus**. Avoid or adjust dose. [Severe] Study

Everolimus (continued)

- ▶ **Eliglustat** is predicted to increase the exposure to everolimus. Adjust dose. [Moderate] Study
- ▶ **Endothelin receptor antagonists (bosentan)** are predicted to decrease the concentration of everolimus. Avoid or adjust dose. [Severe] Study
- ▶ **Entrectinib** is predicted to increase the exposure to everolimus. [Mild] Theoretical
- ▶ **Grapefruit juice** is predicted to increase the exposure to everolimus. Avoid. [Severe] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the concentration of everolimus. Avoid. [Severe] Study
- ▶ **Ibrutinib** is predicted to increase the exposure to everolimus. Separate administration by at least 6 hours. [Moderate] Theoretical
- ▶ **Idelalisib** is predicted to increase the concentration of everolimus. Avoid. [Severe] Study
- ▶ **Imatinib** is predicted to increase the concentration of everolimus. Avoid or adjust dose. [Moderate] Study
- ▶ **Ivacaftor** is predicted to increase the exposure to everolimus. [Moderate] Study
- ▶ **Lapatinib** is predicted to increase the exposure to everolimus. [Moderate] Theoretical
- ▶ **Letermovir** is predicted to increase the concentration of everolimus. Avoid or adjust dose. [Moderate] Study
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with everolimus. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Everolimus** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Mild] Theoretical
- ▶ **Lorlatinib** is predicted to decrease the exposure to everolimus. Avoid. [Moderate] Study
- ▶ **Lumacaftor** is predicted to decrease the exposure to everolimus. Avoid. [Severe] Theoretical
- ▶ **Macrolides (clarithromycin)** are predicted to increase the concentration of everolimus. Avoid. [Severe] Study
- ▶ **Macrolides (erythromycin)** are predicted to increase the concentration of everolimus. Avoid or adjust dose. [Moderate] Study
- ▶ **Mirabegron** is predicted to increase the exposure to everolimus. [Mild] Theoretical
- ▶ **Mitotane** is predicted to decrease the concentration of everolimus. Avoid or adjust dose. [Severe] Study
- ▶ **Neratinib** is predicted to increase the exposure to everolimus. [Moderate] Study
- ▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to increase the concentration of everolimus. Avoid or adjust dose. [Moderate] Study
- ▶ **Nilotinib** is predicted to increase the concentration of everolimus. Avoid or adjust dose. [Moderate] Study
- ▶ **NNRTIs (efavirenz, nevirapine)** are predicted to decrease the concentration of everolimus. Avoid or adjust dose. [Severe] Study
- ▶ **Olaparib** might increase the exposure to everolimus. [Moderate] Theoretical
- ▶ **Osimertinib** is predicted to increase the exposure to everolimus. [Moderate] Study
- ▶ **Palbociclib** is predicted to increase the exposure to everolimus. Adjust dose. [Moderate] Theoretical
- ▶ **Pibrentasvir** with glecaprevir is predicted to increase the exposure to everolimus. [Moderate] Study
- ▶ **Pitolisant** is predicted to decrease the exposure to everolimus. Avoid. [Severe] Theoretical
- ▶ **Ribociclib** is predicted to increase the exposure to everolimus. Use with caution and adjust dose. [Moderate] Theoretical
- ▶ **Rifamycins (rifampicin)** are predicted to decrease the concentration of everolimus. Avoid or adjust dose. [Severe] Study
- ▶ **St John's wort** is predicted to decrease the concentration of everolimus. Avoid or adjust dose. [Severe] Study
- ▶ **Vandetanib** is predicted to increase the exposure to everolimus. [Moderate] Study
- ▶ **Velpatasvir** is predicted to increase the exposure to everolimus. [Severe] Theoretical
- ▶ **Vemurafenib** is predicted to increase the exposure to everolimus. Use with caution and adjust dose. [Severe] Theoretical

- ▶ **Venetoclox** is predicted to increase the exposure to everolimus. Avoid or adjust dose. [Severe] Study

Exemestane

- ▶ **Anti-androgens (apalutamide, enzalutamide)** moderately decrease the exposure to exemestane. [Moderate] Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** moderately decrease the exposure to exemestane. [Moderate] Study
- ▶ **Mitotane** moderately decreases the exposure to exemestane. [Moderate] Study
- ▶ **Rifamycins (rifampicin)** moderately decrease the exposure to exemestane. [Moderate] Study
- ▶ **St John's wort** is predicted to decrease the exposure to exemestane. [Moderate] Theoretical

Exenatide → see glucagon-like peptide-1 receptor agonists

Ezetimibe

- ▶ **Ciclosporin** moderately increases the exposure to ezetimibe and ezetimibe slightly increases the exposure to ciclosporin. [Moderate] Study
- ▶ **Fibrates** are predicted to increase the risk of gallstones when given with ezetimibe. [Severe] Theoretical

Factor XA inhibitors → see TABLE 3 p. 1447 (anticoagulant effects)

apixaban · edoxaban · fondaparinux · rivaroxaban

- ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to apixaban. [Moderate] Study
- ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to rivaroxaban. Avoid unless patient can be monitored for signs of thrombosis. [Severe] Study
- ▶ **Antiarrhythmics (amiodarone)** slightly increase the exposure to edoxaban. [Severe] Study
- ▶ **Antiarrhythmics (amiodarone)** might increase the exposure to rivaroxaban. [Moderate] Study
- ▶ **Antiarrhythmics (amiodarone, dronedarone)** are predicted to increase the exposure to apixaban. [Moderate] Theoretical
- ▶ **Antiarrhythmics (dronedarone)** slightly increase the exposure to edoxaban. Adjust edoxaban dose, p. 138. [Severe] Study
- ▶ **Antiarrhythmics (dronedarone)** might increase the exposure to rivaroxaban. Avoid. [Moderate] Study
- ▶ **Antiepileptics (carbamazepine)** are predicted to decrease the exposure to edoxaban. [Moderate] Study
- ▶ **Antiepileptics (carbamazepine, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to rivaroxaban. Avoid unless patient can be monitored for signs of thrombosis. [Severe] Study
- ▶ **Antiepileptics (carbamazepine, phenytoin)** are predicted to decrease the exposure to apixaban. Use with caution or avoid. [Severe] Study
- ▶ **Antiepileptics (fosphenytoin)** are predicted to decrease the exposure to rivaroxaban. Avoid unless patient can be monitored for signs of thrombosis. [Severe] Theoretical
- ▶ **Antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to edoxaban. [Severe] Theoretical
- ▶ **Antiepileptics (fosphenytoin, primidone)** are predicted to decrease the exposure to apixaban. [Severe] Study
- ▶ **Antiepileptics (oxcarbazepine)** are predicted to decrease the exposure to rivaroxaban. [Severe] Study
- ▶ **Antiepileptics (phenobarbital)** are predicted to decrease the exposure to apixaban. Use with caution or avoid. [Severe] Anecdotal
- ▶ **Antifungals, azoles (fluconazole)** might increase the risk of bleeding when given with apixaban. [Moderate] Study
- ▶ **Antifungals, azoles (itraconazole)** are predicted to increase the exposure to edoxaban. [Severe] Theoretical
- ▶ **Antifungals, azoles (ketoconazole)** slightly increase the exposure to edoxaban. Adjust edoxaban dose, p. 138. [Severe] Study
- ▶ **Antifungals, azoles (posaconazole, voriconazole)** are predicted to increase the exposure to apixaban. Avoid. [Moderate] Theoretical
- ▶ **Antifungals, azoles (posaconazole, voriconazole)** are predicted to increase the exposure to rivaroxaban. Avoid. [Severe] Theoretical
- ▶ **Antifungals, azoles (itraconazole)** are predicted to increase the exposure to factor XA inhibitors (apixaban, rivaroxaban). Avoid. [Severe] Theoretical

- ▶ **Antifungals, azoles (ketoconazole)** moderately increase the exposure to factor XA inhibitors (**apixaban, rivaroxaban**). Avoid. [Severe] Study
- ▶ **Aspirin** (high-dose) increases the exposure to **edoxaban**. Avoid. [Severe] Study
- ▶ **Calcium channel blockers (verapamil)** are predicted to increase the exposure to **apixaban**. [Moderate] Theoretical
- ▶ **Calcium channel blockers (verapamil)** slightly increase the exposure to **edoxaban**. [Severe] Study
- ▶ **Ceritinib** is predicted to increase the exposure to **edoxaban**. [Moderate] Theoretical
- ▶ **Ciclosporin** is predicted to increase the exposure to **apixaban**. [Moderate] Theoretical
- ▶ **Ciclosporin** slightly increases the exposure to **edoxaban**. Adjust **edoxaban** dose, p. 138. [Severe] Study
- ▶ **Ciclosporin** slightly increases the exposure to **rivaroxaban**. [Moderate] Study
- ▶ **Cobicistat** is predicted to increase the exposure to factor XA inhibitors (**apixaban, edoxaban, rivaroxaban**). Avoid. [Severe] Theoretical
- ▶ **Eliglustat** is predicted to increase the exposure to **edoxaban**. Adjust dose. [Moderate] Study
- ▶ **HIV-protease inhibitors (atazanavir)** boosted with ritonavir are predicted to increase the exposure to **apixaban**. [Severe] Theoretical
- ▶ **HIV-protease inhibitors (atazanavir, fosamprenavir, tipranavir)** boosted with ritonavir are predicted to increase the exposure to **rivaroxaban**. Avoid. [Severe] Theoretical
- ▶ **HIV-protease inhibitors (darunavir)** boosted with ritonavir or cobicistat are predicted to increase the exposure to **apixaban**. Avoid. [Severe] Theoretical
- ▶ **HIV-protease inhibitors (darunavir)** boosted with ritonavir are predicted to increase the exposure to **rivaroxaban**. Avoid. [Severe] Anecdotal
- ▶ **HIV-protease inhibitors (fosamprenavir, tipranavir)** boosted with ritonavir are predicted to increase the exposure to **apixaban**. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors (lopinavir)** boosted with ritonavir are predicted to slightly increase the exposure to **edoxaban**. [Severe] Theoretical
- ▶ **HIV-protease inhibitors (ritonavir)** are predicted to increase the exposure to **apixaban**. Avoid. [Severe] Theoretical
- ▶ **HIV-protease inhibitors (ritonavir)** are predicted to slightly increase the exposure to **edoxaban**. [Severe] Theoretical
- ▶ **HIV-protease inhibitors (ritonavir)** moderately increase the exposure to **rivaroxaban**. Avoid. [Severe] Study
- ▶ **HIV-protease inhibitors (lopinavir)** boosted with ritonavir are predicted to increase the exposure to factor XA inhibitors (**apixaban, rivaroxaban**). Avoid. [Severe] Theoretical
- ▶ **Ibrutinib** is predicted to increase the exposure to factor XA inhibitors (**edoxaban, rivaroxaban**). Separate administration by at least 6 hours. [Moderate] Theoretical
- ▶ **Idelalisib** is predicted to increase the exposure to **apixaban**. [Moderate] Theoretical
- ▶ **Ivacaftor** is predicted to increase the exposure to factor XA inhibitors (**edoxaban, rivaroxaban**). [Moderate] Study
- ▶ **Lapatinib** is predicted to increase the exposure to **apixaban**. [Moderate] Theoretical
- ▶ **Lapatinib** is predicted to slightly increase the exposure to **edoxaban**. [Severe] Theoretical
- ▶ **Lorlatinib** is predicted to decrease the exposure to factor XA inhibitors (**edoxaban, rivaroxaban**). [Moderate] Study
- ▶ **Macrolides (azithromycin, clarithromycin)** are predicted to increase the exposure to **edoxaban**. [Severe] Theoretical
- ▶ **Macrolides (azithromycin, erythromycin)** are predicted to increase the exposure to **apixaban**. [Moderate] Theoretical
- ▶ **Macrolides (clarithromycin)** slightly increase the exposure to **apixaban**. [Moderate] Study
- ▶ **Macrolides (erythromycin)** slightly increase the exposure to **edoxaban**. Adjust **edoxaban** dose, p. 138. [Severe] Study
- ▶ **Macrolides (erythromycin)** slightly increase the exposure to **rivaroxaban**. [Mild] Study
- ▶ **Mirabegron** is predicted to increase the exposure to **edoxaban**. [Mild] Theoretical
- ▶ **Mitotane** is predicted to decrease the exposure to **apixaban**. [Moderate] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **rivaroxaban**. Avoid unless patient can be monitored for signs of thrombosis. [Severe] Study
- ▶ **Neratinib** is predicted to increase the exposure to **apixaban**. [Moderate] Theoretical
- ▶ **Neratinib** is predicted to increase the exposure to factor XA inhibitors (**edoxaban, rivaroxaban**). [Moderate] Study
- ▶ **NNRTIs (nevirapine)** are predicted to decrease the exposure to **rivaroxaban**. [Severe] Anecdotal
- ▶ **Olaparib** might increase the exposure to factor XA inhibitors (**edoxaban, rivaroxaban**). [Moderate] Theoretical
- ▶ **Osimertinib** is predicted to increase the exposure to factor XA inhibitors (**edoxaban, rivaroxaban**). [Moderate] Study
- ▶ **Pibrentasvir** with glecaprevir is predicted to increase the exposure to **edoxaban**. [Moderate] Study
- ▶ **Pitolisant** is predicted to decrease the exposure to **edoxaban**. [Mild] Theoretical
- ▶ **Ranolazine** is predicted to increase the exposure to **apixaban**. [Moderate] Theoretical
- ▶ **Ranolazine** is predicted to slightly increase the exposure to **edoxaban**. [Severe] Theoretical
- ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **apixaban**. Use with caution or avoid. [Severe] Study
- ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **edoxaban**. [Moderate] Study
- ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **rivaroxaban**. Avoid unless patient can be monitored for signs of thrombosis. [Severe] Study
- ▶ **St John's wort** is predicted to decrease the exposure to **apixaban**. Use with caution or avoid. [Severe] Study
- ▶ **St John's wort** is predicted to decrease the exposure to **edoxaban**. [Moderate] Study
- ▶ **St John's wort** is predicted to decrease the exposure to **rivaroxaban**. Avoid unless patient can be monitored for signs of thrombosis. [Severe] Study
- ▶ **Vandetanib** is predicted to increase the exposure to **apixaban**. [Moderate] Theoretical
- ▶ **Vandetanib** is predicted to increase the exposure to factor XA inhibitors (**edoxaban, rivaroxaban**). [Moderate] Study
- ▶ **Velpatasvir** is predicted to increase the exposure to **edoxaban**. [Severe] Theoretical
- ▶ **Vemurafenib** is predicted to increase the exposure to **apixaban**. [Moderate] Theoretical
- ▶ **Vemurafenib** is predicted to slightly increase the exposure to **edoxaban**. [Severe] Theoretical
- ▶ **Vemurafenib** might increase the exposure to **rivaroxaban**. Use with caution and adjust dose. [Moderate] Theoretical
- ▶ **Voxilaprevir** with sofosbuvir and velpatasvir is predicted to increase the concentration of **edoxaban**. Avoid. [Severe] Theoretical
- Famotidine** → see H₂ receptor antagonists
- Fampridine**
 - ▶ **Dolutegravir** might increase the concentration of **fampridine**. Avoid. [Severe] Theoretical
- ▶ **H₂ receptor antagonists (cimetidine)** increase the concentration of **fampridine**. Avoid. [Severe] Theoretical
- Febuxostat**
 - ▶ **Febuxostat** is predicted to increase the exposure to **azathioprine**. Avoid. [Severe] Theoretical
 - ▶ **Febuxostat** is predicted to increase the exposure to **mercaptopurine**. Avoid. [Severe] Theoretical
- Felbinac** → see NSAIDs
- Felodipine** → see calcium channel blockers
- Fenofibrate** → see fibrates
- Fentanyl** → see opioids
- Fesoterodine** → see TABLE 10 p. 1449 (antimuscarinics)
 - ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to **fesoterodine**. Avoid. [Moderate] Study
 - ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to **fesoterodine**. Adjust **fesoterodine** dose with moderate CYP3A4 inhibitors in hepatic and renal impairment, p. 824. [Mild] Study

Fesoterodine (continued)

- ▶ Antiepileptics (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **fesoterodine**. Avoid. [Moderate] Study
- ▶ Antifungals, azoles (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **fesoterodine**. Adjust **fesoterodine** dose with moderate CYP3A4 inhibitors in hepatic and renal impairment, p. 824. [Mild] Study
- ▶ Antifungals, azoles (**itraconazole**, **ketoconazole**, **voriconazole**) are predicted to moderately increase the exposure to **fesoterodine**. Adjust **fesoterodine** dose with potent CYP3A4 inhibitors; avoid in hepatic and renal impairment, p. 824. [Severe] Study
- ▶ **Bupropion** is predicted to increase the exposure to **fesoterodine**. Use with caution and adjust dose. [Mild] Theoretical
- ▶ **Calcium channel blockers** (**diltiazem**, **verapamil**) are predicted to increase the exposure to **fesoterodine**. Adjust **fesoterodine** dose with moderate CYP3A4 inhibitors in hepatic and renal impairment, p. 824. [Mild] Study
- ▶ **Cinacalcet** is predicted to increase the exposure to **fesoterodine**. Use with caution and adjust dose. [Mild] Theoretical
- ▶ **Cobicistat** is predicted to moderately increase the exposure to **fesoterodine**. Adjust **fesoterodine** dose with potent CYP3A4 inhibitors; avoid in hepatic and renal impairment, p. 824. [Severe] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **fesoterodine**. Adjust **fesoterodine** dose with moderate CYP3A4 inhibitors in hepatic and renal impairment, p. 824. [Mild] Study
- ▶ **HIV-protease inhibitors** are predicted to moderately increase the exposure to **fesoterodine**. Adjust **fesoterodine** dose with potent CYP3A4 inhibitors; avoid in hepatic and renal impairment, p. 824. [Severe] Study
- ▶ **Idelalisib** is predicted to moderately increase the exposure to **fesoterodine**. Adjust **fesoterodine** dose with potent CYP3A4 inhibitors; avoid in hepatic and renal impairment, p. 824. [Severe] Study
- ▶ **Imatinib** is predicted to increase the exposure to **fesoterodine**. Adjust **fesoterodine** dose with moderate CYP3A4 inhibitors in hepatic and renal impairment, p. 824. [Mild] Study
- ▶ **Letermovir** is predicted to increase the exposure to **fesoterodine**. Adjust **fesoterodine** dose with moderate CYP3A4 inhibitors in hepatic and renal impairment, p. 824. [Mild] Study
- ▶ **Macrolides** (**clarithromycin**) are predicted to moderately increase the exposure to **fesoterodine**. Adjust **fesoterodine** dose with potent CYP3A4 inhibitors; avoid in hepatic and renal impairment, p. 824. [Severe] Study
- ▶ **Macrolides** (**erythromycin**) are predicted to increase the exposure to **fesoterodine**. Adjust **fesoterodine** dose with moderate CYP3A4 inhibitors in hepatic and renal impairment, p. 824. [Mild] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **fesoterodine**. Avoid. [Moderate] Study
- ▶ **Neurokinin-1 receptor antagonists** (**aprepitant**, **netupitant**) are predicted to increase the exposure to **fesoterodine**. Adjust **fesoterodine** dose with moderate CYP3A4 inhibitors in hepatic and renal impairment, p. 824. [Mild] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **fesoterodine**. Adjust **fesoterodine** dose with moderate CYP3A4 inhibitors in hepatic and renal impairment, p. 824. [Mild] Study
- ▶ **Rifamycins** (**rifampicin**) are predicted to decrease the exposure to **fesoterodine**. Avoid. [Moderate] Study
- ▶ **SSRIs** (**fluoxetine**, **paroxetine**) are predicted to increase the exposure to **fesoterodine**. Use with caution and adjust dose. [Mild] Theoretical
- ▶ **St John's wort** is predicted to decrease the exposure to **fesoterodine**. Avoid. [Severe] Theoretical
- ▶ **Terbinafine** is predicted to increase the exposure to **fesoterodine**. Use with caution and adjust dose. [Mild] Theoretical

Fexofenadine → see antihistamines, non-sedating

Fibrates

- bezafibrate · ciprofibrate · fenofibrate · gemfibrozil
- ▶ **Acipimox** is predicted to increase the risk of rhabdomyolysis when given with **fibrates**. [Severe] Theoretical
 - ▶ Oral **antacids** decrease the exposure to oral **gemfibrozil**. [Moderate] Study
 - ▶ **Gemfibrozil** is predicted to increase the exposure to **anti-androgens** (**apalutamide**). [Mild] Study
 - ▶ **Gemfibrozil** moderately increases the exposure to **anti-androgens** (**enzalutamide**). Avoid or adjust **enzalutamide** dose, p. 997. [Severe] Study
 - ▶ **Bezafibrate** is predicted to increase the risk of nephrotoxicity when given with **ciclosporin**. [Severe] Theoretical
 - ▶ **Fenofibrate** increases the risk of nephrotoxicity when given with **ciclosporin**. [Severe] Study
 - ▶ **Colchicine** increases the risk of rhabdomyolysis when given with **fibrates**. [Severe] Anecdotal
 - ▶ **Fibrates** are predicted to increase the anticoagulant effect of **coumarins**. Monitor INR and adjust dose. [Severe] Study
 - ▶ **Gemfibrozil** is predicted to increase the exposure to **dabrafenib**. [Moderate] Theoretical
 - ▶ **Fibrates** are predicted to increase the risk of rhabdomyolysis when given with **daptomycin**. [Severe] Theoretical
 - ▶ **Fibrates** are predicted to increase the risk of gallstones when given with **ezetimibe**. [Severe] Theoretical
 - ▶ **Fibrates** are predicted to increase the risk of hypoglycaemia when given with **insulin**. [Moderate] Theoretical
 - ▶ **Gemfibrozil** is predicted to increase the exposure to **irinotecan**. Avoid. [Moderate] Theoretical
 - ▶ **Gemfibrozil** is predicted to increase the concentration of **letemrovir**. [Moderate] Study
 - ▶ **Gemfibrozil** increases the exposure to **meglitinides** (**repaglinide**). Avoid. [Severe] Study
 - ▶ **Gemfibrozil** is predicted to moderately increase the exposure to **montelukast**. [Moderate] Study
 - ▶ **Gemfibrozil** is predicted to increase the exposure to the active metabolites of **ozanimod**. [Moderate] Study
 - ▶ **Fibrates** are predicted to increase the anticoagulant effect of **phenindione**. Monitor INR and adjust dose. [Severe] Study
 - ▶ **Gemfibrozil** increases the exposure to **pioglitazone**. Monitor blood glucose and adjust dose. [Severe] Study
 - ▶ **Gemfibrozil** is predicted to increase the exposure to **retinoids** (**alitretinoin**). Adjust **alitretinoin** dose, p. 1315. [Moderate] Theoretical
 - ▶ **Gemfibrozil** increases the concentration of **retinoids** (**bexarotene**). Avoid. [Severe] Study
 - ▶ **Gemfibrozil** increases the exposure to **selexipag**. Avoid. [Severe] Study
 - ▶ **Ciprofibrate** increases the risk of rhabdomyolysis when given with **statins** (**atorvastatin**). Avoid or adjust dose. [Severe] Study
 - ▶ **Fenofibrate** increases the risk of rhabdomyolysis when given with **statins** (**atorvastatin**). Monitor and adjust **fenofibrate** dose, p. 215. [Severe] Anecdotal
 - ▶ **Bezafibrate** increases the risk of rhabdomyolysis when given with **statins** (**atorvastatin**, **fluvastatin**). [Severe] Study
 - ▶ **Ciprofibrate** increases the risk of rhabdomyolysis when given with **statins** (**fluvastatin**). [Severe] Study
 - ▶ **Fenofibrate** is predicted to increase the risk of rhabdomyolysis when given with **statins** (**fluvastatin**). Use with caution and adjust **fenofibrate** dose, p. 215. [Severe] Theoretical
 - ▶ **Fenofibrate** is predicted to increase the risk of rhabdomyolysis when given with **statins** (**pravastatin**). Avoid. [Severe] Theoretical
 - ▶ **Fibrates** (**bezafibrate**, **ciprofibrate**) increase the risk of rhabdomyolysis when given with **statins** (**pravastatin**). Avoid. [Severe] Study
 - ▶ **Fenofibrate** increases the risk of rhabdomyolysis when given with **statins** (**rosuvastatin**). Adjust **fenofibrate** and **rosuvastatin** doses, p. 215, p. 220. [Severe] Anecdotal
 - ▶ **Fibrates** (**bezafibrate**, **ciprofibrate**) increase the risk of rhabdomyolysis when given with **statins** (**rosuvastatin**). Adjust **rosuvastatin** dose, p. 220. [Severe] Study
 - ▶ **Fenofibrate** increases the risk of rhabdomyolysis when given with **statins** (**simvastatin**). Adjust **fenofibrate** dose, p. 215. [Severe] Anecdotal
 - ▶ **Fibrates** (**bezafibrate**, **ciprofibrate**) increase the risk of rhabdomyolysis when given with **statins** (**simvastatin**). Adjust **simvastatin** dose, p. 221. [Severe] Study
 - ▶ **Gemfibrozil** increases the risk of rhabdomyolysis when given with **statins**. Avoid. [Severe] Anecdotal
 - ▶ **Fibrates** are predicted to increase the risk of hypoglycaemia when given with **sulfonylureas**. [Moderate] Theoretical

- ▶ **Gemfibrozil** is predicted to increase the concentration of **taxanes (paclitaxel)**. [Severe] Anecdotal
- ▶ **Gemfibrozil** increases the exposure to **treprostinil**. Adjust dose. [Moderate] Study
- ▶ **Fibrates** are predicted to decrease the efficacy of **ursodeoxycholic acid**. Avoid. [Severe] Theoretical

Fidaxomicin

- ▶ **Antiarrhythmics (amiodarone, dronedarone)** are predicted to increase the exposure to **fidaxomicin**. Avoid. [Moderate] Study
- ▶ **Antifungals, azoles (itraconazole, ketoconazole)** are predicted to increase the exposure to **fidaxomicin**. Avoid. [Moderate] Study
- ▶ **Calcium channel blockers (verapamil)** are predicted to increase the exposure to **fidaxomicin**. Avoid. [Moderate] Study
- ▶ **Ciclosporin** is predicted to increase the exposure to **fidaxomicin**. Avoid. [Moderate] Study
- ▶ **HIV-protease inhibitors (lopinavir, ritonavir)** are predicted to increase the exposure to **fidaxomicin**. Avoid. [Moderate] Study
- ▶ **Ivacaftor** is predicted to increase the exposure to **fidaxomicin**. Avoid. [Moderate] Study
- ▶ **Lapatinib** is predicted to increase the exposure to **fidaxomicin**. Avoid. [Moderate] Study
- ▶ **Macrolides** are predicted to increase the exposure to **fidaxomicin**. Avoid. [Moderate] Study
- ▶ **Neratinib** is predicted to increase the exposure to **fidaxomicin**. Avoid. [Moderate] Study
- ▶ **Ranolazine** is predicted to increase the exposure to **fidaxomicin**. Avoid. [Moderate] Study
- ▶ **Rucaparib** is predicted to increase the exposure to **fidaxomicin**. Avoid. [Moderate] Study
- ▶ **Vandetanib** is predicted to increase the exposure to **fidaxomicin**. Avoid. [Moderate] Study
- ▶ **Vemurafenib** is predicted to increase the exposure to **fidaxomicin**. Avoid. [Moderate] Study

Filgotinib

- ▶ **Filgotinib** is predicted to increase the risk of immunosuppression when given with **abatacept**. Avoid. [Severe] Theoretical
- ▶ **Filgotinib** is predicted to increase the risk of immunosuppression when given with **anakinra**. Avoid. [Severe] Theoretical
- ▶ **Filgotinib** is predicted to increase the exposure to **angiotensin-II receptor antagonists (valsartan)**. Avoid. [Moderate] Theoretical
- ▶ **Filgotinib** is predicted to increase the exposure to **antihistamines, non-sedating (fexofenadine)**. Avoid. [Moderate] Theoretical
- ▶ **Filgotinib** is predicted to increase the risk of immunosuppression when given with **azathioprine**. Avoid. [Severe] Theoretical
- ▶ **Filgotinib** is predicted to increase the risk of immunosuppression when given with **baricitinib**. Avoid. [Severe] Theoretical
- ▶ **Filgotinib** is predicted to increase the risk of immunosuppression when given with **ciclosporin**. Avoid. [Severe] Theoretical
- ▶ **Filgotinib** is predicted to increase the exposure to **endothelin receptor antagonists (bosentan)**. Avoid. [Moderate] Theoretical
- ▶ **Filgotinib** is predicted to increase the risk of immunosuppression when given with **etanercept**. Avoid. [Severe] Theoretical
- ▶ **Filgotinib** is predicted to increase the risk of immunosuppression when given with **leflunomide**. Avoid. [Severe] Theoretical
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **filgotinib**. Avoid. [Severe] Theoretical
- ▶ **Filgotinib** is predicted to increase the exposure to **meglitinides (repaglinide)**. Avoid. [Moderate] Theoretical
- ▶ **Filgotinib** is predicted to increase the risk of immunosuppression when given with **monoclonal antibodies (adalimumab, certolizumab pegol, golimumab, infliximab, rituximab, sarilumab, secukinumab, tocilizumab)**. Avoid. [Severe] Theoretical
- ▶ **Filgotinib** is predicted to increase the exposure to **statins (atorvastatin, pravastatin, rosuvastatin, simvastatin)**. Avoid. [Moderate] Theoretical

- ▶ **Filgotinib** is predicted to increase the exposure to **sulfonylureas (glibenclamide)**. Avoid. [Moderate] Theoretical
- ▶ **Filgotinib** is predicted to increase the risk of immunosuppression when given with **tacrolimus**. Avoid. [Severe] Theoretical
- ▶ **Filgotinib** is predicted to increase the risk of immunosuppression when given with **teriflunomide**. Avoid. [Severe] Theoretical
- ▶ **Filgotinib** is predicted to increase the risk of immunosuppression when given with **tofacitinib**. Avoid. [Severe] Theoretical

Fingolimod → see TABLE 6 p. 1448 (bradycardia), TABLE 9 p. 1449 (QT-interval prolongation)

- ▶ **Live vaccines** might increase the risk of generalised infection (possibly life-threatening) when given with **fingolimod**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Monoclonal antibodies (alemtuzumab)** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **fingolimod**. Avoid. [Severe] Theoretical
- ▶ **St John's wort** is predicted to decrease the exposure to **fingolimod**. Avoid. [Moderate] Theoretical

Flavoxate → see TABLE 10 p. 1449 (antismuscarinics)

Flecainide → see antiarrhythmics

Flucloxacillin → see penicillins

Fluconazole → see antifungals, azoles

Flucytosine

- ▶ **Amphotericin B** increases the risk of toxicity when given with **flucytosine**. [Severe] Study
- ▶ **Cytarabine** decreases the concentration of **flucytosine**. Avoid. [Severe] Study
- ▶ **NRTIs (zidovudine)** increase the risk of haematological toxicity when given with **flucytosine**. Monitor and adjust dose. [Severe] Theoretical
- ▶ **Fludarabine** → see TABLE 15 p. 1450 (myelosuppression)
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **fludarabine**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Fludarabine** increases the risk of pulmonary toxicity when given with **pentostatin**. Avoid. [Severe] Study → Also see TABLE 15 p. 1450

Fludrocortisone → see corticosteroids

Fluocinolone

- ▶ With intravitreal use of **fluocinolone** in adults: caution with concurrent administration of anticoagulant or antiplatelet drugs (higher incidence of conjunctival haemorrhage).
- ▶ Interactions do not generally apply to corticosteroids used for topical action unless specified.

Fluorouracil → see TABLE 15 p. 1450 (myelosuppression), TABLE 5 p. 1448 (thromboembolism)

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application of **fluorouracil**, the possibility of interactions should be borne in mind.

- ▶ **Fluorouracil** increases the concentration of **antiepileptics (fosphenytoin, phenytoin)**. Monitor concentration and adjust dose. [Severe] Anecdotal
- ▶ **Fluorouracil** increases the anticoagulant effect of **coumarins**. [Severe] Anecdotal
- ▶ **Folates (folic acid)** are predicted to increase the risk of toxicity when given with **fluorouracil**. Avoid. [Severe] Theoretical
- ▶ **Folates (folic acid)** are predicted to increase the risk of toxicity when given with **fluorouracil**. Monitor and adjust dose. [Severe] Theoretical
- ▶ **H₂ receptor antagonists (cimetidine)** slightly increase the exposure to **fluorouracil**. [Severe] Study
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **fluorouracil**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Methotrexate** potentially increases the risk of severe skin reaction when given with topical **fluorouracil**. [Severe] Anecdotal → Also see TABLE 15 p. 1450 → Also see TABLE 5 p. 1448

Fluorouracil (continued)

- ▶ **Metronidazole** increases the risk of toxicity when given with **fluorouracil**. [\[Severe\]](#) Study

Fluoxetine → see SSRIs

- ▶ **Flupentixol** → see TABLE 8 p. 1448 (hypotension), TABLE 11 p. 1449 (CNS depressant effects)

- ▶ **Flupentixol** is predicted to decrease the effects of **dopamine receptor agonists**. Avoid. [\[Moderate\]](#) Theoretical → Also see TABLE 8 p. 1448

- ▶ **Flupentixol** decreases the effects of **levodopa**. Avoid or monitor worsening parkinsonian symptoms. [\[Severe\]](#) Theoretical → Also see TABLE 8 p. 1448

Fluphenazine → see phenothiazines**Flurazepam** → see benzodiazepines**Flurbiprofen** → see NSAIDs**Flutamide** → see anti-androgens**Fluticasone** → see corticosteroids**Fluvastatin** → see statins**Fluvoxamine** → see SSRIs**Folates**

folic acid · folic acid · levofolnic acid

- ▶ **Folates** are predicted to decrease the concentration of **antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone)**. Monitor concentration and adjust dose. [\[Severe\]](#) Study
- ▶ **Folates** are predicted to increase the risk of toxicity when given with **capecitabine**. [\[Severe\]](#) Anecdotal
- ▶ **Folic acid** is predicted to increase the risk of toxicity when given with **fluorouracil**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Folnic acid** is predicted to increase the risk of toxicity when given with **fluorouracil**. Monitor and adjust dose. [\[Severe\]](#) Theoretical
- ▶ **Folates** are predicted to alter the effects of **raltixred**. Avoid. [\[Moderate\]](#) Study
- ▶ **Sulfasalazine** is predicted to decrease the absorption of **folates**. [\[Moderate\]](#) Study
- ▶ **Folates** are predicted to increase the risk of toxicity when given with **tegafur**. [\[Severe\]](#) Theoretical

Folic acid → see folates**Folinic acid** → see folates**Fondaparinux** → see factor XA inhibitors**Formoterol** → see beta₂ agonists**Fosamprenavir** → see HIV-protease inhibitors**Fosaprepitant** → see neurokinin-1 receptor antagonists**Foscarnet** → see TABLE 2 p. 1447 (nephrotoxicity)

- ▶ **Foscarnet** increases the risk of hypocalcaemia when given with **pentamidine**. [\[Severe\]](#) Anecdotal → Also see TABLE 2 p. 1447

Fosinopril → see ACE inhibitors**Fosphenytoin** → see antiepileptics**Fostamatinib**

- ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to **fostamatinib**. Avoid. [\[Severe\]](#) Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **fostamatinib**. Avoid. [\[Severe\]](#) Study
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **fostamatinib**. Monitor adverse effects and adjust dose. [\[Moderate\]](#) Study
- ▶ **Antifungals, azoles (posaconazole)** are predicted to increase the exposure to **fostamatinib**. Monitor adverse effects and adjust dose. [\[Moderate\]](#) Theoretical
- ▶ **Calcium channel blockers (diltiazem)** are predicted to increase the exposure to **fostamatinib**. Monitor adverse effects and adjust dose. [\[Moderate\]](#) Theoretical
- ▶ **Cobiciclat** is predicted to increase the exposure to **fostamatinib**. Monitor adverse effects and adjust dose. [\[Moderate\]](#) Study
- ▶ **Fostamatinib** potentially alters the anticoagulant effect of **coumarins (warfarin)**. [\[Moderate\]](#) Theoretical
- ▶ **Fostamatinib** slightly increases the exposure to **digoxin**. Monitor **digoxin** concentration and adjust dose, p. 117. [\[Moderate\]](#) Study
- ▶ **Grapefruit** juice is predicted to increase the exposure to **fostamatinib**. Monitor adverse effects and adjust dose. [\[Moderate\]](#) Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **fostamatinib**. Monitor adverse effects and adjust dose. [\[Moderate\]](#) Study
- ▶ **Idelalisib** is predicted to increase the exposure to **fostamatinib**. Monitor adverse effects and adjust dose. [\[Moderate\]](#) Study
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **fostamatinib**. Monitor adverse effects and adjust dose. [\[Moderate\]](#) Study
- ▶ **Mitotane** is predicted to decrease the exposure to **fostamatinib**. Avoid. [\[Severe\]](#) Study
- ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **fostamatinib**. Avoid. [\[Severe\]](#) Study
- ▶ **Fostamatinib** slightly increases the exposure to **statins (rosuvastatin)**. [\[Moderate\]](#) Study
- ▶ **Fostamatinib** slightly increases the exposure to **statins (simvastatin)**. Monitor adverse effects and adjust dose. [\[Moderate\]](#) Study

Frovatriptan → see triptans**Fulvestrant** → see TABLE 5 p. 1448 (thromboembolism)**Furosemide** → see loop diuretics**Fusidate**

- ▶ **Fusidate** has been reported to cause rhabdomyolysis when given with **statins**. Avoid. [\[Severe\]](#) Anecdotal

Gabapentin → see antiepileptics**Galantamine** → see anticholinesterases, centrally acting**Ganciclovir** → see TABLE 15 p. 1450 (myelosuppression), TABLE 2 p. 1447 (nephrotoxicity)

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

- ▶ **Ganciclovir** is predicted to increase the risk of seizures when given with **carbapenems (imipenem)**. Avoid. [\[Severe\]](#) Anecdotal
 - ▶ **Leflunomide** is predicted to increase the exposure to **ganciclovir**. [\[Moderate\]](#) Theoretical → Also see TABLE 15 p. 1450
 - ▶ **Mycophenolate** is predicted to increase the risk of haematological toxicity when given with **ganciclovir**. [\[Moderate\]](#) Theoretical
 - ▶ **Nitisinone** is predicted to increase the exposure to **ganciclovir**. [\[Moderate\]](#) Study
 - ▶ **Teriflunomide** is predicted to increase the exposure to **ganciclovir**. [\[Moderate\]](#) Study
- Gefitinib**
- ▶ **Oral antacids** are predicted to decrease the exposure to oral **gefitinib**. [\[Moderate\]](#) Theoretical
 - ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to **gefitinib**. Avoid. [\[Severe\]](#) Study
 - ▶ **Antiarrhythmics (dronedaron)** are predicted to increase the exposure to **gefitinib**. [\[Moderate\]](#) Study
 - ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **gefitinib**. Avoid. [\[Severe\]](#) Study
 - ▶ **Antiepileptics (eslicarbazepine)** are predicted to decrease the exposure to **gefitinib**. [\[Moderate\]](#) Theoretical
 - ▶ **Antiepileptics (oxcarbazepine)** decrease the exposure to **gefitinib**. [\[Severe\]](#) Study
 - ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **gefitinib**. [\[Moderate\]](#) Study
 - ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **gefitinib**. [\[Severe\]](#) Study
 - ▶ **Bupropion** is predicted to increase the exposure to **gefitinib**. [\[Moderate\]](#) Theoretical
 - ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **gefitinib**. [\[Moderate\]](#) Study
 - ▶ **Oral calcium salts (calcium carbonate)**-containing antacids are predicted to decrease the exposure to oral **gefitinib**. [\[Moderate\]](#) Theoretical
 - ▶ **Cinacalcet** is predicted to increase the exposure to **gefitinib**. [\[Moderate\]](#) Theoretical
 - ▶ **Cobiciclat** is predicted to increase the exposure to **gefitinib**. [\[Severe\]](#) Study
 - ▶ **Gefitinib** is predicted to increase the anticoagulant effect of **coumarins**. [\[Severe\]](#) Anecdotal
 - ▶ **Crizotinib** is predicted to increase the exposure to **gefitinib**. [\[Moderate\]](#) Study

- ▶ **Dabrafenib** is predicted to decrease the exposure to **gefitinib**. Avoid. [\[Severe\]](#) Study
 - ▶ **Endothelin receptor antagonists (bosentan)** are predicted to decrease the exposure to **gefitinib**. Avoid. [\[Severe\]](#) Study
 - ▶ **H₂ receptor antagonists** are predicted to slightly to moderately decrease the exposure to **gefitinib**. [\[Moderate\]](#) Study
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **gefitinib**. [\[Severe\]](#) Study
 - ▶ **Idelalisib** is predicted to increase the exposure to **gefitinib**. [\[Severe\]](#) Study
 - ▶ **Imatinib** is predicted to increase the exposure to **gefitinib**. [\[Moderate\]](#) Study
 - ▶ **Letermovir** is predicted to increase the exposure to **gefitinib**. [\[Moderate\]](#) Study
 - ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **gefitinib**. [\[Severe\]](#) Study
 - ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **gefitinib**. [\[Moderate\]](#) Study
 - ▶ **Mitotane** is predicted to decrease the exposure to **gefitinib**. Avoid. [\[Severe\]](#) Study
 - ▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to increase the exposure to **gefitinib**. [\[Moderate\]](#) Study
 - ▶ **Nilotinib** is predicted to increase the exposure to **gefitinib**. [\[Moderate\]](#) Study
 - ▶ **NNRTIs (efavirenz, nevirapine)** are predicted to decrease the exposure to **gefitinib**. Avoid. [\[Severe\]](#) Study
 - ▶ **Gefitinib** is predicted to increase the risk of bleeding events when given with **phenindione**. [\[Severe\]](#) Theoretical
 - ▶ **Proton pump inhibitors** are predicted to decrease the exposure to **gefitinib**. [\[Severe\]](#) Theoretical
 - ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **gefitinib**. Avoid. [\[Severe\]](#) Study
 - ▶ Oral **sodium bicarbonate** -containing antacids are predicted to decrease the exposure to oral **gefitinib**. [\[Moderate\]](#) Theoretical
 - ▶ **SSRIs (fluoxetine, paroxetine)** are predicted to increase the exposure to **gefitinib**. [\[Moderate\]](#) Theoretical
 - ▶ **St John's wort** is predicted to decrease the exposure to **gefitinib**. Avoid. [\[Severe\]](#) Study
 - ▶ **Terbinafine** is predicted to increase the exposure to **gefitinib**. [\[Moderate\]](#) Theoretical
 - ▶ **Gefitinib** might affect the exposure to **vemurafenib**. [\[Moderate\]](#) Theoretical
 - Gemcitabine** → see TABLE 15 p. 1450 (myelosuppression)
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **gemcitabine**. Public Health England advises avoid (refer to Green Book). [\[Severe\]](#) Theoretical
 - Gemfibrozil** → see fibrates
 - Gemtuzumab ozogamicin** → see TABLE 15 p. 1450 (myelosuppression)
 - Gentamicin** → see aminoglycosides
 - Gilteritinib**
 - ▶ **Antiarrhythmics (amiodarone, dronedarone)** are predicted to increase the exposure to **gilteritinib**. [\[Moderate\]](#) Theoretical
 - ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenytoin)** are predicted to decrease the exposure to **gilteritinib**. Avoid. [\[Severe\]](#) Study
 - ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **gilteritinib**. [\[Moderate\]](#) Study
 - ▶ **Calcium channel blockers (verapamil)** are predicted to increase the exposure to **gilteritinib**. [\[Moderate\]](#) Theoretical
 - ▶ **Ciclosporin** is predicted to increase the exposure to **gilteritinib**. [\[Moderate\]](#) Theoretical
 - ▶ **Cobicistat** is predicted to increase the exposure to **gilteritinib**. [\[Moderate\]](#) Study
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **gilteritinib**. [\[Moderate\]](#) Study
 - ▶ **Idelalisib** is predicted to increase the exposure to **gilteritinib**. [\[Moderate\]](#) Study
 - ▶ **Ivacaftor** is predicted to increase the exposure to **gilteritinib**. [\[Moderate\]](#) Theoretical
 - ▶ **Lapatinib** is predicted to increase the exposure to **gilteritinib**. [\[Moderate\]](#) Theoretical
 - ▶ **Macrolides (azithromycin, erythromycin)** are predicted to increase the exposure to **gilteritinib**. [\[Moderate\]](#) Theoretical
 - ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **gilteritinib**. [\[Moderate\]](#) Theoretical
 - ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **gilteritinib**. [\[Moderate\]](#) Theoretical
 - ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **gilteritinib**. [\[Severe\]](#) Study
 - ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **gilteritinib**. [\[Moderate\]](#) Study
 - ▶ **Mitotane** is predicted to decrease the exposure to **gilteritinib**. Avoid. [\[Severe\]](#) Study
 - ▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to increase the exposure to **gilteritinib**. [\[Moderate\]](#) Study
 - ▶ **Nilotinib** is predicted to increase the exposure to **gilteritinib**. [\[Moderate\]](#) Study
 - ▶ **NNRTIs (efavirenz, nevirapine)** are predicted to decrease the exposure to **gilteritinib**. Avoid. [\[Severe\]](#) Study
 - ▶ **St John's wort** is predicted to decrease the exposure to **gilteritinib**. Avoid. [\[Severe\]](#) Study
 - ▶ **Terbinafine** is predicted to increase the exposure to **gilteritinib**. [\[Moderate\]](#) Theoretical
 - ▶ **Gefitinib** might affect the exposure to **vemurafenib**. [\[Moderate\]](#) Theoretical
 - Glasdegib** → see TABLE 9 p. 1449 (QT-interval prolongation)
 - ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to moderately decrease the exposure to **glasdegib**. Avoid. [\[Severe\]](#) Study → Also see TABLE 9 p. 1449
 - ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to moderately decrease the exposure to **glasdegib**. Avoid. [\[Severe\]](#) Study
 - ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to moderately increase the exposure to **glasdegib**. Use with caution or avoid. [\[Moderate\]](#) Study → Also see TABLE 9 p. 1449
 - ▶ **Antifungals, azoles (posaconazole)** are predicted to increase the exposure to **glasdegib**. Use with caution or avoid. [\[Moderate\]](#) Theoretical
 - ▶ **Cobicistat** is predicted to moderately increase the exposure to **glasdegib**. Use with caution or avoid. [\[Moderate\]](#) Study
 - ▶ **Dabrafenib** is predicted to decrease the exposure to **glasdegib**. Avoid or adjust **glasdegib** dose, p. 1056. [\[Severe\]](#) Theoretical
 - ▶ **Endothelin receptor antagonists (bosentan)** are predicted to decrease the exposure to **glasdegib**. Avoid or adjust **glasdegib** dose, p. 1056. [\[Severe\]](#) Theoretical
 - ▶ **Grapefruit juice** is predicted to increase the exposure to **glasdegib**. Use with caution or avoid. [\[Moderate\]](#) Theoretical
 - ▶ **HIV-protease inhibitors** are predicted to moderately increase the exposure to **glasdegib**. Use with caution or avoid. [\[Moderate\]](#) Study
 - ▶ **Idelalisib** is predicted to moderately increase the exposure to **glasdegib**. Use with caution or avoid. [\[Moderate\]](#) Study
 - ▶ **Macrolides (clarithromycin)** are predicted to moderately increase the exposure to **glasdegib**. Use with caution or avoid. [\[Moderate\]](#) Study → Also see TABLE 9 p. 1449
 - ▶ **Mitotane** is predicted to moderately decrease the exposure to **glasdegib**. Avoid. [\[Severe\]](#) Study
 - ▶ **Modafinil** is predicted to decrease the exposure to **glasdegib**. Avoid or adjust **glasdegib** dose, p. 1056. [\[Moderate\]](#) Theoretical
 - ▶ **NNRTIs (efavirenz, nevirapine)** are predicted to decrease the exposure to **glasdegib**. Avoid or adjust **glasdegib** dose, p. 1056. [\[Severe\]](#) Theoretical → Also see TABLE 9 p. 1449
 - ▶ **NNRTIs (etravirine)** are predicted to decrease the exposure to **glasdegib**. Avoid or adjust **glasdegib** dose, p. 1056. [\[Moderate\]](#) Theoretical
 - ▶ **Rifamycins (rifampicin)** are predicted to moderately decrease the exposure to **glasdegib**. Avoid. [\[Severe\]](#) Study
 - ▶ **St John's wort** is predicted to decrease the exposure to **glasdegib**. Avoid or adjust **glasdegib** dose, p. 1056. [\[Severe\]](#) Theoretical
- Glecaprevir**
- ▶ **Anti-androgens (enzalutamide)** are predicted to greatly decrease the concentration of **glecaprevir**. Avoid. [\[Severe\]](#) Study
 - ▶ **Antiarrhythmics (dronedarone)** potentially increase the exposure to **glecaprevir**. [\[Moderate\]](#) Theoretical
 - ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to moderately decrease the exposure to **glecaprevir**. Avoid. [\[Severe\]](#) Study
 - ▶ **Antiepileptics (eslicarbazepine, oxcarbazepine)** potentially decrease the exposure to **glecaprevir**. Avoid. [\[Severe\]](#) Theoretical
 - ▶ **Antifungals, azoles (itraconazole, ketoconazole)** potentially increase the exposure to **glecaprevir**. [\[Moderate\]](#) Theoretical

Glecaprevir (continued)

- ▶ **Ciclosporin** increases the exposure to **glecaprevir**. Avoid or monitor. [Severe] Study
- ▶ **Cobicistat** potentially increases the exposure to **glecaprevir**. [Moderate] Theoretical
- ▶ **Combined hormonal contraceptives** (containing ethinylestradiol) are predicted to increase the risk of increased ALT concentrations when given with **glecaprevir**. Avoid. [Severe] Study
- ▶ **Crizotinib** potentially decreases the exposure to **glecaprevir**. Avoid. [Severe] Theoretical
- ▶ **Dabrafenib** is predicted to decrease the exposure to **glecaprevir**. Avoid. [Severe] Study
- ▶ **Glecaprevir** with pibrentasvir increases the exposure to **digoxin**. [Moderate] Study
- ▶ **Endothelin receptor antagonists (bosentan)** are predicted to decrease the exposure to **glecaprevir**. Avoid. [Severe] Study
- ▶ **HIV-protease inhibitors (atazanavir, darunavir, lopinavir)** boosted with ritonavir increase the exposure to **glecaprevir**. Avoid. [Severe] Study
- ▶ **HIV-protease inhibitors (ritonavir)** increase the exposure to **glecaprevir**. Avoid. [Severe] Study
- ▶ **Lumacaftor** potentially decreases the exposure to **glecaprevir**. Avoid. [Severe] Theoretical
- ▶ **Mitotane** is predicted to greatly decrease the concentration of **glecaprevir**. Avoid. [Severe] Study
- ▶ **NNRTIs (efavirenz, nevirapine)** are predicted to decrease the exposure to **glecaprevir**. Avoid. [Severe] Study
- ▶ **Rifamycins (rifampicin)** markedly affect the exposure to **glecaprevir**. Avoid. [Severe] Study
- ▶ **St John's wort** is predicted to decrease the exposure to **glecaprevir**. Avoid. [Severe] Study
- ▶ **Glecaprevir** with pibrentasvir markedly increases the exposure to **statins (atorvastatin)**. Avoid. [Severe] Study
- ▶ **Glecaprevir** with pibrentasvir is predicted to increase the exposure to **statins (fluvastatin)**. [Moderate] Theoretical
- ▶ **Glecaprevir** with pibrentasvir moderately increases the exposure to **statins (pravastatin)**. Use with caution and adjust pravastatin dose. [Moderate] Study
- ▶ **Glecaprevir** with pibrentasvir moderately increases the exposure to **statins (rosuvastatin)**. Use with caution and adjust rosuvastatin dose, p. 220. [Moderate] Study
- ▶ **Glecaprevir** with pibrentasvir moderately increases the exposure to **statins (simvastatin)**. Avoid. [Moderate] Study
- ▶ **Glecaprevir** with pibrentasvir slightly increases the exposure to **tacrolimus**. Monitor and adjust dose. [Mid] Study
- ▶ **Glecaprevir** with pibrentasvir increases the exposure to **thrombin inhibitors (dabigatran)**. Avoid. [Moderate] Study

Glibenclamide → see sulfonylureas

Gliclazide → see sulfonylureas

Glimepiride → see sulfonylureas

Glipizide → see sulfonylureas

Glucagon

- ▶ **Glucagon** increases the anticoagulant effect of **coumarins (warfarin)**. [Severe] Study

Glucagon-like peptide-1 receptor agonists → see TABLE 14 p. 1450 (antidiabetic drugs)

dulaglutide · exenatide · liraglutide · lixisenatide · semaglutide

- ▶ With standard-release **exenatide**: some orally administered drugs should be taken at least 1 hour before, or 4 hours after, exenatide injection.
- ▶ Some orally administered drugs should be taken at least 1 hour before, or 4 hours after, **lixisenatide** injection.

Glucosamine

- ▶ **Glucosamine** potentially decreases the anticoagulant effect of **coumarins (acenocoumarol)**. [Moderate] Anecdotal
- ▶ **Glucosamine** potentially increases the anticoagulant effect of **coumarins (warfarin)**. Avoid. [Moderate] Anecdotal

Glycerol phenylbutyrate

- ▶ **Antiepileptics (valproate)** potentially oppose the effects of **glycerol phenylbutyrate**. [Moderate] Theoretical
- ▶ **Corticosteroids** potentially oppose the effects of **glycerol phenylbutyrate**. [Moderate] Theoretical

- ▶ **Haloperidol** potentially opposes the effects of **glycerol phenylbutyrate**. [Moderate] Theoretical

Glycerol trinitrate → see nitrates

Glycopyrronium → see TABLE 10 p. 1449 (antimuscarinics)

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application of **glycopyrronium**, the possibility of interactions should be borne in mind.

Gold

- ▶ **ACE inhibitors** are predicted to increase the risk of hypersensitivity when given with **gold**. [Severe] Anecdotal
- ▶ **Gold** potentially increases the risk of adverse effects when given with **penicillamine** (in those who have had previous adverse reactions to gold). Avoid. [Severe] Study

Golimumab → see monoclonal antibodies

Granisetron → see 5-HT₃-receptor antagonists

Grapefruit

- ▶ **Grapefruit** juice is predicted to increase the exposure to **abemaciclib**. Avoid. [Moderate] Theoretical
- ▶ **Grapefruit** juice moderately decreases the exposure to **aliskiren**. Avoid. [Severe] Study
- ▶ **Grapefruit** juice increases the exposure to **antiarrhythmics (amiodarone)**. Avoid. [Moderate] Study
- ▶ **Grapefruit** juice moderately increases the exposure to **antiarrhythmics (dronedarone)**. Avoid. [Severe] Study
- ▶ **Grapefruit** juice increases the exposure to **antiarrhythmics (propafenone)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Grapefruit** juice slightly increases the exposure to **antiepileptics (carbamazepine)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Grapefruit** juice slightly decreases the exposure to **antihistamines, non-sedating (bilastine)**. Bilastine should be taken 1 hour before or 2 hours after **grapefruit**. [Moderate] Study
- ▶ **Grapefruit** juice increases the exposure to **antihistamines, non-sedating (rupatadine)**. Avoid. [Moderate] Study
- ▶ **Grapefruit** juice increases the exposure to **antimalarials (artemether)**. [Unknown] Study
- ▶ **Grapefruit** juice is predicted to increase the concentration of **antimalarials (piperaquine)**. Avoid. [Severe] Theoretical
- ▶ **Grapefruit** juice is predicted to increase the exposure to **antipsychotics, second generation (cariprazine)**. Avoid. [Moderate] Study
- ▶ **Grapefruit** juice is predicted to increase the exposure to **antipsychotics, second generation (lurasidone, quetiapine)**. Avoid. [Severe] Theoretical
- ▶ **Grapefruit** juice is predicted to increase the exposure to **avapritinib**. Avoid. [Moderate] Theoretical
- ▶ **Grapefruit** juice is predicted to increase the exposure to **axitinib**. [Moderate] Theoretical
- ▶ **Grapefruit** juice greatly decreases the exposure to **beta blockers, selective (celiprolol)**. [Moderate] Study
- ▶ **Grapefruit** juice is predicted to increase the exposure to **bosutinib**. Avoid. [Moderate] Theoretical
- ▶ **Grapefruit** juice is predicted to increase the concentration of **brigatinib**. Avoid. [Severe] Study
- ▶ **Grapefruit** juice increases the exposure to **busiprone**. Avoid. [Mid] Study
- ▶ **Grapefruit** juice is predicted to increase the exposure to **cabozantinib**. [Moderate] Theoretical
- ▶ **Grapefruit** juice very slightly increases the exposure to **calcium channel blockers (amlodipine)**. Avoid. [Mid] Study
- ▶ **Grapefruit** juice increases the exposure to **calcium channel blockers (felodipine)**. Avoid. [Moderate] Study
- ▶ **Grapefruit** juice is predicted to increase the exposure to **calcium channel blockers (ercanidipine)**. Avoid. [Moderate] Theoretical
- ▶ **Grapefruit** juice increases the exposure to **calcium channel blockers (nicardipine)**. [Mid] Study
- ▶ **Grapefruit** juice increases the exposure to **calcium channel blockers (nifedipine, verapamil)**. Avoid. [Mid] Study
- ▶ **Grapefruit** juice is predicted to increase the exposure to **ceritinib**. Avoid. [Severe] Theoretical
- ▶ **Grapefruit** juice increases the concentration of **ciclosporin**. Avoid. [Severe] Study
- ▶ **Grapefruit** juice markedly decreases the exposure to **clopidogrel**. [Severe] Study

- ▶ Grapefruit juice is predicted to increase the exposure to **cobimetinib**. Avoid. [\[Severe\]](#) Theoretical
 - ▶ Grapefruit juice moderately increases the exposure to oral corticosteroids (**budesonide**). Avoid. [\[Moderate\]](#) Study
 - ▶ Grapefruit juice is predicted to increase the exposure to **crizotinib**. Avoid. [\[Moderate\]](#) Theoretical
 - ▶ Grapefruit juice is predicted to increase the exposure to **darifenacin**. [\[Moderate\]](#) Study
 - ▶ Grapefruit juice is predicted to increase the exposure to **dasatinib**. Avoid. [\[Moderate\]](#) Theoretical
 - ▶ Grapefruit juice is predicted to increase the exposure to dipeptidylpeptidase-4 inhibitors (**saxagliptin**). [\[Mild\]](#) Theoretical
 - ▶ Grapefruit juice is predicted to increase the exposure to **elexacafort**. Avoid. [\[Moderate\]](#) Theoretical
 - ▶ Grapefruit juice is predicted to increase the exposure to **eliglustat**. Avoid. [\[Severe\]](#) Theoretical
 - ▶ Grapefruit juice is predicted to increase the exposure to **encorafenib**. Avoid. [\[Moderate\]](#) Study
 - ▶ Grapefruit juice is predicted to increase the exposure to **entrectinib**. Avoid. [\[Severe\]](#) Theoretical
 - ▶ Grapefruit juice is predicted to increase the exposure to **ergometrine**. [\[Severe\]](#) Theoretical
 - ▶ Grapefruit juice is predicted to increase the exposure to **eraprotinib**. [\[Severe\]](#) Theoretical
 - ▶ Grapefruit juice is predicted to increase the exposure to **erlotinib**. [\[Moderate\]](#) Theoretical
 - ▶ Grapefruit juice is predicted to increase the exposure to **everolimus**. Avoid. [\[Severe\]](#) Theoretical
 - ▶ Grapefruit juice is predicted to increase the exposure to **foxtamatinib**. Monitor adverse effects and adjust dose. [\[Moderate\]](#) Theoretical
 - ▶ Grapefruit juice is predicted to increase the exposure to **glasdegib**. Use with caution or avoid. [\[Moderate\]](#) Theoretical
 - ▶ Grapefruit juice is predicted to increase the exposure to **guanfacine**. Avoid. [\[Moderate\]](#) Theoretical
 - ▶ Grapefruit juice is predicted to increase the exposure to **ibrutinib**. Avoid. [\[Moderate\]](#) Theoretical
 - ▶ Grapefruit juice is predicted to increase the exposure to **imatinitib**. [\[Moderate\]](#) Theoretical
 - ▶ Grapefruit juice is predicted to increase the exposure to **ivabradine**. Avoid. [\[Moderate\]](#) Study
 - ▶ Grapefruit juice is predicted to increase the exposure to **ivacaftor**. Avoid. [\[Moderate\]](#) Theoretical
 - ▶ Grapefruit juice is predicted to increase the exposure to **lapatinib**. Avoid. [\[Moderate\]](#) Theoretical
 - ▶ Grapefruit juice is predicted to increase the exposure to **larotrectinib**. Avoid. [\[Moderate\]](#) Theoretical
 - ▶ Grapefruit juice is predicted to increase the exposure to **lomitapide**. Avoid. [\[Mild\]](#) Theoretical
 - ▶ Grapefruit juice is predicted to increase the concentration of **lorlatinib**. Avoid. [\[Moderate\]](#) Theoretical
 - ▶ Grapefruit juice is predicted to increase the exposure to **naldemedine**. Avoid or monitor. [\[Moderate\]](#) Theoretical
 - ▶ Grapefruit juice is predicted to increase the exposure to **naloxegol**. Avoid. [\[Moderate\]](#) Theoretical
 - ▶ Grapefruit juice is predicted to increase the exposure to **neratinib**. Avoid. [\[Severe\]](#) Theoretical
 - ▶ Grapefruit juice is predicted to increase the exposure to **nilotinib**. Avoid. [\[Severe\]](#) Theoretical
 - ▶ Grapefruit juice is predicted to increase the exposure to **olaparib**. Avoid. [\[Moderate\]](#) Theoretical
 - ▶ Grapefruit juice is predicted to increase the exposure to **palbociclib**. Avoid. [\[Severe\]](#) Theoretical
 - ▶ Grapefruit juice is predicted to increase the exposure to **pazopanib**. Avoid. [\[Severe\]](#) Theoretical
 - ▶ Grapefruit juice is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors**. Use with caution or avoid. [\[Moderate\]](#) Study
 - ▶ Grapefruit juice increases the exposure to **pimozide**. Avoid. [\[Severe\]](#) Theoretical
 - ▶ Grapefruit juice is predicted to increase the exposure to **ponatinib**. [\[Moderate\]](#) Theoretical
 - ▶ Grapefruit juice is predicted to increase the exposure to **praziquantel**. [\[Moderate\]](#) Study
 - ▶ Grapefruit juice is predicted to increase the concentration of **ranolazine**. Avoid. [\[Severe\]](#) Theoretical
 - ▶ Grapefruit juice is predicted to increase the exposure to **regorafenib**. Avoid. [\[Moderate\]](#) Theoretical
 - ▶ Grapefruit juice is predicted to increase the exposure to **ribociclib**. Avoid. [\[Moderate\]](#) Theoretical
 - ▶ Grapefruit juice is predicted to increase the exposure to **roxolitinib**. [\[Severe\]](#) Theoretical
 - ▶ Grapefruit juice increases the concentration of **siriolimus**. Avoid. [\[Moderate\]](#) Study
 - ▶ Grapefruit juice moderately increases the exposure to **SSRIs (sertraline)**. Avoid. [\[Moderate\]](#) Study
 - ▶ Grapefruit juice increases the exposure to **statins (atorvastatin)**. [\[Mild\]](#) Study
 - ▶ Grapefruit juice increases the exposure to **statins (simvastatin)**. Avoid. [\[Severe\]](#) Study
 - ▶ Grapefruit juice is predicted to increase the exposure to **sunitinib**. Avoid. [\[Moderate\]](#) Theoretical
 - ▶ Grapefruit juice greatly increases the concentration of **tacrolimus**. Avoid. [\[Severe\]](#) Study
 - ▶ Grapefruit juice is predicted to increase the concentration of **temsirolimus**. Use with caution or avoid. [\[Moderate\]](#) Theoretical
 - ▶ Grapefruit juice is predicted to increase the exposure to **tezacaftor**. Avoid. [\[Severe\]](#) Study
 - ▶ Grapefruit juice moderately increases the exposure to **ticagrelor**. [\[Moderate\]](#) Study
 - ▶ Grapefruit juice increases the exposure to **tolvaptan**. Avoid. [\[Moderate\]](#) Study
 - ▶ Grapefruit juice is predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [\[Moderate\]](#) Theoretical
 - ▶ Grapefruit juice is predicted to increase the exposure to **venetoclax**. Avoid. [\[Severe\]](#) Theoretical
- Grass pollen extract**
- GENERAL INFORMATION** Desensitising vaccines should be avoided in patients taking beta-blockers (adrenaline might be ineffective in case of a hypersensitivity reaction) or ACE inhibitors (risk of severe anaphylactoid reactions).
- Grazoprevir**
- ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to **grazoprevir**. Avoid. [\[Severe\]](#) Study
 - ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **grazoprevir**. Avoid. [\[Severe\]](#) Study
 - ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to moderately to markedly increase the exposure to **grazoprevir**. Avoid. [\[Severe\]](#) Study
 - ▶ **Grazoprevir** is predicted to increase the concentration of **calcium channel blockers**. [\[Moderate\]](#) Theoretical
 - ▶ **Ciclosporin** greatly increases the exposure to **grazoprevir**. Avoid. [\[Severe\]](#) Study
 - ▶ **Cobicistat** is predicted to moderately to markedly increase the exposure to **grazoprevir**. Avoid. [\[Severe\]](#) Study
 - ▶ **Dabrafenib** is predicted to markedly decrease the exposure to **grazoprevir**. Avoid. [\[Severe\]](#) Study
 - ▶ **Elvitegravir** markedly increases the exposure to **grazoprevir**. Avoid. [\[Severe\]](#) Study
 - ▶ **Endothelin receptor antagonists (bosentan)** are predicted to markedly decrease the exposure to **grazoprevir**. Avoid. [\[Severe\]](#) Study
 - ▶ **HIV-protease inhibitors** are predicted to moderately to markedly increase the exposure to **grazoprevir**. Avoid. [\[Severe\]](#) Study
 - ▶ **Idelalisib** is predicted to moderately to markedly increase the exposure to **grazoprevir**. Avoid. [\[Severe\]](#) Study
 - ▶ **Macrolides (clarithromycin)** are predicted to moderately to markedly increase the exposure to **grazoprevir**. Avoid. [\[Severe\]](#) Study
 - ▶ **Mitotane** is predicted to decrease the exposure to **grazoprevir**. Avoid. [\[Severe\]](#) Study
 - ▶ **Modafinil** is predicted to decrease the exposure to **grazoprevir**. Avoid. [\[Severe\]](#) Theoretical
 - ▶ **NNRTs (efavirenz, nevirapine)** are predicted to markedly decrease the exposure to **grazoprevir**. Avoid. [\[Severe\]](#) Study
 - ▶ **NNRTs (etravirine)** are predicted to decrease the exposure to **grazoprevir**. Avoid. [\[Mild\]](#) Theoretical

Grazoprevir (continued)

- ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **grazoprevir**. Avoid. [Severe] Study
- ▶ **St John's wort** is predicted to markedly decrease the exposure to **grazoprevir**. Avoid. [Severe] Study
- ▶ **Grazoprevir** moderately increases the exposure to **statins (atorvastatin)**. Adjust **atorvastatin** dose, p. 218. [Moderate] Study
- ▶ **Grazoprevir** with **elbasvir** is predicted to increase the exposure to **statins (fluvastatin)**. Adjust **fluvastatin** dose, p. 219. [Moderate] Theoretical
- ▶ **Grazoprevir** with **elbasvir** moderately increases the exposure to **statins (rosuvastatin)**. Adjust **rosuvastatin** dose, p. 220. [Moderate] Study
- ▶ **Grazoprevir** with **elbasvir** is predicted to increase the exposure to **statins (simvastatin)**. Adjust **simvastatin** dose, p. 221. [Moderate] Theoretical
- ▶ **Grazoprevir** is predicted to increase the concentration of **sunitinib**. Use with caution and adjust dose. [Moderate] Theoretical
- ▶ **Grazoprevir** increases the exposure to **tacrolimus**. [Moderate] Study

Griseofulvin

ROUTE-SPECIFIC INFORMATION Interactions do not generally apply to topical use unless specified.

- ▶ **Alcohol** potentially causes a disulfiram-like reaction when given with **griseofulvin**. [Moderate] Anecdotal
- ▶ **Antiepileptics (phenobarbital, primidone)** decrease the effects of **griseofulvin**. [Moderate] Study
- ▶ **Griseofulvin** potentially decreases the efficacy of **combined hormonal contraceptives**. For FSRH guidance, see Contraceptives, interactions p. 843. [Severe] Anecdotal
- ▶ **Griseofulvin** potentially decreases the anticoagulant effect of **coumarins**. [Moderate] Anecdotal
- ▶ **Griseofulvin** potentially decreases the efficacy of **desogestrel**. For FSRH guidance, see Contraceptives, interactions p. 843. [Severe] Anecdotal
- ▶ **Griseofulvin** decreases the efficacy of **etonogestrel**. For FSRH guidance, see Contraceptives, interactions p. 843. [Severe] Anecdotal
- ▶ **Griseofulvin** potentially decreases the efficacy of oral **levonorgestrel**. For FSRH guidance, see Contraceptives, interactions p. 843. [Severe] Anecdotal
- ▶ **Griseofulvin** potentially decreases the efficacy of **norethisterone**. For FSRH guidance, see Contraceptives, interactions p. 843. [Severe] Anecdotal
- ▶ **Griseofulvin** potentially decreases the efficacy of **ulipristal**. For FSRH guidance, see Contraceptives, interactions p. 843. [Severe] Anecdotal

Guanfacine → see TABLE 8 p. 1448 (hypotension), TABLE 11 p. 1449 (CNS depressant effects)

- ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the concentration of **guanfacine**. Adjust **guanfacine** dose, p. 375. [Moderate] Study
- ▶ **Antiarrhythmics (dronedaron)** are predicted to increase the concentration of **guanfacine**. Adjust **guanfacine** dose, p. 375. [Moderate] Theoretical
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the concentration of **guanfacine**. Adjust **guanfacine** dose, p. 375. [Moderate] Study → Also see TABLE 11 p. 1449
- ▶ **Antiepileptics (oxcarbazepine)** are predicted to decrease the concentration of **guanfacine**. Monitor and adjust **guanfacine** dose, p. 375. [Moderate] Theoretical
- ▶ **Guanfacine** increases the concentration of **antiepileptics (valproate)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the concentration of **guanfacine**. Adjust **guanfacine** dose, p. 375. [Moderate] Theoretical
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **guanfacine**. Adjust **guanfacine** dose, p. 375. [Moderate] Study
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the concentration of **guanfacine**. Adjust **guanfacine** dose, p. 375. [Moderate] Theoretical → Also see TABLE 8 p. 1448

- ▶ **Chloramphenicol** is predicted to increase the exposure to **guanfacine**. Adjust **guanfacine** dose, p. 375. [Moderate] Theoretical
- ▶ **Cobicistat** is predicted to increase the exposure to **guanfacine**. Adjust **guanfacine** dose, p. 375. [Moderate] Study
- ▶ **Crizotinib** is predicted to increase the concentration of **guanfacine**. Adjust **guanfacine** dose, p. 375. [Moderate] Theoretical
- ▶ **Dabrafenib** is predicted to decrease the concentration of **guanfacine**. Adjust dose. [Moderate] Theoretical
- ▶ **Endothelin receptor antagonists (bosentan)** are predicted to decrease the concentration of **guanfacine**. Adjust dose. [Moderate] Theoretical
- ▶ **Grapefruit** juice is predicted to increase the exposure to **guanfacine**. Avoid. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **guanfacine**. Adjust **guanfacine** dose, p. 375. [Moderate] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **guanfacine**. Adjust **guanfacine** dose, p. 375. [Moderate] Study
- ▶ **Imatinib** is predicted to increase the concentration of **guanfacine**. Adjust **guanfacine** dose, p. 375. [Moderate] Theoretical
- ▶ **Letermovir** is predicted to increase the concentration of **guanfacine**. Adjust **guanfacine** dose, p. 375. [Moderate] Theoretical
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **guanfacine**. Adjust **guanfacine** dose, p. 375. [Moderate] Study
- ▶ **Macrolides (erythromycin)** are predicted to increase the concentration of **guanfacine**. Adjust **guanfacine** dose, p. 375. [Moderate] Theoretical
- ▶ **Guanfacine** is predicted to increase the concentration of **metformin**. [Moderate] Theoretical
- ▶ **Mitotane** is predicted to decrease the concentration of **guanfacine**. Adjust **guanfacine** dose, p. 375. [Moderate] Study
- ▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to increase the concentration of **guanfacine**. Adjust **guanfacine** dose, p. 375. [Moderate] Theoretical
- ▶ **Neurokinin-1 receptor antagonists (fosaprepitant)** are predicted to increase the concentration of **guanfacine**. [Moderate] Theoretical
- ▶ **Nilotinib** is predicted to increase the concentration of **guanfacine**. Adjust **guanfacine** dose, p. 375. [Moderate] Theoretical
- ▶ **NNRTIs (efavirenz, nevirapine)** are predicted to decrease the concentration of **guanfacine**. Adjust dose. [Moderate] Theoretical
- ▶ **Rifamycins (rifampicin)** are predicted to decrease the concentration of **guanfacine**. Adjust **guanfacine** dose, p. 375. [Moderate] Study
- ▶ **St John's wort** is predicted to decrease the concentration of **guanfacine**. Adjust dose. [Moderate] Theoretical

Guselkumab → see monoclonal antibodies

H₂ receptor antagonists

cimetidine · famotidine · nizatidine · ranitidine

- ▶ **H₂ receptor antagonists** are predicted to decrease the exposure to **acalabrutinib**. **Acalabrutinib** should be taken 2 hours before or 10 hours after **H₂ receptor antagonists**. [Moderate] Theoretical
- ▶ **Cimetidine** decreases the clearance of **albendazole**. [Moderate] Study
- ▶ **Cimetidine** increases the concentration of **aminophylline**. Adjust dose. [Severe] Study
- ▶ **Cimetidine** slightly increases the exposure to **anthracyclines (epirubicin)**. Avoid. [Moderate] Study
- ▶ **Cimetidine** increases the exposure to **antiarrhythmics (amiodarone)**. [Moderate] Study
- ▶ **Cimetidine** slightly increases the exposure to **antiarrhythmics (flecainide)**. Monitor and adjust dose. [Mid] Study
- ▶ **Cimetidine** increases the exposure to **antiarrhythmics (lidocaine)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Cimetidine** is predicted to increase the exposure to **antiarrhythmics (propafenone)**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Cimetidine** transiently increases the concentration of **antiepileptics (carbamazepine)**. Monitor concentration and adjust dose. [Moderate] Study
- ▶ **Cimetidine** increases the concentration of **antiepileptics (fosphenytoin, phenytoin)**. Monitor concentration and adjust dose. [Severe] Study
- ▶ **H₂ receptor antagonists** are predicted to decrease the absorption of **antifungals, azoles (itraconazole)**. Administer

- itraconazole capsules with an acidic beverage, p. 641. [Moderate](#) Study
- ▶ H₂ receptor antagonists are predicted to decrease the absorption of antifungals, azoles (**ketoconazole**). Administer ketoconazole with an acidic beverage, p. 724. [Moderate](#) Study
 - ▶ H₂ receptor antagonists are predicted to decrease the exposure to antifungals, azoles (**posaconazole**). Avoid use of posaconazole oral suspension. [Moderate](#) Study
 - ▶ Cimetidine decreases the clearance of antimalarials (**chloroquine**). [Moderate](#) Study
 - ▶ Cimetidine slightly increases the exposure to antimalarials (**quinine**). [Moderate](#) Study
 - ▶ H₂ receptor antagonists are predicted to decrease the absorption of **bosutinib**. [Moderate](#) Theoretical
 - ▶ Cimetidine slightly increases the exposure to calcium channel blockers (**diltiazem**, **nifedipine**). Monitor and adjust dose. [Moderate](#) Study
 - ▶ Cimetidine (high-dose) is predicted to increase the exposure to calcium channel blockers (**lercanidipine**). [Moderate](#) Theoretical
 - ▶ Cimetidine moderately increases the exposure to calcium channel blockers (**nifedipine**). Monitor and adjust dose. [Severe](#) Study
 - ▶ Cimetidine increases the exposure to calcium channel blockers (**verapamil**). [Moderate](#) Study
 - ▶ Cimetidine is predicted to slightly increase the exposure to **capecitabine**. [Severe](#) Theoretical
 - ▶ H₂ receptor antagonists are predicted to decrease the absorption of **ceritinib**. [Moderate](#) Theoretical
 - ▶ Cimetidine increases the concentration of **ciclosporin**. [Mild](#) Study
 - ▶ Cimetidine increases the anticoagulant effect of **coumarins**. [Severe](#) Study
 - ▶ H₂ receptor antagonists are predicted to decrease the concentration of **dacomitinib**. Dacomitinib should be taken 2 hours before or 10 hours after H₂ receptor antagonists. [Mild](#) Study
 - ▶ Cimetidine increases the exposure to **darifenacin**. [Mild](#) Study
 - ▶ H₂ receptor antagonists are predicted to decrease the exposure to **dasatinib**. Avoid. [Moderate](#) Study
 - ▶ H₂ receptor antagonists are predicted to decrease the absorption of **dipyridamole** (immediate release tablets). [Moderate](#) Theoretical
 - ▶ Cimetidine is predicted to increase the exposure to dopamine receptor agonists (**pramipexole**). Adjust dose. [Moderate](#) Study
 - ▶ H₂ receptor antagonists are predicted to decrease the exposure to **erlotinib**. Erlotinib should be taken 2 hours before or 10 hours after H₂ receptor antagonists. [Moderate](#) Study
 - ▶ Cimetidine increases the concentration of **fampridine**. Avoid. [Severe](#) Theoretical
 - ▶ Cimetidine slightly increases the exposure to **fluorouracil**. [Severe](#) Study
 - ▶ H₂ receptor antagonists are predicted to slightly to moderately decrease the exposure to **gefitinib**. [Moderate](#) Study
 - ▶ H₂ receptor antagonists decrease the exposure to HIV-protease inhibitors (**atazanavir**). Monitor and adjust dose. [Moderate](#) Study
 - ▶ Cimetidine is predicted to decrease the clearance of **hydroxychloroquine**. [Moderate](#) Theoretical
 - ▶ H₂ receptor antagonists are predicted to decrease the absorption of **lapatinib**. Avoid. [Moderate](#) Theoretical
 - ▶ H₂ receptor antagonists are predicted to decrease the exposure to **ledipasvir**. Adjust dose, see ledipasvir with sofosbuvir p. 672. [Moderate](#) Study
 - ▶ **Leflunomide** is predicted to increase the exposure to H₂ receptor antagonists (**cimetidine**, **famotidine**). [Moderate](#) Theoretical
 - ▶ Cimetidine is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Mild](#) Theoretical
 - ▶ **Ranitidine** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate](#) Theoretical
 - ▶ Cimetidine slightly increases the exposure to macrolides (**erythromycin**). [Moderate](#) Study
 - ▶ Cimetidine increases the concentration of **mebendazole**. [Moderate](#) Study
 - ▶ Cimetidine increases the exposure to **metformin**. Monitor and adjust dose. [Moderate](#) Study
 - ▶ **Cimetidine** slightly increases the exposure to **mirtazapine**. Use with caution and adjust dose. [Moderate](#) Theoretical
 - ▶ **Cimetidine** increases the exposure to **moclobemide**. Adjust moclobemide dose, p. 386. [Mild](#) Study
 - ▶ H₂ receptor antagonists are predicted to decrease the exposure to **neratinib**. Avoid. [Severe](#) Theoretical
 - ▶ H₂ receptor antagonists might affect the absorption of **nilotinib**. H₂ receptor antagonists should be taken 10 hours before or 2 hours after nilotinib. [Mild](#) Theoretical
 - ▶ **Nitisinone** is predicted to increase the exposure to H₂ receptor antagonists (**cimetidine**, **famotidine**). [Moderate](#) Study
 - ▶ H₂ receptor antagonists are predicted to decrease the exposure to **NNRTIs (rilpivirine)**. H₂ receptor antagonists should be taken 12 hours before or 4 hours after rilpivirine. [Severe](#) Study
 - ▶ **Cimetidine** increases the concentration of **opioids (alfentanil)**. Use with caution and adjust dose. [Severe](#) Study
 - ▶ **Cimetidine** increases the exposure to **opioids (fentanyl)**. [Moderate](#) Study
 - ▶ H₂ receptor antagonists are predicted to decrease the exposure to **pazopanib**. H₂ receptor antagonists should be taken 10 hours before or 2 hours after pazopanib. [Moderate](#) Theoretical
 - ▶ **Cimetidine** increases the exposure to **phenindione**. [Severe](#) Anecdotal
 - ▶ **Cimetidine** slightly increases the exposure to **phosphodiesterase type-4 inhibitors (roflumilast)**. [Moderate](#) Study
 - ▶ **Cimetidine** moderately increases the exposure to **praziquantel**. [Moderate](#) Study
 - ▶ H₂ receptor antagonists potentially decrease the exposure to **sofosbuvir**. Adjust dose, see ledipasvir with sofosbuvir p. 672, sofosbuvir with velpatasvir p. 673, and sofosbuvir with velpatasvir and voxilaprevir p. 674. [Moderate](#) Study
 - ▶ **Cimetidine** slightly increases the exposure to **SSRIs (citalopram, escitalopram)**. Adjust dose. [Moderate](#) Study
 - ▶ **Cimetidine** slightly increases the exposure to **SSRIs (paroxetine, sertraline)**. [Moderate](#) Study
 - ▶ **Cimetidine** is predicted to increase the risk of toxicity when given with **tegafur**. [Severe](#) Theoretical
 - ▶ **Teriflunomide** is predicted to increase the exposure to H₂ receptor antagonists (**cimetidine**, **famotidine**). [Moderate](#) Study
 - ▶ **Cimetidine** increases the concentration of **theophylline**. Adjust dose. [Severe](#) Study
 - ▶ **Cimetidine** increases the exposure to **tricyclic antidepressants**. [Moderate](#) Study
 - ▶ **Cimetidine** slightly increases the exposure to **triptans (zolmitriptan)**. Adjust zolmitriptan dose, p. 507. [Mild](#) Study
 - ▶ H₂ receptor antagonists are predicted to decrease the concentration of **velpatasvir**. Adjust dose, see sofosbuvir with velpatasvir p. 673. [Moderate](#) Study
 - ▶ **Cimetidine** slightly increases the exposure to **venlafaxine**. [Mild](#) Study
- Haloperidol** → see TABLE 8 p. 1448 (hypotension), TABLE 9 p. 1449 (QT-interval prolongation), TABLE 11 p. 1449 (CNS depressant effects), TABLE 10 p. 1449 (antimuscarinics)
- FOOD AND LIFESTYLE** Dose adjustment might be necessary if smoking started or stopped during treatment.
- ▶ **Anti-androgens (apalutamide, enzalutamide)** decrease the concentration of **haloperidol**. Adjust dose. [Moderate](#) Study → Also see TABLE 9 p. 1449
 - ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** decrease the concentration of **haloperidol**. Adjust dose. [Moderate](#) Study → Also see TABLE 11 p. 1449
 - ▶ **Haloperidol** potentially increases the risk of overheating and dehydration when given with **antiepileptics (zonisamide)**. Avoid in children. [Severe](#) Theoretical
 - ▶ **Antifungals, azoles (itraconazole)** increase the concentration of **haloperidol**. [Moderate](#) Study
 - ▶ **Haloperidol** is predicted to decrease the effects of **dopamine receptor agonists**. Avoid. [Moderate](#) Theoretical → Also see TABLE 8 p. 1448 → Also see TABLE 9 p. 1449 → Also see TABLE 10 p. 1449
 - ▶ **Haloperidol** potentially opposes the effects of **glycerol phenylbutyrate**. [Moderate](#) Theoretical
 - ▶ **HIV-protease inhibitors (ritonavir)** are predicted to increase the exposure to **haloperidol**. [Severe](#) Theoretical

Haloperidol (continued)

- ▶ Haloperidol decreases the effects of **levodopa**. [\[Severe\]](#) Study → Also see TABLE 8 p. 1448
- ▶ **Motidone** decreases the concentration of haloperidol. Adjust dose. [\[Moderate\]](#) Study
- ▶ **Rifamycins (rifampicin)** decrease the concentration of haloperidol. Adjust dose. [\[Moderate\]](#) Study
- ▶ Haloperidol potentially decreases the effects of **sodium phenylbutyrate**. [\[Moderate\]](#) Anecdotal
- ▶ **SSRIs (fluoxetine)** increase the concentration of haloperidol. Adjust dose. [\[Moderate\]](#) Anecdotal
- ▶ **SSRIs (fluvoxamine)** increase the concentration of haloperidol. Adjust dose. [\[Moderate\]](#) Study
- ▶ **Venlafaxine** slightly increases the exposure to haloperidol. [\[Severe\]](#) Study → Also see TABLE 9 p. 1449 → Also see TABLE 11 p. 1449

Heparin → see TABLE 16 p. 1451 (increased serum potassium), TABLE 3 p. 1447 (anticoagulant effects)

- ▶ **Andexanet alfa** has been reported to affect the anticoagulant effect of heparin. Avoid. [\[Severe\]](#) Anecdotal
- ▶ **Ranibizumab** increases the risk of bleeding events when given with heparin. [\[Severe\]](#) Theoretical

Hepatitis B immunoglobulin → see immunoglobulins

HIV-protease inhibitors

atazanavir · darunavir · fosamprenavir · lopinavir · ritonavir · tipranavir

- ▶ Caution on concurrent use of **atazanavir, lopinavir with ritonavir, and ritonavir** with drugs that prolong the PR interval.
- ▶ Caution with concurrent use of **tipranavir** with drugs that increase risk of bleeding.

- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **abemaciclib**. Avoid or adjust abemaciclib dose, p. 1015. [\[Severe\]](#) Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **acalabrutinib**. Avoid. [\[Severe\]](#) Study
- ▶ HIV-protease inhibitors (**lopinavir, ritonavir**) are predicted to increase the exposure to **afatinib**. Separate administration by 12 hours. [\[Moderate\]](#) Study
- ▶ **Ritonavir** is predicted to decrease the exposure to **agomelatine**. [\[Moderate\]](#) Theoretical
- ▶ **Ritonavir** decreases the exposure to **albendazole**. [\[Moderate\]](#) Study
- ▶ **HIV-protease inhibitors** are predicted to markedly increase the exposure to **aldosterone antagonists (eplerenone)**. Avoid. [\[Severe\]](#) Study
- ▶ **Ritonavir** is predicted to increase the exposure to **aliskiren**. [\[Moderate\]](#) Theoretical
- ▶ **HIV-protease inhibitors** are predicted to moderately increase the exposure to **alpha blockers (alfuzosin, tamsulosin)**. Use with caution or avoid. [\[Moderate\]](#) Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **alpha blockers (doxazosin)**. [\[Moderate\]](#) Study
- ▶ HIV-protease inhibitors (**ritonavir, tipranavir**) are predicted to increase the exposure to **amfetamines**. [\[Severe\]](#) Theoretical
- ▶ **Ritonavir** decreases the exposure to **aminophylline**. Adjust dose. [\[Moderate\]](#) Study
- ▶ **Ritonavir** is predicted to decrease the exposure to **anaesthetics, local (ropivacaine)**. [\[Moderate\]](#) Theoretical
- ▶ Oral **antacids** are predicted to decrease the absorption of oral atazanavir. Atazanavir should be taken 2 hours before or 1 hour after antacids. [\[Severe\]](#) Theoretical
- ▶ Oral **antacids** are predicted to decrease the absorption of oral tipranavir. Separate administration by 2 hours. [\[Moderate\]](#) Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **anti-androgens (apalutamide)**. [\[Mild\]](#) Study
- ▶ HIV-protease inhibitors (**lopinavir, ritonavir**) are predicted to increase the exposure to **anti-androgens (darolutamide)**. Monitor and adjust dose. [\[Moderate\]](#) Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **antiarrhythmics (amiodarone)**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **antiarrhythmics (disopyramide)**. [\[Severe\]](#) Theoretical
- ▶ **HIV-protease inhibitors** very markedly increase the exposure to **antiarrhythmics (dronedaron)**. Avoid. [\[Severe\]](#) Study
- ▶ **Ritonavir** is predicted to increase the exposure to **antiarrhythmics (flecainide)**. Avoid or monitor adverse effects. [\[Severe\]](#) Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **antiarrhythmics (lidocaine)**. Avoid. [\[Severe\]](#) Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **antiarrhythmics (propafenone)**. Monitor and adjust dose. [\[Severe\]](#) Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **anticholinesterases, centrally acting (galantamine)**. Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **antiepileptics (carbamazepine) and antiepileptics (carbamazepine)** are predicted to decrease the exposure to **HIV-protease inhibitors**. Monitor and adjust dose. [\[Severe\]](#) Theoretical
- ▶ **HIV-protease inhibitors** are predicted to affect the exposure to **antiepileptics (fosphenytoin, phenytoin) and antiepileptics (fosphenytoin, phenytoin)** decrease the concentration of **HIV-protease inhibitors**. [\[Severe\]](#) Theoretical
- ▶ **Ritonavir** slightly decreases the exposure to **antiepileptics (lamotrigine)**. [\[Severe\]](#) Study
- ▶ **HIV-protease inhibitors** are predicted to very slightly increase the exposure to **antiepileptics (perampanel)**. [\[Mild\]](#) Study
- ▶ **HIV-protease inhibitors** are predicted to affect the concentration of **antiepileptics (phenobarbital, primidone) and antiepileptics (phenobarbital, primidone)** are predicted to decrease the concentration of **HIV-protease inhibitors**. [\[Severe\]](#) Theoretical
- ▶ **Ritonavir** is predicted to decrease the concentration of **antiepileptics (valproate)**. [\[Severe\]](#) Anecdotal
- ▶ **Antifungals, azoles (fluconazole)** slightly increase the exposure to **tipranavir**. Avoid or adjust dose. [\[Moderate\]](#) Study
- ▶ **Antifungals, azoles (miconazole)** are predicted to increase the concentration of **HIV-protease inhibitors**. Use with caution and adjust dose. [\[Moderate\]](#) Theoretical
- ▶ **Antifungals, azoles (posaconazole)** are predicted to increase the exposure to **HIV-protease inhibitors**. [\[Moderate\]](#) Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **antifungals, azoles (isavuconazole)**. Avoid or monitor adverse effects. [\[Severe\]](#) Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **antifungals, azoles (itraconazole)**. Use with caution and adjust dose. [\[Severe\]](#) Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **antifungals, azoles (ketoconazole)**. Use with caution and adjust dose. [\[Moderate\]](#) Study
- ▶ **HIV-protease inhibitors** are predicted to affect the exposure to **antifungals, azoles (voriconazole) and antifungals, azoles (voriconazole)** potentially affect the exposure to **HIV-protease inhibitors**. [\[Severe\]](#) Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **antihistamines, non-sedating (mizolastine)**. Avoid. [\[Severe\]](#) Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **antihistamines, non-sedating (rupatadine)**. Avoid. [\[Moderate\]](#) Study
- ▶ **HIV-protease inhibitors** decrease the exposure to **antimalarials (atovaquone)**. Avoid if boosted with ritonavir. [\[Moderate\]](#) Study
- ▶ **HIV-protease inhibitors** are predicted to increase the concentration of **antimalarials (piperaquine)**. [\[Severe\]](#) Theoretical
- ▶ **HIV-protease inhibitors** are predicted to decrease the exposure to **antimalarials (proguanil)**. Avoid. [\[Moderate\]](#) Study
- ▶ **HIV-protease inhibitors** are predicted to affect the exposure to **antimalarials (quinine)**. [\[Severe\]](#) Study
- ▶ **HIV-protease inhibitors** are predicted to slightly increase the exposure to **antipsychotics, second generation (aripiprazole)**. Adjust aripiprazole dose, p. 418. [\[Moderate\]](#) Study
- ▶ **HIV-protease inhibitors** are predicted to moderately increase the exposure to **antipsychotics, second generation (cariprazine)**. Avoid. [\[Severe\]](#) Study
- ▶ **Ritonavir** is predicted to affect the exposure to **antipsychotics, second generation (clozapine)**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **antipsychotics, second generation (lurasidone, quetiapine)**. Avoid. [\[Severe\]](#) Study

- ▶ **Ritonavir** is predicted to decrease the exposure to **antipsychotics, second generation (olanzapine)**. Monitor and adjust dose. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **antipsychotics, second generation (risperidone)**. Adjust dose. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **avapritinib**. Avoid. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **axitinib**. Avoid or adjust dose. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **bedaquiline**. Avoid prolonged use. [Mild] Study
- ▶ **HIV-protease inhibitors** moderately increase the exposure to **benzodiazepines (alprazolam)**. Avoid. [Moderate] Study
- ▶ **Ritonavir** is predicted to increase the exposure to **benzodiazepines (diazepam, flurazepam)**. Avoid. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to markedly to very markedly increase the exposure to **benzodiazepines (midazolam)**. Avoid or adjust dose. [Severe] Study
- ▶ **HIV-protease inhibitors (lopinavir, ritonavir)** are predicted to increase the exposure to **beta blockers, non-selective (nadolol)**. [Moderate] Study
- ▶ **Ritonavir** is predicted to increase the exposure to **beta blockers, selective (metoprolol)**. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **beta₂ agonists (salmeterol)**. Avoid. [Severe] Study
- ▶ **Atazanavir** moderately increases the exposure to **bictegravir**. Avoid. [Severe] Study
- ▶ **HIV-protease inhibitors (lopinavir, ritonavir)** are predicted to increase the exposure to **bictegravir**. Use with caution or avoid. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors** slightly increase the exposure to **bortezomib**. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **bosutinib**. Avoid or adjust dose. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **brigatinib**. Avoid or adjust brigatinib dose, p. 1022. [Severe] Study
- ▶ **Ritonavir** is predicted to decrease the exposure to **bupropion**. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **bupirone**. Adjust bupirone dose, p. 364. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **cabozantinib**. [Moderate] Study
- ▶ **Ritonavir** is predicted to moderately increase the clearance of **caffeine citrate**. Monitor and adjust dose. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **calcium channel blockers (amlodipine, felodipine, lacidipine, nicardipine, nifedipine, nimodipine)**. Monitor and adjust dose. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **calcium channel blockers (diltiazem, verapamil)**. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to markedly increase the exposure to **calcium channel blockers (lercanidipine)**. Avoid. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **cannabidiol**. Avoid or adjust dose. [Mild] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **ceritinib**. Avoid or adjust ceritinib dose, p. 1024. [Severe] Study
- ▶ **HIV-protease inhibitors** increase the concentration of **ciclosporin**. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to moderately increase the exposure to **cilostazol**. Adjust cilostazol dose, p. 249. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to moderately increase the exposure to **cinacalcet**. Adjust dose. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **cobimetinib**. Avoid or monitor for toxicity. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **colchicine**. Avoid potent CYP3A4 inhibitors or adjust colchicine dose, p. 1175. [Severe] Study
- ▶ **Atazanavir** (unboosted) increases the exposure to **combined hormonal contraceptives**. Adjust dose. [Severe] Study
- ▶ **Ritonavir** is predicted to decrease the efficacy of **combined hormonal contraceptives**. For FSRH guidance, see Contraceptives, interactions p. 843. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **corticosteroids (beclometasone)** (risk with beclometasone is likely to be lower than with other corticosteroids). [Moderate] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **corticosteroids (betamethasone, budesonide, ciclesonide, deflazacort, dexamethasone, fludrocortisone, fluticasone, hydrocortisone, methylprednisolone, mometasone, prednisolone, triamcinolone)**. Avoid or monitor adverse effects. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to affect the anticoagulant effect of **coumarins**. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **crizotinib**. Avoid. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **dabrafenib**. Use with caution or avoid. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to markedly to very markedly increase the exposure to **darifenacin**. Avoid. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **dasatinib**. Avoid or adjust dose—consult product literature. [Severe] Study
- ▶ **HIV-protease inhibitors** very slightly increase the exposure to **delamanid**. [Severe] Study
- ▶ **Ritonavir** is predicted to decrease the efficacy of **desogestrel**. For FSRH guidance, see Contraceptives, interactions p. 843. [Severe] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to moderately increase the exposure to **dienogest**. [Moderate] Study
- ▶ **Ritonavir** increases the concentration of **digoxin**. Adjust dose and monitor concentration. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **dipeptidylpeptidase-4 inhibitors (saxagliptin)**. [Moderate] Study
- ▶ **Fosamprenavir** boosted with ritonavir slightly decreases the exposure to **dolutegravir**. Avoid if resistant to HIV-integrase inhibitors. [Severe] Study
- ▶ **Tipranavir** moderately decreases the exposure to **dolutegravir**. Refer to specialist literature. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **domperidone**. Avoid. [Severe] Study
- ▶ **HIV-protease inhibitors** increase the exposure to **dopamine receptor agonists (bromocriptine)**. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the concentration of **dopamine receptor agonists (cabergoline)**. [Moderate] Anecdotal
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **dronabinol**. Adjust dose. [Mild] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **drospirenone**. [Severe] Study
- ▶ **Ritonavir** is predicted to decrease the exposure to **duloxetine**. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **dutasteride**. Monitor adverse effects and adjust dose. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **elxacaftor**. Adjust tezacaftor with ivacaftor and elxacaftor p. 314 dose with potent CYP3A4 inhibitors. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
- ▶ **HIV-protease inhibitors (atazanavir, lopinavir)** boosted with ritonavir increase the concentration of **elvitegravir**. Refer to specialist literature. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **encorafenib**. Avoid or monitor. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **endothelin receptor antagonists (bosentan)**. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **endothelin receptor antagonists (macitentan)**. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **entrectinib**. Avoid potent CYP3A4 inhibitors or adjust entrectinib dose, p. 1030. [Severe] Study

HIV-protease inhibitors (continued)

- ▶ HIV-protease inhibitors are predicted to increase the risk of ergotism when given with **ergometrine**. Avoid. [\[Severe\]](#) Theoretical
- ▶ HIV-protease inhibitors are predicted to increase the risk of ergotism when given with **ergotamine**. Avoid. [\[Severe\]](#) Theoretical
- ▶ HIV-protease inhibitors are predicted to increase the exposure to **erlotinib**. Use with caution and adjust dose. [\[Severe\]](#) Study
- ▶ HIV-protease inhibitors are predicted to increase the exposure to **esketamine**. Adjust dose. [\[Moderate\]](#) Study
- ▶ Ritonavir is predicted to decrease the efficacy of **etonogestrel**. For FSRH guidance, see Contraceptives, interactions p. 843. [\[Severe\]](#) Theoretical
- ▶ HIV-protease inhibitors are predicted to increase the concentration of **everolimus**. Avoid. [\[Severe\]](#) Study
- ▶ Atazanavir boosted with ritonavir is predicted to increase the exposure to **factor XA inhibitors (apixaban)**. [\[Severe\]](#) Theoretical
- ▶ Darunavir boosted with ritonavir or cobicistat is predicted to increase the exposure to **factor XA inhibitors (apixaban)**. Avoid. [\[Severe\]](#) Theoretical
- ▶ Ritonavir is predicted to increase the exposure to **factor XA inhibitors (apixaban)**. Avoid. [\[Severe\]](#) Theoretical
- ▶ HIV-protease inhibitors (**fosamprenavir, tipranavir**) boosted with ritonavir are predicted to increase the exposure to **factor XA inhibitors (apixaban, rivaroxaban)**. Avoid. [\[Severe\]](#) Theoretical
- ▶ Lopinavir boosted with ritonavir is predicted to increase the exposure to **factor XA inhibitors (apixaban, rivaroxaban)**. Avoid. [\[Severe\]](#) Theoretical
- ▶ Lopinavir boosted with ritonavir is predicted to slightly increase the exposure to **factor XA inhibitors (edoxaban)**. [\[Severe\]](#) Theoretical
- ▶ Ritonavir is predicted to slightly increase the exposure to **factor XA inhibitors (edoxaban)**. [\[Severe\]](#) Theoretical
- ▶ Darunavir boosted with ritonavir is predicted to increase the exposure to **factor XA inhibitors (rivaroxaban)**. Avoid. [\[Severe\]](#) Anecdotal
- ▶ Ritonavir moderately increases the exposure to **factor XA inhibitors (rivaroxaban)**. Avoid. [\[Severe\]](#) Study
- ▶ HIV-protease inhibitors (**atazanavir, fosamprenavir, tipranavir**) boosted with ritonavir are predicted to increase the exposure to **factor XA inhibitors (rivaroxaban)**. Avoid. [\[Severe\]](#) Theoretical
- ▶ HIV-protease inhibitors are predicted to moderately increase the exposure to **fesoterodine**. Adjust fesoterodine dose with potent CYP3A4 inhibitors; avoid in hepatic and renal impairment, p. 824. [\[Severe\]](#) Study
- ▶ HIV-protease inhibitors (**lopinavir, ritonavir**) are predicted to increase the exposure to **fidaxomicin**. Avoid. [\[Moderate\]](#) Study
- ▶ HIV-protease inhibitors are predicted to increase the exposure to **fofostatinib**. Monitor adverse effects and adjust dose. [\[Moderate\]](#) Study
- ▶ HIV-protease inhibitors are predicted to increase the exposure to **gefinitinib**. [\[Severe\]](#) Study
- ▶ HIV-protease inhibitors are predicted to increase the exposure to **gilteritinib**. [\[Moderate\]](#) Study
- ▶ HIV-protease inhibitors are predicted to moderately increase the exposure to **glasdegib**. Use with caution or avoid. [\[Moderate\]](#) Study
- ▶ HIV-protease inhibitors (**atazanavir, darunavir, lopinavir**) boosted with ritonavir increase the exposure to **glecaprevir**. Avoid. [\[Severe\]](#) Study
- ▶ Ritonavir increases the exposure to **glecaprevir**. Avoid. [\[Severe\]](#) Study
- ▶ HIV-protease inhibitors are predicted to moderately to markedly increase the exposure to **grazoprevir**. Avoid. [\[Severe\]](#) Study
- ▶ HIV-protease inhibitors are predicted to increase the exposure to **guanfacine**. Adjust guanfacine dose, p. 375. [\[Moderate\]](#) Study
- ▶ **H₂ receptor antagonists** decrease the exposure to **atazanavir**. Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ Ritonavir is predicted to increase the exposure to **haloperidol**. [\[Severe\]](#) Theoretical
- ▶ Ritonavir is predicted to decrease the effects of **hormone replacement therapy**. [\[Moderate\]](#) Anecdotal
- ▶ HIV-protease inhibitors are predicted to increase the exposure to **ibrutinib**. Avoid potent CYP3A4 inhibitors or adjust ibrutinib dose, p. 1034. [\[Severe\]](#) Study
- ▶ HIV-protease inhibitors are predicted to increase the exposure to **imatinitib**. [\[Moderate\]](#) Study
- ▶ HIV-protease inhibitors are predicted to increase the risk of toxicity when given with **irinotecan**. Avoid. [\[Moderate\]](#) Study
- ▶ Ritonavir is predicted to decrease the exposure to **iron chelators (deferasirox)**. Monitor serum ferritin and adjust dose. [\[Moderate\]](#) Theoretical
- ▶ HIV-protease inhibitors are predicted to increase the exposure to **ivabradine**. Avoid. [\[Severe\]](#) Study
- ▶ HIV-protease inhibitors are predicted to increase the exposure to **ivacaftor**. Adjust dose with potent CYP3A4 inhibitors, see ivacaftor p. 312, lumacaftor with ivacaftor p. 312, tezacaftor with ivacaftor p. 314, and tezacaftor with ivacaftor and elexacaftor p. 314. [\[Severe\]](#) Study
- ▶ HIV-protease inhibitors are predicted to increase the exposure to **lapatinib**. Avoid. [\[Moderate\]](#) Study
- ▶ HIV-protease inhibitors are predicted to moderately increase the exposure to **larotrectinib**. Avoid or adjust **larotrectinib** dose, p. 1038. [\[Moderate\]](#) Study
- ▶ Tipranavir boosted with ritonavir is predicted to decrease the exposure to **ledipasvir**. Avoid. [\[Severe\]](#) Theoretical
- ▶ HIV-protease inhibitors (**atazanavir, lopinavir**) boosted with ritonavir are predicted to increase the concentration of **letermovir**. [\[Moderate\]](#) Study
- ▶ Ritonavir is predicted to decrease the concentration of **letermovir**. [\[Moderate\]](#) Theoretical
- ▶ Ritonavir is predicted to decrease the efficacy of **levonorgestrel**. For FSRH guidance, see Contraceptives, interactions p. 843. [\[Severe\]](#) Theoretical
- ▶ HIV-protease inhibitors are predicted to markedly increase the exposure to **lomitapide**. Avoid. [\[Severe\]](#) Study
- ▶ HIV-protease inhibitors are predicted to increase the exposure to **lorlatinib**. Avoid or adjust **lorlatinib** dose, p. 1040. [\[Severe\]](#) Study
- ▶ Atazanavir is predicted to increase the exposure to **macrolides (clarithromycin)**. Adjust dose in renal impairment. [\[Severe\]](#) Study
- ▶ Ritonavir increases the exposure to **macrolides (clarithromycin)**. Adjust dose in renal impairment. [\[Severe\]](#) Study
- ▶ Tipranavir boosted with ritonavir increases the exposure to **macrolides (clarithromycin)** and **macrolides (clarithromycin)** increase the exposure to **tipranavir** boosted with ritonavir. Monitor; adjust dose in renal impairment. [\[Severe\]](#) Study
- ▶ HIV-protease inhibitors (**darunavir, fosamprenavir, lopinavir**) boosted with ritonavir are predicted to increase the exposure to **macrolides (clarithromycin)**. Adjust dose in renal impairment. [\[Severe\]](#) Study
- ▶ HIV-protease inhibitors are predicted to increase the exposure to **macrolides (erythromycin)**. [\[Severe\]](#) Theoretical
- ▶ Atazanavir moderately to markedly increases the exposure to **maraviroc**. Refer to specialist literature. [\[Severe\]](#) Study
- ▶ Darunavir boosted with ritonavir markedly increases the exposure to **maraviroc**. Refer to specialist literature. [\[Severe\]](#) Study
- ▶ **Maraviroc** potentially decreases the exposure to **fosamprenavir** and **fosamprenavir** potentially decreases the exposure to **maraviroc**. Avoid. [\[Severe\]](#) Study
- ▶ Lopinavir boosted with ritonavir moderately increases the exposure to **maraviroc**. Refer to specialist literature. [\[Severe\]](#) Study
- ▶ Ritonavir markedly increases the exposure to **maraviroc**. Refer to specialist literature. [\[Severe\]](#) Study
- ▶ HIV-protease inhibitors are predicted to increase the exposure to **mequitinides (repaglinide)**. [\[Moderate\]](#) Study
- ▶ Ritonavir is predicted to decrease the exposure to **melatonin**. [\[Moderate\]](#) Theoretical
- ▶ Ritonavir is predicted to increase the clearance of **mexiletine**. Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ HIV-protease inhibitors are predicted to very markedly increase the exposure to **midostaurin**. Avoid or monitor for toxicity. [\[Severe\]](#) Study

- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **mirabegron**. Adjust **mirabegron** dose in hepatic and renal impairment, p. 828. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **mirtazapine**. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **modafinil**. [Mid] Theoretical
- ▶ **HIV-protease inhibitors (lopinavir, ritonavir)** are predicted to increase the risk of neutropenia when given with **monoclonal antibodies (brentuximab vedotin)**. Monitor and adjust dose. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **monoclonal antibodies (polatuzumab vedotin)**. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **monoclonal antibodies (trastuzumab emtansine)**. Avoid. [Severe] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **naldemedine**. Avoid or monitor. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to markedly increase the exposure to **naloxegol**. Avoid. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **neratinib**. Avoid potent CYP3A4 inhibitors or adjust **neratinib** dose, p. 1041. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to markedly increase the exposure to **neurokinin-1 receptor antagonists (aprepitant)**. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **neurokinin-1 receptor antagonists (fosaprepitant)**. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **neurokinin-1 receptor antagonists (netupitant)**. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **nilotinib**. Avoid. [Severe] Study
- ▶ **HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, tipranavir)** boosted with ritonavir are predicted to increase the exposure to **nintedanib**. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors (lopinavir, ritonavir)** are predicted to increase the exposure to **nintedanib**. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **nitisone**. Adjust dose. [Moderate] Theoretical
- ▶ **NNRTIs (efavirenz)** decrease the exposure to **HIV-protease inhibitors**. Refer to specialist literature. [Severe] Study
- ▶ **NNRTIs (etravirine)** increase the exposure to **fosamprenavir** boosted with ritonavir. Refer to specialist literature. [Moderate] Study
- ▶ **NNRTIs (nevirapine)** decrease the exposure to **HIV-protease inhibitors**. Refer to specialist literature. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **NNRTIs (doravirine)**. [Mid] Study
- ▶ **Tipranavir** decreases the exposure to **NNRTIs (etravirine)**. Avoid. [Severe] Study
- ▶ **Ritonavir** is predicted to decrease the efficacy of **norethisterone**. For FSRH guidance, see Contraceptives, interactions p. 843. [Severe] Anecdotal
- ▶ **Tipranavir** slightly decreases the exposure to **NRTIs (abacavir)**. Avoid. [Severe] Study
- ▶ **Tipranavir** slightly decreases the exposure to **NRTIs (zidovudine)**. Avoid. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **olaparib**. Avoid potent CYP3A4 inhibitors or adjust **olaparib** dose, p. 1057. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **opioids (alfentanil, buprenorphine, fentanyl, oxycodone)**. Monitor and adjust dose. [Severe] Study
- ▶ **HIV-protease inhibitors** boosted with ritonavir are predicted to decrease the exposure to **opioids (methadone)**. [Moderate] Study
- ▶ **Ritonavir** is predicted to decrease the concentration of **opioids (morphine)**. [Moderate] Theoretical
- ▶ **Ritonavir** increases the risk of CNS toxicity when given with **opioids (pethidine)**. Avoid. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **ospemifene**. Avoid in poor CYP2C9 metabolisers. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **oxybutynin**. [Mid] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **palbociclib**. Avoid or adjust **palbociclib** dose, p. 1045. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **panobinostat**. Adjust **panobinostat** dose; in hepatic impairment avoid, p. 984. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **pazopanib**. Avoid or adjust **pazopanib** dose, p. 1045. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (avanafil, vardenafil)**. Avoid. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (sildenafil)**. Avoid potent CYP3A4 inhibitors or adjust **sildenafil** dose, p. 863. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (tadalafil)**. Use with caution or avoid. [Severe] Study
- ▶ **HIV-protease inhibitors (atazanavir, lopinavir)** boosted with ritonavir increase the exposure to **pibrentasvir**. Avoid. [Severe] Study
- ▶ **Ritonavir** potentially increases the exposure to **pibrentasvir**. [Severe] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **pimozide**. Avoid. [Severe] Study
- ▶ **Ritonavir** is predicted to decrease the exposure to **pirfenidone**. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to slightly increase the exposure to **ponatinib**. Monitor and adjust **ponatinib** dose, p. 1046. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to moderately increase the exposure to **praziquantel**. [Mid] Study
- ▶ **HIV-protease inhibitors** given with carbimazole are predicted to increase the exposure to **propriverine**. Adjust starting dose. [Moderate] Theoretical
- ▶ **Proton pump inhibitors** decrease the exposure to **atazanavir**. Avoid or adjust dose. [Severe] Study
- ▶ **Tipranavir** decreases the exposure to **proton pump inhibitors**. Avoid. [Severe] Study
- ▶ **Atazanavir** increases the exposure to **raltegravir** (high-dose). Avoid. [Moderate] Study
- ▶ **Darunavir** increases the risk of rash when given with **raltegravir**. [Moderate] Study
- ▶ **Fosamprenavir** boosted with ritonavir decreases the exposure to **raltegravir** and **raltegravir** decreases the exposure to **fosamprenavir** boosted with ritonavir. Avoid. [Severe] Study
- ▶ **Tipranavir** boosted with ritonavir is predicted to decrease the exposure to **raltegravir** (high-dose). Avoid. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **ranolazine**. Avoid. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **reboxetine**. Avoid. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **regorafenib**. Avoid. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **retinoids (alitretinoin)**. Adjust **alitretinoin** dose, p. 1315. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **ribociclib**. Avoid or adjust **ribociclib** dose, p. 1048. [Moderate] Study
- ▶ **Rifamycins (rifampicin)** slightly decrease the exposure to **ritonavir**. [Severe] Study
- ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **tipranavir**. Avoid. [Severe] Study
- ▶ **Rifamycins (rifampicin)** are predicted to moderately to markedly decrease the exposure to **HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir)**. Avoid. [Severe] Study
- ▶ **Ritonavir** markedly increases the exposure to **rifamycins (rifabutin)**. Avoid or adjust dose. [Severe] Study
- ▶ **HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, tipranavir)** boosted with ritonavir increase the

HIV-protease inhibitors (continued)

- exposure to **rifamycins (rifabutin)**. Monitor and adjust dose. [\[Severe\]](#) Study
- ▶ **Ritonavir** is predicted to increase the exposure to **riociguat**. Adjust dose and monitor blood pressure. [\[Moderate\]](#) Theoretical
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **roxolitinib**. Adjust dose and monitor adverse effects. [\[Moderate\]](#) Study
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **spionimod**. Avoid depending on other drugs taken—consult product literature. [\[Severe\]](#) Theoretical
 - ▶ **HIV-protease inhibitors** are predicted to increase the concentration of **sirolimus**. Avoid. [\[Severe\]](#) Study
 - ▶ **Sodium zirconium cyclosilicate** is predicted to decrease the exposure to **HIV-protease inhibitors**. Separate administration by at least 2 hours. [\[Moderate\]](#) Theoretical
 - ▶ **Tipranavir** is predicted to decrease the exposure to **sofosbuvir**. Avoid. [\[Severe\]](#) Theoretical
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **solifenacin**. Adjust solifenacin p. 826 or tamsulosin with solifenacin p. 832 dose; avoid in hepatic and renal impairment. [\[Severe\]](#) Study
 - ▶ **HIV-protease inhibitors** are predicted to moderately increase the exposure to **SSRIs (dapoxetine)**. Avoid potent CYP3A4 inhibitors or adjust **dapoxetine** dose, p. 870. [\[Severe\]](#) Study
 - ▶ **St John's wort** is predicted to decrease the exposure to **HIV-protease inhibitors**. Avoid. [\[Severe\]](#) Study
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **statins (atorvastatin)**. Avoid or adjust dose and monitor rhabdomyolysis. [\[Severe\]](#) Study
 - ▶ **HIV-protease inhibitors** might affect the exposure to **statins (pravastatin)**. [\[Moderate\]](#) Study
 - ▶ **HIV-protease inhibitors (atazanavir, lopinavir)** are predicted to increase the exposure to **statins (rosuvastatin)**. Avoid or adjust **rosuvastatin** dose, p. 220. [\[Severe\]](#) Study
 - ▶ **HIV-protease inhibitors (darunavir, ritonavir)** are predicted to increase the exposure to **statins (rosuvastatin)**. Avoid or adjust dose. [\[Severe\]](#) Study
 - ▶ **HIV-protease inhibitors (fosamprenavir, tipranavir)** are predicted to increase the exposure to **statins (rosuvastatin)**. Use with caution and adjust dose. [\[Severe\]](#) Study
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **statins (simvastatin)**. Avoid. [\[Severe\]](#) Study
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **sunitinib**. Avoid or adjust **sunitinib** dose, p. 1051. [\[Moderate\]](#) Study
 - ▶ **HIV-protease inhibitors** are predicted to increase the concentration of **tacrolimus**. Monitor and adjust dose. [\[Severe\]](#) Study
 - ▶ **HIV-protease inhibitors (darunavir, tipranavir)** are predicted to increase the exposure to **talazoparib**. Avoid or adjust **talazoparib** dose, p. 1059. [\[Moderate\]](#) Theoretical
 - ▶ **HIV-protease inhibitors (lopinavir, ritonavir)** are predicted to slightly increase the exposure to **talazoparib**. Avoid or adjust **talazoparib** dose, p. 1059. [\[Severe\]](#) Study
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **taxanes (cabazitaxel)**. Avoid. [\[Severe\]](#) Study
 - ▶ **HIV-protease inhibitors** are predicted to moderately increase the exposure to **taxanes (docetaxel)**. Avoid or adjust dose. [\[Severe\]](#) Study
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **taxanes (paclitaxel)**. [\[Severe\]](#) Theoretical
 - ▶ **HIV-protease inhibitors** are predicted to increase the concentration of **temsirolimus**. Avoid. [\[Severe\]](#) Theoretical
 - ▶ **HIV-protease inhibitors (atazanavir, darunavir, lopinavir)** increase the exposure to **tenofovir alafenamide**. Avoid or adjust dose. [\[Moderate\]](#) Study
 - ▶ **Tipranavir** is predicted to decrease the exposure to **tenofovir alafenamide**. Avoid. [\[Moderate\]](#) Theoretical
 - ▶ **HIV-protease inhibitors (atazanavir, darunavir, lopinavir)** are predicted to increase the risk of renal impairment when given with **tenofovir disoproxil**. [\[Severe\]](#) Anecdotal
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **tezacaftor**. Adjust dose with potent CYP3A4 inhibitors, see tezacaftor with ivacaftor p. 314 and tezacaftor with ivacaftor and elexacaftor p. 314. [\[Severe\]](#) Study
 - ▶ **Ritonavir** is predicted to decrease the exposure to **theophylline**. Adjust dose. [\[Moderate\]](#) Study
 - ▶ **Ritonavir** is predicted to increase the exposure to **thrombin inhibitors (dabigatran)**. Avoid. [\[Severe\]](#) Study
 - ▶ **HIV-protease inhibitors (atazanavir, darunavir, lopinavir)** boosted with ritonavir are predicted to increase the exposure to **thrombin inhibitors (dabigatran)**. Avoid. [\[Severe\]](#) Anecdotal
 - ▶ **HIV-protease inhibitors (fosamprenavir, tipranavir)** boosted with ritonavir are predicted to increase the exposure to **thrombin inhibitors (dabigatran)**. Avoid. [\[Severe\]](#) Theoretical
 - ▶ **Ritonavir** decreases the concentration of **thyroid hormones (levothyroxine)**. MHRA advises monitor TSH for at least one month after starting or stopping ritonavir. [\[Moderate\]](#) Anecdotal
 - ▶ **HIV-protease inhibitors** are predicted to markedly increase the exposure to **ticagrelor**. Avoid. [\[Severe\]](#) Study
 - ▶ **HIV-protease inhibitors (lopinavir, ritonavir)** might increase the exposure to **tigecycline**. [\[Mild\]](#) Anecdotal
 - ▶ **Ritonavir** moderately decreases the exposure to **tizanidine**. [\[Mild\]](#) Study
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **tofacinib**. Adjust **tofacinib** dose, p. 1163. [\[Moderate\]](#) Study
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **tolterodine**. Avoid. [\[Severe\]](#) Study
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **tolvaptan**. Manufacturer advises caution or adjust **tolvaptan** dose with potent CYP3A4 inhibitors, p. 711. [\[Severe\]](#) Study
 - ▶ **HIV-protease inhibitors (lopinavir, ritonavir)** are predicted to increase the exposure to **topotecan**. [\[Severe\]](#) Study
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **toremifene**. [\[Moderate\]](#) Theoretical
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **trabectedin**. Avoid or adjust dose. [\[Severe\]](#) Theoretical
 - ▶ **HIV-protease inhibitors (lopinavir, ritonavir)** are predicted to increase the concentration of **trametinib**. [\[Moderate\]](#) Theoretical
 - ▶ **HIV-protease inhibitors** are predicted to moderately increase the exposure to **trazodone**. Avoid or adjust dose. [\[Moderate\]](#) Study
 - ▶ **HIV-protease inhibitors (ritonavir, tipranavir)** are predicted to increase the exposure to **tricyclic antidepressants**. [\[Moderate\]](#) Theoretical
 - ▶ **HIV-protease inhibitors** increase the exposure to **triptans (almotriptan)**. [\[Mild\]](#) Study
 - ▶ **HIV-protease inhibitors** are predicted to markedly increase the exposure to **triptans (eletriptan)**. Avoid. [\[Severe\]](#) Study
 - ▶ **HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, tipranavir)** are predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [\[Severe\]](#) Study
 - ▶ **Ritonavir** decreases the efficacy of **ulipristal**. For FSRH guidance, see Contraceptives, interactions p. 843. [\[Severe\]](#) Anecdotal
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **upadacitinib**. Use with caution or avoid. [\[Severe\]](#) Study
 - ▶ **Tipranavir** is predicted to increase the exposure to **velpatasvir**. [\[Severe\]](#) Theoretical
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **vemurafenib**. [\[Severe\]](#) Theoretical
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **venetoclax**. Avoid or adjust dose—consult product literature. [\[Severe\]](#) Study
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **venlafaxine**. [\[Moderate\]](#) Study
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **vinca alkaloids**. [\[Severe\]](#) Theoretical
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **vitamin D substances (paricalcitol)**. [\[Moderate\]](#) Study
 - ▶ **Atazanavir** boosted with ritonavir increases the concentration of **voxilaprevir**. Avoid. [\[Severe\]](#) Study
 - ▶ **Lopinavir** boosted with ritonavir is predicted to increase the concentration of **voxilaprevir**. Avoid. [\[Severe\]](#) Theoretical
 - ▶ **Tipranavir** boosted with ritonavir is predicted to increase the concentration of **voxilaprevir**. [\[Severe\]](#) Theoretical
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **zopiclone**. Adjust dose. [\[Moderate\]](#) Theoretical

Homatropine → see TABLE 10 p. 1449 (antimuscarinics)

Hormone replacement therapy

- ▶ **Antiepileptics** (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampamil, phenobarbital, phenytoin, primidone, rufinamide, topiramate) are predicted to decrease the effects of hormone replacement therapy. [Moderate] Anecdotal
- ▶ **Hormone replacement therapy** is predicted to alter the exposure to antiepileptics (lamotrigine). [Moderate] Theoretical
- ▶ **Hormone replacement therapy** decreases the clearance of dopamine receptor agonists (ropinirole). Monitor and adjust dose. [Moderate] Study
- ▶ **Endothelin receptor antagonists** (bosentan) are predicted to decrease the effects of hormone replacement therapy. [Moderate] Anecdotal
- ▶ **HIV-protease inhibitors** (ritonavir) are predicted to decrease the effects of hormone replacement therapy. [Moderate] Anecdotal
- ▶ **Hormone replacement therapy** is predicted to increase the risk of venous thromboembolism when given with lenalidomide. [Moderate] Theoretical
- ▶ **Hormone replacement therapy** is predicted to increase the exposure to MAO-B inhibitors (selegiline). Avoid. [Moderate] Study
- ▶ **Modafinil** is predicted to decrease the effects of hormone replacement therapy. [Moderate] Anecdotal
- ▶ **Neurokinin-1 receptor antagonists** (aprepitant, fosaprepitant) are predicted to decrease the effects of hormone replacement therapy. [Moderate] Anecdotal
- ▶ **NNRTIs** (efavirenz, nevirapine) are predicted to decrease the effects of hormone replacement therapy. [Moderate] Anecdotal
- ▶ **NSAIDs** (etoricoxib) increase the exposure to hormone replacement therapy. [Moderate] Study
- ▶ **Hormone replacement therapy** potentially opposes the effects of ospemifene. Avoid. [Severe] Theoretical
- ▶ **Hormone replacement therapy** is predicted to increase the risk of venous thromboembolism when given with pomalidomide. [Severe] Theoretical
- ▶ **Hormone replacement therapy** potentially opposes the effects of raloxifene. Avoid. [Severe] Theoretical
- ▶ **Rifamycins** are predicted to decrease the effects of hormone replacement therapy. [Moderate] Anecdotal
- ▶ **St John's wort** is predicted to decrease the efficacy of hormone replacement therapy. [Moderate] Theoretical
- ▶ **Hormone replacement therapy** is predicted to increase the risk of venous thromboembolism when given with thalidomide. [Severe] Theoretical
- ▶ **Oral hormone replacement therapy** is predicted to decrease the effects of thyroid hormones. [Moderate] Theoretical

Hydralazine → see TABLE 8 p. 1448 (hypotension)

- ▶ **Diazoxide** increases the risk of severe hypotension when given with hydralazine. [Severe] Study → Also see TABLE 8 p. 1448

Hydrochlorothiazide → see thiazide diuretics

Hydrocortisone → see corticosteroids

Hydroflumethiazide → see thiazide diuretics

Hydromorphone → see opioids

Hydroxycarbamide → see TABLE 15 p. 1450 (myelosuppression)

- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with hydroxycarbamide. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical

Hydroxychloroquine

- ▶ **Hydroxychloroquine** is predicted to decrease the effects of agalsidase alfa. [Moderate] Theoretical
- ▶ **Hydroxychloroquine** is predicted to decrease the exposure to agalsidase beta. [Moderate] Theoretical
- ▶ **Oral antacids** decrease the absorption of oral hydroxychloroquine. Separate administration by at least 4 hours. [Moderate] Study
- ▶ **Calcium salts** (calcium carbonate) decrease the absorption of hydroxychloroquine. Separate administration by at least 4 hours. [Moderate] Study
- ▶ **Hydroxychloroquine** is predicted to decrease the efficacy of oral cholera vaccine. [Moderate] Theoretical
- ▶ **H₂ receptor antagonists** (cimetidine) are predicted to decrease the clearance of hydroxychloroquine. [Moderate] Theoretical

- ▶ **Lanthanum** is predicted to decrease the absorption of hydroxychloroquine. Separate administration by at least 2 hours. [Moderate] Theoretical
- ▶ **Hydroxychloroquine** is predicted to decrease the exposure to laronidase. Avoid simultaneous administration. [Severe] Theoretical
- ▶ **Hydroxychloroquine** is predicted to increase the risk of haematological toxicity when given with penicillamine. Avoid. [Severe] Theoretical
- ▶ **Hydroxychloroquine** is predicted to decrease efficacy rabies vaccine. [Moderate] Theoretical
- ▶ **Hydroxychloroquine** potentially decrease the effects of remdesivir. Avoid. [Moderate] Theoretical

Hydroxyzine → see antihistamines, sedating

Hyoscine → see TABLE 10 p. 1449 (antimuscarinics)

Ibandronate → see bisphosphonates

Ibrutinib → see TABLE 15 p. 1450 (myelosuppression), TABLE 4 p. 1447 (antiplatelet effects)

FOOD AND LIFESTYLE Avoid food or drink containing bitter (Seville) oranges as they are predicted to increase the exposure to ibrutinib.

- ▶ **Ibrutinib** is predicted to increase the exposure to aliskiren. Separate administration by at least 6 hours. [Moderate] Theoretical
- ▶ **Anti-androgens** (apalutamide, enzalutamide) are predicted to decrease the exposure to ibrutinib. Avoid or monitor. [Severe] Study
- ▶ **Antiarrhythmics** (amiodarone) are predicted to increase the exposure to ibrutinib. Adjust ibrutinib dose, p. 1034. [Severe] Theoretical
- ▶ **Antiarrhythmics** (dronedarone) are predicted to increase the exposure to ibrutinib. Adjust ibrutinib dose with moderate CYP3A4 inhibitors, p. 1034. [Severe] Study
- ▶ **Antiepileptics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ibrutinib. Avoid or monitor. [Severe] Study
- ▶ **Antifungals, azoles** (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to ibrutinib. Adjust ibrutinib dose with moderate CYP3A4 inhibitors, p. 1034. [Severe] Study
- ▶ **Antifungals, azoles** (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to ibrutinib. Avoid potent CYP3A4 inhibitors or adjust ibrutinib dose, p. 1034. [Severe] Study
- ▶ **Ibrutinib** is predicted to increase the exposure to antihistamines, non-sedating (fexofenadine). Separate administration by at least 6 hours. [Moderate] Theoretical
- ▶ **Calcium channel blockers** (diltiazem, verapamil) are predicted to increase the exposure to ibrutinib. Adjust ibrutinib dose with moderate CYP3A4 inhibitors, p. 1034. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to ibrutinib. Avoid potent CYP3A4 inhibitors or adjust ibrutinib dose, p. 1034. [Severe] Study
- ▶ **Ibrutinib** is predicted to increase the exposure to colchicine. Separate administration by at least 6 hours. [Moderate] Theoretical
- ▶ **Crizotinib** is predicted to increase the exposure to ibrutinib. Adjust ibrutinib dose with moderate CYP3A4 inhibitors, p. 1034. [Severe] Study
- ▶ **Dabrafenib** is predicted to decrease the exposure to ibrutinib. Avoid or monitor. [Severe] Study
- ▶ **Ibrutinib** is predicted to increase the exposure to digoxin. Separate administration by at least 6 hours. [Moderate] Theoretical
- ▶ **Endothelin receptor antagonists** (bosentan) are predicted to decrease the exposure to ibrutinib. Avoid or monitor. [Severe] Study
- ▶ **Ibrutinib** is predicted to increase the exposure to everolimus. Separate administration by at least 6 hours. [Moderate] Theoretical
- ▶ **Ibrutinib** is predicted to increase the exposure to factor XA inhibitors (edoxaban, rivaroxaban). Separate administration by at least 6 hours. [Moderate] Theoretical
- ▶ **Grapefruit juice** is predicted to increase the exposure to ibrutinib. Avoid. [Moderate] Theoretical

Ibrutinib (continued)

- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **ibrutinib**. Avoid potent CYP3A4 inhibitors or adjust **ibrutinib** dose, p. 1034. [\[Severe\]](#) Study
- ▶ **Idelalisib** is predicted to increase the exposure to **ibrutinib**. Avoid potent CYP3A4 inhibitors or adjust **ibrutinib** dose, p. 1034. [\[Severe\]](#) Study
- ▶ **Imatinib** is predicted to increase the exposure to **ibrutinib**. Adjust **ibrutinib** dose with moderate CYP3A4 inhibitors, p. 1034. [\[Severe\]](#) Study → Also see TABLE 15 p. 1450
- ▶ **Letermovir** is predicted to increase the exposure to **ibrutinib**. Adjust **ibrutinib** dose with moderate CYP3A4 inhibitors, p. 1034. [\[Severe\]](#) Study
- ▶ **Ibrutinib** is predicted to increase the exposure to **loperamide**. Separate administration by at least 6 hours. [\[Moderate\]](#) Theoretical
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **ibrutinib**. Avoid potent CYP3A4 inhibitors or adjust **ibrutinib** dose, p. 1034. [\[Severe\]](#) Study
- ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **ibrutinib**. Adjust **ibrutinib** dose with moderate CYP3A4 inhibitors, p. 1034. [\[Severe\]](#) Study
- ▶ **Mitotane** is predicted to decrease the exposure to **ibrutinib**. Avoid or monitor. [\[Severe\]](#) Study → Also see TABLE 15 p. 1450
- ▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to increase the exposure to **ibrutinib**. Adjust **ibrutinib** dose with moderate CYP3A4 inhibitors, p. 1034. [\[Severe\]](#) Study
- ▶ **Neurokinin-1 receptor antagonists (fosaprepitant)** are predicted to slightly increase the exposure to **ibrutinib**. [\[Moderate\]](#) Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to **ibrutinib**. Adjust **ibrutinib** dose with moderate CYP3A4 inhibitors, p. 1034. [\[Severe\]](#) Study → Also see TABLE 15 p. 1450
- ▶ **NNRTIs (efavirenz, nevirapine)** are predicted to decrease the exposure to **ibrutinib**. Avoid or monitor. [\[Severe\]](#) Study
- ▶ **Quinolones (ciprofloxacin)** are predicted to increase the exposure to **ibrutinib**. Adjust **ibrutinib** dose, p. 1034. [\[Severe\]](#) Theoretical
- ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **ibrutinib**. Avoid or monitor. [\[Severe\]](#) Study
- ▶ **Ibrutinib** is predicted to increase the exposure to **sirolimus**. Separate administration by at least 6 hours. [\[Moderate\]](#) Theoretical
- ▶ **St John's wort** is predicted to decrease the exposure to **ibrutinib**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Ibrutinib** is predicted to increase the exposure to **talazoparib**. Separate administration by at least 6 hours. [\[Moderate\]](#) Theoretical → Also see TABLE 15 p. 1450
- ▶ **Ibrutinib** is predicted to increase the exposure to **taxanes (paclitaxel)**. Separate administration by at least 6 hours. [\[Moderate\]](#) Theoretical → Also see TABLE 15 p. 1450
- ▶ **Ibrutinib** is predicted to increase the exposure to **thrombin inhibitors (dabigatran)**. Separate administration by at least 6 hours. [\[Moderate\]](#) Theoretical
- ▶ **Ibrutinib** is predicted to increase the exposure to **topotecan**. Separate administration by at least 6 hours. [\[Moderate\]](#) Theoretical → Also see TABLE 15 p. 1450

**Ibuprofen
icatibant**

- ▶ **ACE inhibitors** are predicted to decrease the efficacy of **icatibant** and **icatibant** is predicted to decrease the efficacy of **ACE inhibitors**. Avoid. [\[Moderate\]](#) Theoretical

Idarubicin → see anthracyclines**Idelalisib**

- ▶ **Idelalisib** is predicted to increase the exposure to **abemaciclib**. Avoid or adjust **abemaciclib** dose, p. 1015. [\[Severe\]](#) Study
- ▶ **Idelalisib** is predicted to increase the exposure to **acalabrutinib**. Avoid. [\[Severe\]](#) Study
- ▶ **Idelalisib** is predicted to markedly increase the exposure to **aldosterone antagonists (eplerenone)**. Avoid. [\[Severe\]](#) Study
- ▶ **Idelalisib** is predicted to moderately increase the exposure to **alpha blockers (alfuzosin, tamsulosin)**. Use with caution or avoid. [\[Moderate\]](#) Study
- ▶ **Idelalisib** is predicted to increase the exposure to **alpha blockers (doxazosin)**. [\[Moderate\]](#) Study
- ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to **idelalisib**. Avoid. [\[Severe\]](#) Study
- ▶ **Idelalisib** is predicted to increase the exposure to **anti-androgens (apalutamide)**. [\[Mild\]](#) Study
- ▶ **Idelalisib** is predicted to increase the exposure to **antiarrhythmics (amiodarone)**. Avoid. [\[Moderate\]](#) Theoretical
- ▶ **Idelalisib** very markedly increases the exposure to **antiarrhythmics (dronedaron)**. Avoid. [\[Severe\]](#) Study
- ▶ **Idelalisib** is predicted to increase the exposure to **antiarrhythmics (propafenone)**. Monitor and adjust dose. [\[Severe\]](#) Study
- ▶ **Idelalisib** is predicted to increase the exposure to **anticholinesterases, centrally acting (galantamine)**. Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **idelalisib**. Avoid. [\[Severe\]](#) Study
- ▶ **Idelalisib** is predicted to very slightly increase the exposure to **antiepileptics (perampanel)**. [\[Mild\]](#) Study
- ▶ **Idelalisib** is predicted to increase the exposure to **antifungals, azoles (isavuconazole)**. Avoid or monitor adverse effects. [\[Severe\]](#) Study
- ▶ **Idelalisib** is predicted to increase the exposure to **antihistamines, non-sedating (mizolastine)**. Avoid. [\[Severe\]](#) Study
- ▶ **Idelalisib** is predicted to increase the exposure to **antihistamines, non-sedating (rupatadine)**. Avoid. [\[Moderate\]](#) Study
- ▶ **Idelalisib** is predicted to increase the concentration of **antimalarials (piperazine)**. [\[Severe\]](#) Theoretical
- ▶ **Idelalisib** is predicted to slightly increase the exposure to **antipsychotics, second generation (aripiprazole)**. Adjust aripiprazole dose, p. 418. [\[Moderate\]](#) Study
- ▶ **Idelalisib** is predicted to moderately increase the exposure to **antipsychotics, second generation (cariprazine)**. Avoid. [\[Severe\]](#) Study
- ▶ **Idelalisib** is predicted to increase the exposure to **antipsychotics, second generation (lurasidone, quetiapine)**. Avoid. [\[Severe\]](#) Study
- ▶ **Idelalisib** is predicted to increase the exposure to **antipsychotics, second generation (risperidone)**. Adjust dose. [\[Moderate\]](#) Study
- ▶ **Idelalisib** is predicted to increase the exposure to **avapritinib**. Avoid. [\[Moderate\]](#) Study
- ▶ **Idelalisib** is predicted to increase the exposure to **axitinib**. Avoid or adjust dose. [\[Moderate\]](#) Study
- ▶ **Idelalisib** is predicted to increase the exposure to **bedaquiline**. Avoid prolonged use. [\[Mild\]](#) Study
- ▶ **Idelalisib** moderately increases the exposure to **benzodiazepines (alprazolam)**. Avoid. [\[Moderate\]](#) Study
- ▶ **Idelalisib** is predicted to markedly to very markedly increase the exposure to **benzodiazepines (midazolam)**. Avoid or adjust dose. [\[Severe\]](#) Study
- ▶ **Idelalisib** is predicted to increase the exposure to **beta₂ agonists (salmeterol)**. Avoid. [\[Severe\]](#) Study
- ▶ **Idelalisib** slightly increases the exposure to **bortezomib**. [\[Moderate\]](#) Study
- ▶ **Idelalisib** is predicted to increase the exposure to **bosutinib**. Avoid or adjust dose. [\[Severe\]](#) Study
- ▶ **Idelalisib** is predicted to increase the exposure to **brigatinib**. Avoid or adjust **brigatinib** dose, p. 1022. [\[Severe\]](#) Study
- ▶ **Idelalisib** is predicted to increase the exposure to **buspirone**. Adjust **buspirone** dose, p. 364. [\[Severe\]](#) Study
- ▶ **Idelalisib** is predicted to increase the exposure to **cabozantinib**. [\[Moderate\]](#) Study
- ▶ **Idelalisib** is predicted to increase the exposure to **calcium channel blockers (amlodipine, felodipine, lacidipine, nifedipine, nimodipine)**. Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ **Idelalisib** is predicted to increase the exposure to **calcium channel blockers (diltiazem, verapamil)**. [\[Severe\]](#) Study
- ▶ **Idelalisib** is predicted to markedly increase the exposure to **calcium channel blockers (lercanidipine)**. Avoid. [\[Severe\]](#) Study
- ▶ **Idelalisib** is predicted to increase the exposure to **cannabidiol**. Avoid or adjust dose. [\[Mild\]](#) Study

- ▶ **Idelalisib** is predicted to increase the exposure to **ceritinib**. Avoid or adjust **ceritinib** dose, p. 1024. [Severe] Study
- ▶ **Idelalisib** increases the concentration of **ciclosporin**. [Severe] Study
- ▶ **Idelalisib** is predicted to moderately increase the exposure to **cilostazol**. Adjust **cilostazol** dose, p. 249. [Moderate] Study
- ▶ **Idelalisib** is predicted to moderately increase the exposure to **cinacalcet**. Adjust dose. [Moderate] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **cobimetinib**. Avoid or monitor for toxicity. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **colchicine**. Avoid potent CYP3A4 inhibitors or adjust **colchicine** dose, p. 1175. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **corticosteroids (beclometasone)** (risk with beclometasone is likely to be lower than with other corticosteroids). [Moderate] Theoretical
- ▶ **Idelalisib** is predicted to increase the exposure to **corticosteroids (betamethasone, budesonide, ciclesonide, deflazacort, dexamethasone, fludrocortisone, fluticasone, hydrocortisone, methylprednisolone, mometasone, prednisolone, triamcinolone)**. Avoid or monitor adverse effects. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **crizotinib**. Avoid. [Moderate] Study
- ▶ **Dabrafenib** is predicted to decrease the exposure to **idelalisib**. Avoid. [Moderate] Theoretical
- ▶ **Idelalisib** is predicted to increase the exposure to **dabrafenib**. Use with caution or avoid. [Moderate] Study
- ▶ **Idelalisib** is predicted to markedly to very markedly increase the exposure to **darifenacin**. Avoid. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **dasatinib**. Avoid or adjust dose—consult product literature. [Severe] Study
- ▶ **Idelalisib** very slightly increases the exposure to **delamanid**. [Severe] Study
- ▶ **Idelalisib** is predicted to moderately increase the exposure to **dienogest**. [Moderate] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **dipeptidylpeptidase-4 inhibitors (saxagliptin)**. [Moderate] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **domperidone**. Avoid. [Severe] Study
- ▶ **Idelalisib** increases the exposure to **dopamine receptor agonists (bromocriptine)**. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the concentration of **dopamine receptor agonists (cabergoline)**. [Moderate] Anecdotal
- ▶ **Idelalisib** is predicted to increase the exposure to **dronabinol**. Adjust dose. [Mild] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **drosipirenone**. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **dutasteride**. Monitor adverse effects and adjust dose. [Moderate] Theoretical
- ▶ **Idelalisib** is predicted to increase the exposure to **elexacaftor**. Adjust tezacaftor with ivacaftor and elexacaftor p. 314 dose with potent CYP3A4 inhibitors. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **encorafenib**. Avoid or monitor. [Severe] Study
- ▶ **Endothelin receptor antagonists (bosentan)** are predicted to decrease the exposure to **idelalisib**. Avoid. [Moderate] Theoretical
- ▶ **Idelalisib** is predicted to increase the exposure to **endothelin receptor antagonists (macitentan)**. [Moderate] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **entrectinib**. Avoid potent CYP3A4 inhibitors or adjust **entrectinib** dose, p. 1030. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the risk of ergotism when given with **ergometrine**. Avoid. [Severe] Theoretical
- ▶ **Idelalisib** is predicted to increase the risk of ergotism when given with **ergotamine**. Avoid. [Severe] Theoretical
- ▶ **Idelalisib** is predicted to increase the exposure to **erlotinib**. Use with caution and adjust dose. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **esketamine**. Adjust dose. [Moderate] Study
- ▶ **Idelalisib** is predicted to increase the concentration of **everolimus**. Avoid. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **factor XA inhibitors (apixaban)**. [Moderate] Theoretical
- ▶ **Idelalisib** is predicted to moderately increase the exposure to **fesoterodine**. Adjust **fesoterodine** dose with potent CYP3A4 inhibitors; avoid in hepatic and renal impairment, p. 824. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **fostamatinib**. Monitor adverse effects and adjust dose. [Moderate] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **gefitinib**. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **gilteritinib**. [Moderate] Study
- ▶ **Idelalisib** is predicted to moderately increase the exposure to **glasdegib**. Use with caution or avoid. [Moderate] Study
- ▶ **Idelalisib** is predicted to moderately to markedly increase the exposure to **grazoprevir**. Avoid. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **guanfacine**. Adjust **guanfacine** dose, p. 375. [Moderate] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **ibrutinib**. Avoid potent CYP3A4 inhibitors or adjust **ibrutinib** dose, p. 1034. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **imatatinib**. [Moderate] Study
- ▶ **Idelalisib** is predicted to increase the risk of toxicity when given with **irinotecan**. Avoid. [Moderate] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **ivabradine**. Avoid. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **ivacaftor**. Adjust dose with potent CYP3A4 inhibitors, see ivacaftor p. 312, lumacaftor with ivacaftor p. 312, tezacaftor with ivacaftor p. 314, and tezacaftor with ivacaftor and elexacaftor p. 314. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **lapatinib**. Avoid. [Moderate] Study
- ▶ **Idelalisib** is predicted to moderately increase the exposure to **larotrectinib**. Avoid or adjust **larotrectinib** dose, p. 1038. [Moderate] Study
- ▶ **Idelalisib** is predicted to markedly increase the exposure to **lomitapide**. Avoid. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **lorlatinib**. Avoid or adjust **lorlatinib** dose, p. 1040. [Severe] Study
- ▶ **Idelalisib** markedly increases the exposure to **maraviroc**. Adjust dose. [Severe] Theoretical
- ▶ **Idelalisib** is predicted to increase the exposure to **meglitinides (repaglinide)**. [Moderate] Study
- ▶ **Idelalisib** is predicted to very markedly increase the exposure to **midostaurin**. Avoid or monitor for toxicity. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **mirabegron**. Adjust **mirabegron** dose in hepatic and renal impairment, p. 828. [Moderate] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **mirtazapine**. [Moderate] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **idelalisib**. Avoid. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **modafinil**. [Mild] Theoretical
- ▶ **Idelalisib** is predicted to increase the exposure to **monoclonal antibodies (polatuzumab vedotin)**. [Moderate] Theoretical
- ▶ **Idelalisib** is predicted to increase the exposure to **monoclonal antibodies (trastuzumab emtansine)**. Avoid. [Severe] Theoretical
- ▶ **Idelalisib** is predicted to increase the exposure to **naldemedine**. Avoid or monitor. [Moderate] Study
- ▶ **Idelalisib** is predicted to markedly increase the exposure to **naloxegol**. Avoid. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **neratinib**. Avoid potent CYP3A4 inhibitors or adjust **neratinib** dose, p. 1041. [Severe] Study
- ▶ **Idelalisib** is predicted to markedly increase the exposure to **neurokinin-1 receptor antagonists (aprepitant)**. [Moderate] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **neurokinin-1 receptor antagonists (fosaprepitant)**. [Moderate] Theoretical
- ▶ **Idelalisib** is predicted to increase the exposure to **neurokinin-1 receptor antagonists (netupitant)**. [Moderate] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **nilotinib**. Avoid. [Severe] Study

Idelalisib (continued)

- ▶ **Idelalisib** is predicted to increase the exposure to **nitisinone**. Adjust dose. [Moderate] Theoretical
 - ▶ **NNRTIs (efavirenz, nevirapine)** are predicted to decrease the exposure to **idelalisib**. Avoid. [Moderate] Theoretical
 - ▶ **Idelalisib** is predicted to increase the exposure to **NNRTIs (doravirine)**. [Mid] Study
 - ▶ **Idelalisib** is predicted to increase the exposure to **olaparib**. Avoid potent CYP3A4 inhibitors or adjust **olaparib** dose, p. 1057. [Moderate] Study
 - ▶ **Idelalisib** is predicted to increase the exposure to **opioids (alfentanil, buprenorphine, fentanyl, oxycodone)**. Monitor and adjust dose. [Severe] Study
 - ▶ **Idelalisib** is predicted to increase the exposure to **opioids (methadone)**. [Severe] Theoretical
 - ▶ **Idelalisib** is predicted to increase the exposure to **ospemifene**. Avoid in poor CYP2C9 metabolisers. [Moderate] Study
 - ▶ **Idelalisib** is predicted to increase the exposure to **oxybutynin**. [Mid] Study
 - ▶ **Idelalisib** is predicted to increase the exposure to **palbociclib**. Avoid or adjust **palbociclib** dose, p. 1045. [Severe] Study
 - ▶ **Idelalisib** is predicted to increase the exposure to **panobinostat**. Adjust **panobinostat** dose; in hepatic impairment avoid, p. 984. [Moderate] Study
 - ▶ **Idelalisib** is predicted to increase the exposure to **pazopanib**. Avoid or adjust **pazopanib** dose, p. 1045. [Moderate] Study
 - ▶ **Idelalisib** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (avanafil, vardenafil)**. Avoid. [Severe] Study
 - ▶ **Idelalisib** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (sildenafil)**. Avoid potent CYP3A4 inhibitors or adjust **sildenafil** dose, p. 863. [Severe] Study
 - ▶ **Idelalisib** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (tadalafil)**. Use with caution or avoid. [Severe] Study
 - ▶ **Idelalisib** is predicted to increase the exposure to **pimozide**. Avoid. [Severe] Study
 - ▶ **Idelalisib** is predicted to slightly increase the exposure to **ponatinib**. Monitor and adjust **ponatinib** dose, p. 1046. [Moderate] Study
 - ▶ **Idelalisib** is predicted to moderately increase the exposure to **praziquantel**. [Mid] Study
 - ▶ **Idelalisib** given with carbimazole is predicted to increase the exposure to **propiverine**. Adjust starting dose. [Moderate] Theoretical
 - ▶ **Idelalisib** is predicted to increase the exposure to **ranolazine**. Avoid. [Severe] Study
 - ▶ **Idelalisib** is predicted to increase the exposure to **reboxetine**. Avoid. [Moderate] Study
 - ▶ **Idelalisib** is predicted to increase the exposure to **regorafenib**. Avoid. [Moderate] Study
 - ▶ **Idelalisib** is predicted to increase the exposure to **retinoids (alitretinoin)**. Adjust **alitretinoin** dose, p. 1315. [Moderate] Theoretical
 - ▶ **Idelalisib** is predicted to increase the exposure to **ribociclib**. Avoid or adjust **ribociclib** dose, p. 1048. [Moderate] Study
 - ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **idelalisib**. Avoid. [Severe] Study
 - ▶ **Idelalisib** is predicted to increase the exposure to **ruxolitinib**. Adjust dose and monitor adverse effects. [Moderate] Study
 - ▶ **Idelalisib** is predicted to increase the exposure to **siponimod**. Avoid depending on other drugs taken—consult product literature. [Severe] Theoretical
 - ▶ **Idelalisib** is predicted to increase the concentration of **sirolimus**. Avoid. [Severe] Study
 - ▶ **Idelalisib** is predicted to increase the exposure to **solifenacin**. Adjust **solifenacin** p. 826 or **tamsulosin** with **solifenacin** p. 832 dose; avoid in hepatic and renal impairment. [Severe] Study
 - ▶ **Idelalisib** is predicted to moderately increase the exposure to **SSRIs (dapoxetine)**. Avoid potent CYP3A4 inhibitors or adjust **dapoxetine** dose, p. 870. [Severe] Study
 - ▶ **St John's wort** is predicted to decrease the exposure to **idelalisib**. Avoid. [Moderate] Theoretical
 - ▶ **Idelalisib** is predicted to increase the exposure to **statins (atorvastatin)**. Avoid or adjust dose and monitor rhabdomyolysis. [Severe] Study
 - ▶ **Idelalisib** is predicted to increase the exposure to **statins (simvastatin)**. Avoid. [Severe] Study
 - ▶ **Idelalisib** is predicted to increase the exposure to **sunitinib**. Avoid or adjust **sunitinib** dose, p. 1051. [Moderate] Study
 - ▶ **Idelalisib** is predicted to increase the concentration of **tacrolimus**. Monitor and adjust dose. [Severe] Study
 - ▶ **Idelalisib** is predicted to increase the exposure to **taxanes (cabazitaxel)**. Avoid. [Severe] Study
 - ▶ **Idelalisib** is predicted to moderately increase the exposure to **taxanes (docetaxel)**. Avoid or adjust dose. [Severe] Study
 - ▶ **Idelalisib** is predicted to increase the exposure to **taxanes (paclitaxel)**. [Severe] Theoretical
 - ▶ **Idelalisib** is predicted to increase the concentration of **temsirolimus**. Avoid. [Severe] Theoretical
 - ▶ **Idelalisib** is predicted to increase the exposure to **tezacaftor**. Adjust dose with potent CYP3A4 inhibitors, see **tezacaftor** with **ivacaftor** p. 314 and **tezacaftor** with **ivacaftor** and **elxacaftor** p. 314. [Severe] Study
 - ▶ **Idelalisib** is predicted to markedly increase the exposure to **ticagrelor**. Avoid. [Severe] Study
 - ▶ **Idelalisib** is predicted to increase the exposure to **tofacitinib**. Adjust **tofacitinib** dose, p. 1163. [Moderate] Study
 - ▶ **Idelalisib** is predicted to increase the exposure to **tolterodine**. Avoid. [Severe] Study
 - ▶ **Idelalisib** is predicted to increase the exposure to **tolvaptan**. Manufacturer advises caution or adjust **tolvaptan** dose with potent CYP3A4 inhibitors, p. 711. [Severe] Study
 - ▶ **Idelalisib** is predicted to increase the exposure to **toremifene**. [Moderate] Theoretical
 - ▶ **Idelalisib** is predicted to increase the exposure to **trabectedin**. Avoid or adjust dose. [Severe] Theoretical
 - ▶ **Idelalisib** is predicted to moderately increase the exposure to **trazodone**. Avoid or adjust dose. [Moderate] Study
 - ▶ **Idelalisib** increases the exposure to **triptans (almotriptan)**. [Mid] Study
 - ▶ **Idelalisib** is predicted to markedly increase the exposure to **triptans (eletriptan)**. Avoid. [Severe] Study
 - ▶ **Idelalisib** is predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [Severe] Study
 - ▶ **Idelalisib** is predicted to increase the exposure to **upadacitinib**. Use with caution or avoid. [Severe] Study
 - ▶ **Idelalisib** is predicted to increase the exposure to **vemurafenib**. [Severe] Theoretical
 - ▶ **Idelalisib** is predicted to increase the exposure to **venetoclax**. Avoid or adjust dose—consult product literature. [Severe] Study
 - ▶ **Idelalisib** is predicted to increase the exposure to **venlafaxine**. [Moderate] Study
 - ▶ **Idelalisib** is predicted to increase the exposure to **vinca alkaloids**. [Severe] Theoretical
 - ▶ **Idelalisib** is predicted to increase the exposure to **vitamin D substances (paricalcitol)**. [Moderate] Study
 - ▶ **Idelalisib** is predicted to increase the exposure to **zopiclone**. Adjust dose. [Moderate] Theoretical
- Ifosfamide** → see alkylating agents
- Iloprost** → see TABLE 8 p. 1448 (hypotension), TABLE 4 p. 1447 (antiplatelet effects)
- Imatinib** → see TABLE 15 p. 1450 (myelosuppression)
- ▶ **Imatinib** is predicted to increase the exposure to **abemaciclib**. [Moderate] Study
 - ▶ **Imatinib** is predicted to increase the exposure to **acalabrutinib**. Avoid or monitor. [Severe] Study
 - ▶ **Imatinib** is predicted to increase the exposure to **aldosterone antagonists (eplerenone)**. Adjust **eplerenone** dose, p. 209. [Severe] Study
 - ▶ **Imatinib** is predicted to increase the exposure to **alpha blockers (tamsulosin)**. [Moderate] Theoretical
 - ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to **imatinib**. Avoid. [Moderate] Study
 - ▶ **Imatinib** is predicted to increase the exposure to **antiarrhythmics (dronedrone)**. [Severe] Theoretical

- ▶ **Imatinib** is predicted to increase the exposure to **antiarrhythmics (propafenone)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, oxcarbazepine, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **imatinib**. Avoid. [Moderate] Study
- ▶ **Antiepileptics (eslicarbazepine)** are predicted to decrease the exposure to **imatinib**. [Moderate] Theoretical
- ▶ **Antiepileptics (topiramate)** are predicted to decrease the exposure to **imatinib**. [Moderate] Study
- ▶ **Antifungals, azoles (fluconazole, posaconazole)** are predicted to increase the exposure to **imatinib**. [Moderate] Theoretical
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **imatinib**. [Moderate] Study
- ▶ **Imatinib** is predicted to increase the exposure to **antifungals, azoles (isavuconazole)**. [Moderate] Theoretical
- ▶ **Imatinib** is predicted to increase the exposure to **antihistamines, non-sedating (mizolastine)**. [Severe] Theoretical
- ▶ **Imatinib** is predicted to increase the exposure to **antihistamines, non-sedating (rupatadine)**. Avoid. [Moderate] Study
- ▶ **Imatinib** is predicted to increase the concentration of **antimalarials (piperaquine)**. [Severe] Theoretical
- ▶ **Imatinib** is predicted to increase the exposure to **antipsychotics, second generation (cariprazine)**. Avoid. [Severe] Study
- ▶ **Imatinib** is predicted to increase the exposure to **antipsychotics, second generation (lurasidone)**. Adjust **lurasidone** dose. [Moderate] Study
- ▶ **Imatinib** is predicted to increase the exposure to **antipsychotics, second generation (quetiapine)**. Avoid. [Moderate] Study
- ▶ **Asparaginase** is predicted to increase the risk of hepatotoxicity when given with **imatinib**. [Severe] Theoretical → Also see TABLE 15 p. 1450
- ▶ **Imatinib** is predicted to increase the exposure to **avapritinib**. Avoid or adjust **avapritinib** dose, p. 1019. [Moderate] Study
- ▶ **Imatinib** is predicted to increase the exposure to **axitinib**. [Moderate] Study → Also see TABLE 15 p. 1450
- ▶ **Imatinib** is predicted to increase the exposure to **bedaquiline**. Avoid prolonged use. [Mild] Theoretical
- ▶ **Imatinib** is predicted to increase the exposure to **benzodiazepines (alprazolam)**. [Severe] Study
- ▶ **Imatinib** is predicted to increase the exposure to **benzodiazepines (midazolam)**. Monitor adverse effects and adjust dose. [Severe] Study
- ▶ **Imatinib** is predicted to increase the exposure to **bosutinib**. Avoid or adjust dose. [Severe] Study → Also see TABLE 15 p. 1450
- ▶ **Imatinib** is predicted to increase the exposure to **brigatinib**. [Moderate] Study
- ▶ **Imatinib** is predicted to increase the exposure to **buspirone**. Use with caution and adjust dose. [Moderate] Study
- ▶ **Imatinib** is predicted to increase the exposure to **cabozantinib**. [Moderate] Study → Also see TABLE 15 p. 1450
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **imatinib**. [Moderate] Theoretical
- ▶ **Imatinib** is predicted to increase the exposure to **calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicanidipine, nifedipine, nimodipine)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Imatinib** is predicted to increase the exposure to **certitinib**. [Moderate] Study → Also see TABLE 15 p. 1450
- ▶ **Imatinib** is predicted to increase the concentration of **ciclosporin**. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **imatinib**. [Moderate] Study
- ▶ **Imatinib** is predicted to increase the exposure to **cobimetinib**. [Severe] Study
- ▶ **Imatinib** is predicted to increase the exposure to **colchicine**. Adjust **colchicine** dose with moderate CYP3A4 inhibitors, p. 1175. [Severe] Study
- ▶ **Imatinib** is predicted to increase the exposure to **corticosteroids (methylprednisolone)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Imatinib** is predicted to increase the risk of bleeding events when given with **coumarins**. [Severe] Theoretical
- ▶ **Crisantaspase** is predicted to increase the risk of hepatotoxicity when given with **imatinib**. [Severe] Theoretical → Also see TABLE 15 p. 1450
- ▶ **Imatinib** is predicted to increase the exposure to **crizotinib**. [Moderate] Study
- ▶ **Imatinib** is predicted to increase the exposure to **dabrafenib**. [Moderate] Study
- ▶ **Dabrafenib** is predicted to decrease the exposure to **imatinib**. [Moderate] Study
- ▶ **Imatinib** is predicted to increase the exposure to **darifenacin**. [Moderate] Study
- ▶ **Imatinib** is predicted to increase the exposure to **dasatinib**. [Severe] Study → Also see TABLE 15 p. 1450
- ▶ **Imatinib** is predicted to slightly increase the exposure to **dienogest**. [Moderate] Study
- ▶ **Imatinib** is predicted to increase the exposure to **dipeptidylpeptidase-4 inhibitors (saxagliptin)**. [Mild] Study
- ▶ **Imatinib** is predicted to increase the exposure to **domperidone**. Avoid. [Severe] Study
- ▶ **Imatinib** is predicted to increase the exposure to **dopamine receptor agonists (bromocriptine)**. [Severe] Theoretical
- ▶ **Imatinib** is predicted to increase the concentration of **dopamine receptor agonists (cabergoline)**. [Moderate] Anecdotal
- ▶ **Imatinib** is predicted to moderately increase the exposure to **dutasteride**. [Mild] Study
- ▶ **Imatinib** is predicted to increase the exposure to **elexacaftor**. Adjust tezacaftor with ivacaftor and elexacaftor p. 314 dose with moderate CYP3A4 inhibitors. [Severe] Theoretical
- ▶ **Imatinib** is predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
- ▶ **Imatinib** is predicted to moderately increase the exposure to **encorafenib**. [Moderate] Study
- ▶ **Endothelin receptor antagonists (bosentan)** are predicted to decrease the exposure to **imatinib**. [Moderate] Study
- ▶ **Imatinib** is predicted to increase the exposure to **entrectinib**. Avoid moderate CYP3A4 inhibitors or adjust **entrectinib** dose, p. 1030. [Severe] Theoretical
- ▶ **Imatinib** is predicted to increase the risk of ergotism when given with **ergometrine**. [Severe] Theoretical
- ▶ **Imatinib** is predicted to increase the risk of ergotism when given with **ergotamine**. [Severe] Theoretical
- ▶ **Imatinib** is predicted to increase the exposure to **erlotinib**. [Moderate] Study
- ▶ **Imatinib** is predicted to increase the concentration of **everolimus**. Avoid or adjust dose. [Moderate] Study
- ▶ **Imatinib** is predicted to increase the exposure to **fesoterodine**. Adjust **fesoterodine** dose with moderate CYP3A4 inhibitors in hepatic and renal impairment, p. 824. [Mild] Study
- ▶ **Imatinib** is predicted to increase the exposure to **gefitinib**. [Moderate] Study
- ▶ **Grapefruit juice** is predicted to increase the exposure to **imatinib**. [Moderate] Theoretical
- ▶ **Imatinib** is predicted to increase the concentration of **guanfacine**. Adjust **guanfacine** dose, p. 375. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **imatinib**. [Moderate] Study
- ▶ **Imatinib** is predicted to increase the exposure to **ibrutinib**. Adjust **ibrutinib** dose with moderate CYP3A4 inhibitors, p. 1034. [Severe] Study → Also see TABLE 15 p. 1450
- ▶ **Idelalisib** is predicted to increase the exposure to **imatinib**. [Moderate] Study
- ▶ **Imatinib** is predicted to increase the exposure to **ivabradine**. Adjust **ivabradine** dose, p. 228. [Severe] Theoretical
- ▶ **Imatinib** is predicted to increase the exposure to **ivacaftor**. Adjust dose with moderate CYP3A4 inhibitors, see ivacaftor p. 312, tezacaftor with ivacaftor p. 314, and tezacaftor with ivacaftor and elexacaftor p. 314. [Moderate] Study
- ▶ **Imatinib** is predicted to increase the exposure to **lapatinib**. [Moderate] Study
- ▶ **Letermovir** is predicted to increase the exposure to **imatinib**. [Moderate] Study
- ▶ **Imatinib** is predicted to increase the exposure to **lomitapide**. Avoid. [Moderate] Theoretical
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **imatinib**. [Moderate] Study
- ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **imatinib**. [Moderate] Theoretical

Imatinib (continued)

- ▶ **Imatinib** is predicted to increase the exposure to **midostaurin**. [\[Moderate\]](#) Theoretical
- ▶ **Mitotane** is predicted to decrease the exposure to **imatinib**. Avoid. [\[Moderate\]](#) Study → Also see [TABLE 15](#) p. 1450
- ▶ **Imatinib** is predicted to increase the exposure to **naldemedine**. [\[Moderate\]](#) Study
- ▶ **Imatinib** is predicted to increase the exposure to **naloxegol**. Adjust **naloxegol** dose and monitor adverse effects, p. 71. [\[Moderate\]](#) Study
- ▶ **Imatinib** is predicted to increase the exposure to **neratinib**. Avoid moderate CYP3A4 inhibitors or adjust **neratinib** dose and monitor for gastrointestinal adverse effects, p. 1041. [\[Severe\]](#) Study
- ▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to increase the exposure to **imatinib**. [\[Moderate\]](#) Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to **imatinib**. [\[Moderate\]](#) Study → Also see [TABLE 15](#) p. 1450
- ▶ **NNRTIs (efavirenz, nevirapine)** are predicted to decrease the exposure to **imatinib**. [\[Moderate\]](#) Study
- ▶ **Imatinib** is predicted to increase the exposure to **olaparib**. Avoid moderate CYP3A4 inhibitors or adjust **olaparib** dose, p. 1057. [\[Moderate\]](#) Theoretical → Also see [TABLE 15](#) p. 1450
- ▶ **Imatinib** is predicted to increase the exposure to **opioids (alfentanil, buprenorphine, fentanyl, oxycodone)**. Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ **Imatinib** is predicted to increase the exposure to **opioids (methadone)**. [\[Moderate\]](#) Theoretical
- ▶ **Imatinib** increases the risk of hepatotoxicity when given with **paracetamol**. [\[Severe\]](#) Anecdotal
- ▶ **Imatinib** is predicted to increase the exposure to **pazopanib**. [\[Moderate\]](#) Study
- ▶ **Pegaspargase** is predicted to increase the risk of hepatotoxicity when given with **imatinib**. [\[Severe\]](#) Theoretical → Also see [TABLE 15](#) p. 1450
- ▶ **Imatinib** is predicted to increase the risk of bleeding events when given with **phenindione**. [\[Severe\]](#) Theoretical
- ▶ **Imatinib** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (avanafil)**. Adjust **avanafil** dose, p. 862. [\[Moderate\]](#) Theoretical
- ▶ **Imatinib** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (sildenafil)**. Monitor or adjust **sildenafil** dose with moderate CYP3A4 inhibitors, p. 863. [\[Moderate\]](#) Study
- ▶ **Imatinib** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (tadalafil)**. [\[Severe\]](#) Theoretical
- ▶ **Imatinib** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (vardenafil)**. Adjust dose. [\[Severe\]](#) Theoretical
- ▶ **Imatinib** is predicted to increase the exposure to **pimozide**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Imatinib** is predicted to increase the exposure to **ponatinib**. [\[Moderate\]](#) Study
- ▶ **Imatinib** is predicted to increase the exposure to **ranolazine**. [\[Severe\]](#) Study
- ▶ **Imatinib** is predicted to increase the exposure to **regorafenib**. [\[Moderate\]](#) Study → Also see [TABLE 15](#) p. 1450
- ▶ **Imatinib** is predicted to increase the exposure to **ribociclib**. [\[Moderate\]](#) Study → Also see [TABLE 15](#) p. 1450
- ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **imatinib**. Avoid. [\[Moderate\]](#) Study
- ▶ **Imatinib** is predicted to increase the exposure to **ruxolitinib**. [\[Moderate\]](#) Study → Also see [TABLE 15](#) p. 1450
- ▶ **Imatinib** is predicted to increase the exposure to **siponimod**. Avoid depending on other drugs taken—consult product literature. [\[Severe\]](#) Study
- ▶ **Imatinib** increases the concentration of **sirolimus**. Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ **Imatinib** is predicted to increase the exposure to **SSRIs (dapoxetine)**. Adjust **dapoxetine** dose with moderate CYP3A4 inhibitors, p. 870. [\[Moderate\]](#) Theoretical
- ▶ **St John's wort** is predicted to decrease the exposure to **imatinib**. [\[Moderate\]](#) Study

- ▶ **Imatinib** is predicted to increase the exposure to **statins (atorvastatin)**. Monitor and adjust dose. [\[Severe\]](#) Theoretical
- ▶ **Imatinib** moderately increases the exposure to **statins (simvastatin)**. Monitor and adjust dose. [\[Severe\]](#) Study
- ▶ **Imatinib** is predicted to increase the exposure to **sunitinib**. [\[Moderate\]](#) Study → Also see [TABLE 15](#) p. 1450
- ▶ **Imatinib** is predicted to increase the concentration of **tacrolimus**. [\[Severe\]](#) Study
- ▶ **Imatinib** is predicted to increase the exposure to **taxanes (cabazitaxel)**. [\[Moderate\]](#) Theoretical → Also see [TABLE 15](#) p. 1450
- ▶ **Tedizolid** is predicted to increase the exposure to **imatinib**. Avoid. [\[Moderate\]](#) Theoretical
- ▶ **Imatinib** is predicted to increase the concentration of **temsirolimus**. Use with caution or avoid. [\[Moderate\]](#) Theoretical → Also see [TABLE 15](#) p. 1450
- ▶ **Imatinib** is predicted to increase the exposure to **tezacaftor**. Adjust dose with moderate CYP3A4 inhibitors, see **tezacaftor** with **ivacaftor** p. 314 and **tezacaftor** with **ivacaftor** and **elxacaftor** p. 314. [\[Severe\]](#) Study
- ▶ **Imatinib** causes hypothyroidism when given with **thyroid hormones (levothyroxine)** in thyroidectomy patients. [\[Moderate\]](#) Study
- ▶ **Imatinib** given with a potent CYP2C19 inhibitor is predicted to increase the exposure to **tofacinib**. Adjust **tofacinib** dose, p. 1163. [\[Moderate\]](#) Study
- ▶ **Imatinib** is predicted to increase the exposure to **tolvaptan**. Manufacturer advises caution or adjust **tolvaptan** dose with moderate CYP3A4 inhibitors, p. 711. [\[Moderate\]](#) Study
- ▶ **Imatinib** is predicted to increase the exposure to **trazodone**. [\[Moderate\]](#) Theoretical
- ▶ **Imatinib** is predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [\[Moderate\]](#) Study
- ▶ **Imatinib** is predicted to increase the exposure to **vemurafenib**. [\[Severe\]](#) Theoretical
- ▶ **Imatinib** is predicted to increase the exposure to **venetoclax**. Avoid or adjust dose—consult product literature. [\[Severe\]](#) Study
- ▶ **Imatinib** is predicted to increase the exposure to **vinca alkaloids**. [\[Severe\]](#) Theoretical → Also see [TABLE 15](#) p. 1450
- ▶ **Imatinib** is predicted to increase the exposure to **zopiclone**. Adjust dose. [\[Moderate\]](#) Study

Imidapril → see ACE inhibitors

Imipenem → see carbapenems

Imipramine → see tricyclic antidepressants

Immunoglobulins

Anti-D (Rh₀) immunoglobulin · antithymocyte immunoglobulin (rabbit) · cytomegalovirus immunoglobulin · hepatitis B immunoglobulin · normal immunoglobulin · rabies immunoglobulin · tetanus immunoglobulin · varicella-zoster immunoglobulin

- ▶ **Cytomegalovirus immunoglobulin** is predicted to decrease the efficacy of **live vaccines**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Cytomegalovirus immunoglobulin** is predicted to increase the risk of adverse effects when given with **loop diuretics**. Avoid. [\[Moderate\]](#) Theoretical
- ▶ **Loop diuretics** might increase the risk of adverse effects when given with **normal immunoglobulin**. Avoid. [\[Moderate\]](#) Theoretical
- ▶ **Normal immunoglobulin** is predicted to alter the effects of **monoclonal antibodies (dinutuximab)**. Avoid. [\[Severe\]](#) Theoretical

Indacaterol → see beta₂ agonists

Indapamide → see thiazide diuretics

Indometacin → see NSAIDs

Indoramin → see alpha blockers

Infliximab → see monoclonal antibodies

Influenza vaccine (live) → see live vaccines

Intersen → see [TABLE 4](#) p. 1447 (antiplatelet effects)

Inotuzumab ozogamicin → see monoclonal antibodies

Insulin → see [TABLE 14](#) p. 1450 (antidiabetic drugs)

▶ **Fibrates** are predicted to increase the risk of hypoglycaemia when given with **insulin**. [\[Moderate\]](#) Theoretical

▶ **Metreleptin** is predicted to increase the risk of hypoglycaemia when given with **insulin**. Monitor blood glucose and adjust dose. [\[Severe\]](#) Theoretical

Interferon beta → see interferons

Interferons → see [TABLE 15](#) p. 1450 (myelosuppression)

interferon beta · peginterferon alfa

- ▶ **Interferons** are predicted to slightly increase the exposure to **aminophylline**. Adjust dose. [Moderate] Theoretical
 - ▶ **Interferons** slightly increase the exposure to **theophylline**. Adjust dose. [Moderate] Study
 - Ipilimumab** → see monoclonal antibodies
 - Ipratropium** → see TABLE 10 p. 1449 (antimuscarinics)
 - ▶ **Beta₂ agonists** are predicted to increase the risk of glaucoma when given with **ipratropium**. [Moderate] Anecdotal
 - Irbesartan** → see angiotensin-II receptor antagonists
 - Irinotecan** → see TABLE 15 p. 1450 (myelosuppression)
 - ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to **irinotecan**. Avoid. [Severe] Study
 - ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **irinotecan**. Avoid. [Severe] Study
 - ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the risk of toxicity when given with **irinotecan**. Avoid. [Moderate] Study
 - ▶ **Cobicistat** is predicted to increase the risk of toxicity when given with **irinotecan**. Avoid. [Moderate] Study
 - ▶ **Fibrates (gemfibrozil)** are predicted to increase the exposure to **irinotecan**. Avoid. [Moderate] Theoretical
 - ▶ **HIV-protease inhibitors** are predicted to increase the risk of toxicity when given with **irinotecan**. Avoid. [Moderate] Study
 - ▶ **Idelalisib** is predicted to increase the risk of toxicity when given with **irinotecan**. Avoid. [Moderate] Study
 - ▶ **Lapatinib** increases the exposure to the active metabolite of **irinotecan**. Monitor adverse effects and adjust dose. [Severe] Study
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **irinotecan**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
 - ▶ **Macrolides (clarithromycin)** are predicted to increase the risk of toxicity when given with **irinotecan**. Avoid. [Moderate] Study
 - ▶ **Mitotane** is predicted to decrease the exposure to **irinotecan**. Avoid. [Severe] Study → Also see TABLE 15 p. 1450
 - ▶ **Neurokinin-1 receptor antagonists (aprepitant, fosaprepitant)** are predicted to increase the exposure to intravenous **irinotecan**. [Severe] Theoretical
 - ▶ **Neurokinin-1 receptor antagonists (netupitant)** are predicted to increase the exposure to **irinotecan**. [Moderate] Study
 - ▶ **Irinotecan** is predicted to decrease the effects of **neuromuscular blocking drugs, non-depolarising**. [Moderate] Theoretical
 - ▶ **Pitolisant** is predicted to decrease the exposure to **irinotecan**. [Mid] Theoretical
 - ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **irinotecan**. Avoid. [Severe] Study
 - ▶ **St John's wort** slightly decreases the exposure to **irinotecan**. Avoid. [Severe] Study
 - ▶ **Irinotecan** is predicted to increase the risk of prolonged neuromuscular blockade when given with **suxamethonium**. [Moderate] Theoretical
- Iron**
- ▶ Oral **antacids** decrease the absorption of oral **iron**. Manufacturer advises iron should be taken 1 hour before or 2 hours after antacids. [Moderate] Study
 - ▶ Oral **iron** decreases the exposure to oral **bictegravir**. Manufacturer advises bictegravir should be taken 2 hours before iron. [Moderate] Study
 - ▶ Oral **iron** decreases the absorption of oral **bisphosphonates (clodronate)**. **Clodronate** should be taken 1 hour before or 2 hours after iron. [Moderate] Study
 - ▶ Oral **iron** is predicted to decrease the absorption of oral **bisphosphonates (ibandronate)**. **Ibandronate** should be taken 1 hour before or 6 hours after iron. [Moderate] Theoretical
 - ▶ Oral **iron** decreases the absorption of oral **bisphosphonates (risedronate)**. Separate administration by at least 2 hours. [Moderate] Study
 - ▶ Oral **calcium salts (calcium carbonate)** decrease the absorption of oral **iron**. **Calcium carbonate** should be taken 1 hour before or 2 hours after iron. [Moderate] Study
 - ▶ Oral **iron** is predicted to decrease the exposure to oral **carbidoopa**. [Moderate] Theoretical
 - ▶ **Chloramphenicol** decreases the efficacy of **iron**. [Moderate] Anecdotal
 - ▶ Oral **iron** decreases the absorption of oral **dolutegravir**. **Dolutegravir** should be taken 2 hours before or 6 hours after iron. [Moderate] Study
 - ▶ Oral **iron** is predicted to decrease the absorption of oral **eltrombopag**. **Eltrombopag** should be taken 2 hours before or 4 hours after iron. [Severe] Theoretical
 - ▶ Oral **entacapone** is predicted to decrease the absorption of oral **iron**. Separate administration by at least 2 hours. [Moderate] Theoretical
 - ▶ Oral **iron** is predicted to decrease the absorption of oral **iron chelators (deferiprone)**. [Moderate] Theoretical
 - ▶ Oral **iron** decreases the absorption of oral **levodopa**. [Moderate] Study
 - ▶ Oral **iron** decreases the effects of oral **methylodopa**. [Moderate] Study
 - ▶ Oral **iron** is predicted to decrease the absorption of oral **penicillamine**. Separate administration by at least 2 hours. [Mid] Study
 - ▶ Oral **iron** decreases the exposure to oral **quinolones**. Separate administration by at least 2 hours. [Moderate] Study
 - ▶ Oral **iron** decreases the absorption of oral **tetracyclines**. **Tetracyclines** should be taken 2 to 3 hours after iron. [Moderate] Study
 - ▶ Oral **iron** decreases the absorption of oral **thyroid hormones (levothyroxine)**. Separate administration by at least 4 hours. [Moderate] Study
 - ▶ Oral **trientine** potentially decreases the absorption of oral **iron**. [Moderate] Theoretical
 - ▶ Oral **zinc** is predicted to decrease the efficacy of oral **iron** and oral **iron** is predicted to decrease the efficacy of oral **zinc**. [Moderate] Study
- Iron chelators** → see TABLE 15 p. 1450 (myelosuppression)
- deferasirox · deferiprone · desferrioxamine · dexrazoxane
- ▶ **Aluminium hydroxide** is predicted to decrease the exposure to **deferasirox**. Avoid. [Moderate] Theoretical
 - ▶ **Aluminium hydroxide** is predicted to decrease the absorption of **deferiprone**. Avoid. [Moderate] Theoretical
 - ▶ **Deferasirox** is predicted to increase the exposure to **aminophylline**. Avoid. [Moderate] Theoretical
 - ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **deferasirox**. Monitor serum ferritin and adjust dose. [Moderate] Theoretical
 - ▶ **Deferasirox** is predicted to increase the exposure to **antipsychotics, second generation (clozapine)**. Avoid. [Moderate] Theoretical
 - ▶ **Ascorbic acid** is predicted to increase the risk of cardiovascular adverse effects when given with **deferiprone**. [Severe] Theoretical
 - ▶ **Ascorbic acid** might increase the risk of cardiovascular adverse effects when given with **desferrioxamine**. Manufacturer advises caution or adjust ascorbic acid dose; monitor cardiac function and avoid concurrent use in those with cardiac failure. [Severe] Theoretical
 - ▶ **Aspirin** (high-dose) is predicted to increase the risk of gastrointestinal bleeds when given with **deferasirox**. [Severe] Theoretical
 - ▶ **Bisphosphonates** are predicted to increase the risk of gastrointestinal bleeding when given with **deferasirox**. [Severe] Theoretical
 - ▶ **Corticosteroids** are predicted to increase the risk of gastrointestinal bleeding when given with **deferasirox**. [Severe] Theoretical
 - ▶ **HIV-protease inhibitors (ritonavir)** are predicted to decrease the exposure to **deferasirox**. Monitor serum ferritin and adjust dose. [Moderate] Theoretical
 - ▶ Oral **iron** is predicted to decrease the absorption of oral **deferiprone**. [Moderate] Theoretical
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **dexrazoxane**. Avoid. [Severe] Theoretical
 - ▶ **Deferasirox** moderately increases the exposure to **meglitinides (repaglinide)**. Avoid. [Moderate] Study

Iron chelators (continued)

- ▶ **Deferasirox** is predicted to increase the exposure to **montelukast**. [Moderate] Theoretical
- ▶ **NSAIDs** are predicted to increase the risk of gastrointestinal bleeding when given with **deferasirox**. [Severe] Theoretical
- ▶ **NSAIDs (diclofenac)** are predicted to increase the exposure to **deferiprone**. [Moderate] Theoretical
- ▶ **Deferasirox** is predicted to increase the exposure to **pioglitazone**. [Moderate] Study
- ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **deferasirox**. Monitor serum ferritin and adjust dose. [Moderate] Study
- ▶ **Deferasirox** is predicted to increase the exposure to **selexipag**. Adjust **selexipag** dose, p. 197. [Moderate] Study
- ▶ **Deferasirox** is predicted to increase the concentration of **taxanes (paclitaxel)**. [Severe] Anecdotal
- ▶ **Deferasirox** increases the exposure to **theophylline**. Avoid. [Moderate] Study
- ▶ **Deferasirox** is predicted to increase the exposure to **tizanidine**. Avoid. [Moderate] Theoretical
- ▶ **Deferasirox** is predicted to increase the exposure to **treprostinil**. Adjust dose. [Moderate] Theoretical
- ▶ Oral **zinc** is predicted to decrease the absorption of oral **deferiprone**. [Moderate] Theoretical

Isavuconazole → see antifungals, azoles

Isoflurane → see MAOIs, irreversible

Isoflurane → see volatile halogenated anaesthetics

Isonitrothene → see sympathomimetics, vasoconstrictor

Isoniazid → see TABLE 1 p. 1447 (hepatotoxicity), TABLE 12 p. 1450 (peripheral neuropathy)

FOOD AND LIFESTYLE Avoid tyramine-rich foods (such as mature cheeses, salami, pickled herring, *Bovril*[®], *Oxo*[®], *Marmite*[®] or any similar meat or yeast extract or fermented soya bean extract, and some beers, lagers or wines) or histamine-rich foods (such as very mature cheese or fish from the scombroid family (e.g. tuna, mackerel, salmon)) with **isoniazid**, as tachycardia, palpitation, hypotension, flushing, headache, dizziness, and sweating reported.

- ▶ **Isoniazid** is predicted to affect the clearance of **aminophylline**. [Severe] Theoretical
 - ▶ **Isoniazid** markedly increases the concentration of **antiepileptics (carbamazepine)** and **antiepileptics (carbamazepine)** increase the risk of hepatotoxicity when given with **isoniazid**. Monitor concentration and adjust dose. [Severe] Study → Also see TABLE 1 p. 1447
 - ▶ **Isoniazid** increases the concentration of **antiepileptics (fosphenytoin, phenytoin)**. [Moderate] Study → Also see TABLE 12 p. 1450
 - ▶ **Cycloserine** increases the risk of CNS toxicity when given with **isoniazid**. Monitor and adjust dose. [Moderate] Study
 - ▶ **Isoniazid** increases the risk of optic neuropathy when given with **ethambutol**. [Severe] Anecdotal
 - ▶ **Isoniazid** decreases the effects of **levodopa**. [Moderate] Study
 - ▶ **Isoniazid** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Unknown] Theoretical → Also see TABLE 1 p. 1447
 - ▶ **Isoniazid** is predicted to affect the clearance of **theophylline**. [Severe] Anecdotal
 - ▶ **Isoniazid** potentially increases the risk of nephrotoxicity when given with **volatile halogenated anaesthetics (methoxyflurane)**. Avoid. [Severe] Theoretical
- Isoorbide dinitrate** → see nitrates
- Isoorbide mononitrate** → see nitrates
- Isotretinoin** → see retinoids
- Itraconazole** → see antifungals, azoles

Ivabradine → see TABLE 6 p. 1448 (bradycardia), TABLE 9 p. 1449 (QT-interval prolongation)

- ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to **ivabradine**. Adjust dose. [Moderate] Theoretical
- ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to **ivabradine**. Adjust **ivabradine** dose, p. 228. [Severe] Theoretical

- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **ivabradine**. Adjust dose. [Moderate] Theoretical
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **ivabradine**. Adjust **ivabradine** dose, p. 228. [Severe] Theoretical
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **ivabradine**. Avoid. [Severe] Study
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **ivabradine**. Avoid. [Moderate] Study → Also see TABLE 6 p. 1448
- ▶ **Cobicistat** is predicted to increase the exposure to **ivabradine**. Avoid. [Severe] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **ivabradine**. Adjust **ivabradine** dose, p. 228. [Severe] Theoretical → Also see TABLE 6 p. 1448
- ▶ **Grapefruit** juice is predicted to increase the exposure to **ivabradine**. Avoid. [Moderate] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **ivabradine**. Avoid. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **ivabradine**. Avoid. [Severe] Study
- ▶ **Imatinib** is predicted to increase the exposure to **ivabradine**. Adjust **ivabradine** dose, p. 228. [Severe] Theoretical
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **ivabradine**. Avoid. [Severe] Study
- ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **ivabradine**. Avoid. [Severe] Theoretical
- ▶ **Mitotane** is predicted to decrease the exposure to **ivabradine**. Adjust dose. [Moderate] Theoretical
- ▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to increase the exposure to **ivabradine**. Adjust **ivabradine** dose, p. 228. [Severe] Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to **ivabradine**. Adjust **ivabradine** dose, p. 228. [Severe] Theoretical
- ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **ivabradine**. Adjust dose. [Moderate] Theoretical
- ▶ **St John's wort** decreases the exposure to **ivabradine**. Avoid. [Moderate] Study

Ivacaftor

FOOD AND LIFESTYLE Food or drinks containing bitter (Seville) oranges are predicted to increase the exposure to **ivacaftor**.

- ▶ **Ivacaftor** is predicted to increase the exposure to **afatinib**. Separate administration by 12 hours. [Moderate] Study
- ▶ **Ivacaftor** is predicted to increase the exposure to **aliskiren**. [Moderate] Study
- ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to **ivacaftor**. Avoid. [Severe] Study
- ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to **ivacaftor**. Adjust dose with moderate CYP3A4 inhibitors, see **ivacaftor** p. 312, **tezacaftor** with **ivacaftor** p. 314, and **tezacaftor** with **ivacaftor** and **elxacaftor** p. 314. [Moderate] Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **ivacaftor**. Avoid. [Severe] Study
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **ivacaftor**. Adjust dose with moderate CYP3A4 inhibitors, see **ivacaftor** p. 312, **tezacaftor** with **ivacaftor** p. 314, and **tezacaftor** with **ivacaftor** and **elxacaftor** p. 314. [Moderate] Study
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **ivacaftor**. Adjust dose with potent CYP3A4 inhibitors, see **ivacaftor** p. 312, **lumacaftor** with **ivacaftor** p. 312, **tezacaftor** with **ivacaftor** p. 314, and **tezacaftor** with **ivacaftor** and **elxacaftor** p. 314. [Severe] Study
- ▶ **Ivacaftor** is predicted to increase the exposure to **antihistamines, non-sedating (fexofenadine)**. [Moderate] Study
- ▶ **Ivacaftor** is predicted to increase the exposure to **bictegravir**. Use with caution or avoid. [Moderate] Theoretical
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **ivacaftor**. Adjust dose with moderate CYP3A4 inhibitors, see **ivacaftor** p. 312, **tezacaftor** with

- ivacaftor p. 314, and tezacaftor with ivacaftor and elexacaftor p. 314. [\[Moderate\]](#) Study
- ▶ **Ivacaftor** is predicted to increase the exposure to **ciclosporin**. [\[Moderate\]](#) Theoretical
 - ▶ **Cobicistat** is predicted to increase the exposure to **ivacaftor**. Adjust dose with potent CYP3A4 inhibitors, see ivacaftor p. 312, lumacaftor with ivacaftor p. 312, tezacaftor with ivacaftor p. 314, and tezacaftor with ivacaftor and elexacaftor p. 314. [\[Severe\]](#) Study
 - ▶ **Ivacaftor** is predicted to increase the exposure to **colchicine**. [\[Moderate\]](#) Study
 - ▶ **Ivacaftor** is predicted to increase the exposure to **coumarins (warfarin)**. [\[Moderate\]](#) Theoretical
 - ▶ **Crizotinib** is predicted to increase the exposure to **ivacaftor**. Adjust dose with moderate CYP3A4 inhibitors, see ivacaftor p. 312, tezacaftor with ivacaftor p. 314, and tezacaftor with ivacaftor and elexacaftor p. 314. [\[Moderate\]](#) Study
 - ▶ **Dabrafenib** is predicted to decrease the exposure to **ivacaftor**. [\[Moderate\]](#) Study
 - ▶ **Ivacaftor** slightly increases the exposure to **digoxin**. [\[Moderate\]](#) Study
 - ▶ **Endothelin receptor antagonists (bosentan)** are predicted to decrease the exposure to **ivacaftor**. [\[Moderate\]](#) Study
 - ▶ **Ivacaftor** is predicted to increase the exposure to **erlotinib**. [\[Moderate\]](#) Theoretical
 - ▶ **Ivacaftor** is predicted to increase the exposure to **everolimus**. [\[Moderate\]](#) Study
 - ▶ **Ivacaftor** is predicted to increase the exposure to **factor XA inhibitors (edoxaban, rivaroxaban)**. [\[Moderate\]](#) Study
 - ▶ **Ivacaftor** is predicted to increase the exposure to **fidaxomicin**. Avoid. [\[Moderate\]](#) Study
 - ▶ **Ivacaftor** is predicted to increase the exposure to **gilteritinib**. [\[Moderate\]](#) Theoretical
 - ▶ **Grapefruit** juice is predicted to increase the exposure to **ivacaftor**. Avoid. [\[Moderate\]](#) Theoretical
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **ivacaftor**. Adjust dose with potent CYP3A4 inhibitors, see ivacaftor p. 312, lumacaftor with ivacaftor p. 312, tezacaftor with ivacaftor p. 314, and tezacaftor with ivacaftor and elexacaftor p. 314. [\[Severe\]](#) Study
 - ▶ **Idelalisib** is predicted to increase the exposure to **ivacaftor**. Adjust dose with potent CYP3A4 inhibitors, see ivacaftor p. 312, lumacaftor with ivacaftor p. 312, tezacaftor with ivacaftor p. 314, and tezacaftor with ivacaftor and elexacaftor p. 314. [\[Severe\]](#) Study
 - ▶ **Imatinib** is predicted to increase the exposure to **ivacaftor**. Adjust dose with moderate CYP3A4 inhibitors, see ivacaftor p. 312, tezacaftor with ivacaftor p. 314, and tezacaftor with ivacaftor and elexacaftor p. 314. [\[Moderate\]](#) Study
 - ▶ **Letermovir** is predicted to increase the exposure to **ivacaftor**. Adjust dose with moderate CYP3A4 inhibitors, see ivacaftor p. 312, tezacaftor with ivacaftor p. 314, and tezacaftor with ivacaftor and elexacaftor p. 314. [\[Moderate\]](#) Study
 - ▶ **Ivacaftor** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [\[Moderate\]](#) Theoretical
 - ▶ **Ivacaftor** is predicted to increase the exposure to **loperamide**. [\[Moderate\]](#) Study
 - ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **ivacaftor**. Adjust dose with potent CYP3A4 inhibitors, see ivacaftor p. 312, lumacaftor with ivacaftor p. 312, tezacaftor with ivacaftor p. 314, and tezacaftor with ivacaftor and elexacaftor p. 314. [\[Severe\]](#) Study
 - ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **ivacaftor**. Adjust dose with moderate CYP3A4 inhibitors, see ivacaftor p. 312, tezacaftor with ivacaftor p. 314, and tezacaftor with ivacaftor and elexacaftor p. 314. [\[Moderate\]](#) Study
 - ▶ **Mitotane** is predicted to decrease the exposure to **ivacaftor**. Avoid. [\[Severe\]](#) Study
 - ▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to increase the exposure to **ivacaftor**. Adjust dose with moderate CYP3A4 inhibitors, see ivacaftor p. 312, tezacaftor with ivacaftor p. 314, and tezacaftor with ivacaftor and elexacaftor p. 314. [\[Moderate\]](#) Study
 - ▶ **Nilotinib** is predicted to increase the exposure to **ivacaftor**. Adjust dose with moderate CYP3A4 inhibitors, see ivacaftor p. 312, tezacaftor with ivacaftor p. 314, and tezacaftor with ivacaftor and elexacaftor p. 314. [\[Moderate\]](#) Study
 - ▶ **Ivacaftor** is predicted to increase the exposure to **nintedanib**. [\[Moderate\]](#) Study
 - ▶ **NRTIs (efavirenz, nevirapine)** are predicted to decrease the exposure to **ivacaftor**. [\[Moderate\]](#) Study
 - ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **ivacaftor**. Avoid. [\[Severe\]](#) Study
 - ▶ **Ivacaftor** is predicted to increase the exposure to **sirolimus**. [\[Moderate\]](#) Study
 - ▶ **St John's wort** is predicted to decrease the exposure to **ivacaftor**. Avoid. [\[Severe\]](#) Study
 - ▶ **Ivacaftor** is predicted to increase the exposure to **tacrolimus**. [\[Moderate\]](#) Theoretical
 - ▶ **Ivacaftor** is predicted to slightly increase the exposure to **talazoparib**. Avoid or adjust **talazoparib** dose, p. 1059. [\[Severe\]](#) Study
 - ▶ **Ivacaftor** is predicted to increase the exposure to **taxanes (paclitaxel)**. [\[Moderate\]](#) Study
 - ▶ **Ivacaftor** is predicted to increase the exposure to **thrombin inhibitors (dabigatran)**. [\[Moderate\]](#) Study
 - ▶ **Ivacaftor** might increase the exposure to **tigecycline**. [\[Mild\]](#) Anecdotal
 - ▶ **Ivacaftor** is predicted to increase the exposure to **topotecan**. [\[Severe\]](#) Study
 - ▶ **Ivacaftor** is predicted to increase the concentration of **trametinib**. [\[Moderate\]](#) Theoretical
 - ▶ **Ivacaftor** might increase the exposure to **vinca alkaloids**. [\[Severe\]](#) Theoretical
- ### Ivermectin
- ROUTE-SPECIFIC INFORMATION** Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.
- ▶ **Ivermectin** potentially increases the anticoagulant effect of **coumarins**. [\[Severe\]](#) Anecdotal
 - ▶ **Levamisole** increases the exposure to **ivermectin**. [\[Moderate\]](#) Study
- ### Ixazomib
- ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to **ixazomib**. Avoid. [\[Severe\]](#) Study
 - ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **ixazomib**. Avoid. [\[Severe\]](#) Study
 - ▶ **Mitotane** is predicted to decrease the exposure to **ixazomib**. Avoid. [\[Severe\]](#) Study
 - ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **ixazomib**. Avoid. [\[Severe\]](#) Study
 - ▶ **St John's wort** is predicted to decrease the exposure to **ixazomib**. Avoid. [\[Severe\]](#) Theoretical
- Ixekizumab** → see monoclonal antibodies
- ### Kaolin
- ▶ **Oral kaolin** is predicted to decrease the absorption of oral **tetracyclines**. [\[Moderate\]](#) Theoretical
- Ketamine** → see TABLE 8 p. 1448 (hypotension), TABLE 11 p. 1449 (CNS depressant effects)
- ▶ **Ketamine** is predicted to increase the risk of elevated blood pressure when given with **ergometrine**. [\[Severe\]](#) Theoretical
 - ▶ **Memantine** is predicted to increase the risk of CNS adverse effects when given with **ketamine**. Avoid. [\[Severe\]](#) Theoretical
- Ketoconazole** → see antifungals, azoles
- Ketoprofen** → see NSAIDs
- Ketorolac** → see NSAIDs
- Ketotifen** → see antihistamines, sedating
- Labetalol** → see beta blockers, non-selective
- Lacidipine** → see calcium channel blockers
- Lacosamide** → see antiepileptics
- Lamivudine** → see NRTIs
- Lamotrigine** → see antiepileptics
- ### Lanreotide
- ▶ **Beta blockers, non-selective** are predicted to increase the risk of bradycardia when given with **lanreotide**. [\[Moderate\]](#) Theoretical
 - ▶ **Beta blockers, selective** are predicted to increase the risk of bradycardia when given with **lanreotide**. [\[Moderate\]](#) Theoretical

Lanreotide (continued)

- ▶ **Lanreotide** is predicted to decrease the absorption of oral **ciclosporin**. Adjust dose. [\[Severe\]](#) Theoretical

Lansoprazole → see proton pump inhibitors

Lanthanum

- ▶ **Lanthanum** is predicted to decrease the absorption of **antifungals, azoles (ketoconazole)**. Separate administration by at least 2 hours. [\[Moderate\]](#) Theoretical
- ▶ **Lanthanum** is predicted to decrease the absorption of **antimalarials (chloroquine)**. Separate administration by at least 2 hours. [\[Moderate\]](#) Theoretical
- ▶ **Lanthanum** is predicted to decrease the absorption of **hydroxychloroquine**. Separate administration by at least 2 hours. [\[Moderate\]](#) Theoretical
- ▶ **Lanthanum** moderately decreases the exposure to **quinolones**. **Quinolones** should be taken 2 hours before or 4 hours after lanthanum. [\[Moderate\]](#) Study
- ▶ Oral **lanthanum** might decrease the absorption of oral **tetracyclines**. Separate administration by 2 hours. [\[Moderate\]](#) Theoretical
- ▶ **Lanthanum** decreases the absorption of **thyroid hormones**. Separate administration by 2 hours. [\[Moderate\]](#) Study

Lapatinib → see TABLE 9 p. 1449 (QT-interval prolongation)

- ▶ **Lapatinib** is predicted to increase the exposure to **afatinib**. Separate administration by 12 hours. [\[Moderate\]](#) Study
- ▶ **Lapatinib** is predicted to increase the exposure to **alsikiren**. [\[Moderate\]](#) Theoretical
- ▶ **Lapatinib** is predicted to increase the exposure to **alpelisib**. [\[Moderate\]](#) Theoretical
- ▶ Oral **antacids** is predicted to decrease the absorption of oral **lapatinib**. Avoid. [\[Moderate\]](#) Theoretical
- ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to **lapatinib**. Avoid. [\[Severe\]](#) Study → Also see TABLE 9 p. 1449
- ▶ **Antiarrhythmics (dronedaron)** are predicted to increase the exposure to **lapatinib**. [\[Moderate\]](#) Study → Also see TABLE 9 p. 1449
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **lapatinib**. Avoid. [\[Severe\]](#) Study
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **lapatinib**. [\[Moderate\]](#) Study → Also see TABLE 9 p. 1449
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **lapatinib**. Avoid. [\[Moderate\]](#) Study → Also see TABLE 9 p. 1449
- ▶ **Lapatinib** is predicted to increase the exposure to **antihistamines, non-sedating (fexofenadine)**. [\[Moderate\]](#) Theoretical
- ▶ **Lapatinib** is predicted to increase the exposure to **beta blockers, non-selective (nadolol)**. [\[Moderate\]](#) Study
- ▶ **Lapatinib** is predicted to increase the exposure to **bictegravir**. Use with caution or avoid. [\[Moderate\]](#) Theoretical
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **lapatinib**. [\[Moderate\]](#) Study
- ▶ Oral **calcium salts (calcium carbonate)** –containing antacids are predicted to decrease the absorption of oral **lapatinib**. Avoid. [\[Moderate\]](#) Theoretical
- ▶ **Lapatinib** is predicted to increase the exposure to **ceritinib**. [\[Moderate\]](#) Theoretical → Also see TABLE 9 p. 1449
- ▶ **Ciclosporin** might increase the concentration of **lapatinib**. [\[Severe\]](#) Theoretical
- ▶ **Cobicistat** is predicted to increase the exposure to **lapatinib**. Avoid. [\[Moderate\]](#) Study
- ▶ **Lapatinib** is predicted to increase the exposure to **colchicine**. Avoid P-glycoprotein inhibitors or adjust colchicine dose, p. 1175. [\[Moderate\]](#) Theoretical
- ▶ **Lapatinib** is predicted to increase the risk of bleeding events when given with **coumarins**. [\[Severe\]](#) Theoretical
- ▶ **Crizotinib** is predicted to increase the exposure to **lapatinib**. [\[Moderate\]](#) Study → Also see TABLE 9 p. 1449
- ▶ **Dabrafenib** is predicted to decrease the exposure to **lapatinib**. Avoid. [\[Severe\]](#) Study
- ▶ **Lapatinib** is predicted to increase the exposure to **digoxin**. [\[Moderate\]](#) Theoretical
- ▶ **Endothelin receptor antagonists (bosentan)** are predicted to decrease the exposure to **lapatinib**. Avoid. [\[Severe\]](#) Study
- ▶ **Lapatinib** is predicted to increase the exposure to **erlotinib**. [\[Moderate\]](#) Theoretical
- ▶ **Lapatinib** is predicted to increase the exposure to **everolimus**. [\[Moderate\]](#) Theoretical
- ▶ **Lapatinib** is predicted to increase the exposure to **factor XA inhibitors (apixaban)**. [\[Moderate\]](#) Theoretical
- ▶ **Lapatinib** is predicted to slightly increase the exposure to **factor XA inhibitors (edoxaban)**. [\[Severe\]](#) Theoretical
- ▶ **Lapatinib** is predicted to increase the exposure to **fidaxomicin**. Avoid. [\[Moderate\]](#) Study
- ▶ **Lapatinib** is predicted to increase the exposure to **gilteritinib**. [\[Moderate\]](#) Theoretical
- ▶ **Grapefruit** juice is predicted to increase the exposure to **lapatinib**. Avoid. [\[Moderate\]](#) Theoretical
- ▶ **H₂ receptor antagonists** are predicted to decrease the absorption of **lapatinib**. Avoid. [\[Moderate\]](#) Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **lapatinib**. Avoid. [\[Moderate\]](#) Study
- ▶ **Idelalisib** is predicted to increase the exposure to **lapatinib**. Avoid. [\[Moderate\]](#) Study
- ▶ **Imatinib** is predicted to increase the exposure to **lapatinib**. [\[Moderate\]](#) Study
- ▶ **Lapatinib** increases the exposure to the active metabolite of **irinotecan**. Monitor adverse effects and adjust dose. [\[Severe\]](#) Study
- ▶ **Lapatinib** is predicted to increase the exposure to **larotrectinib**. [\[Mild\]](#) Theoretical
- ▶ **Letermovir** is predicted to increase the exposure to **lapatinib**. [\[Moderate\]](#) Study
- ▶ **Lapatinib** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [\[Mild\]](#) Theoretical
- ▶ **Lapatinib** is predicted to increase the exposure to **loperamide**. [\[Moderate\]](#) Theoretical
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **lapatinib**. Avoid. [\[Moderate\]](#) Study → Also see TABLE 9 p. 1449
- ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **lapatinib**. [\[Moderate\]](#) Study → Also see TABLE 9 p. 1449
- ▶ **Mitotane** is predicted to decrease the exposure to **lapatinib**. Avoid. [\[Severe\]](#) Study
- ▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to increase the exposure to **lapatinib**. [\[Moderate\]](#) Study
- ▶ **Nilotinib** is predicted to increase the exposure to **lapatinib**. [\[Moderate\]](#) Study → Also see TABLE 9 p. 1449
- ▶ **Lapatinib** is predicted to increase the exposure to **nintedanib**. [\[Moderate\]](#) Study
- ▶ **NNRTIs (efavirenz, nevirapine)** are predicted to decrease the exposure to **lapatinib**. Avoid. [\[Severe\]](#) Study → Also see TABLE 9 p. 1449
- ▶ **Lapatinib** is predicted to increase the exposure to **panobinostat**. Adjust dose. [\[Moderate\]](#) Theoretical → Also see TABLE 9 p. 1449
- ▶ **Lapatinib** increases the exposure to **pazopanib**. Avoid. [\[Severe\]](#) Study → Also see TABLE 9 p. 1449
- ▶ **Lapatinib** is predicted to increase the risk of bleeding events when given with **phenindione**. [\[Severe\]](#) Theoretical
- ▶ **Lapatinib** is predicted to increase the exposure to **pibrentasvir**. [\[Moderate\]](#) Theoretical
- ▶ **Pitolisant** is predicted to decrease the exposure to **lapatinib**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **lapatinib**. Avoid. [\[Severe\]](#) Study
- ▶ **Lapatinib** is predicted to increase the exposure to **sirolimus**. [\[Moderate\]](#) Theoretical
- ▶ Oral **sodium bicarbonate**-containing antacids are predicted to decrease the absorption of oral **lapatinib**. Avoid. [\[Moderate\]](#) Theoretical
- ▶ **St John's wort** is predicted to decrease the exposure to **lapatinib**. Avoid. [\[Severe\]](#) Study
- ▶ **Lapatinib** is predicted to slightly increase the exposure to **talazoparib**. Avoid or adjust talazoparib dose, p. 1059. [\[Severe\]](#) Study
- ▶ **Lapatinib** slightly increases the exposure to **taxanes (paclitaxel)**. [\[Severe\]](#) Study

- ▶ **Tedizolid** is predicted to increase the exposure to **lapatinib**. Avoid. [Moderate] Theoretical
 - ▶ **Lapatinib** is predicted to increase the exposure to **thrombin inhibitors (dabigatran)**. [Severe] Theoretical
 - ▶ **Lapatinib** might increase the exposure to **tigecycline**. [Mild] Anecdotal
 - ▶ **Lapatinib** is predicted to increase the exposure to **topotecan**. [Severe] Study
 - ▶ **Lapatinib** is predicted to increase the concentration of **trametinib**. [Moderate] Theoretical
 - ▶ **Lapatinib** is predicted to increase the exposure to **venetoclax**. Avoid or monitor for toxicity. [Severe] Theoretical
 - ▶ **Lapatinib** might increase the exposure to **vinca alkaloids**. [Severe] Theoretical → Also see TABLE 9 p. 1449
- Laronidase**
- ▶ **Antimalarials (chloroquine)** are predicted to decrease the exposure to **laronidase**. Avoid simultaneous administration. [Severe] Theoretical
 - ▶ **Hydroxychloroquine** is predicted to decrease the exposure to **laronidase**. Avoid simultaneous administration. [Severe] Theoretical
- Larotrectinib**
- ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to moderately decrease the exposure to **larotrectinib**. Avoid. [Moderate] Study
 - ▶ **Antiarrhythmics (amiodarone, dronedarone)** are predicted to increase the exposure to **larotrectinib**. [Mild] Theoretical
 - ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to moderately decrease the exposure to **larotrectinib**. Avoid. [Moderate] Study
 - ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to moderately increase the exposure to **larotrectinib**. Avoid or adjust **larotrectinib** dose, p. 1038. [Moderate] Study
 - ▶ **Larotrectinib** slightly increases the exposure to **benzodiazepines (midazolam)**. Use with caution and adjust dose. [Mild] Study
 - ▶ **Calcium channel blockers (verapamil)** are predicted to increase the exposure to **larotrectinib**. [Mild] Theoretical
 - ▶ **Ciclosporin** is predicted to increase the exposure to **larotrectinib**. [Mild] Study
 - ▶ **Cobicistat** is predicted to moderately increase the exposure to **larotrectinib**. Avoid or adjust **larotrectinib** dose, p. 1038. [Moderate] Study
 - ▶ **Larotrectinib** potentially decreases the efficacy of **combined hormonal contraceptives**. Use additional contraceptive precautions. [Severe] Theoretical
 - ▶ **Dabrafenib** is predicted to decrease the exposure to **larotrectinib**. Avoid. [Moderate] Study
 - ▶ **Eltrombopag** is predicted to increase the exposure to **larotrectinib**. [Mild] Study
 - ▶ **Endothelin receptor antagonists (bosentan)** are predicted to decrease the exposure to **larotrectinib**. Avoid. [Moderate] Study
 - ▶ **Larotrectinib** is predicted to increase the exposure to **ergotamine**. Use with caution and adjust dose. [Mild] Theoretical
 - ▶ **Grapefruit** juice is predicted to increase the exposure to **larotrectinib**. Avoid. [Moderate] Theoretical
 - ▶ **HIV-protease inhibitors** are predicted to moderately increase the exposure to **larotrectinib**. Avoid or adjust **larotrectinib** dose, p. 1038. [Moderate] Study
 - ▶ **Idelalisib** is predicted to moderately increase the exposure to **larotrectinib**. Avoid or adjust **larotrectinib** dose, p. 1038. [Moderate] Study
 - ▶ **Lapatinib** is predicted to increase the exposure to **larotrectinib**. [Mild] Theoretical
 - ▶ **Leflunomide** is predicted to increase the exposure to **larotrectinib**. [Mild] Study
 - ▶ **Macrolides (azithromycin, erythromycin)** are predicted to increase the exposure to **larotrectinib**. [Mild] Theoretical
 - ▶ **Macrolides (clarithromycin)** are predicted to moderately increase the exposure to **larotrectinib**. Avoid or adjust **larotrectinib** dose, p. 1038. [Moderate] Study
 - ▶ **Mitotane** is predicted to moderately decrease the exposure to **larotrectinib**. Avoid. [Moderate] Study
 - ▶ **NNRTIs (efavirenz, nevirapine)** are predicted to decrease the exposure to **larotrectinib**. Avoid. [Moderate] Study
- ▶ **Larotrectinib** is predicted to increase the exposure to **opioids (alfentanil, fentanyl)**. Use with caution and adjust dose. [Mild] Theoretical
 - ▶ **Larotrectinib** is predicted to increase the exposure to **pimozide**. Use with caution and adjust dose. [Mild] Theoretical
 - ▶ **Ranolazine** is predicted to increase the exposure to **larotrectinib**. [Mild] Theoretical
 - ▶ **Rifamycins (rifampicin)** are predicted to moderately decrease the exposure to **larotrectinib**. Avoid. [Moderate] Study
 - ▶ **Larotrectinib** is predicted to increase the exposure to **sirolimus**. Use with caution and adjust dose. [Mild] Theoretical
 - ▶ **St John's wort** is predicted to decrease the exposure to **larotrectinib**. Avoid. [Moderate] Study
 - ▶ **Larotrectinib** is predicted to increase the exposure to **tacrolimus**. Use with caution and adjust dose. [Mild] Theoretical
 - ▶ **Teriflunomide** is predicted to increase the exposure to **larotrectinib**. [Mild] Study
 - ▶ **Vemurafenib** is predicted to increase the exposure to **larotrectinib**. [Mild] Theoretical
- Ledipasvir**
- ▶ Oral **antacids** are predicted to decrease the exposure to oral **ledipasvir**. Separate administration by 4 hours. [Moderate] Theoretical
 - ▶ **Ledipasvir** increases the risk of severe bradycardia or heart block when given with **antiarrhythmics (amiodarone)**. Refer to specialist literature. [Severe] Anecdotal
 - ▶ **Antiepileptics (carbamazepine)** are predicted to decrease the exposure to **ledipasvir**. Avoid. [Severe] Study
 - ▶ **Antiepileptics (fosphenytoin, oxcarbazepine, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **ledipasvir**. Avoid. [Severe] Theoretical
 - ▶ **Calcium salts (calcium carbonate)** are predicted to decrease the exposure to **ledipasvir**. Separate administration by 4 hours. [Moderate] Theoretical
 - ▶ **Ledipasvir** is predicted to increase the exposure to **digoxin**. Monitor and adjust dose. [Moderate] Theoretical
 - ▶ **H₂ receptor antagonists** are predicted to decrease the exposure to **ledipasvir**. Adjust dose, see ledipasvir with sofosbuvir p. 672. [Moderate] Study
 - ▶ **HIV-protease inhibitors (tipranavir)** boosted with ritonavir are predicted to decrease the exposure to **ledipasvir**. Avoid. [Severe] Theoretical
 - ▶ **Proton pump inhibitors** are predicted to decrease the exposure to **ledipasvir**. Adjust dose, see ledipasvir with sofosbuvir p. 672. [Moderate] Theoretical
 - ▶ **Rifamycins (rifabutin)** are predicted to decrease the exposure to **ledipasvir**. Avoid. [Severe] Theoretical
 - ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **ledipasvir**. Avoid. [Severe] Study
 - ▶ **Sodium zirconium cyclosilicate** is predicted to decrease the exposure to **ledipasvir**. Separate administration by at least 2 hours. [Moderate] Theoretical
 - ▶ **St John's wort** is predicted to decrease the exposure to **ledipasvir**. Avoid. [Severe] Study
 - ▶ **Ledipasvir** with sofosbuvir is predicted to increase the exposure to **statins (atorvastatin)**. Monitor and adjust dose. [Moderate] Anecdotal
 - ▶ **Ledipasvir** with sofosbuvir is predicted to increase the exposure to **statins (fluvastatin, pravastatin, simvastatin)**. Monitor and adjust dose. [Moderate] Theoretical
 - ▶ **Ledipasvir** with sofosbuvir is predicted to increase the exposure to **statins (rosuvastatin)**. Avoid. [Severe] Theoretical
 - ▶ **Ledipasvir** with sofosbuvir slightly increases the exposure to **tenofovir disoproxil**. [Moderate] Study
 - ▶ **Ledipasvir** is predicted to increase the exposure to **thrombin inhibitors (dabigatran)**. [Moderate] Theoretical
- Leflunomide** → see TABLE 1 p. 1447 (hepatotoxicity), TABLE 15 p. 1450 (myelosuppression)
- PHARMACOLOGY** Leflunomide has a long half-life; washout procedure recommended before switching to other DMARDs (consult product literature).
- ▶ **Leflunomide** is predicted to increase the exposure to **adefovir**. [Moderate] Theoretical
 - ▶ **Leflunomide** is predicted to decrease the exposure to **agomelatine**. [Moderate] Theoretical

Leflunomide (continued)

- ▶ **Leflunomide** is predicted to increase the exposure to **alpelisib**. [Moderate] Theoretical
- ▶ **Leflunomide** decreases the exposure to **aminophylline**. Adjust dose. [Moderate] Study
- ▶ **Leflunomide** is predicted to decrease the exposure to anaesthetics, local (**ropivacaine**). [Moderate] Theoretical
- ▶ **Leflunomide** is predicted to increase the exposure to **antihistamines, non-sedating (fexofenadine)**. [Moderate] Study
- ▶ **Leflunomide** is predicted to decrease the exposure to **antipsychotics, second generation (clozapine)**. [Moderate] Theoretical
- ▶ **Leflunomide** is predicted to decrease the exposure to **antipsychotics, second generation (olanzapine)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Leflunomide** is predicted to increase the exposure to **baricitinib**. [Moderate] Study
- ▶ **Leflunomide** is predicted to moderately increase the clearance of **caffeine citrate**. Monitor and adjust dose. [Moderate] Study
- ▶ **Leflunomide** is predicted to increase the exposure to **cephalosporins (cefactor)**. [Moderate] Theoretical
- ▶ **Leflunomide** increases the anticoagulant effect of **coumarins**. [Severe] Anecdotal
- ▶ **Leflunomide** is predicted to decrease the exposure to **duloxetine**. [Moderate] Theoretical
- ▶ **Leflunomide** is predicted to increase the exposure to **endothelin receptor antagonists (bosentan)**. [Moderate] Study
- ▶ **Filgotinib** is predicted to increase the risk of immunosuppression when given with **leflunomide**. Avoid. [Severe] Theoretical
- ▶ **Leflunomide** is predicted to increase the exposure to **ganciclovir**. [Moderate] Theoretical → Also see TABLE 15 p. 1450
- ▶ **Leflunomide** is predicted to increase the exposure to **H₂ receptor antagonists (cimetidine, famotidine)**. [Moderate] Theoretical
- ▶ **Leflunomide** is predicted to increase the exposure to **larotrectinib**. [Mild] Study
- ▶ **Leflunomide** is predicted to increase the concentration of **letermovir**. [Moderate] Study
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **leflunomide**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Leflunomide** is predicted to increase the exposure to **loop diuretics (furosemide)**. [Moderate] Theoretical
- ▶ **Leflunomide** is predicted to increase the exposure to **meglitinides (repaglinide)**. [Moderate] Study
- ▶ **Leflunomide** is predicted to decrease the exposure to **melatonin**. [Moderate] Theoretical
- ▶ **Leflunomide** is predicted to increase the exposure to **methotrexate**. [Moderate] Theoretical → Also see TABLE 1 p. 1447 → Also see TABLE 15 p. 1450
- ▶ **Leflunomide** is predicted to increase the clearance of **mexiletine**. Monitor and adjust dose. [Moderate] Study
- ▶ **Leflunomide** is predicted to increase the exposure to **montelukast**. [Moderate] Theoretical
- ▶ **Leflunomide** is predicted to increase the exposure to **NRTIs (zidovudine)**. [Moderate] Theoretical
- ▶ **Leflunomide** is predicted to increase the exposure to **NSAIDs (indometacin, ketoprofen)**. [Moderate] Theoretical
- ▶ **Leflunomide** is predicted to increase the exposure to **oseltamivir**. [Moderate] Theoretical
- ▶ **Leflunomide** is predicted to increase the exposure to the active metabolites of **ozanimod**. Avoid. [Moderate] Study
- ▶ **Leflunomide** is predicted to increase the exposure to **penicillins (benzylpenicillin)**. [Moderate] Theoretical
- ▶ **Leflunomide** is predicted to increase the exposure to **pioglitazone**. [Moderate] Study
- ▶ **Leflunomide** is predicted to decrease the exposure to **pirlfenidone**. [Moderate] Theoretical
- ▶ **Leflunomide** is predicted to increase the exposure to **quinolones (ciprofloxacin)**. [Moderate] Theoretical

- ▶ **Leflunomide** is predicted to increase the exposure to **rifamycins (rifampicin)**. [Moderate] Theoretical
 - ▶ **Leflunomide** is predicted to increase the exposure to **selexipag**. Adjust **selexipag** dose, p. 197. [Moderate] Study
 - ▶ **Leflunomide** is predicted to increase the exposure to **statins (atorvastatin, fluvastatin, pravastatin, simvastatin)**. [Moderate] Study → Also see TABLE 1 p. 1447
 - ▶ **Leflunomide** is predicted to increase the exposure to **statins (rosuvastatin)**. Adjust dose. [Moderate] Study → Also see TABLE 1 p. 1447
 - ▶ **Leflunomide** is predicted to increase the exposure to **sulfasalazine**. [Moderate] Study → Also see TABLE 1 p. 1447 → Also see TABLE 15 p. 1450
 - ▶ **Leflunomide** is predicted to increase the exposure to **sulfonylureas (glibenclamide)**. [Moderate] Study
 - ▶ **Leflunomide** is predicted to increase the exposure to **talazoparib**. Avoid or monitor. [Moderate] Theoretical → Also see TABLE 15 p. 1450
 - ▶ **Leflunomide** is predicted to increase the concentration of **taxanes (paclitaxel)**. [Severe] Anecdotal → Also see TABLE 15 p. 1450
 - ▶ **Leflunomide** is predicted to increase the exposure to **tenofovir alafenamide**. [Moderate] Theoretical
 - ▶ **Leflunomide** is predicted to increase the exposure to **tenofovir disoproxil**. [Moderate] Theoretical
 - ▶ **Leflunomide** is predicted to decrease the exposure to **theophylline**. Adjust dose. [Moderate] Study
 - ▶ **Leflunomide** moderately decreases the exposure to **tizanidine**. [Mild] Study
 - ▶ **Leflunomide** is predicted to increase the exposure to **topotecan**. [Moderate] Study → Also see TABLE 15 p. 1450
- Lenalidomide** → see TABLE 1 p. 1447 (hepatotoxicity), TABLE 15 p. 1450 (myelosuppression), TABLE 5 p. 1448 (thromboembolism)
- ▶ **Combined hormonal contraceptives** are predicted to increase the risk of venous thromboembolism when given with **lenalidomide**. Avoid. [Severe] Theoretical
 - ▶ **Hormone replacement therapy** is predicted to increase the risk of venous thromboembolism when given with **lenalidomide**. [Moderate] Theoretical
- Lenvatinib** → see TABLE 9 p. 1449 (QT-interval prolongation), TABLE 4 p. 1447 (antiplatelet effects)
- Lercanidipine** → see calcium channel blockers
- Letermovir**
- ▶ **Letermovir** is predicted to increase the exposure to **abemaciclib**. [Moderate] Study
 - ▶ **Letermovir** is predicted to increase the exposure to **acalabrutinib**. Avoid or monitor. [Severe] Study
 - ▶ **Letermovir** is predicted to increase the exposure to **aldosterone antagonists (eplerenone)**. Adjust **eplerenone** dose, p. 209. [Severe] Study
 - ▶ **Letermovir** is predicted to increase the exposure to **alpha blockers (tamsulosin)**. [Moderate] Theoretical
 - ▶ **Letermovir** is predicted to increase the concentration of **antiarrhythmics (amiodarone)**. [Moderate] Theoretical
 - ▶ **Letermovir** is predicted to increase the exposure to **antiarrhythmics (propafenone)**. Monitor and adjust dose. [Moderate] Study
 - ▶ **Antiepileptics (carbamazepine, phenobarbital, primidone)** are predicted to decrease the concentration of **letermovir**. [Moderate] Theoretical
 - ▶ **Letermovir** is predicted to decrease the concentration of **antiepileptics (fosphenytoin, phenytoin)** and **antiepileptics (fosphenytoin, phenytoin)** are predicted to decrease the concentration of **letermovir**. [Moderate] Theoretical
 - ▶ **Letermovir** slightly decreases the exposure to **antifungals, azoles (voriconazole)**. [Moderate] Study
 - ▶ **Letermovir** is predicted to increase the concentration of **antihistamines, non-sedating (fexofenadine)**. [Moderate] Theoretical
 - ▶ **Letermovir** is predicted to increase the exposure to **antihistamines, non-sedating (mizolastine)**. [Severe] Theoretical
 - ▶ **Letermovir** is predicted to increase the exposure to **antihistamines, non-sedating (rupatadine)**. Avoid. [Moderate] Study
 - ▶ **Letermovir** is predicted to increase the concentration of **antimalarials (piperazine)**. [Severe] Theoretical

- ▶ **Letermovir** is predicted to increase the exposure to antipsychotics, second generation (**cariprazine**). Avoid. [Severe] Study
- ▶ **Letermovir** is predicted to increase the exposure to antipsychotics, second generation (**quetiapine**). Avoid. [Moderate] Study
- ▶ **Letermovir** is predicted to increase the exposure to **avapritinib**. Avoid or adjust **avapritinib** dose, p. 1019. [Moderate] Study
- ▶ **Letermovir** is predicted to increase the exposure to **axitinib**. [Moderate] Study
- ▶ **Letermovir** is predicted to increase the exposure to **bedaquiline**. Avoid prolonged use. [Mild] Theoretical
- ▶ **Letermovir** is predicted to increase the exposure to benzodiazepines (**alprazolam**). [Severe] Study
- ▶ **Letermovir** is predicted to increase the exposure to benzodiazepines (**midazolam**). Monitor adverse effects and adjust dose. [Severe] Study
- ▶ **Letermovir** is predicted to increase the exposure to **bosutinib**. Avoid or adjust dose. [Severe] Study
- ▶ **Letermovir** is predicted to increase the exposure to **brigatinib**. [Moderate] Study
- ▶ **Letermovir** is predicted to increase the exposure to **buspiron**. Use with caution and adjust dose. [Moderate] Study
- ▶ **Letermovir** is predicted to increase the exposure to **cabozantinib**. [Moderate] Study
- ▶ **Letermovir** is predicted to increase the exposure to calcium channel blockers (**amlodipine, felodipine, lacidipine, lercanidipine, nifedipine, nimodipine**). Monitor and adjust dose. [Moderate] Study
- ▶ **Letermovir** is predicted to increase the exposure to **ceritinib**. [Moderate] Study
- ▶ **Letermovir** increases the exposure to **ciclosporin** and **ciclosporin** increases the exposure to **letermovir**. Monitor and adjust **letermovir** dose, p. 682. [Severe] Study
- ▶ **Letermovir** is predicted to increase the exposure to **cobimetinib**. [Severe] Study
- ▶ **Letermovir** is predicted to increase the exposure to **colchicine**. Adjust **colchicine** dose with moderate CYP3A4 inhibitors, p. 1175. [Severe] Study
- ▶ **Letermovir** is predicted to increase the exposure to corticosteroids (**methylprednisolone**). Monitor and adjust dose. [Moderate] Study
- ▶ **Letermovir** is predicted to decrease the concentration of coumarins (**warfarin**). Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Letermovir** is predicted to increase the exposure to **crizotinib**. [Moderate] Study
- ▶ **Letermovir** is predicted to increase the exposure to **dabrafenib**. [Moderate] Study
- ▶ **Letermovir** is predicted to increase the exposure to **darifenacin**. [Moderate] Study
- ▶ **Letermovir** is predicted to increase the exposure to **dasatinib**. [Severe] Study
- ▶ **Letermovir** is predicted to slightly increase the exposure to **dienogest**. [Moderate] Study
- ▶ **Letermovir** is predicted to increase the exposure to dipeptidylpeptidase-4 inhibitors (**saxagliptin**). [Mild] Study
- ▶ **Letermovir** is predicted to increase the exposure to **domperidone**. Avoid. [Severe] Study
- ▶ **Letermovir** is predicted to increase the exposure to dopamine receptor agonists (**bromocriptine**). [Severe] Theoretical
- ▶ **Letermovir** is predicted to moderately increase the exposure to **dutasteride**. [Mild] Study
- ▶ **Letermovir** is predicted to increase the exposure to **elxacaftor**. Adjust **tezaftor** with **ivacaftor** and **elxacaftor** p. 314 dose with moderate CYP3A4 inhibitors. [Severe] Theoretical
- ▶ **Letermovir** is predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
- ▶ **Eltrombopag** is predicted to increase the concentration of **letermovir**. [Moderate] Study
- ▶ **Letermovir** is predicted to moderately increase the exposure to **encorafenib**. [Moderate] Study
- ▶ **Letermovir** is predicted to increase the concentration of endothelin receptor antagonists (**bosentan**). [Moderate] Theoretical
- ▶ **Letermovir** is predicted to increase the exposure to **entrectinib**. Avoid moderate CYP3A4 inhibitors or adjust **entrectinib** dose, p. 1030. [Severe] Theoretical
- ▶ **Letermovir** is predicted to increase the risk of ergotism when given with **ergometrine**. [Severe] Theoretical
- ▶ **Letermovir** is predicted to increase the risk of ergotism when given with **ergotamine**. [Severe] Theoretical
- ▶ **Letermovir** is predicted to increase the exposure to **erlotinib**. [Moderate] Study
- ▶ **Letermovir** is predicted to increase the concentration of **everolimus**. Avoid or adjust dose. [Moderate] Study
- ▶ **Letermovir** is predicted to increase the exposure to **fesoterodine**. Adjust **fesoterodine** dose with moderate CYP3A4 inhibitors in hepatic and renal impairment, p. 824. [Mild] Study
- ▶ **Fibrates** (**gemfibrozil**) are predicted to increase the concentration of **letermovir**. [Moderate] Study
- ▶ **Letermovir** is predicted to increase the exposure to **gefitinib**. [Moderate] Study
- ▶ **Letermovir** is predicted to increase the concentration of **guanfacine**. Adjust **guanfacine** dose, p. 375. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors** (**atazanavir, lopinavir**) boosted with **ritonavir** are predicted to increase the concentration of **letermovir**. [Moderate] Study
- ▶ **HIV-protease inhibitors** (**ritonavir**) are predicted to decrease the concentration of **letermovir**. [Moderate] Theoretical
- ▶ **Letermovir** is predicted to increase the exposure to **ibrutinib**. Adjust **ibrutinib** dose with moderate CYP3A4 inhibitors, p. 1034. [Severe] Study
- ▶ **Letermovir** is predicted to increase the exposure to **imatinib**. [Moderate] Study
- ▶ **Letermovir** is predicted to increase the exposure to **ivacaftor**. Adjust dose with moderate CYP3A4 inhibitors, see **ivacaftor** p. 312, **tezaftor** with **ivacaftor** p. 314, and **tezaftor** with **ivacaftor** and **elxacaftor** p. 314. [Moderate] Study
- ▶ **Letermovir** is predicted to increase the exposure to **lapatinib**. [Moderate] Study
- ▶ **Leflunomide** is predicted to increase the concentration of **letermovir**. [Moderate] Study
- ▶ **Letermovir** is predicted to increase the exposure to **lomitapide**. Avoid. [Moderate] Theoretical
- ▶ **Macrolides** (**clarithromycin, erythromycin**) are predicted to increase the concentration of **letermovir**. [Moderate] Study
- ▶ **Letermovir** is predicted to increase the concentration of **meglitinides** (**repaglinide**). Avoid. [Moderate] Theoretical
- ▶ **Letermovir** is predicted to increase the exposure to **midostaurin**. [Moderate] Theoretical
- ▶ **Mdafinil** is predicted to decrease the concentration of **letermovir**. [Moderate] Theoretical
- ▶ **Letermovir** is predicted to increase the exposure to **naldemedine**. [Moderate] Study
- ▶ **Letermovir** is predicted to increase the exposure to **naloxegol**. Adjust **naloxegol** dose and monitor adverse effects, p. 71. [Moderate] Study
- ▶ **Letermovir** is predicted to increase the exposure to **neratinib**. Avoid moderate CYP3A4 inhibitors or adjust **neratinib** dose and monitor for gastrointestinal adverse effects, p. 1041. [Severe] Study
- ▶ **Letermovir** is predicted to increase the exposure to **nilotinib**. [Moderate] Study
- ▶ **NNRTIs** (**efavirenz**) are predicted to decrease the concentration of **letermovir**. [Moderate] Theoretical
- ▶ **NNRTIs** (**etravirine**) are predicted to decrease the exposure to **letermovir**. [Moderate] Theoretical
- ▶ **Letermovir** is predicted to increase the exposure to **olaparib**. Avoid moderate CYP3A4 inhibitors or adjust **olaparib** dose, p. 1057. [Moderate] Theoretical
- ▶ **Letermovir** is predicted to increase the exposure to opioids (**alfentanil, buprenorphine, fentanyl, oxycodone**). Monitor and adjust dose. [Moderate] Study
- ▶ **Letermovir** is predicted to increase the exposure to opioids (**methadone**). [Moderate] Theoretical
- ▶ **Letermovir** is predicted to increase the exposure to **pazopanib**. [Moderate] Study

Letemrovir (continued)

- ▶ **Letemrovir** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (avanafil)**. Adjust **avanafil** dose, p. 862. [\[Moderate\]](#) Theoretical
- ▶ **Letemrovir** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (sildenafil)**. Monitor or adjust **sildenafil** dose with moderate CYP3A4 inhibitors, p. 863. [\[Moderate\]](#) Study
- ▶ **Letemrovir** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (tadalafil)**. [\[Severe\]](#) Theoretical
- ▶ **Letemrovir** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (vardenafil)**. Adjust dose. [\[Severe\]](#) Theoretical
- ▶ **Letemrovir** is predicted to increase the exposure to **pimozide**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Letemrovir** is predicted to increase the exposure to **ponatinib**. [\[Moderate\]](#) Study
- ▶ **Letemrovir** is predicted to increase the exposure to **ranolazine**. [\[Severe\]](#) Study
- ▶ **Letemrovir** is predicted to increase the exposure to **regorafenib**. [\[Moderate\]](#) Study
- ▶ **Letemrovir** is predicted to increase the exposure to **ribociclib**. [\[Moderate\]](#) Study
- ▶ **Rifamycins (rifabutin)** are predicted to decrease the concentration of **letemrovir**. [\[Moderate\]](#) Theoretical
- ▶ **Rifamycins (rifampicin)** are predicted to affect the concentration of **letemrovir**. [\[Severe\]](#) Theoretical
- ▶ **Letemrovir** is predicted to increase the exposure to **ruxolitinib**. [\[Moderate\]](#) Study
- ▶ **Letemrovir** is predicted to increase the exposure to **siponimod**. Avoid depending on other drugs taken—consult product literature. [\[Severe\]](#) Study
- ▶ **Letemrovir** increases the concentration of **sirrolimus**. Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ **Letemrovir** is predicted to increase the exposure to **SSRIs (dapoxetine)**. Adjust **dapoxetine** dose with moderate CYP3A4 inhibitors, p. 870. [\[Moderate\]](#) Theoretical
- ▶ **St John's wort** is predicted to decrease the concentration of **letemrovir**. [\[Moderate\]](#) Theoretical
- ▶ **Letemrovir** moderately increases the exposure to **statins (atorvastatin)**. Avoid or adjust **atorvastatin** dose, p. 218. [\[Severe\]](#) Study
- ▶ **Letemrovir** is predicted to increase the exposure to **statins (fluvastatin)**. Monitor and adjust dose. [\[Moderate\]](#) Theoretical
- ▶ **Letemrovir** is predicted to increase the exposure to **statins (pravastatin)**. Avoid or adjust dose. [\[Moderate\]](#) Theoretical
- ▶ **Letemrovir** is predicted to increase the exposure to **statins (rosuvastatin, simvastatin)**. Avoid. [\[Severe\]](#) Study
- ▶ **Letemrovir** is predicted to increase the concentration of **sulfonyleureas (glibenclamide)**. [\[Moderate\]](#) Theoretical
- ▶ **Letemrovir** is predicted to increase the exposure to **sunitinib**. [\[Moderate\]](#) Study
- ▶ **Letemrovir** is predicted to increase the concentration of **tacrolimus**. [\[Severe\]](#) Study
- ▶ **Letemrovir** is predicted to increase the exposure to **taxanes (cabazitaxel)**. [\[Moderate\]](#) Theoretical
- ▶ **Teriflunomide** is predicted to increase the concentration of **letemrovir**. [\[Moderate\]](#) Study
- ▶ **Letemrovir** is predicted to increase the exposure to **tezacaftor**. Adjust dose with moderate CYP3A4 inhibitors, see **tezacaftor** with **ivacaftor** p. 314 and **tezacaftor** with **ivacaftor** and **elxacaftor** p. 314. [\[Severe\]](#) Study
- ▶ **Letemrovir** is predicted to decrease the concentration of **thrombin inhibitors (dabigatran)**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Letemrovir** given with a potent CYP2C19 inhibitor is predicted to increase the exposure to **tofacitinib**. Adjust **tofacitinib** dose, p. 1163. [\[Moderate\]](#) Study
- ▶ **Letemrovir** is predicted to increase the exposure to **tolvaptan**. Manufacturer advises caution or adjust **tolvaptan** dose with moderate CYP3A4 inhibitors, p. 711. [\[Moderate\]](#) Study
- ▶ **Letemrovir** is predicted to increase the exposure to **trazodone**. [\[Moderate\]](#) Theoretical
- ▶ **Letemrovir** is predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [\[Moderate\]](#) Study

- ▶ **Letemrovir** is predicted to increase the exposure to **vemurafenib**. [\[Severe\]](#) Theoretical
- ▶ **Letemrovir** is predicted to increase the exposure to **venetoclax**. Avoid or adjust dose—consult product literature. [\[Severe\]](#) Study
- ▶ **Letemrovir** is predicted to increase the exposure to **vinca alkaloids**. [\[Severe\]](#) Theoretical
- ▶ **Letemrovir** is predicted to increase the exposure to **zopiclone**. Adjust dose. [\[Moderate\]](#) Study

Levamisole

- ▶ **Albendazole** slightly decreases the exposure to **levamisole** and **levamisole** moderately decreases the exposure to **albendazole**. [\[Moderate\]](#) Study
- ▶ **Alcohol** potentially causes a disulfiram-like reaction when given with **levamisole**. [\[Moderate\]](#) Study
- ▶ **Levamisole** increases the exposure to **ivermectin**. [\[Moderate\]](#) Study

Levetiracetam → see antiepileptics

Levobunolol → see beta blockers, non-selective

Levobupivacaine → see anaesthetics, local

Levocetirizine → see antihistamines, non-sedating

Levodopa → see TABLE 8 p. 1448 (hypotension)

- ▶ **Antiepileptics (fosphenytoin, phenytoin)** decrease the effects of **levodopa**. [\[Moderate\]](#) Study
- ▶ **Antipsychotics, second generation (amisulpride)** are predicted to decrease the effects of **levodopa**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Antipsychotics, second generation (aripiprazole, clozapine, lurasidone, paliperidone)** are predicted to decrease the effects of **levodopa**. [\[Severe\]](#) Theoretical → Also see TABLE 8 p. 1448
- ▶ **Antipsychotics, second generation (asenapine)** are predicted to decrease the effects of **levodopa**. Adjust dose. [\[Severe\]](#) Theoretical → Also see TABLE 8 p. 1448
- ▶ **Antipsychotics, second generation (olanzapine)** decrease the effects of **levodopa**. Avoid or monitor worsening parkinsonian symptoms. [\[Severe\]](#) Anecdotal → Also see TABLE 8 p. 1448
- ▶ **Antipsychotics, second generation (quetiapine)** decrease the effects of **levodopa**. [\[Severe\]](#) Anecdotal → Also see TABLE 8 p. 1448
- ▶ **Antipsychotics, second generation (risperidone)** are predicted to decrease the effects of **levodopa**. Avoid or adjust dose. [\[Severe\]](#) Anecdotal → Also see TABLE 8 p. 1448
- ▶ **Baclofen** is predicted to increase the risk of adverse effects when given with **levodopa**. [\[Severe\]](#) Anecdotal → Also see TABLE 8 p. 1448
- ▶ **Benperidol** is predicted to decrease the effects of **levodopa**. [\[Severe\]](#) Study → Also see TABLE 8 p. 1448
- ▶ **Bupropion** increases the risk of adverse effects when given with **levodopa**. [\[Moderate\]](#) Study
- ▶ **Droperidol** decreases the effects of **levodopa**. [\[Severe\]](#) Study → Also see TABLE 8 p. 1448
- ▶ **Drugs with antimuscarinic effects** (see TABLE 10 p. 1449) decrease the absorption of **levodopa**. [\[Moderate\]](#) Theoretical
- ▶ **Entacapone** increases the exposure to **levodopa**. Monitor adverse effects and adjust dose. [\[Moderate\]](#) Study
- ▶ **Flupentixol** decreases the effects of **levodopa**. Avoid or monitor worsening parkinsonian symptoms. [\[Severe\]](#) Theoretical → Also see TABLE 8 p. 1448
- ▶ **Haloperidol** decreases the effects of **levodopa**. [\[Severe\]](#) Study → Also see TABLE 8 p. 1448
- ▶ Oral **iron** decreases the absorption of oral **levodopa**. [\[Moderate\]](#) Study
- ▶ **Isoniazid** decreases the effects of **levodopa**. [\[Moderate\]](#) Study
- ▶ **Levodopa** is predicted to increase the risk of elevated blood pressure when given with **linezolid**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Loxapine** is predicted to decrease the effects of **levodopa**. [\[Severe\]](#) Theoretical → Also see TABLE 8 p. 1448
- ▶ **MAO-B inhibitors** are predicted to increase the effects of **levodopa**. Adjust dose. [\[Mild\]](#) Study → Also see TABLE 8 p. 1448
- ▶ **Levodopa** increases the risk of a hypertensive crisis when given with **MAOIs, irreversible**. Avoid and for 14 days after stopping the MAOI. [\[Severe\]](#) Study → Also see TABLE 8 p. 1448
- ▶ **Memantine** is predicted to increase the effects of **levodopa**. [\[Moderate\]](#) Theoretical
- ▶ **Metoclopramide** decreases the effects of **levodopa**. Avoid. [\[Moderate\]](#) Study
- ▶ **Levodopa** increases the risk of adverse effects when given with **moclobemide**. [\[Moderate\]](#) Study

- ▶ **Opicapone** increases the exposure to **levodopa**. Adjust dose. [Moderate] Study
 - ▶ **Phenothiazines** decrease the effects of **levodopa**. Avoid or monitor worsening parkinsonian symptoms. [Severe] Study → Also see TABLE 8 p. 1448
 - ▶ **Pimozide** decreases the effects of **levodopa**. [Severe] Theoretical → Also see TABLE 8 p. 1448
 - ▶ **Sulpiride** is predicted to decrease the effects of **levodopa**. Avoid. [Severe] Theoretical → Also see TABLE 8 p. 1448
 - ▶ **Tetrabenazine** is predicted to decrease the effects of **levodopa**. Use with caution or avoid. [Moderate] Theoretical
 - ▶ **Tolcapone** increases the exposure to **levodopa**. Monitor and adjust dose. [Moderate] Study
 - ▶ **Tryptophan** greatly decreases the concentration of **levodopa**. [Moderate] Study
 - ▶ **Zuclopenthixol** is predicted to decrease the effects of **levodopa**. Avoid or monitor worsening parkinsonian symptoms. [Severe] Theoretical → Also see TABLE 8 p. 1448
- Levofloxacin** → see quinolones
Levofolinic acid → see folates
Levomoprazine → see phenothiazines
Levonorgestrel
- ▶ **Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate)** are predicted to decrease the efficacy of **levonorgestrel**. For FSRH guidance, see Contraceptives, interactions p. 843. [Severe] Theoretical
 - ▶ **Endothelin receptor antagonists (bosentan)** are predicted to decrease the efficacy of **levonorgestrel**. For FSRH guidance, see Contraceptives, interactions p. 843. [Severe] Theoretical
 - ▶ **Griseofulvin** potentially decreases the efficacy of oral **levonorgestrel**. For FSRH guidance, see Contraceptives, interactions p. 843. [Severe] Anecdotal
 - ▶ **HIV-protease inhibitors (ritonavir)** are predicted to decrease the efficacy of **levonorgestrel**. For FSRH guidance, see Contraceptives, interactions p. 843. [Severe] Theoretical
 - ▶ **Lumacaftor** is predicted to decrease the efficacy of **levonorgestrel**. Use additional contraceptive precautions. [Severe] Theoretical
 - ▶ **Modafinil** is predicted to decrease the efficacy of **levonorgestrel**. For FSRH guidance, see Contraceptives, interactions p. 843. [Severe] Theoretical
 - ▶ **Neurokinin-1 receptor antagonists (aprepitant, fosaprepitant)** are predicted to decrease the efficacy of **levonorgestrel**. For FSRH guidance, see Contraceptives, interactions p. 843. [Severe] Theoretical
 - ▶ **NNRTIs (efavirenz, nevirapine)** are predicted to decrease the efficacy of **levonorgestrel**. For FSRH guidance, see Contraceptives, interactions p. 843. [Severe] Theoretical
 - ▶ **Rifamycins** are predicted to decrease the efficacy of **levonorgestrel**. For FSRH guidance, see Contraceptives, interactions p. 843. [Severe] Theoretical
 - ▶ **St John's wort** is predicted to decrease the efficacy of **levonorgestrel**. MHRA advises avoid. For FSRH guidance, see Contraceptives, interactions p. 843. [Severe] Theoretical
 - ▶ **Sugammadex** is predicted to decrease the exposure to **levonorgestrel**. Use additional contraceptive precautions. [Severe] Theoretical
 - ▶ **Ulipristal** is predicted to decrease the efficacy of **levonorgestrel**. Avoid. [Severe] Theoretical
- Levothyroxine** → see thyroid hormones
Lidocaine → see antiarrhythmics
Linagliptin → see dipeptidylpeptidase-4 inhibitors
Linezolid → see TABLE 13 p. 1450 (serotonin syndrome)
- FOOD AND LIFESTYLE** Patients taking linezolid should avoid consuming large amounts of tyramine-rich foods (such as mature cheese, salami, pickled herring, Bovril[®], Oxo[®], Marmite[®] or any similar meat or yeast extract or fermented soya bean extract, and some beers, lagers or wines).
- ▶ **Beta₂ agonists** are predicted to increase the risk of elevated blood pressure when given with **linezolid**. Avoid. [Severe] Theoretical
 - ▶ **Bupropion** is predicted to increase the risk of intraoperative hypertension when given with **linezolid**. [Severe] Anecdotal
 - ▶ **Buspiron** is predicted to increase the risk of elevated blood pressure when given with **linezolid**. Avoid. [Severe] Theoretical
 - ▶ **Levodopa** is predicted to increase the risk of elevated blood pressure when given with **linezolid**. Avoid. [Severe] Theoretical
 - ▶ **Macrolides (clarithromycin)** increase the exposure to **linezolid**. [Moderate] Anecdotal
 - ▶ **MAO-B inhibitors (rasagiline, selegiline)** are predicted to increase the risk of adverse effects when given with **linezolid**. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical → Also see TABLE 13 p. 1450
 - ▶ **MAO-B inhibitors (safinamide)** are predicted to increase the risk of adverse effects when given with **linezolid**. Avoid and for 1 week after stopping **saquinamide**. [Severe] Theoretical → Also see TABLE 13 p. 1450
 - ▶ **MAOIs, irreversible** are predicted to increase the risk of adverse effects when given with **linezolid**. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical → Also see TABLE 13 p. 1450
 - ▶ **Methylphenidate** is predicted to increase the risk of elevated blood pressure when given with **linezolid**. Avoid. [Severe] Theoretical
 - ▶ **Moclobemide** is predicted to increase the risk of adverse effects when given with **linezolid**. Avoid and for 14 days after stopping **moclobemide**. [Severe] Theoretical → Also see TABLE 13 p. 1450
 - ▶ **Ozanimod** might increase the risk of a hypertensive crisis when given with **linezolid**. Avoid. [Severe] Theoretical
 - ▶ **Reboxetine** is predicted to increase the risk of a hypertensive crisis when given with **linezolid**. Avoid. [Severe] Theoretical
 - ▶ **Rifamycins (rifampicin)** slightly decrease the exposure to **linezolid**. [Moderate] Study
 - ▶ **Sympathomimetics, inotropic** are predicted to increase the risk of elevated blood pressure when given with **linezolid**. Avoid. [Severe] Theoretical
 - ▶ **Sympathomimetics, vasoconstrictor (adrenaline/epinephrine, ephedrine, isometheptene, noradrenaline/norepinephrine, phenylephrine)** are predicted to increase the risk of elevated blood pressure when given with **linezolid**. Avoid. [Severe] Theoretical
 - ▶ **Sympathomimetics, vasoconstrictor (pseudoephedrine)** increase the risk of elevated blood pressure when given with **linezolid**. Avoid. [Severe] Study
- Liothyronine** → see thyroid hormones
Liraglutide → see glucagon-like peptide-1 receptor agonists
Lisdexamfetamine → see amfetamines
Lisinopril → see ACE inhibitors
Lithium → see TABLE 13 p. 1450 (serotonin syndrome), TABLE 9 p. 1449 (QT-interval prolongation)
- ▶ **ACE inhibitors** are predicted to increase the concentration of **lithium**. Monitor and adjust dose. [Severe] Anecdotal
 - ▶ **Acetazolamide** alters the concentration of **lithium**. [Severe] Anecdotal
 - ▶ **Aldosterone antagonists (eplerenone)** potentially increase the concentration of **lithium**. Avoid. [Moderate] Theoretical
 - ▶ **Aldosterone antagonists (spironolactone)** potentially increase the concentration of **lithium**. [Moderate] Study
 - ▶ **Aminophylline** is predicted to decrease the concentration of **lithium**. [Moderate] Theoretical
 - ▶ **Angiotensin-II receptor antagonists** potentially increase the concentration of **lithium**. Monitor concentration and adjust dose. [Severe] Anecdotal
 - ▶ **Antiepileptics (carbamazepine, oxcarbazepine)** are predicted to increase the risk of neurotoxicity when given with **lithium**. [Severe] Anecdotal
 - ▶ **Antipsychotics, second generation (quetiapine, risperidone)** potentially increase the risk of neurotoxicity when given with **lithium**. [Severe] Anecdotal → Also see TABLE 9 p. 1449
 - ▶ **Calcitonins** decrease the concentration of **lithium**. Adjust dose. [Moderate] Study
 - ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the risk of neurotoxicity when given with **lithium**. [Severe] Anecdotal
 - ▶ **Loop diuretics** increase the concentration of **lithium**. Monitor and adjust dose. [Severe] Study
 - ▶ **Methyldopa** increases the risk of neurotoxicity when given with **lithium**. [Severe] Anecdotal

Lithium (continued)

- ▶ **Metronidazole** is predicted to increase the concentration of **lithium**. Avoid or adjust dose. [Severe] Anecdotal
- ▶ **Mexiletine** potentially affects the exposure to **lithium**. Avoid. [Unknown] Theoretical
- ▶ **NSAIDs** increase the concentration of **lithium**. Monitor and adjust dose. [Severe] Study
- ▶ **Phenothiazines** potentially increase the risk of neurotoxicity when given with **lithium**. [Severe] Anecdotal → Also see TABLE 9 p. 1449
- ▶ **Potassium-sparing diuretics (triamterene)** potentially increase the clearance of **lithium**. [Moderate] Study
- ▶ **Sodium bicarbonate** decreases the concentration of **lithium**. [Severe] Anecdotal
- ▶ **Sulpiride** potentially increases the risk of neurotoxicity when given with **lithium**. [Severe] Anecdotal → Also see TABLE 9 p. 1449
- ▶ **Tetracyclines** are predicted to increase the risk of **lithium** toxicity when given with **lithium**. Avoid or adjust dose. [Severe] Anecdotal
- ▶ **Theophylline** is predicted to decrease the concentration of **lithium**. Monitor concentration and adjust dose. [Moderate] Anecdotal
- ▶ **Thiazide diuretics** increase the concentration of **lithium**. Avoid or adjust dose and monitor concentration. [Severe] Study
- ▶ **Tricyclic antidepressants** potentially increase the risk of neurotoxicity when given with **lithium**. [Severe] Anecdotal → Also see TABLE 13 p. 1450 → Also see TABLE 9 p. 1449
- ▶ **Zuclopenthixol** potentially increases the risk of neurotoxicity when given with **lithium**. [Severe] Anecdotal → Also see TABLE 9 p. 1449

Live vaccines

Bacillus Calmette-Guérin vaccine · influenza vaccine (live) · measles, mumps and rubella vaccine, live · rotavirus vaccine · typhoid vaccine, oral · varicella-zoster vaccine · yellow fever vaccine, live

GENERAL INFORMATION Oral typhoid vaccine is inactivated by concurrent administration of antibacterials or antimalarials: antibacterials should be avoided for 3 days before and after oral typhoid vaccination; *mefloquine* should be avoided for at least 12 hours before or after oral typhoid vaccination; for other antimalarials oral typhoid vaccine vaccination should be completed at least 3 days before the first dose of the antimalarial (except proguanil hydrochloride with atovaquone, which can be given concurrently).

- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **abatcept**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **alkylating agents**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **amsacrine**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **anakinra**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **anthracyclines**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **azathioprine** (high-dose). Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **baricitinib**. Avoid. [Severe] Theoretical
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **belatacept**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **bleomycin**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **capecitabine**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **ciclosporin**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **cladribine**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **clofarabine**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **corticosteroids** (high-dose). Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **cytarabine**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **dactinomycin**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **dimethyl fumarate**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **etanercept**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **etoposide**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **everolimus**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **filgotinib**. Avoid. [Severe] Theoretical
- ▶ **Live vaccines** might increase the risk of generalised infection (possibly life-threatening) when given with **figulimod**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **fludarabine**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **flourouracil**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **gemcitabine**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **hydroxycarbamide**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Immunoglobulins (cytomegalovirus immunoglobulin)** are predicted to decrease the efficacy of **live vaccines**. Avoid. [Severe] Theoretical

- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **irinotecan**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **iron chelators (dexrazoxane)**. Avoid. [Severe] Theoretical
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **leflunomide**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **mercaptopurine** (high-dose). Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **methotrexate** (high-dose). Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **mitomycin**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **monoclonal antibodies**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **mycophenolate**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
 - ▶ **Live vaccines** might increase the risk of generalised infection (possibly life-threatening) when given with **ozanimod**. Avoid and for 3 months after stopping **ozanimod**. [Severe] Theoretical
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **pemetrexed**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **platinum compounds**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **procarbazine**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **ralitrexed**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
 - ▶ **Live vaccines** might increase the risk of generalised infection (possibly life-threatening) when given with **siponimod**. Avoid and for 4 weeks after stopping **siponimod**. [Severe] Theoretical
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **sirolimus**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **streptozocin**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **tacrolimus**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **taxanes (docetaxel, paclitaxel)**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **tegafur**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **temsirolimus**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **teriflunomide**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **tioguanine**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
 - ▶ **Live vaccines** potentially increase the risk of generalised infection (possibly life-threatening) when given with **tofacitinib**. Avoid. [Severe] Theoretical
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **topotecan**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **trabectedin**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **upadacitinib**. Avoid. [Severe] Theoretical
 - ▶ **Venetoclax** potentially decreases the efficacy of **live vaccines**. Avoid. [Severe] Theoretical
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **vinca alkaloids**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- Lixisenatide** → see glucagon-like peptide-1 receptor agonists
- Lofepramine** → see tricyclic antidepressants
- Lofexidine** → see TABLE 8 p. 1448 (hypotension), TABLE 9 p. 1449 (QT-interval prolongation), TABLE 11 p. 1449 (CNS depressant effects)
- Lomitapide** → see TABLE 1 p. 1447 (hepatotoxicity)
- FOOD AND LIFESTYLE** Bitter (Seville) orange is predicted to increase the exposure to lomitapide; separate administration by 12 hours.
- ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to **lomitapide**. Monitor and adjust dose. [Moderate] Theoretical
 - ▶ **Anti-androgens (bicalutamide)** are predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
 - ▶ **Antiarrhythmics (amiodarone)** are predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
 - ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to **lomitapide**. Avoid. [Moderate] Theoretical
 - ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **lomitapide**. Monitor and adjust dose. [Moderate] Theoretical → Also see TABLE 1 p. 1447
 - ▶ **Antifungals, azoles (clotrimazole)** are predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
 - ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **lomitapide**. Avoid. [Moderate] Theoretical → Also see TABLE 1 p. 1447
 - ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to markedly increase the exposure to **lomitapide**. Avoid. [Severe] Study → Also see TABLE 1 p. 1447
 - ▶ **Benzodiazepines (alprazolam)** are predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
 - ▶ **Calcium channel blockers (amlodipine, lacidipine)** are predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
 - ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **lomitapide**. Avoid. [Moderate] Theoretical
 - ▶ **Ciclosporin** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
 - ▶ **Cilostazol** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical

Lomitapide (continued)

- ▶ **Cobicistat** is predicted to markedly increase the exposure to **lomitapide**. Avoid. [Severe] Study
- ▶ Oral **combined hormonal contraceptives** slightly increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
- ▶ **Lomitapide** increases the exposure to **coumarins (warfarin)**. Monitor INR and adjust dose. [Severe] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **lomitapide**. Avoid. [Moderate] Theoretical
- ▶ **Dipeptidylpeptidase-4 inhibitors (linagliptin)** are predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
- ▶ **Everolimus** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Mild] Theoretical
- ▶ **Grapefruit** juice is predicted to increase the exposure to **lomitapide**. Avoid. [Mild] Theoretical
- ▶ **H₂ receptor antagonists (cimetidine)** are predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Mild] Theoretical
- ▶ **H₂ receptor antagonists (ranitidine)** are predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to markedly increase the exposure to **lomitapide**. Avoid. [Severe] Study
- ▶ **Idelalisib** is predicted to markedly increase the exposure to **lomitapide**. Avoid. [Severe] Study
- ▶ **Imatinib** is predicted to increase the exposure to **lomitapide**. Avoid. [Moderate] Theoretical
- ▶ **Isoniazid** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Unknown] Theoretical → Also see TABLE 1 p. 1447
- ▶ **Ivacaftor** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
- ▶ **Lapatinib** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Mild] Theoretical
- ▶ **Letermovir** is predicted to increase the exposure to **lomitapide**. Avoid. [Moderate] Theoretical
- ▶ **Macrolides (azithromycin)** are predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
- ▶ **Macrolides (clarithromycin)** are predicted to markedly increase the exposure to **lomitapide**. Avoid. [Severe] Study
- ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **lomitapide**. Avoid. [Moderate] Theoretical
- ▶ **Mitotane** is predicted to decrease the exposure to **lomitapide**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to increase the exposure to **lomitapide**. Avoid. [Moderate] Theoretical
- ▶ **Neurokinin-1 receptor antagonists (fosaprepitant)** are predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Mild] Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to **lomitapide**. Avoid. [Moderate] Theoretical
- ▶ **Pazopanib** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Mild] Theoretical
- ▶ **Peppermint** oil is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
- ▶ **Propiverine** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
- ▶ **Ranolazine** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Mild] Theoretical
- ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **lomitapide**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **SSRIs (fluoxetine)** are predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Unknown] Theoretical
- ▶ **SSRIs (fluvoxamine)** are predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Mild] Theoretical

- ▶ **Lomitapide** increases the exposure to **statins (atorvastatin)**. Adjust **lomitapide** dose or separate administration by 12 hours, p. 224. [Mild] Study → Also see TABLE 1 p. 1447
 - ▶ **Lomitapide** increases the exposure to **statins (simvastatin)**. Monitor and adjust **simvastatin** dose, p. 221. [Moderate] Study → Also see TABLE 1 p. 1447
 - ▶ **Tacrolimus** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
 - ▶ **Ticagrelor** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
 - ▶ **Tolvaptan** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
- Losmoline** → see alkylating agents
- Loop diuretics** → see TABLE 18 p. 1451 (hyponatraemia), TABLE 8 p. 1448 (hypotension), TABLE 19 p. 1451 (ototoxicity), TABLE 17 p. 1451 (reduced serum potassium)

bumetanide - furosemide - torasemide

- ▶ **Aliskiren** slightly decreases the exposure to **furosemide**. [Moderate] Study → Also see TABLE 8 p. 1448
- ▶ **Loop diuretics** increase the risk of nephrotoxicity when given with **aminoglycosides**. Avoid. [Moderate] Study → Also see TABLE 19 p. 1451
- ▶ **Antiepileptics (fosphenytoin, phenytoin)** decrease the effects of **furosemide**. [Moderate] Study
- ▶ Intravenous **furosemide** potentially increases the risk of sweating, variable blood pressure, and tachycardia when given after **chloral hydrate**. [Moderate] Anecdotal
- ▶ **Immunoglobulins (cytomegalovirus immunoglobulin)** are predicted to increase the risk of adverse effects when given with **loop diuretics**. Avoid. [Moderate] Theoretical
- ▶ **Loop diuretics** might increase the risk of adverse effects when given with **immunoglobulins (normal immunoglobulin)**. Avoid. [Moderate] Theoretical
- ▶ **Leflunomide** is predicted to increase the exposure to **furosemide**. [Moderate] Theoretical
- ▶ **Loop diuretics** increase the concentration of **lithium**. Monitor and adjust dose. [Severe] Study
- ▶ **Nitisinone** is predicted to increase the exposure to **furosemide**. [Moderate] Study
- ▶ **Reboxetine** is predicted to increase the risk of hypokalaemia when given with **loop diuretics**. [Moderate] Theoretical
- ▶ **Teriflunomide** is predicted to increase the exposure to **furosemide**. [Moderate] Study
- ▶ **Furosemide** might slightly decrease the clearance of **treprostinil**. [Unknown] Theoretical → Also see TABLE 8 p. 1448

Loperamide

- ▶ **Antiarrhythmics (dronedaron)** are predicted to increase the exposure to **loperamide**. [Severe] Theoretical
- ▶ **Ceritinib** is predicted to increase the exposure to **loperamide**. [Moderate] Theoretical
- ▶ **Loperamide** greatly increases the absorption of oral **desmopressin** (and possibly sublingual). [Moderate] Study
- ▶ **Eliglustat** is predicted to increase the exposure to **loperamide**. Adjust dose. [Moderate] Study
- ▶ **Ibrutinib** is predicted to increase the exposure to **loperamide**. Separate administration by at least 6 hours. [Moderate] Theoretical
- ▶ **Ivacaftor** is predicted to increase the exposure to **loperamide**. [Moderate] Study
- ▶ **Lapatinib** is predicted to increase the exposure to **loperamide**. [Moderate] Theoretical
- ▶ **Lorlatinib** is predicted to decrease the exposure to **loperamide**. [Moderate] Study
- ▶ **Mirabegron** is predicted to increase the exposure to **loperamide**. [Mild] Theoretical
- ▶ **Neratinib** is predicted to increase the exposure to **loperamide**. [Moderate] Study
- ▶ **Olaparib** might increase the exposure to **loperamide**. [Moderate] Theoretical
- ▶ **Opicapone** is predicted to increase the exposure to **loperamide**. Avoid. [Moderate] Study
- ▶ **Osimertinib** is predicted to increase the exposure to **loperamide**. [Moderate] Study
- ▶ **Pibrentasvir** with glecaprevir is predicted to increase the exposure to **loperamide**. [Moderate] Study

- ▶ **Pitolisant** is predicted to decrease the exposure to **loperamide**. [Mild] Theoretical
- ▶ **Vandetanib** is predicted to increase the exposure to **loperamide**. [Moderate] Study
- ▶ **Velpatasvir** is predicted to increase the exposure to **loperamide**. [Severe] Theoretical
- ▶ **Vemurafenib** might increase the exposure to **loperamide**. Use with caution and adjust dose. [Moderate] Theoretical
- Lopinavir** → see HIV-protease inhibitors
- Loprazolam** → see benzodiazepines
- Loratadine** → see antihistamines, non-sedating
- Lorazepam** → see benzodiazepines
- Lorlatinib**
 - ▶ **Lorlatinib** is predicted to decrease the exposure to **aliskiren**. [Moderate] Study
 - ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to **lorlatinib**. Avoid. [Severe] Study
 - ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **lorlatinib**. Avoid. [Severe] Study
 - ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **lorlatinib**. Avoid or adjust **lorlatinib** dose, p. 1040. [Severe] Study
 - ▶ **Lorlatinib** decreases the exposure to **antihistamines, non-sedating (fexofenadine)**. [Moderate] Study
 - ▶ **Lorlatinib** moderately decreases the exposure to **benzodiazepines (midazolam)**. Avoid. [Moderate] Study
 - ▶ **Lorlatinib** is predicted to decrease the exposure to **ciclosporin**. Avoid. [Moderate] Theoretical
 - ▶ **Cobicistat** is predicted to increase the exposure to **lorlatinib**. Avoid or adjust **lorlatinib** dose, p. 1040. [Severe] Study
 - ▶ **Lorlatinib** is predicted to decrease the exposure to **colchicine**. [Moderate] Study
 - ▶ **Lorlatinib** is predicted to decrease the exposure to **combined hormonal contraceptives**. Avoid. [Moderate] Theoretical
 - ▶ **Lorlatinib** is predicted to decrease the exposure to **coumarins**. [Moderate] Theoretical
 - ▶ **Lorlatinib** is predicted to decrease the exposure to **digoxin**. [Moderate] Study
 - ▶ **Lorlatinib** is predicted to decrease the exposure to **ergotamine**. Avoid. [Moderate] Theoretical
 - ▶ **Lorlatinib** is predicted to decrease the exposure to **everolimus**. Avoid. [Moderate] Study
 - ▶ **Lorlatinib** is predicted to decrease the exposure to **factor XA inhibitors (edoxaban, rivaroxaban)**. [Moderate] Study
 - ▶ **Grapefruit** juice is predicted to increase the concentration of **lorlatinib**. Avoid. [Moderate] Theoretical
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **lorlatinib**. Avoid or adjust **lorlatinib** dose, p. 1040. [Severe] Study
 - ▶ **Idelalisib** is predicted to increase the exposure to **lorlatinib**. Avoid or adjust **lorlatinib** dose, p. 1040. [Severe] Study
 - ▶ **Lorlatinib** is predicted to decrease the exposure to **loperamide**. [Moderate] Study
 - ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **lorlatinib**. Avoid or adjust **lorlatinib** dose, p. 1040. [Severe] Study
 - ▶ **Mitotane** is predicted to decrease the exposure to **lorlatinib**. Avoid. [Severe] Study
 - ▶ **Lorlatinib** is predicted to decrease the exposure to **opioids (alfentanil, fentanyl)**. Avoid. [Moderate] Theoretical
 - ▶ **Lorlatinib** is predicted to decrease the exposure to **pimozide**. Avoid. [Moderate] Theoretical
 - ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **lorlatinib**. Avoid. [Severe] Study
 - ▶ **Lorlatinib** is predicted to decrease the exposure to **sirolimus**. Avoid. [Moderate] Theoretical
 - ▶ **St John's wort** is predicted to decrease the exposure to **lorlatinib**. Avoid. [Severe] Theoretical
 - ▶ **Lorlatinib** is predicted to decrease the exposure to **tacrolimus**. Avoid. [Moderate] Theoretical
 - ▶ **Lorlatinib** is predicted to decrease the exposure to **talazoparib**. [Moderate] Study
 - ▶ **Lorlatinib** is predicted to decrease the exposure to **taxanes (paclitaxel)**. [Moderate] Study
- ▶ **Lorlatinib** is predicted to decrease the exposure to **thrombin inhibitors (dabigatran)**. [Moderate] Study
- ▶ **Lorlatinib** is predicted to decrease the exposure to **topotecan**. [Moderate] Study
- Lormetazepam** → see benzodiazepines
- Losartan** → see angiotensin-II receptor antagonists
- Low molecular-weight heparins** → see TABLE 16 p. 1451 (increased serum potassium), TABLE 3 p. 1447 (anticoagulant effects)
 - dalteparin · enoxaparin · tinzaparin
- ▶ **Andexanet alfa** is predicted to affect the anticoagulant effect of **low molecular-weight heparins**. Avoid. [Severe] Theoretical
- ▶ **Ranibizumab** increases the risk of bleeding events when given with **low molecular-weight heparins**. [Severe] Theoretical
- Loxapine** → see TABLE 8 p. 1448 (hypotension), TABLE 11 p. 1449 (CNS depressant effects), TABLE 10 p. 1449 (antimuscarinics)
 - ▶ **Combined hormonal contraceptives** is predicted to increase the exposure to **loxapine**. Avoid. [Unknown] Theoretical
 - ▶ **Loxapine** is predicted to decrease the effects of **dopamine receptor agonists**. [Moderate] Theoretical → Also see TABLE 8 p. 1448 → Also see TABLE 10 p. 1449
 - ▶ **Loxapine** is predicted to decrease the effects of **levodopa**. [Severe] Theoretical → Also see TABLE 8 p. 1448
 - ▶ **Mexiletine** is predicted to increase the exposure to **loxapine**. Avoid. [Unknown] Theoretical
 - ▶ **Quinolones (ciprofloxacin)** are predicted to increase the exposure to **loxapine**. Avoid. [Unknown] Theoretical
 - ▶ **Rucaparib** is predicted to increase the exposure to **loxapine**. Avoid. [Unknown] Theoretical
 - ▶ **SSRIs (fluvoxamine)** are predicted to increase the exposure to **loxapine**. Avoid. [Unknown] Theoretical
 - ▶ **Vemurafenib** is predicted to increase the exposure to **loxapine**. Avoid. [Unknown] Theoretical
- Lumacaftor**
 - ▶ **Lumacaftor** is predicted to decrease the exposure to **antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)**. Avoid. [Severe] Theoretical
 - ▶ **Lumacaftor** is predicted to decrease the exposure to **antifungals, azoles (itraconazole, ketoconazole, posaconazole, voriconazole)**. Avoid or monitor efficacy. [Moderate] Theoretical
 - ▶ **Lumacaftor** is predicted to decrease the exposure to **benzodiazepines (midazolam)**. Avoid. [Severe] Theoretical
 - ▶ **Lumacaftor** is predicted to decrease the exposure to **bupropion**. Adjust dose. [Moderate] Theoretical
 - ▶ **Lumacaftor** is predicted to decrease the exposure to **ciclosporin**. Avoid. [Severe] Theoretical
 - ▶ **Lumacaftor** is predicted to decrease the exposure to **combined hormonal contraceptives**. Use additional contraceptive precautions. [Severe] Theoretical
 - ▶ **Lumacaftor** is predicted to decrease the exposure to **corticosteroids (methylprednisolone)**. Adjust dose. [Severe] Theoretical
 - ▶ **Lumacaftor** might decrease the efficacy of subdermal **etonogestrel**. Use additional contraceptive precautions. [Severe] Theoretical
 - ▶ **Lumacaftor** is predicted to decrease the exposure to **everolimus**. Avoid. [Severe] Theoretical
 - ▶ **Lumacaftor** potentially decreases the exposure to **glecaprevir**. Avoid. [Severe] Theoretical
 - ▶ **Lumacaftor** is predicted to decrease the efficacy of **levonorgestrel**. Use additional contraceptive precautions. [Severe] Theoretical
 - ▶ **Lumacaftor** is predicted to decrease the exposure to **macrolides (clarithromycin, erythromycin)**. [Moderate] Theoretical
 - ▶ **Lumacaftor** is predicted to decrease the exposure to **NNRTIs (doravirine)**. Avoid. [Severe] Theoretical
 - ▶ **Lumacaftor** potentially decreases the exposure to **pibrentasvir**. Avoid. [Severe] Theoretical
 - ▶ **Lumacaftor** might decrease the efficacy of oral **progestogen-only contraceptives**. Use additional contraceptive precautions. [Severe] Theoretical
 - ▶ **Lumacaftor** is predicted to decrease the exposure to **rifamycins (rifabutin)**. Adjust dose. [Moderate] Theoretical
 - ▶ **Lumacaftor** is predicted to decrease the exposure to **sirolimus**. Avoid. [Severe] Theoretical

Lumacaftor (continued)

- ▶ **Lumacaftor** is predicted to decrease the exposure to **tacrolimus**. Avoid. [Severe] Theoretical
- ▶ **Lumacaftor** is predicted to decrease the exposure to **temsirolimus**. Avoid. [Severe] Theoretical
- ▶ **Lumacaftor** is predicted to decrease the efficacy of **ulipristal**. Use additional contraceptive precautions. [Severe] Theoretical

Lumefantrine → see antimalarials

Lurasidone → see antipsychotics, second generation

Lymecycline → see tetracyclines

Macitentan → see endothelin receptor antagonists

Macrolides → see TABLE 9 p. 1449 (QT-interval prolongation)

azithromycin · clarithromycin · erythromycin

- ▶ Interactions do not generally apply to topical use of **azithromycin** unless specified.
- ▶ Since systemic absorption can follow topical application of **erythromycin**, the possibility of interactions should be borne in mind.

- ▶ **Clarithromycin** is predicted to increase the exposure to **abemaciclib**. Avoid or adjust **abemaciclib** dose, p. 1015. [Severe] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **abemaciclib**. [Moderate] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **acalabrutinib**. Avoid. [Severe] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **acalabrutinib**. Avoid or monitor. [Severe] Study
- ▶ **Macrolides** are predicted to increase the exposure to **afatinib**. Separate administration by 12 hours. [Moderate] Study
- ▶ **Clarithromycin** is predicted to markedly increase the exposure to **aldosterone antagonists (eplerenone)**. Avoid. [Severe] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **aldosterone antagonists (eplerenone)**. Adjust **eplerenone** dose, p. 209. [Severe] Study
- ▶ **Azithromycin** is predicted to increase the exposure to **aliskiren**. [Moderate] Theoretical
- ▶ **Macrolides (clarithromycin, erythromycin)** are predicted to increase the exposure to **aliskiren**. [Moderate] Study
- ▶ **Clarithromycin** is predicted to moderately increase the exposure to **alpha blockers (alfuzosin, tamsulosin)**. Use with caution or avoid. [Moderate] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **alpha blockers (doxazosin)**. [Moderate] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **alpha blockers (tamsulosin)**. [Moderate] Theoretical
- ▶ **Azithromycin** is predicted to increase the exposure to **aminophylline**. [Moderate] Theoretical
- ▶ **Clarithromycin** is predicted to increase the exposure to **aminophylline**. Adjust dose. [Moderate] Theoretical
- ▶ **Aminophylline** is predicted to decrease the exposure to **erythromycin**. Adjust dose. [Severe] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **anti-androgens (apalutamide)**. [Mild] Study → Also see TABLE 9 p. 1449
- ▶ **Clarithromycin** is predicted to increase the exposure to **anti-androgens (darolutamide)**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Clarithromycin** very markedly increases the exposure to **antiarrhythmics (dronedarone)**. Avoid. [Severe] Study → Also see TABLE 9 p. 1449
- ▶ **Erythromycin** is predicted to moderately increase the exposure to **antiarrhythmics (dronedarone)**. Avoid. [Severe] Theoretical → Also see TABLE 9 p. 1449
- ▶ **Macrolides (clarithromycin, erythromycin)** are predicted to increase the exposure to **antiarrhythmics (lidocaine)**. [Moderate] Theoretical
- ▶ **Clarithromycin** is predicted to increase the exposure to **antiarrhythmics (propafenone)**. Monitor and adjust dose. [Severe] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **antiarrhythmics (propafenone)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **anticholinesterases, centrally acting (galantamine)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Clarithromycin** slightly increases the concentration of **antiepileptics (carbamazepine)**. Monitor concentration and adjust dose. [Severe] Study
- ▶ **Erythromycin** markedly increases the concentration of **antiepileptics (carbamazepine)**. Monitor concentration and adjust dose. [Severe] Study
- ▶ **Clarithromycin** is predicted to very slightly increase the exposure to **antiepileptics (perampanel)**. [Mild] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **antifungals, azoles (isavuconazole)**. Avoid or monitor adverse effects. [Severe] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **antifungals, azoles (isavuconazole)**. [Moderate] Theoretical
- ▶ **Clarithromycin** is predicted to increase the exposure to **antihistamines, non-sedating (mizolastine)**. Avoid. [Severe] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **antihistamines, non-sedating (mizolastine)**. [Severe] Theoretical
- ▶ **Macrolides (clarithromycin, erythromycin)** are predicted to increase the exposure to **antihistamines, non-sedating (rupatadine)**. Avoid. [Moderate] Study
- ▶ **Macrolides (clarithromycin, erythromycin)** are predicted to increase the concentration of **antimalarials (piperaquine)**. [Severe] Theoretical
- ▶ **Clarithromycin** is predicted to slightly increase the exposure to **antipsychotics, second generation (aripiprazole)**. Adjust **aripiprazole** dose, p. 418. [Moderate] Study
- ▶ **Clarithromycin** is predicted to moderately increase the exposure to **antipsychotics, second generation (cariprazine)**. Avoid. [Severe] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **antipsychotics, second generation (cariprazine)**. Avoid. [Severe] Study
- ▶ **Erythromycin** potentially increases the risk of toxicity when given with **antipsychotics, second generation (clozapine)**. [Severe] Anecdotal
- ▶ **Erythromycin** is predicted to increase the exposure to **antipsychotics, second generation (lurasidone)**. Adjust **lurasidone** dose. [Moderate] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **antipsychotics, second generation (lurasidone, quetiapine)**. Avoid. [Severe] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **antipsychotics, second generation (quetiapine)**. Avoid. [Moderate] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **antipsychotics, second generation (risperidone)**. Adjust dose. [Moderate] Study → Also see TABLE 9 p. 1449
- ▶ **Clarithromycin** is predicted to increase the exposure to **avapritinib**. Avoid. [Moderate] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **avapritinib**. Avoid or adjust **avapritinib** dose, p. 1019. [Moderate] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **axitinib**. Avoid or adjust dose. [Moderate] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **axitinib**. [Moderate] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **bedaquiline**. Avoid prolonged use. [Mild] Study → Also see TABLE 9 p. 1449
- ▶ **Erythromycin** is predicted to increase the exposure to **bedaquiline**. Avoid prolonged use. [Mild] Theoretical → Also see TABLE 9 p. 1449
- ▶ **Clarithromycin** moderately increases the exposure to **benzodiazepines (alprazolam)**. Avoid. [Moderate] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **benzodiazepines (alprazolam)**. [Severe] Study
- ▶ **Clarithromycin** is predicted to markedly to very markedly increase the exposure to **benzodiazepines (midazolam)**. Avoid or adjust dose. [Severe] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **benzodiazepines (midazolam)**. Monitor adverse effects and adjust dose. [Severe] Study
- ▶ **Macrolides** are predicted to increase the exposure to **beta blockers, non-selective (nadolol)**. [Moderate] Study

- ▶ **Clarithromycin** is predicted to increase the exposure to **beta₂ agonists (salmeterol)**. Avoid. [Severe] Study
- ▶ **Macrolides** are predicted to increase the exposure to **bictegravir**. Use with caution or avoid. [Moderate] Theoretical
- ▶ **Clarithromycin** slightly increases the exposure to **bortezomib**. [Moderate] Study
 - ▶ Macrolides (**clarithromycin, erythromycin**) are predicted to increase the exposure to **bosutinib**. Avoid or adjust dose. [Severe] Study → Also see TABLE 9 p. 1449
- ▶ **Clarithromycin** is predicted to increase the exposure to **brigatinib**. Avoid or adjust brigatinib dose, p. 1022. [Severe] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **brigatinib**. [Moderate] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **buspiron**. Adjust buspiron dose, p. 364. [Severe] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **buspiron**. Use with caution and adjust dose. [Moderate] Study
- ▶ Macrolides (**clarithromycin, erythromycin**) are predicted to increase the exposure to **cabozantinib**. [Moderate] Study → Also see TABLE 9 p. 1449
- ▶ **Erythromycin** is predicted to increase the exposure to **calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nifedipine, nimodipine)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **calcium channel blockers (amlodipine, felodipine, lacidipine, nifedipine, nimodipine)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **calcium channel blockers (diltiazem)**. [Severe] Theoretical
- ▶ **Clarithromycin** is predicted to increase the exposure to **calcium channel blockers (diltiazem, verapamil)**. [Severe] Study
- ▶ **Clarithromycin** is predicted to markedly increase the exposure to **calcium channel blockers (lercanidipine)**. Avoid. [Severe] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **calcium channel blockers (verapamil)**. [Severe] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **cannabidiol**. Avoid or adjust dose. [Mild] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **ceritinib**. Avoid or adjust ceritinib dose, p. 1024. [Severe] Study → Also see TABLE 9 p. 1449
- ▶ **Erythromycin** is predicted to increase the exposure to **ceritinib**. [Moderate] Study → Also see TABLE 9 p. 1449
- ▶ **Clarithromycin** increases the concentration of **ciclosporin**. [Severe] Study
- ▶ **Erythromycin** is predicted to increase the concentration of **ciclosporin**. [Severe] Study
- ▶ **Clarithromycin** is predicted to moderately increase the exposure to **cilostazol**. Adjust cilostazol dose, p. 249. [Moderate] Study
- ▶ **Erythromycin** slightly increases the exposure to **cilostazol**. Adjust cilostazol dose, p. 249. [Moderate] Study
- ▶ **Clarithromycin** is predicted to moderately increase the exposure to **cinacalcet**. Adjust dose. [Moderate] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **cobimetinib**. Avoid or monitor for toxicity. [Severe] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **cobimetinib**. [Severe] Study
- ▶ **Azithromycin** is predicted to increase the exposure to **colchicine**. Avoid P-glycoprotein inhibitors or adjust colchicine dose, p. 1175. [Severe] Theoretical
- ▶ **Clarithromycin** is predicted to increase the exposure to **colchicine**. Avoid potent CYP3A4 inhibitors or adjust colchicine dose, p. 1175. [Severe] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **colchicine**. Adjust colchicine dose with moderate CYP3A4 inhibitors, p. 1175. [Severe] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **corticosteroids (beclomethasone)** (risk with beclomethasone is likely to be lower than with other corticosteroids). [Moderate] Theoretical
- ▶ **Clarithromycin** is predicted to increase the exposure to **corticosteroids (betamethasone, budesonide, ciclesonide, deflazacort, dexamethasone, fludrocortisone, fluticasone, hydrocortisone, methylprednisolone, mometasone, prednisolone, triamcinolone)**. Avoid or monitor adverse effects. [Severe] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **corticosteroids (methylprednisolone)**. Monitor and adjust dose. [Moderate] Study
- ▶ Macrolides (**clarithromycin, erythromycin**) increase the anticoagulant effect of **coumarins**. Monitor INR and adjust dose. [Severe] Anecdotal
- ▶ Macrolides (**clarithromycin, erythromycin**) are predicted to increase the exposure to **crizotinib**. Avoid. [Moderate] Study → Also see TABLE 9 p. 1449
- ▶ **Clarithromycin** is predicted to increase the exposure to **dabrafenib**. Use with caution or avoid. [Moderate] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **dabrafenib**. [Moderate] Study
- ▶ **Clarithromycin** is predicted to markedly to very markedly increase the exposure to **darifenacin**. Avoid. [Severe] Study
- ▶ **Erythromycin** slightly increases the exposure to **darifenacin**. [Moderate] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **dasatinib**. Avoid or adjust dose—consult product literature. [Severe] Study → Also see TABLE 9 p. 1449
- ▶ **Erythromycin** is predicted to increase the exposure to **dasatinib**. [Severe] Study → Also see TABLE 9 p. 1449
- ▶ **Clarithromycin** very slightly increases the exposure to **delamanid**. [Severe] Study → Also see TABLE 9 p. 1449
- ▶ **Clarithromycin** is predicted to moderately increase the exposure to **dienogest**. [Moderate] Study
- ▶ **Erythromycin** is predicted to slightly increase the exposure to **dienogest**. [Moderate] Study
- ▶ **Macrolides** increase the concentration of **digoxin**. [Severe] Anecdotal
- ▶ **Clarithromycin** is predicted to increase the exposure to **dipeptidylpeptidase-4 inhibitors (saxagliptin)**. [Moderate] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **dipeptidylpeptidase-4 inhibitors (saxagliptin)**. [Mild] Study
- ▶ Macrolides (**clarithromycin, erythromycin**) are predicted to increase the exposure to **domperidone**. Avoid. [Severe] Study
- ▶ **Clarithromycin** increases the exposure to **dopamine receptor agonists (bromocriptine)**. [Severe] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **dopamine receptor agonists (bromocriptine)**. [Severe] Theoretical
- ▶ Macrolides (**clarithromycin, erythromycin**) are predicted to increase the concentration of **dopamine receptor agonists (cabergoline)**. Avoid. [Severe] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **dronabinol**. Adjust dose. [Mild] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **drosiprone**. [Severe] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **dutasteride**. Monitor adverse effects and adjust dose. [Moderate] Theoretical
- ▶ **Erythromycin** is predicted to moderately increase the exposure to **dutasteride**. [Mild] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **elxacaftor**. Adjust tezacaftor with ivacaftor and elxacaftor p. 314 dose with potent CYP3A4 inhibitors. [Severe] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **elxacaftor**. Adjust tezacaftor with ivacaftor and elxacaftor p. 314 dose with moderate CYP3A4 inhibitors. [Severe] Theoretical
- ▶ Macrolides (**clarithromycin, erythromycin**) are predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **encorafenib**. Avoid or monitor. [Severe] Study → Also see TABLE 9 p. 1449
- ▶ **Erythromycin** is predicted to moderately increase the exposure to **encorafenib**. [Moderate] Study → Also see TABLE 9 p. 1449
- ▶ **Clarithromycin** is predicted to increase the exposure to **endothelin receptor antagonists (bosentan)**. [Moderate] Theoretical
- ▶ **Clarithromycin** is predicted to increase the exposure to **endothelin receptor antagonists (macitentan)**. [Moderate] Study

Macrolides (continued)

- ▶ **Clarithromycin** is predicted to increase the exposure to **entrectinib**. Avoid potent CYP3A4 inhibitors or adjust **entrectinib** dose, p. 1030. [\[Severe\]](#) Study → Also see **TABLE 9** p. 1449
- ▶ **Erythromycin** is predicted to increase the exposure to **entrectinib**. Avoid moderate CYP3A4 inhibitors or adjust **entrectinib** dose, p. 1030. [\[Severe\]](#) Theoretical → Also see **TABLE 9** p. 1449
- ▶ **Clarithromycin** is predicted to increase the risk of ergotism when given with **ergometrine**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Erythromycin** is predicted to increase the risk of ergotism when given with **ergometrine**. [\[Severe\]](#) Theoretical
- ▶ **Clarithromycin** is predicted to increase the risk of ergotism when given with **ergotamine**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Erythromycin** is predicted to increase the risk of ergotism when given with **ergotamine**. [\[Severe\]](#) Theoretical
- ▶ **Azithromycin** is predicted to increase the exposure to **erlotinib**. [\[Moderate\]](#) Theoretical
- ▶ **Clarithromycin** is predicted to increase the exposure to **erlotinib**. Use with caution and adjust dose. [\[Severe\]](#) Study
- ▶ **Erythromycin** is predicted to increase the exposure to **erlotinib**. [\[Moderate\]](#) Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **esketamine**. Adjust dose. [\[Moderate\]](#) Study
- ▶ **Clarithromycin** is predicted to increase the concentration of **everolimus**. Avoid. [\[Severe\]](#) Study
- ▶ **Erythromycin** is predicted to increase the concentration of **everolimus**. Avoid or adjust dose. [\[Moderate\]](#) Study
- ▶ **Clarithromycin** slightly increases the exposure to **factor XA inhibitors (apixaban)**. [\[Moderate\]](#) Study
- ▶ Macrolides (**azithromycin, erythromycin**) are predicted to increase the exposure to **factor XA inhibitors (apixaban)**. [\[Moderate\]](#) Theoretical
- ▶ **Erythromycin** slightly increases the exposure to **factor XA inhibitors (edoxaban)**. Adjust **edoxaban** dose, p. 138. [\[Severe\]](#) Study
- ▶ Macrolides (**azithromycin, clarithromycin**) are predicted to increase the exposure to **factor XA inhibitors (edoxaban)**. [\[Severe\]](#) Theoretical
- ▶ **Erythromycin** slightly increases the exposure to **factor XA inhibitors (rivaroxaban)**. [\[Mild\]](#) Study
- ▶ **Clarithromycin** is predicted to moderately increase the exposure to **fosetorodine**. Adjust **fosetorodine** dose with potent CYP3A4 inhibitors; avoid in hepatic and renal impairment, p. 824. [\[Severe\]](#) Study
- ▶ **Erythromycin** is predicted to increase the exposure to **fosetorodine**. Adjust **fosetorodine** dose with moderate CYP3A4 inhibitors in hepatic and renal impairment, p. 824. [\[Mild\]](#) Study
- ▶ **Macrolides** are predicted to increase the exposure to **fidaxomicin**. Avoid. [\[Moderate\]](#) Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **fofostatinib**. Monitor adverse effects and adjust dose. [\[Moderate\]](#) Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **gefitinib**. [\[Severe\]](#) Study
- ▶ **Erythromycin** is predicted to increase the exposure to **gefitinib**. [\[Moderate\]](#) Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **gilteritinib**. [\[Moderate\]](#) Study
- ▶ Macrolides (**azithromycin, erythromycin**) are predicted to increase the exposure to **gilteritinib**. [\[Moderate\]](#) Theoretical
- ▶ **Clarithromycin** is predicted to moderately increase the exposure to **glasdegib**. Use with caution or avoid. [\[Moderate\]](#) Study → Also see **TABLE 9** p. 1449
- ▶ **Clarithromycin** is predicted to moderately to markedly increase the exposure to **grazoprevir**. Avoid. [\[Severe\]](#) Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **guanfacine**. Adjust **guanfacine** dose, p. 375. [\[Moderate\]](#) Study
- ▶ **Erythromycin** is predicted to increase the concentration of **guanfacine**. Adjust **guanfacine** dose, p. 375. [\[Moderate\]](#) Theoretical
- ▶ **H₂ receptor antagonists (cimetidine)** slightly increase the exposure to **erythromycin**. [\[Moderate\]](#) Study
- ▶ **HIV-protease inhibitors (atazanavir)** are predicted to increase the exposure to **clarithromycin**. Adjust dose in renal impairment. [\[Severe\]](#) Study
- ▶ **HIV-protease inhibitors (darunavir, fosamprenavir, lopinavir)** boosted with ritonavir are predicted to increase the exposure to **clarithromycin**. Adjust dose in renal impairment. [\[Severe\]](#) Study
- ▶ **HIV-protease inhibitors (ritonavir)** increase the exposure to **clarithromycin**. Adjust dose in renal impairment. [\[Severe\]](#) Study
- ▶ **HIV-protease inhibitors (tipranavir)** boosted with ritonavir increase the exposure to **clarithromycin** and **clarithromycin** increases the exposure to **HIV-protease inhibitors (tipranavir)** boosted with ritonavir. Monitor; adjust dose in renal impairment. [\[Severe\]](#) Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **erythromycin**. [\[Severe\]](#) Theoretical
- ▶ **Clarithromycin** is predicted to increase the exposure to **ibrutinib**. Avoid potent CYP3A4 inhibitors or adjust **ibrutinib** dose, p. 1034. [\[Severe\]](#) Study
- ▶ **Erythromycin** is predicted to increase the exposure to **ibrutinib**. Adjust **ibrutinib** dose with moderate CYP3A4 inhibitors, p. 1034. [\[Severe\]](#) Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **imatinib**. [\[Moderate\]](#) Study
- ▶ **Erythromycin** is predicted to increase the exposure to **imatinib**. [\[Moderate\]](#) Theoretical
- ▶ **Clarithromycin** is predicted to increase the risk of toxicity when given with **irinotecan**. Avoid. [\[Moderate\]](#) Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **ivabradine**. Avoid. [\[Severe\]](#) Study
- ▶ **Erythromycin** is predicted to increase the exposure to **ivabradine**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Clarithromycin** is predicted to increase the exposure to **ivacaftor**. Adjust dose with potent CYP3A4 inhibitors, see **ivacaftor** p. 312, **lumacaftor** with **ivacaftor** p. 312, **tezacaftor** with **ivacaftor** p. 314, and **tezacaftor** with **ivacaftor** and **elexacaftor** p. 314. [\[Severe\]](#) Study
- ▶ **Erythromycin** is predicted to increase the exposure to **ivacaftor**. Adjust dose with moderate CYP3A4 inhibitors, see **ivacaftor** p. 312, **tezacaftor** with **ivacaftor** p. 314, and **tezacaftor** with **ivacaftor** and **elexacaftor** p. 314. [\[Moderate\]](#) Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **lapatinib**. Avoid. [\[Moderate\]](#) Study → Also see **TABLE 9** p. 1449
- ▶ **Erythromycin** is predicted to increase the exposure to **lapatinib**. [\[Moderate\]](#) Study → Also see **TABLE 9** p. 1449
- ▶ **Clarithromycin** is predicted to moderately increase the exposure to **larotrectinib**. Avoid or adjust **larotrectinib** dose, p. 1038. [\[Moderate\]](#) Study
- ▶ Macrolides (**azithromycin, erythromycin**) are predicted to increase the exposure to **larotrectinib**. [\[Mild\]](#) Theoretical
- ▶ Macrolides (**clarithromycin, erythromycin**) are predicted to increase the concentration of **letermovir**. [\[Moderate\]](#) Study
- ▶ **Clarithromycin** increases the exposure to **linezolid**. [\[Moderate\]](#) Anecdotal
- ▶ **Azithromycin** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [\[Moderate\]](#) Theoretical
- ▶ **Clarithromycin** is predicted to markedly increase the exposure to **lomitapide**. Avoid. [\[Severe\]](#) Study
- ▶ **Erythromycin** is predicted to increase the exposure to **lomitapide**. Avoid. [\[Moderate\]](#) Theoretical
- ▶ **Clarithromycin** is predicted to increase the exposure to **lorlatinib**. Avoid or adjust **lorlatinib** dose, p. 1040. [\[Severe\]](#) Study
- ▶ **Lumacaftor** is predicted to decrease the exposure to macrolides (**clarithromycin, erythromycin**). [\[Moderate\]](#) Theoretical
- ▶ **Clarithromycin** is predicted to markedly increase the exposure to **maraviroc**. Adjust dose. [\[Severe\]](#) Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **meglitinides (repaglinide)**. [\[Moderate\]](#) Study
- ▶ **Clarithromycin** is predicted to very markedly increase the exposure to **midostaurin**. Avoid or monitor for toxicity. [\[Severe\]](#) Study
- ▶ **Erythromycin** is predicted to increase the exposure to **midostaurin**. [\[Moderate\]](#) Theoretical
- ▶ **Clarithromycin** is predicted to increase the exposure to **mirabegron**. Adjust **mirabegron** dose in hepatic and renal impairment, p. 828. [\[Moderate\]](#) Study

- ▶ **Clarithromycin** is predicted to increase the exposure to **mirtazapine**. [Moderate] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **modafinil**. [Mild] Theoretical
- ▶ **Clarithromycin** increases the risk of neutropenia when given with **monoclonal antibodies (brentuximab vedotin)**. Monitor and adjust dose. [Severe] Theoretical
- ▶ **Clarithromycin** is predicted to increase the exposure to **monoclonal antibodies (polatuzumab vedotin)**. [Moderate] Theoretical
- ▶ **Clarithromycin** is predicted to increase the exposure to **monoclonal antibodies (trastuzumab emtansine)**. Avoid. [Severe] Theoretical
- ▶ **Clarithromycin** is predicted to increase the exposure to **naldemedine**. Avoid or monitor. [Moderate] Study
- ▶ Macrolides (**azithromycin, erythromycin**) are predicted to increase the exposure to **naldemedine**. [Moderate] Study
- ▶ **Clarithromycin** is predicted to markedly increase the exposure to **naloxegol**. Avoid. [Severe] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **naloxegol**. Adjust **naloxegol** dose and monitor adverse effects, p. 71. [Moderate] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **neratinib**. Avoid potent CYP3A4 inhibitors or adjust **neratinib** dose, p. 1041. [Severe] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **neratinib**. Avoid moderate CYP3A4 inhibitors or adjust **neratinib** dose and monitor for gastrointestinal adverse effects, p. 1041. [Severe] Study
- ▶ **Clarithromycin** is predicted to markedly increase the exposure to **neurokinin-1 receptor antagonists (aprepitant)**. [Moderate] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **neurokinin-1 receptor antagonists (aprepitant)**. [Moderate] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **neurokinin-1 receptor antagonists (fosaprepitant)**. [Moderate] Theoretical
- ▶ **Clarithromycin** is predicted to increase the exposure to **neurokinin-1 receptor antagonists (netupitant)**. [Moderate] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **nilotinib**. Avoid. [Severe] Study → Also see TABLE 9 p. 1449
- ▶ **Erythromycin** is predicted to increase the exposure to **nilotinib**. [Moderate] Study → Also see TABLE 9 p. 1449
- ▶ **Macrolides** are predicted to increase the exposure to **nintedanib**. [Moderate] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **nitisinone**. Adjust dose. [Moderate] Theoretical
- ▶ **NNRTIs (efavirenz, nevirapine)** decrease the exposure to **clarithromycin**. [Moderate] Study → Also see TABLE 9 p. 1449
- ▶ **NNRTIs (etravirine)** decrease the exposure to **clarithromycin** and **clarithromycin** slightly increases the exposure to **NNRTIs (etravirine)**. [Severe] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **NNRTIs (doravirine)**. [Mild] Study
- ▶ **Clarithromycin** decreases the absorption of **NRTIs (zidovudine)**. Separate administration by at least 2 hours. [Moderate] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **olaparib**. Avoid potent CYP3A4 inhibitors or adjust **olaparib** dose, p. 1057. [Moderate] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **olaparib**. Avoid moderate CYP3A4 inhibitors or adjust **olaparib** dose, p. 1057. [Moderate] Theoretical
- ▶ **Clarithromycin** is predicted to increase the exposure to **opioids (alfentanil, buprenorphine, fentanyl, oxycodone)**. Monitor and adjust dose. [Severe] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **opioids (alfentanil, buprenorphine, fentanyl, oxycodone)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Clarithromycin** is predicted to increase the concentration of **opioids (methadone)**. [Severe] Theoretical → Also see TABLE 9 p. 1449
- ▶ **Erythromycin** is predicted to increase the exposure to **opioids (methadone)**. [Moderate] Theoretical → Also see TABLE 9 p. 1449
- ▶ **Clarithromycin** is predicted to increase the exposure to **ospemifene**. Avoid in poor CYP2C9 metabolisers. [Moderate] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **oxybutynin**. [Mild] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **palbociclib**. Avoid or adjust **palbociclib** dose, p. 1045. [Severe] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **panobinostat**. Adjust **panobinostat** dose; in hepatic impairment avoid, p. 984. [Moderate] Study → Also see TABLE 9 p. 1449
- ▶ Macrolides (**azithromycin, erythromycin**) are predicted to increase the exposure to **panobinostat**. Adjust dose. [Moderate] Theoretical → Also see TABLE 9 p. 1449
- ▶ **Clarithromycin** is predicted to increase the exposure to **pazopanib**. Avoid or adjust **pazopanib** dose, p. 1045. [Moderate] Study → Also see TABLE 9 p. 1449
- ▶ **Erythromycin** is predicted to increase the exposure to **pazopanib**. [Moderate] Study → Also see TABLE 9 p. 1449
- ▶ **Erythromycin** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (avanafil)**. Adjust **avanafil** dose, p. 862. [Moderate] Theoretical
- ▶ **Clarithromycin** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (avanafil, vardenafil)**. Avoid. [Severe] Study → Also see TABLE 9 p. 1449
- ▶ **Clarithromycin** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (sildenafil)**. Avoid potent CYP3A4 inhibitors or adjust **sildenafil** dose, p. 863. [Severe] Study → Also see TABLE 9 p. 1449
- ▶ **Erythromycin** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (sildenafil)**. Monitor or adjust **sildenafil** dose with moderate CYP3A4 inhibitors, p. 863. [Moderate] Study → Also see TABLE 9 p. 1449
- ▶ **Clarithromycin** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (tadalafil)**. Use with caution or avoid. [Severe] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (tadalafil)**. [Severe] Theoretical
- ▶ **Erythromycin** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (vardenafil)**. Adjust dose. [Severe] Theoretical → Also see TABLE 9 p. 1449
- ▶ **Macrolides** are predicted to increase the exposure to **pibrentasvir**. [Moderate] Theoretical
- ▶ **Clarithromycin** is predicted to increase the exposure to **pimozide**. Avoid. [Severe] Study → Also see TABLE 9 p. 1449
- ▶ **Erythromycin** is predicted to increase the exposure to **pimozide**. Avoid. [Severe] Theoretical → Also see TABLE 9 p. 1449
- ▶ **Clarithromycin** is predicted to slightly increase the exposure to **ponatinib**. Monitor and adjust **ponatinib** dose, p. 1046. [Moderate] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **ponatinib**. [Moderate] Study
- ▶ **Clarithromycin** is predicted to moderately increase the exposure to **praziquantel**. [Mild] Study
- ▶ **Clarithromycin** given with carbimazole is predicted to increase the exposure to **propiverine**. Adjust starting dose. [Moderate] Theoretical
- ▶ **Clarithromycin** is predicted to increase the exposure to **ranolazine**. Avoid. [Severe] Study → Also see TABLE 9 p. 1449
- ▶ **Erythromycin** is predicted to increase the exposure to **ranolazine**. [Severe] Study → Also see TABLE 9 p. 1449
- ▶ **Clarithromycin** is predicted to increase the exposure to **reboxetine**. Avoid. [Moderate] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **regorafenib**. Avoid. [Moderate] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **regorafenib**. [Moderate] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **retinoids (alitretinoin)**. Adjust **alitretinoin** dose, p. 1315. [Moderate] Theoretical
- ▶ **Clarithromycin** is predicted to increase the exposure to **ribociclib**. Avoid or adjust **ribociclib** dose, p. 1048. [Moderate] Study → Also see TABLE 9 p. 1449
- ▶ **Erythromycin** is predicted to increase the exposure to **ribociclib**. [Moderate] Study → Also see TABLE 9 p. 1449
- ▶ **Rifamycins (rifampicin)** decrease the concentration of **clarithromycin**. [Severe] Study

Macrolides (continued)

- ▶ **Azithromycin** increases the risk of neutropenia when given with **rifamycins (rifabutin)**. [Severe] Study
- ▶ **Clarithromycin** increases the risk of uveitis when given with **rifamycins (rifabutin)**. Adjust dose. [Severe] Study
- ▶ **Erythromycin** is predicted to increase the risk of uveitis when given with **rifamycins (rifabutin)**. Adjust dose. [Severe] Theoretical
- ▶ **Clarithromycin** is predicted to increase the exposure to **roxitholone**. Adjust dose and monitor adverse effects. [Moderate] Study
- ▶ **Erythromycin** slightly increases the exposure to **roxitholone**. [Mild] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **siponimod**. Avoid depending on other drugs taken—consult product literature. [Severe] Theoretical
- ▶ **Erythromycin** is predicted to increase the exposure to **siponimod**. Avoid depending on other drugs taken—consult product literature. [Severe] Study
- ▶ **Clarithromycin** is predicted to increase the concentration of **sirolimus**. Avoid. [Severe] Study
- ▶ **Erythromycin** increases the concentration of **sirolimus**. Monitor and adjust dose. [Moderate] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **solifenacin**. Adjust solifenacin p. 826 or tamsulosin with solifenacin p. 832 dose; avoid in hepatic and renal impairment. [Severe] Study
- ▶ **Clarithromycin** is predicted to moderately increase the exposure to **SSRIs (dapoxetine)**. Avoid potent CYP3A4 inhibitors or adjust **dapoxetine** dose, p. 870. [Severe] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **SSRIs (dapoxetine)**. Adjust **dapoxetine** dose with moderate CYP3A4 inhibitors, p. 870. [Moderate] Theoretical
- ▶ **Clarithromycin** is predicted to increase the exposure to **statins (atorvastatin)**. Avoid or adjust dose and monitor rhabdomyolysis. [Severe] Study
- ▶ **Erythromycin** slightly increases the exposure to **statins (atorvastatin)**. Monitor and adjust dose. [Severe] Study
- ▶ **Clarithromycin** moderately increases the exposure to **statins (pravastatin)**. [Severe] Study
- ▶ **Erythromycin** slightly increases the exposure to **statins (pravastatin)**. [Severe] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **statins (simvastatin)**. Avoid. [Severe] Study
- ▶ **Erythromycin** markedly increases the exposure to **statins (simvastatin)**. Avoid. [Severe] Study
- ▶ **Clarithromycin** is predicted to slightly increase the exposure to **sulfonylureas**. [Moderate] Theoretical
- ▶ **Clarithromycin** is predicted to increase the exposure to **sunitinib**. Avoid or adjust **sunitinib** dose, p. 1051. [Moderate] Study → Also see TABLE 9 p. 1449
- ▶ **Erythromycin** is predicted to increase the exposure to **sunitinib**. [Moderate] Study → Also see TABLE 9 p. 1449
- ▶ **Clarithromycin** is predicted to increase the concentration of **tacrolimus**. Monitor and adjust dose. [Severe] Study
- ▶ **Erythromycin** is predicted to increase the concentration of **tacrolimus**. [Severe] Study
- ▶ **Macrolides** are predicted to slightly increase the exposure to **talazoparib**. Avoid or adjust **talazoparib** dose, p. 1059. [Severe] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **taxanes (cabazitaxel)**. Avoid. [Severe] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **taxanes (cabazitaxel)**. [Moderate] Theoretical
- ▶ **Clarithromycin** is predicted to moderately increase the exposure to **taxanes (docetaxel)**. Avoid or adjust dose. [Severe] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **taxanes (paclitaxel)**. [Severe] Theoretical
- ▶ **Clarithromycin** is predicted to increase the concentration of **temsirolimus**. Avoid. [Severe] Theoretical
- ▶ **Erythromycin** is predicted to increase the concentration of **temsirolimus**. Use with caution or avoid. [Moderate] Theoretical
- ▶ **Clarithromycin** is predicted to increase the exposure to **tezacaftor**. Adjust dose with potent CYP3A4 inhibitors, see tezacaftor with ivacaftor p. 314 and tezacaftor with ivacaftor and elexacaftor p. 314. [Severe] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **tezacaftor**. Adjust dose with moderate CYP3A4 inhibitors, see tezacaftor with ivacaftor p. 314 and tezacaftor with ivacaftor and elexacaftor p. 314. [Severe] Study
- ▶ **Erythromycin** decreases the clearance of **theophylline** and **theophylline** potentially decreases the clearance of **erythromycin**. Adjust dose. [Severe] Study
- ▶ **Macrolides (azithromycin, clarithromycin)** are predicted to increase the exposure to **theophylline**. Adjust dose. [Moderate] Anecdotal
- ▶ **Clarithromycin** increases the exposure to **thrombin inhibitors (dabigatran)**. [Moderate] Study
- ▶ **Macrolides (azithromycin, erythromycin)** are predicted to increase the exposure to **thrombin inhibitors (dabigatran)**. [Severe] Theoretical
- ▶ **Azithromycin** is predicted to increase the exposure to **ticagrelor**. Use with caution or avoid. [Severe] Study
- ▶ **Clarithromycin** is predicted to markedly increase the exposure to **ticagrelor**. Avoid. [Severe] Study
- ▶ **Macrolides** might increase the exposure to **tigecycline**. [Mild] Anecdotal
- ▶ **Clarithromycin** is predicted to increase the exposure to **tofacinib**. Adjust **tofacinib** dose, p. 1163. [Moderate] Study
- ▶ **Erythromycin** given with a potent CYP2C19 inhibitor is predicted to increase the exposure to **tofacinib**. Adjust **tofacinib** dose, p. 1163. [Moderate] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **tolterodine**. Avoid. [Severe] Study → Also see TABLE 9 p. 1449
- ▶ **Clarithromycin** is predicted to increase the exposure to **tolvaptan**. Manufacturer advises caution or adjust **tolvaptan** dose with potent CYP3A4 inhibitors, p. 711. [Severe] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **tolvaptan**. Manufacturer advises caution or adjust **tolvaptan** dose with moderate CYP3A4 inhibitors, p. 711. [Moderate] Study
- ▶ **Macrolides** are predicted to increase the exposure to **topotecan**. [Severe] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **toremifene**. [Moderate] Theoretical → Also see TABLE 9 p. 1449
- ▶ **Clarithromycin** is predicted to increase the exposure to **trabectedin**. Avoid or adjust dose. [Severe] Theoretical
- ▶ **Macrolides** are predicted to increase the concentration of **trametinib**. [Moderate] Theoretical
- ▶ **Clarithromycin** is predicted to moderately increase the exposure to **trazodone**. Avoid or adjust dose. [Moderate] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **trazodone**. [Moderate] Theoretical
- ▶ **Clarithromycin** increases the exposure to **triptans (almotriptan)**. [Mild] Study
- ▶ **Clarithromycin** is predicted to markedly increase the exposure to **triptans (eletriptan)**. Avoid. [Severe] Study
- ▶ **Erythromycin** moderately increases the exposure to **triptans (eletriptan)**. Avoid. [Moderate] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [Severe] Study
- ▶ **Erythromycin** is predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [Moderate] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **upadacitinib**. Use with caution or avoid. [Severe] Study
- ▶ **Macrolides (clarithromycin, erythromycin)** are predicted to increase the exposure to **venlafaxine**. [Severe] Theoretical → Also see TABLE 9 p. 1449
- ▶ **Macrolides (clarithromycin, erythromycin)** are predicted to increase the exposure to **venetoclax**. Avoid or adjust dose—consult product literature. [Severe] Study
- ▶ **Clarithromycin** is predicted to increase the exposure to **venlafaxine**. [Moderate] Study → Also see TABLE 9 p. 1449
- ▶ **Azithromycin** might increase the exposure to **vinca alkaloids**. [Severe] Theoretical
- ▶ **Macrolides (clarithromycin, erythromycin)** are predicted to increase the exposure to **vinca alkaloids**. [Severe] Theoretical → Also see TABLE 9 p. 1449
- ▶ **Clarithromycin** is predicted to increase the exposure to **vitamin D substances (paricalcitol)**. [Moderate] Study

- ▶ **Clarithromycin** is predicted to increase the exposure to **zopiclone**. Adjust dose. [Moderate] Theoretical
- ▶ **Erythromycin** is predicted to increase the exposure to **zopiclone**. Adjust dose. [Moderate] Study

Magnesium

SEPARATION OF ADMINISTRATION **Magnesium-containing antacids** should preferably not be taken at the same time as other drugs since they might impair absorption. **Magnesium-containing antacids** might damage enteric coatings designed to prevent dissolution in the stomach.

- ▶ Oral **magnesium** decreases the absorption of oral **bisphosphonates (alendronate)**. **Alendronate** should be taken at least 30 minutes before **magnesium**. [Moderate] Study
- ▶ Oral **magnesium** decreases the absorption of oral **bisphosphonates (clodronate)**. Avoid **magnesium** for 2 hours before or 1 hour after **clodronate**. [Moderate] Study
- ▶ Oral **magnesium** is predicted to decrease the absorption of oral **bisphosphonates (ibandronate)**. Avoid for at least 6 hours before or 1 hour after **ibandronate**. [Moderate] Theoretical
- ▶ Oral **magnesium** decreases the absorption of oral **bisphosphonates (risedronate)**. Separate administration by at least 2 hours. [Moderate] Study
- ▶ Intravenous **magnesium** potentially increases the risk of hypotension when given with **calcium channel blockers (amlodipine, felodipine, lacidipine, lecanidipine, nicardipine, nifedipine, nimodipine, verapamil)** in pregnant women. [Severe] Anecdotal
- ▶ Intravenous **magnesium** increases the effects of **neuromuscular blocking drugs, non-depolarising**. [Moderate] Study
- ▶ Oral **magnesium trisilicate** decreases the absorption of oral **nitrofurantoin**. [Moderate] Study
- ▶ Intravenous **magnesium** is predicted to increase the effects of **suxamethonium**. [Moderate] Study

MAO-B inhibitors → see TABLE 6 p. 1448 (bradycardia), TABLE 8 p. 1448 (hypotension), TABLE 13 p. 1450 (serotonin syndrome)

rasagiline · safinamide · selegiline

FOOD AND LIFESTYLE Hypertension is predicted to occur when high-dose **selegiline** is taken with tyramine-rich foods (such as mature cheese, salami, pickled herring, *Bovril*[®], *Oxo*[®], *Marmite*[®] or any similar meat or yeast extract or fermented soya bean extract, and some beers, lagers or wines).

- ▶ MAO-B inhibitors (**rasagiline, selegiline**) are predicted to increase the risk of severe hypertension when given with **amfetamines**. Avoid. [Severe] Theoretical → Also see TABLE 13 p. 1450
- ▶ **Safinamide** is predicted to increase the risk of severe hypertension when given with **amfetamines**. [Severe] Theoretical → Also see TABLE 13 p. 1450
- ▶ **Axitinib** is predicted to increase the exposure to **rasagiline**. [Moderate] Theoretical
- ▶ MAO-B inhibitors (**rasagiline, selegiline**) are predicted to increase the risk of severe hypertension when given with **beta₂ agonists**. Avoid. [Severe] Theoretical
- ▶ **Safinamide** is predicted to increase the risk of severe hypertension when given with **beta₂ agonists**. [Severe] Theoretical
- ▶ **Bupropion** is predicted to increase the risk of severe hypertension when given with **MAO-B inhibitors**. Avoid. [Moderate] Theoretical
- ▶ **Combined hormonal contraceptives** slightly increases the exposure to **rasagiline**. [Moderate] Study
- ▶ **Combined hormonal contraceptives** increase the exposure to **selegiline**. Avoid. [Severe] Study
- ▶ **Hormone replacement therapy** is predicted to increase the exposure to **selegiline**. Avoid. [Moderate] Study
- ▶ MAO-B inhibitors are predicted to increase the effects of **levodopa**. Adjust dose. [Mid] Study → Also see TABLE 8 p. 1448
- ▶ MAO-B inhibitors (**rasagiline, selegiline**) are predicted to increase the risk of adverse effects when given with **linezolid**. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical → Also see TABLE 13 p. 1450
- ▶ **Safinamide** is predicted to increase the risk of adverse effects when given with **linezolid**. Avoid and for 1 week after stopping **safranamide**. [Severe] Theoretical → Also see TABLE 13 p. 1450

- ▶ MAO-B inhibitors (**rasagiline, selegiline**) are predicted to increase the risk of adverse effects when given with **MAOIs, irreversible**. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical → Also see TABLE 8 p. 1448 → Also see TABLE 13 p. 1450
 - ▶ **Safinamide** is predicted to increase the risk of adverse effects when given with **MAOIs, irreversible**. Avoid and for 1 week after stopping **safranamide**. [Severe] Theoretical → Also see TABLE 13 p. 1450
 - ▶ MAO-B inhibitors (**rasagiline, selegiline**) are predicted to increase the risk of a hypertensive crisis when given with **methylphenidate**. Avoid. [Severe] Theoretical
 - ▶ **Mexiletine** slightly increases the exposure to **rasagiline**. [Moderate] Study
 - ▶ **Moclobemide** is predicted to increase the effects of MAO-B inhibitors (**rasagiline, selegiline**). Avoid. [Severe] Theoretical → Also see TABLE 13 p. 1450
 - ▶ **Moclobemide** is predicted to increase the risk of adverse effects when given with **safranamide**. Avoid and for 1 week after stopping **safranamide**. [Severe] Theoretical → Also see TABLE 13 p. 1450
 - ▶ **Rasagiline** is predicted to increase the risk of adverse effects when given with **opioids (pethidine)**. Avoid and for 14 days after stopping **rasagiline**. [Severe] Theoretical → Also see TABLE 13 p. 1450
 - ▶ **Safinamide** is predicted to increase the risk of adverse effects when given with **opioids (pethidine)**. Avoid and for 1 week after stopping **safranamide**. [Severe] Theoretical → Also see TABLE 13 p. 1450
 - ▶ **Selegiline** increases the risk of adverse effects when given with **opioids (pethidine)**. Avoid. [Severe] Anecdotal → Also see TABLE 13 p. 1450
 - ▶ **Ozanimod** might increase the risk of a hypertensive crisis when given with **MAO-B inhibitors** and **MAO-B inhibitors** might decrease the exposure to the active metabolites of **ozanimod**. Avoid. [Severe] Theoretical → Also see TABLE 6 p. 1448
 - ▶ **Quinolones (ciprofloxacin)** slightly increase the exposure to **rasagiline**. [Moderate] Study
 - ▶ **Reboxetine** is predicted to increase the risk of a hypertensive crisis when given with MAO-B inhibitors (**rasagiline, selegiline**). Avoid. [Severe] Theoretical
 - ▶ **Rucaparib** slightly increases the exposure to **rasagiline**. [Moderate] Study
 - ▶ **Solriamfetol** is predicted to increase the risk of a hypertensive crisis when given with **MAO-B inhibitors**. Avoid and for 14 days after stopping **MAO-B inhibitors**. [Severe] Theoretical
 - ▶ **Sympathomimetics, inotropic** are predicted to increase the risk of a hypertensive crisis when given with **MAO-B inhibitors**. Avoid. [Severe] Anecdotal
 - ▶ **Sympathomimetics, vasoconstrictor** are predicted to increase the risk of a hypertensive crisis when given with **MAO-B inhibitors**. Avoid. [Severe] Anecdotal
 - ▶ **Tetrabenazine** potentially increases the risk of CNS excitation and hypertension when given with **MAO-B inhibitors**. [Severe] Theoretical
 - ▶ **Vemurafenib** slightly increases the exposure to **rasagiline**. [Moderate] Study
- MAOIs, irreversible** → see TABLE 8 p. 1448 (hypotension), TABLE 13 p. 1450 (serotonin syndrome)

isocarboxazid · phenelzine · tranylcypromine

FOOD AND LIFESTYLE Potentially life-threatening hypertensive crisis can develop in those taking MAOIs who eat tyramine-rich food (such as mature cheese, salami, pickled herring, *Bovril*[®], *Oxo*[®], *Marmite*[®] or any similar meat or yeast extract or fermented soya bean extract, and some beers, lagers or wines) or foods containing dopa (such as broad bean pods). Avoid tyramine-rich or dopa-rich food or drinks with, or for 2 to 3 weeks after stopping, the MAOI.

- ▶ **MAOIs, irreversible** are predicted to increase the effects of **alpha blockers (indoramin)**. Avoid. [Severe] Theoretical → Also see TABLE 8 p. 1448
- ▶ **Amfetamines** are predicted to increase the risk of a hypertensive crisis when given with **MAOIs, irreversible**. Avoid and for 14 days after stopping the MAOI. [Severe] Anecdotal → Also see TABLE 13 p. 1450

MAOIs, irreversible (continued)

- ▶ **Antiepileptics (carbamazepine)** are predicted to increase the risk of severe toxic reaction when given with **MAOIs, irreversible**. Avoid and for 14 days after stopping the MAOI. [\[Severe\]](#) Theoretical
- ▶ **Antiepileptics (phenobarbital, primidone)** are predicted to increase the effects of **MAOIs, irreversible**. [\[Severe\]](#) Theoretical
- ▶ **MAOIs, irreversible** are predicted to increase the risk of antimuscarinic adverse effects when given with **antihistamines, non-sedating**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **MAOIs, irreversible** are predicted to increase the risk of antimuscarinic adverse effects when given with **antihistamines, sedating**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **MAOIs, irreversible** are predicted to increase the risk of adverse effects when given with **atomoxetine**. Avoid and for 2 weeks after stopping the MAOI. [\[Severe\]](#) Theoretical
- ▶ **MAOIs, irreversible** are predicted to increase the risk of cardiovascular adverse effects when given with **beta₂ agonists**. [\[Moderate\]](#) Anecdotal
- ▶ **Bupropion** is predicted to increase the risk of severe hypertension when given with **MAOIs, irreversible**. Avoid and for 14 days after stopping the MAOI. [\[Severe\]](#) Theoretical
- ▶ **Buspiron** is predicted to increase the risk of elevated blood pressure when given with **MAOIs, irreversible**. Avoid. [\[Severe\]](#) Anecdotal
- ▶ **MAOIs, irreversible** are predicted to increase the effects of **doxapram**. [\[Moderate\]](#) Theoretical
- ▶ **Entacapone** is predicted to increase the risk of elevated blood pressure when given with **MAOIs, irreversible**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Levodopa** increases the risk of a hypertensive crisis when given with **MAOIs, irreversible**. Avoid and for 14 days after stopping the MAOI. [\[Severe\]](#) Study → Also see TABLE 8 p. 1448
- ▶ **MAOIs, irreversible** are predicted to increase the risk of adverse effects when given with **linezolid**. Avoid and for 14 days after stopping the MAOI. [\[Severe\]](#) Theoretical → Also see TABLE 13 p. 1450
- ▶ **MAO-B inhibitors (rasagiline, selegiline)** are predicted to increase the risk of adverse effects when given with **MAOIs, irreversible**. Avoid and for 14 days after stopping the MAOI. [\[Severe\]](#) Theoretical → Also see TABLE 8 p. 1448 → Also see TABLE 13 p. 1450
- ▶ **MAO-B inhibitors (safinamide)** are predicted to increase the risk of adverse effects when given with **MAOIs, irreversible**. Avoid and for 1 week after stopping **saquinamide**. [\[Severe\]](#) Theoretical → Also see TABLE 13 p. 1450
- ▶ **MAOIs, irreversible** are predicted to alter the antihypertensive effects of **methylodopa**. Avoid. [\[Severe\]](#) Theoretical → Also see TABLE 8 p. 1448
- ▶ **Methylphenidate** is predicted to increase the risk of a hypertensive crisis when given with **MAOIs, irreversible**. Avoid and for 14 days after stopping the MAOI. [\[Severe\]](#) Theoretical
- ▶ **Mianserin** is predicted to increase the risk of toxicity when given with **MAOIs, irreversible**. Avoid and for 14 days after stopping the MAOI. [\[Severe\]](#) Theoretical
- ▶ **Nefopam** is predicted to increase the risk of serious elevations in blood pressure when given with **MAOIs, irreversible**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Opicapone** is predicted to increase the risk of elevated blood pressure when given with **MAOIs, irreversible**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Opioids** are predicted to increase the risk of CNS excitation or depression when given with **MAOIs, irreversible**. Avoid. [\[Severe\]](#) Study → Also see TABLE 13 p. 1450
- ▶ **Ozanimod** might increase the risk of a hypertensive crisis when given with **MAOIs, irreversible**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **MAOIs, irreversible** are predicted to increase the risk of neuroleptic malignant syndrome when given with **phenothiazines**. [\[Severe\]](#) Theoretical → Also see TABLE 8 p. 1448
- ▶ **Pholcodine** is predicted to increase the risk of CNS excitation or depression when given with **MAOIs, irreversible**. Avoid and for 14 days after stopping the MAOI. [\[Severe\]](#) Theoretical
- ▶ **Reboxetine** is predicted to increase the risk of a hypertensive crisis when given with **MAOIs, irreversible**. Avoid. [\[Severe\]](#) Theoretical

- ▶ **Solriamfetol** is predicted to increase the risk of a hypertensive crisis when given with **MAOIs, irreversible**. Avoid and for 14 days after stopping the MAOI. [\[Severe\]](#) Theoretical
- ▶ **Sympathomimetics, inotropic** are predicted to increase the risk of a hypertensive crisis when given with **MAOIs, irreversible**. Avoid and for 14 days after stopping the MAOI. [\[Severe\]](#) Theoretical
- ▶ **Sympathomimetics, vasoconstrictor** are predicted to increase the risk of a hypertensive crisis when given with **MAOIs, irreversible**. Avoid and for 14 days after stopping the MAOI. [\[Severe\]](#) Study
- ▶ **Tetrabenazine** potentially increases the risk of CNS excitation and hypertension when given with **MAOIs, irreversible**. Avoid and for 14 days after stopping the MAOI. [\[Severe\]](#) Theoretical
- ▶ **Tolcapone** is predicted to increase the effects of **MAOIs, irreversible**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Tricyclic antidepressants** are predicted to increase the risk of severe toxic reaction when given with **MAOIs, irreversible**. Avoid and for 14 days after stopping the MAOI. [\[Severe\]](#) Theoretical → Also see TABLE 8 p. 1448 → Also see TABLE 13 p. 1450
- ▶ **MAOIs, irreversible** are predicted to increase the exposure to **triptans (rizatriptan, sumatriptan)**. Avoid and for 14 days after stopping the MAOI. [\[Severe\]](#) Theoretical → Also see TABLE 13 p. 1450
- ▶ **MAOIs, irreversible** are predicted to increase the exposure to **triptans (zolmitriptan)**. [\[Severe\]](#) Theoretical → Also see TABLE 13 p. 1450
- ▶ **Tryptophan** increases the risk of adverse effects when given with **MAOIs, irreversible**. [\[Severe\]](#) Anecdotal → Also see TABLE 13 p. 1450

Maraviroc

- ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to **maraviroc**. Adjust dose. [\[Severe\]](#) Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **maraviroc**. Adjust dose. [\[Severe\]](#) Study
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to markedly increase the exposure to **maraviroc**. Adjust dose. [\[Severe\]](#) Study
- ▶ **Cobicistat** markedly increases the exposure to **maraviroc**. Refer to specialist literature. [\[Severe\]](#) Study
- ▶ **Endothelin receptor antagonists (bosentan)** are predicted to decrease the exposure to **maraviroc**. Avoid. [\[Moderate\]](#) Theoretical
- ▶ **HIV-protease inhibitors (atazanavir)** moderately to markedly increase the exposure to **maraviroc**. Refer to specialist literature. [\[Severe\]](#) Study
- ▶ **HIV-protease inhibitors (darunavir)** boosted with ritonavir markedly increase the exposure to **maraviroc**. Refer to specialist literature. [\[Severe\]](#) Study
- ▶ **HIV-protease inhibitors (lopinavir)** boosted with ritonavir moderately increase the exposure to **maraviroc**. Refer to specialist literature. [\[Severe\]](#) Study
- ▶ **HIV-protease inhibitors (ritonavir)** markedly increase the exposure to **maraviroc**. Refer to specialist literature. [\[Severe\]](#) Study
- ▶ **Maraviroc** potentially decreases the exposure to **HIV-protease inhibitors (fosamprenavir)** and **HIV-protease inhibitors (fosamprenavir)** potentially decrease the exposure to **maraviroc**. Avoid. [\[Severe\]](#) Study
- ▶ **Idelalisib** markedly increases the exposure to **maraviroc**. Adjust dose. [\[Severe\]](#) Theoretical
- ▶ **Macrolides (clarithromycin)** are predicted to markedly increase the exposure to **maraviroc**. Adjust dose. [\[Severe\]](#) Study
- ▶ **Mitotane** is predicted to decrease the exposure to **maraviroc**. Adjust dose. [\[Severe\]](#) Study
- ▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to increase the exposure to **maraviroc**. [\[Moderate\]](#) Study
- ▶ **NNRTIs (efavirenz)** decrease the exposure to **maraviroc**. Refer to specialist literature. [\[Severe\]](#) Theoretical
- ▶ **NNRTIs (etravirine)** with a boosted HIV-protease inhibitor increase the exposure to **maraviroc**. Avoid or adjust dose. [\[Moderate\]](#) Study
- ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **maraviroc**. Adjust dose. [\[Severe\]](#) Study

- ▶ **St John's wort** is predicted to decrease the exposure to **maraviroc**. Avoid. [Severe] Theoretical
- ▶ **Vemurafenib** is predicted to increase the exposure to **maraviroc**. Use with caution or avoid. [Moderate] Theoretical
- Measles, mumps and rubella vaccine, live** → see live vaccines
- Mebendazole**
 - ▶ **H₂ receptor antagonists (cimetidine)** increase the concentration of **mebendazole**. [Moderate] Study
- Medroxyprogesterone**
 - ▶ **Sugammadex** is predicted to decrease the exposure to **medroxyprogesterone**. Use additional contraceptive precautions. [Severe] Theoretical
- Mefenamic acid** → see NSAIDs
- Mefloquine** → see antimalarials
- Meglitinides** → see TABLE 14 p. 1450 (antidiabetic drugs)
 - repaglinide
 - ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to **repaglinide**. Monitor blood glucose and adjust dose. [Moderate] Study
 - ▶ **Anti-androgens (darolutamide)** are predicted to increase the concentration of **repaglinide**. [Moderate] Theoretical
 - ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **repaglinide**. Monitor blood glucose and adjust dose. [Moderate] Study
 - ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **repaglinide**. [Moderate] Study
 - ▶ **Ciclosporin** moderately increases the exposure to **repaglinide**. [Moderate] Study
 - ▶ **Clopidogrel** increases the exposure to **repaglinide**. Avoid. [Severe] Study
 - ▶ **Cobicistat** is predicted to increase the exposure to **repaglinide**. [Moderate] Study
 - ▶ **Elxacaftor** is predicted to increase the exposure to **repaglinide**. [Moderate] Theoretical
 - ▶ **Fibrates (gemfibrozil)** increase the exposure to **repaglinide**. Avoid. [Severe] Study
 - ▶ **Filgotinib** is predicted to increase the exposure to **repaglinide**. Avoid. [Moderate] Theoretical
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **repaglinide**. [Moderate] Study
 - ▶ **Idealisib** is predicted to increase the exposure to **repaglinide**. [Moderate] Study
 - ▶ **Iron chelators (deferasirox)** moderately increase the exposure to **repaglinide**. Avoid. [Moderate] Study
 - ▶ **Lefunomide** is predicted to increase the exposure to **repaglinide**. [Moderate] Study
 - ▶ **Letermovir** is predicted to increase the concentration of **repaglinide**. Avoid. [Moderate] Theoretical
 - ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **repaglinide**. [Moderate] Study
 - ▶ **Mitotane** is predicted to decrease the exposure to **repaglinide**. Monitor blood glucose and adjust dose. [Moderate] Study
 - ▶ **Opicapone** is predicted to increase the exposure to **repaglinide**. Avoid. [Moderate] Study
 - ▶ **Pitolisant** is predicted to decrease the exposure to **repaglinide**. [Mid] Theoretical
 - ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **repaglinide**. Monitor blood glucose and adjust dose. [Moderate] Study
 - ▶ **Teriflunomide** is predicted to increase the exposure to **repaglinide**. [Moderate] Study
 - ▶ **Trimethoprim** slightly increases the exposure to **repaglinide**. Avoid or monitor blood glucose. [Moderate] Study
 - ▶ **Venetoclax** is predicted to increase the exposure to **repaglinide**. [Moderate] Theoretical
 - Melatonin** → see TABLE 11 p. 1449 (CNS depressant effects)
 - ▶ **Antiepileptics (phenytoin)** are predicted to decrease the exposure to **melatonin**. [Moderate] Theoretical
 - ▶ **Axitinib** is predicted to increase the exposure to **melatonin**. [Moderate] Theoretical
 - ▶ **Combined hormonal contraceptives** is predicted to increase the exposure to **melatonin**. [Moderate] Theoretical
 - ▶ **HIV-protease inhibitors (ritonavir)** are predicted to decrease the exposure to **melatonin**. [Moderate] Theoretical
 - ▶ **Lefunomide** is predicted to decrease the exposure to **melatonin**. [Moderate] Theoretical
 - ▶ **Mexiletine** is predicted to increase the exposure to **melatonin**. [Moderate] Theoretical
 - ▶ **Quinolones (ciprofloxacin)** are predicted to increase the exposure to **melatonin**. [Moderate] Theoretical
 - ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **melatonin**. [Moderate] Theoretical
 - ▶ **Rucaparib** is predicted to increase the exposure to **melatonin**. [Moderate] Theoretical
 - ▶ **SSRIs (fluvoxamine)** very markedly increase the exposure to **melatonin**. Avoid. [Severe] Study
 - ▶ **Teriflunomide** is predicted to decrease the exposure to **melatonin**. [Moderate] Theoretical
 - ▶ **Vemurafenib** is predicted to increase the exposure to **melatonin**. [Moderate] Theoretical
 - Meloxicam** → see NSAIDs
 - Melphalan** → see alkylating agents
 - Memantine**
 - ▶ **Dopamine receptor agonists (amantadine)** increase the risk of CNS toxicity when given with **memantine**. Use with caution or avoid. [Severe] Theoretical
 - ▶ **Memantine** is predicted to increase the effects of **dopamine receptor agonists (apomorphine, bromocriptine, cabergoline, pramipexole, quinagolide, ropinirole, rotigotine)**. [Moderate] Theoretical
 - ▶ **Memantine** is predicted to increase the risk of CNS adverse effects when given with **ketamine**. Avoid. [Severe] Theoretical
 - ▶ **Memantine** is predicted to increase the effects of **levodopa**. [Moderate] Theoretical
 - Mepacrine**
 - ▶ **Mepacrine** is predicted to increase the concentration of **antimalarials (primaquine)**. Avoid. [Moderate] Theoretical
 - Mepivacaine** → see anaesthetics, local
 - Mepizolinol** → see opioids
 - Mercaptopurine** → see TABLE 1 p. 1447 (hepatotoxicity), TABLE 15 p. 1450 (myelosuppression)
 - ▶ **Allopurinol** potentially increases the risk of haematological toxicity when given with **mercaptopurine**. Adjust **mercaptopurine** dose, p. 962. [Severe] Study
 - ▶ **Mercaptopurine** decreases the anticoagulant effect of **coumarins**. [Moderate] Anecdotal
 - ▶ **Febuxostat** is predicted to increase the exposure to **mercaptopurine**. Avoid. [Severe] Theoretical
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **mercaptopurine** (high-dose). Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
 - Meropenem** → see carbapenems
 - Mesalazine**

ROUTE-SPECIFIC INFORMATION The manufacturers of some mesalazine gastro-resistant and modified-release medicines (*Asacol MR* tablets, *Ipcol*, *Salofalk* granules) suggest that preparations that lower stool pH (e.g. lactulose) might prevent the release of mesalazine.

 - ▶ **Metaraminol** → see sympathomimetics, vasoconstrictor
 - ▶ **Metformin** → see TABLE 14 p. 1450 (antidiabetic drugs)
 - ▶ **Alcohol** (excessive consumption) potentially increases the risk of lactic acidosis when given with **metformin**. Avoid excessive alcohol consumption. [Moderate] Theoretical
 - ▶ **Bictegravir** slightly increases the exposure to **metformin**. [Moderate] Study
 - ▶ **Dolutegravir** increases the exposure to **metformin**. Use with caution and adjust dose. [Severe] Study
 - ▶ **Guanfacine** is predicted to increase the concentration of **metformin**. [Moderate] Theoretical
 - ▶ **H₂ receptor antagonists (cimetidine)** increase the exposure to **metformin**. Monitor and adjust dose. [Moderate] Study
 - ▶ **Mexiletine** is predicted to affect the exposure to **metformin**. [Unknown] Theoretical
 - ▶ **Pitolisant** is predicted to increase the exposure to **metformin**. [Mid] Theoretical

Metformin (continued)

- ▶ **Ribociclib** is predicted to increase the exposure to **metformin**. [\[Moderate\]](#) Theoretical
- ▶ **Vandetanib** increases the exposure to **metformin**. Monitor and adjust dose. [\[Moderate\]](#) Study

Methadone → see opioids

Methenamine

- ▶ **Acetazolamide** is predicted to decrease the efficacy of methenamine. Avoid. [\[Moderate\]](#) Theoretical
- ▶ **Potassium citrate** is predicted to decrease the efficacy of methenamine. Avoid. [\[Moderate\]](#) Theoretical
- ▶ **Sodium bicarbonate** is predicted to decrease the efficacy of methenamine. Avoid. [\[Moderate\]](#) Theoretical
- ▶ **Sodium citrate** is predicted to decrease the efficacy of methenamine. Avoid. [\[Moderate\]](#) Theoretical

Methocarbamol → see TABLE 11 p. 1449 (CNS depressant effects)

Methotrexate → see TABLE 1 p. 1447 (hepatotoxicity), TABLE 15 p. 1450 (myelosuppression), TABLE 2 p. 1447 (nephrotoxicity), TABLE 5 p. 1448 (thromboembolism)

- ▶ **Acetazolamide** increases the urinary excretion of **methotrexate**. [\[Moderate\]](#) Study
- ▶ **Methotrexate** is predicted to decrease the clearance of **aminophylline**. [\[Moderate\]](#) Theoretical
- ▶ **Anti-androgens (apalutamide)** are predicted to decrease the exposure to **methotrexate**. [\[Mild\]](#) Study
- ▶ **Anti-androgens (darolutamide)** are predicted to increase the concentration of **methotrexate**. [\[Moderate\]](#) Theoretical
- ▶ **Antiepileptics (levetiracetam)** decrease the clearance of **methotrexate**. [\[Severe\]](#) Anecdotal
- ▶ **Antimalarials (pyrimethamine)** are predicted to increase the risk of adverse effects when given with **methotrexate**. [\[Severe\]](#) Theoretical
- ▶ **Asparaginase** affects the efficacy of **methotrexate**. [\[Severe\]](#) Anecdotal → Also see TABLE 1 p. 1447 → Also see TABLE 15 p. 1450
- ▶ **Aspirin** (high-dose) is predicted to increase the risk of toxicity when given with **methotrexate**. [\[Severe\]](#) Study
- ▶ **Crisantaspase** affects the efficacy of **methotrexate**. [\[Severe\]](#) Anecdotal → Also see TABLE 1 p. 1447 → Also see TABLE 15 p. 1450
- ▶ **Eltrombopag** is predicted to increase the concentration of **methotrexate**. [\[Moderate\]](#) Theoretical
- ▶ **Methotrexate** potentially increases the risk of severe skin reaction when given with topical **fluorouracil**. [\[Severe\]](#) Anecdotal → Also see TABLE 15 p. 1450 → Also see TABLE 5 p. 1448
- ▶ **Leflunomide** is predicted to increase the exposure to **methotrexate**. [\[Moderate\]](#) Theoretical → Also see TABLE 1 p. 1447 → Also see TABLE 15 p. 1450
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **methotrexate** (high-dose). Public Health England advises avoid (refer to Green Book). [\[Severe\]](#) Theoretical
- ▶ **Nitisinone** is predicted to increase the exposure to **methotrexate**. [\[Moderate\]](#) Study
- ▶ **Nitrous oxide** potentially increases the risk of **methotrexate** toxicity when given with **methotrexate**. Avoid. [\[Severe\]](#) Study
- ▶ **NSAIDs** are predicted to increase the risk of toxicity when given with **methotrexate**. [\[Severe\]](#) Study → Also see TABLE 2 p. 1447
- ▶ **Pegaspargase** affects the efficacy of **methotrexate**. [\[Severe\]](#) Anecdotal → Also see TABLE 1 p. 1447 → Also see TABLE 15 p. 1450
- ▶ **Penicillins** are predicted to increase the risk of toxicity when given with **methotrexate**. [\[Severe\]](#) Anecdotal → Also see TABLE 1 p. 1447
- ▶ **Potassium aminobenzoate** increases the concentration of **methotrexate**. [\[Moderate\]](#) Theoretical
- ▶ **Proton pump inhibitors** decrease the clearance of **methotrexate** (high-dose). Use with caution or avoid. [\[Severe\]](#) Study
- ▶ **Quinolones (ciprofloxacin)** potentially increase the risk of toxicity when given with **methotrexate**. [\[Severe\]](#) Anecdotal
- ▶ **Regorafenib** is predicted to increase the exposure to **methotrexate**. [\[Moderate\]](#) Theoretical → Also see TABLE 15 p. 1450
- ▶ **Retinoids (acitretin)** are predicted to increase the concentration of **methotrexate**. Avoid. [\[Moderate\]](#) Anecdotal
- ▶ **Methotrexate** is predicted to decrease the efficacy of **sufpropterin**. [\[Moderate\]](#) Theoretical
- ▶ **Sulfonamides** are predicted to increase the exposure to **methotrexate**. Use with caution or avoid. [\[Severe\]](#) Theoretical

- ▶ **Tedizolid** is predicted to increase the exposure to **methotrexate**. Avoid. [\[Moderate\]](#) Theoretical
- ▶ **Methotrexate** is predicted to increase the risk of toxicity when given with **tegafur**. [\[Severe\]](#) Theoretical → Also see TABLE 15 p. 1450
- ▶ **Teriflunomide** is predicted to increase the exposure to **methotrexate**. [\[Moderate\]](#) Study → Also see TABLE 1 p. 1447
- ▶ **Methotrexate** decreases the clearance of **theophylline**. [\[Moderate\]](#) Study
- ▶ **Trimethoprim** increases the risk of adverse effects when given with **methotrexate**. Avoid. [\[Severe\]](#) Anecdotal → Also see TABLE 2 p. 1447

Methoxy polyethylene glycol-epoetin beta → see TABLE 5 p. 1448 (thromboembolism)

Methoxyflurane → see volatile halogenated anaesthetics

Methyldopa → see TABLE 8 p. 1448 (hypotension)

▶ **Entacapone** is predicted to increase the exposure to **methyldopa**. [\[Moderate\]](#) Theoretical

▶ Oral **iron** decreases the effects of oral **methyldopa**. [\[Moderate\]](#) Study

▶ **Methyldopa** increases the risk of neurotoxicity when given with **lithium**. [\[Severe\]](#) Anecdotal

▶ **MAOIs, irreversible** are predicted to alter the antihypertensive effects of **methyldopa**. Avoid. [\[Severe\]](#) Theoretical → Also see TABLE 8 p. 1448

Methylphenidate

▶ **Antipsychotics, second generation (risperidone)** increase the risk of dyskinesias when given with **methylphenidate**. [\[Severe\]](#) Anecdotal

▶ **Methylphenidate** increases the risk of dyskinesias when given with **antipsychotics, second generation (paliperidone)**. [\[Severe\]](#) Theoretical

▶ **Methylphenidate** is predicted to decrease the effects of **apraclonidine**. Avoid. [\[Severe\]](#) Theoretical

▶ **Methylphenidate** is predicted to increase the risk of elevated blood pressure when given with **linezolid**. Avoid. [\[Severe\]](#) Theoretical

▶ **MAO-B inhibitors (rasagiline, selegiline)** are predicted to increase the risk of a hypertensive crisis when given with **methylphenidate**. Avoid. [\[Severe\]](#) Theoretical

▶ **Methylphenidate** is predicted to increase the risk of a hypertensive crisis when given with **MAOIs, irreversible**. Avoid and for 14 days after stopping the MAOI. [\[Severe\]](#) Theoretical

▶ **Methylphenidate** is predicted to increase the risk of a hypertensive crisis when given with **moclobemide**. [\[Severe\]](#) Theoretical

▶ **Methylphenidate** is predicted to increase the risk of a hypertensive crisis when given with **ozanimod**. [\[Severe\]](#) Theoretical

Methylprednisolone → see corticosteroids

Methylthionium chloride → see TABLE 13 p. 1450 (serotonin syndrome)

▶ **Methylthionium chloride** is predicted to increase the risk of severe hypertension when given with **bupropion**. Avoid. [\[Severe\]](#) Theoretical

Metoclopramide

▶ **Metoclopramide** is predicted to increase the risk of methaemoglobinemia when given with topical **anaesthetics, local (prilocaine)**. Avoid. [\[Severe\]](#) Theoretical

▶ **Metoclopramide** potentially decreases the absorption of **antifungals, azoles (posaconazole)** oral suspension. [\[Moderate\]](#) Study

▶ **Metoclopramide** decreases the concentration of **antimalarials (atovaquone)**. Avoid. [\[Moderate\]](#) Study

▶ **Metoclopramide** is predicted to decrease the effects of **dopamine receptor agonists (apomorphine, bromocriptine, cabergoline, pramipexole, quinagolide, ropinirole, rotigotine)**. Avoid. [\[Moderate\]](#) Study

▶ **Metoclopramide** decreases the effects of **levodopa**. Avoid. [\[Moderate\]](#) Study

▶ **Metoclopramide** is predicted to increase the effects of **neuromuscular blocking drugs, non-depolarising**. [\[Moderate\]](#) Theoretical

▶ **Metoclopramide** increases the effects of **suxamethonium**. [\[Moderate\]](#) Study

Metolazone → see thiazide diuretics

Metoprolol → see beta blockers, selective

Metreleptin

- ▶ **Metreleptin** might alter the exposure to **aminophylline**. [Severe] Theoretical
- ▶ **Metreleptin** might alter the exposure to **ciclosporin**. Monitor concentration and adjust dose. [Severe] Theoretical
- ▶ **Metreleptin** might decrease the efficacy of **combined hormonal contraceptives**. Use additional contraceptive precautions. [Severe] Theoretical
- ▶ **Metreleptin** might alter the exposure to **coumarins (warfarin)**. Monitor INR and adjust dose. [Severe] Theoretical
- ▶ **Metreleptin** is predicted to increase the risk of hypoglycaemia when given with **insulin**. Monitor blood glucose and adjust dose. [Severe] Theoretical
- ▶ **Metreleptin** is predicted to increase the risk of hypoglycaemia when given with **sulfonylureas**. Monitor blood glucose and adjust dose. [Severe] Theoretical
- ▶ **Metreleptin** might alter the exposure to **theophylline**. Monitor concentration and adjust dose. [Severe] Theoretical

Metronidazole → see TABLE 12 p. 1450 (peripheral neuropathy)

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

- ▶ **Alcohol** potentially causes a disulfiram-like reaction when given with **metronidazole**. Avoid for at least 48 hours stopping treatment. [Moderate] Study
- ▶ **Metronidazole** increases the risk of toxicity when given with **alkylating agents (busulfan)**. [Severe] Study
- ▶ **Antiepileptics (phenobarbital, primidone)** are predicted to decrease the exposure to **metronidazole**. [Moderate] Study
- ▶ **Metronidazole** is predicted to increase the risk of capecitabine toxicity when given with **capecitabine**. [Severe] Theoretical
- ▶ **Metronidazole** increases the anticoagulant effect of **coumarins**. Monitor INR and adjust dose. [Severe] Study
- ▶ **Disulfiram** increases the risk of acute psychoses when given with **metronidazole**. [Severe] Study → Also see TABLE 12 p. 1450
- ▶ **Metronidazole** increases the risk of toxicity when given with **flourouracil**. [Severe] Study
- ▶ **Metronidazole** is predicted to increase the concentration of **lithium**. Avoid or adjust dose. [Severe] Anecdotal

Metyrapone

- ▶ **Antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the effects of **metyrapone**. Avoid. [Moderate] Study
- ▶ **Antihistamines, sedating (cyproheptadine)** decrease the effects of **metyrapone**. Avoid. [Moderate] Study
- ▶ **Carbamazole** decreases the effects of **metyrapone**. Avoid. [Moderate] Theoretical
- ▶ **Combined hormonal contraceptives** decrease the effects of **metyrapone**. Avoid. [Moderate] Theoretical
- ▶ **Phenothiazines (chlorpromazine)** decrease the effects of **metyrapone**. Avoid. [Moderate] Theoretical
- ▶ **Propylthiouracil** is predicted to decrease the effects of **metyrapone**. Avoid. [Moderate] Theoretical
- ▶ **Tricyclic antidepressants (amitriptyline)** decrease the effects of **metyrapone**. Avoid. [Moderate] Theoretical

Mexiletine

FOOD AND LIFESTYLE Dose adjustment might be necessary if smoking started or stopped during treatment.

- ▶ **Mexiletine** is predicted to increase the exposure to **agomelatine**. [Moderate] Study
- ▶ **Mexiletine** is predicted to increase the exposure to **aminophylline**. Adjust dose. [Moderate] Theoretical
- ▶ **Mexiletine** is predicted to increase the exposure to **anaesthetics, local (ropivacaine)**. [Moderate] Theoretical
- ▶ **Mexiletine** is predicted to increase the exposure to **anagrelide**. [Moderate] Theoretical
- ▶ **Mexiletine** is predicted to increase the risk of torsade de pointes when given with **antiarrhythmics**. Avoid. [Severe] Theoretical
- ▶ **Antiepileptics (phenytoin)** are predicted to increase the clearance of **mexiletine**. Monitor and adjust dose. [Moderate] Study

- ▶ **Mexiletine** increases the concentration of **antipsychotics, second generation (clozapine)**. Monitor adverse effects and adjust dose. [Severe] Study
- ▶ **Mexiletine** is predicted to increase the exposure to **antipsychotics, second generation (olanzapine)**. Adjust dose. [Moderate] Anecdotal
- ▶ **Mexiletine** potentially increases the risk of cardiovascular adverse effects when given with **beta blockers, non-selective**. Avoid or monitor. [Severe] Theoretical
- ▶ **Mexiletine** potentially increases the risk of cardiovascular adverse effects when given with **beta blockers, selective**. Avoid or monitor. [Severe] Theoretical
- ▶ **Bupropion** is predicted to increase the exposure to **mexiletine**. [Moderate] Study
- ▶ **Mexiletine** increases the risk of cardiovascular adverse effects when given with **calcium channel blockers (diltiazem)**. Avoid or monitor. [Severe] Theoretical
- ▶ **Mexiletine** potentially increases the risk of cardiovascular adverse effects when given with **calcium channel blockers (verapamil)**. Avoid or monitor. [Severe] Theoretical
- ▶ **Cinacalcet** is predicted to increase the exposure to **mexiletine**. [Moderate] Study
- ▶ **Cobicistat** potentially increases the exposure to **mexiletine**. [Severe] Theoretical
- ▶ **Mexiletine** potentially affects the exposure to **coumarins (warfarin)**. Avoid. [Unknown] Theoretical
- ▶ **Mexiletine** is predicted to increase the exposure to **dopamine receptor agonists (ropinrole)**. Adjust dose. [Moderate] Study
- ▶ **Mexiletine** is predicted to increase the exposure to **duloxetine**. [Moderate] Theoretical
- ▶ **Mexiletine** are predicted to increase the exposure to **erlotinib**. Monitor adverse effects and adjust dose. [Moderate] Study
- ▶ **HIV-protease inhibitors (ritonavir)** are predicted to increase the clearance of **mexiletine**. Monitor and adjust dose. [Moderate] Study
- ▶ **Leflunomide** is predicted to increase the clearance of **mexiletine**. Monitor and adjust dose. [Moderate] Study
- ▶ **Mexiletine** potentially affects the exposure to **lithium**. Avoid. [Unknown] Theoretical
- ▶ **Mexiletine** is predicted to increase the exposure to **loxapine**. Avoid. [Unknown] Theoretical
- ▶ **Mexiletine** slightly increases the exposure to **MAO-B inhibitors (rasagiline)**. [Moderate] Study
- ▶ **Mexiletine** is predicted to increase the exposure to **melatonin**. [Moderate] Theoretical
- ▶ **Mexiletine** is predicted to affect the exposure to **metformin**. [Unknown] Theoretical
- ▶ **Opioids** potentially decrease the absorption of oral **mexiletine**. [Moderate] Study
- ▶ **Mexiletine** is predicted to increase the exposure to **phenothiazines (chlorpromazine)**. [Moderate] Theoretical
- ▶ **Mexiletine** is predicted to increase the exposure to **phosphodiesterase type-4 inhibitors (roflumilast)**. [Moderate] Theoretical
- ▶ **Mexiletine** is predicted to increase the exposure to **pirfenidone**. Use with caution and adjust dose. [Moderate] Study
- ▶ **Rifamycins (rifampicin)** are predicted to increase the clearance of **mexiletine**. Monitor and adjust dose. [Moderate] Study
- ▶ **Mexiletine** is predicted to increase the exposure to **riluzole**. [Moderate] Theoretical
- ▶ **SSRIs (fluoxetine, fluvoxamine, paroxetine)** are predicted to increase the exposure to **mexiletine**. [Moderate] Study
- ▶ **Terbinafine** is predicted to increase the exposure to **mexiletine**. [Moderate] Study
- ▶ **Terflunomide** is predicted to increase the clearance of **mexiletine**. Monitor and adjust dose. [Moderate] Study
- ▶ **Mexiletine** is predicted to increase the exposure to **theophylline**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Mexiletine** increases the exposure to **tizanidine**. Avoid. [Moderate] Study
- ▶ **Mexiletine** is predicted to increase the exposure to **triptans (zolmitriptan)**. Adjust zolmitriptan dose, p. 507. [Moderate] Theoretical

Mianserin → see TABLE 11 p. 1449 (CNS depressant effects)

Mianserin (continued)

- ▶ **Antiepileptics (carbamazepine)** markedly decrease the exposure to mianserin. Adjust dose. [Moderate] Study
- ▶ **Antiepileptics (phenobarbital, primidone)** are predicted to decrease the exposure to mianserin. [Moderate] Study → Also see TABLE 11 p. 1449
- ▶ **Mianserin** is predicted to increase the risk of toxicity when given with **MAOs, irreversible**. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical
- ▶ **Mianserin** is predicted to increase the risk of toxicity when given with **moclobemide**. Avoid and for 1 week after stopping mianserin. [Severe] Theoretical
- ▶ **Mianserin** is predicted to decrease the efficacy of **pitolisant**. [Moderate] Theoretical
- ▶ **Mianserin** decreases the effects of **sympathomimetics, vasoconstrictor (ephedrine)**. [Severe] Anecdotal
- Micafungin** → see TABLE 1 p. 1447 (hepatotoxicity)
- ▶ **Micafungin** slightly increases the exposure to **amphotericin B**. Avoid or monitor toxicity. [Moderate] Study
- Miconazole** → see antifungals, azoles
- Midazolam** → see benzodiazepines
- Midodrine** → see sympathomimetics, vasoconstrictor
- Midostaurin**
 - ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to midostaurin. Avoid. [Severe] Study
 - ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to midostaurin. [Moderate] Theoretical
 - ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to midostaurin. Avoid. [Severe] Study
 - ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to midostaurin. [Moderate] Theoretical
 - ▶ **Anti-fungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to very markedly increase the exposure to midostaurin. Avoid or monitor for toxicity. [Severe] Study
 - ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to midostaurin. [Moderate] Theoretical
 - ▶ **Cobicistat** is predicted to very markedly increase the exposure to midostaurin. Avoid or monitor for toxicity. [Severe] Study
 - ▶ **Crizotinib** is predicted to increase the exposure to midostaurin. [Moderate] Theoretical
 - ▶ **HIV-protease inhibitors** are predicted to very markedly increase the exposure to midostaurin. Avoid or monitor for toxicity. [Severe] Study
 - ▶ **Idelalisib** is predicted to very markedly increase the exposure to midostaurin. Avoid or monitor for toxicity. [Severe] Study
 - ▶ **Imatinib** is predicted to increase the exposure to midostaurin. [Moderate] Theoretical
 - ▶ **Letermovir** is predicted to increase the exposure to midostaurin. [Moderate] Theoretical
 - ▶ **Macrolides (clarithromycin)** are predicted to very markedly increase the exposure to midostaurin. Avoid or monitor for toxicity. [Severe] Study
 - ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to midostaurin. [Moderate] Theoretical
 - ▶ **Mitotane** is predicted to decrease the exposure to midostaurin. Avoid. [Severe] Study
 - ▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to increase the exposure to midostaurin. [Moderate] Theoretical
 - ▶ **Nilotinib** is predicted to increase the exposure to midostaurin. [Moderate] Theoretical
 - ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to midostaurin. Avoid. [Severe] Study
 - ▶ **St John's wort** is predicted to decrease the exposure to midostaurin. Avoid. [Severe] Theoretical
- Mifamurtide** → see TABLE 15 p. 1450 (myelosuppression)
- ▶ **Ciclosporin** is predicted to decrease the efficacy of mifamurtide. Avoid. [Severe] Theoretical
- ▶ **Corticosteroids** are predicted to decrease the efficacy of mifamurtide. Avoid. [Severe] Theoretical
- ▶ **NSAIDs (high-dose)** are predicted to decrease the efficacy of mifamurtide. Avoid. [Severe] Theoretical

- ▶ **Pimecrolimus** is predicted to decrease the efficacy of mifamurtide. Avoid. [Severe] Theoretical
- ▶ **Sirolimus** is predicted to decrease the efficacy of mifamurtide. Avoid. [Severe] Theoretical
- ▶ **Tacrolimus** is predicted to affect the efficacy of mifamurtide. Avoid. [Severe] Theoretical

Mifepristone

- ▶ **Mifepristone** is predicted to decrease the efficacy of **corticosteroids**. Use with caution and adjust dose. [Moderate] Theoretical

Minocycline → see tetracyclines**Minoxidil** → see TABLE 8 p. 1448 (hypotension)

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

Mirabegron

- ▶ **Mirabegron** is predicted to increase the exposure to **alsikiren**. [Mid] Theoretical
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to mirabegron. Adjust mirabegron dose in hepatic and renal impairment, p. 828. [Moderate] Study
- ▶ **Mirabegron** is predicted to increase the exposure to **antihistamines, non-sedating (fexofenadine)**. [Mid] Theoretical
- ▶ **Mirabegron** is predicted to increase the exposure to **beta blockers, selective (metoprolol)**. [Moderate] Study
- ▶ **Cobicistat** is predicted to increase the exposure to mirabegron. Adjust mirabegron dose in hepatic and renal impairment, p. 828. [Moderate] Study
- ▶ **Mirabegron** is predicted to increase the exposure to **colchicine**. [Mid] Theoretical
- ▶ **Mirabegron** slightly increases the exposure to **digoxin**. Monitor concentration and adjust dose. [Severe] Study
- ▶ **Mirabegron** is predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
- ▶ **Mirabegron** is predicted to increase the exposure to **everolimus**. [Mid] Theoretical
- ▶ **Mirabegron** is predicted to increase the exposure to **factor XA inhibitors (edoxaban)**. [Mid] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to mirabegron. Adjust mirabegron dose in hepatic and renal impairment, p. 828. [Moderate] Study
- ▶ **Idelalisib** is predicted to increase the exposure to mirabegron. Adjust mirabegron dose in hepatic and renal impairment, p. 828. [Moderate] Study
- ▶ **Mirabegron** is predicted to increase the exposure to **loperamide**. [Mid] Theoretical
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to mirabegron. Adjust mirabegron dose in hepatic and renal impairment, p. 828. [Moderate] Study
- ▶ **Mirabegron** is predicted to increase the exposure to **sirolimus**. [Mid] Theoretical
- ▶ **Mirabegron** is predicted to increase the exposure to **taxanes (paclitaxel)**. [Mid] Theoretical
- ▶ **Mirabegron** is predicted to increase the exposure to **thrombin inhibitors (dabigatran)**. [Severe] Theoretical
- ▶ **Mirabegron** is predicted to increase the exposure to **topotecan**. [Mid] Theoretical
- Mirtazapine** → see TABLE 13 p. 1450 (serotonin syndrome), TABLE 11 p. 1449 (CNS depressant effects)
- ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to mirtazapine. Adjust dose. [Moderate] Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to mirtazapine. Adjust dose. [Moderate] Study → Also see TABLE 11 p. 1449
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to mirtazapine. [Moderate] Study
- ▶ **Cobicistat** is predicted to increase the exposure to mirtazapine. [Moderate] Study
- ▶ **H₂ receptor antagonists (cimetidine)** slightly increase the exposure to mirtazapine. Use with caution and adjust dose. [Moderate] Theoretical

- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **mirtazapine**. [Moderate] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **mirtazapine**. [Moderate] Study
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **mirtazapine**. [Moderate] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **mirtazapine**. Adjust dose. [Moderate] Study
- ▶ **Mirtazapine** is predicted to decrease the efficacy of **pitolisant**. [Moderate] Theoretical
- ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **mirtazapine**. Adjust dose. [Moderate] Study
- Misoprostol**
 - ▶ **Misoprostol** can cause uterine contractions, as can **oxytocin**—these effects might be additive on concurrent use. Avoid and for 4 hours after stopping **misoprostol**. [Severe] Theoretical
- Mitomycin** → see TABLE 15 p. 1450 (myelosuppression), TABLE 5 p. 1448 (thromboembolism)
- ▶ **Live vaccinia** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **mitomycin**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- Mitotane** → see TABLE 15 p. 1450 (myelosuppression)
 - ▶ **Mitotane** is predicted to decrease the exposure to **5-HT₃-receptor antagonists (ondansetron)**. [Moderate] Study
 - ▶ **Mitotane** is predicted to markedly decrease the exposure to **abemaciclib**. Avoid. [Severe] Study
 - ▶ **Mitotane** is predicted to decrease the exposure to **acalabrutinib**. Avoid. [Severe] Study
 - ▶ **Aldosterone antagonists (spironolactone)** are predicted to decrease the effects of **mitotane**. Avoid. [Severe] Anecdotal
 - ▶ **Mitotane** is predicted to decrease the exposure to **aldosterone antagonists (eplerenone)**. Avoid. [Moderate] Theoretical
 - ▶ **Mitotane** is predicted to decrease the exposure to **anti-androgens (abiraterone)**. Avoid. [Severe] Study
 - ▶ **Mitotane** is predicted to decrease the exposure to **anti-androgens (darolutamide)**. Avoid. [Moderate] Study
 - ▶ **Mitotane** is predicted to decrease the exposure to **antiarrhythmics (disopyramide, dronedarone)**. Avoid. [Severe] Study
 - ▶ **Mitotane** is predicted to decrease the efficacy of **antiarrhythmics (propafenone)**. [Moderate] Study
 - ▶ **Mitotane** is predicted to decrease the exposure to **anticholinesterases, centrally acting (donepezil)**. [Mild] Study
 - ▶ **Mitotane** is predicted to decrease the exposure to **antiepileptics (perampanel)**. Monitor and adjust dose. [Moderate] Study
 - ▶ **Mitotane** is predicted to decrease the exposure to **antifungals, azoles (isavuconazole)**. Avoid. [Severe] Study
 - ▶ **Mitotane** is predicted to decrease the exposure to **antimalarials (artemether)** with lumefantrine. Avoid. [Severe] Study
 - ▶ **Mitotane** is predicted to decrease the concentration of **antimalarials (piperazine)**. Avoid. [Moderate] Theoretical
 - ▶ **Mitotane** is predicted to moderately decrease the exposure to **antipsychotics, second generation (aripiprazole)**. Adjust aripiprazole dose, p. 418. [Moderate] Study
 - ▶ **Mitotane** is predicted to decrease the exposure to **antipsychotics, second generation (cariprazine)**. Avoid. [Severe] Theoretical
 - ▶ **Mitotane** is predicted to decrease the exposure to **antipsychotics, second generation (lurasidone)**. Avoid. [Moderate] Study
 - ▶ **Mitotane** is predicted to decrease the exposure to **antipsychotics, second generation (paliperidone)**. Monitor and adjust dose. [Severe] Study
 - ▶ **Mitotane** is predicted to decrease the exposure to **antipsychotics, second generation (quetiapine)**. [Moderate] Study
 - ▶ **Mitotane** is predicted to decrease the exposure to **antipsychotics, second generation (risperidone)**. Adjust dose. [Moderate] Study
 - ▶ **Mitotane** is predicted to decrease the exposure to **avapritinib**. Avoid. [Severe] Study
 - ▶ **Mitotane** is predicted to decrease the exposure to **axitinib**. Avoid or adjust dose. [Moderate] Study → Also see TABLE 15 p. 1450
 - ▶ **Mitotane** decreases the exposure to **bedaquiline**. Avoid. [Severe] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **benzodiazepines (alprazolam)**. Adjust dose. [Moderate] Theoretical
- ▶ **Mitotane** is predicted to decrease the exposure to **benzodiazepines (midazolam)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **bictegravir**. Avoid. [Moderate] Study
- ▶ **Mitotane** slightly decreases the exposure to **bortezomib**. Avoid. [Severe] Study → Also see TABLE 15 p. 1450
- ▶ **Mitotane** is predicted to very markedly decrease the exposure to **bosutinib**. Avoid. [Severe] Study → Also see TABLE 15 p. 1450
- ▶ **Mitotane** is predicted to decrease the exposure to **brigatinib**. Avoid. [Severe] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **bupirone**. Use with caution and adjust dose. [Severe] Study
- ▶ **Mitotane** moderately decreases the exposure to **cabozantinib**. Avoid. [Moderate] Study → Also see TABLE 15 p. 1450
- ▶ **Mitotane** is predicted to decrease the exposure to **calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **calcium channel blockers (diltiazem)**. [Severe] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **cannabidiol**. Adjust dose. [Moderate] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **ceritinib**. Avoid. [Severe] Study → Also see TABLE 15 p. 1450
- ▶ **Mitotane** decreases the concentration of **ciclosporin**. [Severe] Study
- ▶ **Mitotane** is predicted to alter the effects of **cilostazol**. [Moderate] Theoretical
- ▶ **Mitotane** is predicted to decrease the exposure to **cinacalcet**. Monitor and adjust dose. [Moderate] Study
- ▶ **Mitotane** decreases the exposure to **clomethiazole**. Monitor and adjust dose. [Moderate] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **cobicistat**. Avoid. [Severe] Theoretical
- ▶ **Mitotane** is predicted to decrease the exposure to **cobimetinib**. Avoid. [Severe] Theoretical
- ▶ **Mitotane** is predicted to decrease the exposure to **corticosteroids (budesonide, deflazacort, dexamethasone, fludrocortisone, hydrocortisone, methylprednisolone, prednisolone, triamcinolone)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **corticosteroids (fluticasone)**. [Unknown] Theoretical
- ▶ **Mitotane** is predicted to markedly decrease the exposure to **crizotinib**. Avoid. [Severe] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **dabrafenib**. Avoid. [Moderate] Theoretical
- ▶ **Mitotane** is predicted to decrease the exposure to **darifenacin**. [Moderate] Theoretical
- ▶ **Mitotane** is predicted to markedly decrease the exposure to **dasatinib**. Avoid. [Severe] Study → Also see TABLE 15 p. 1450
- ▶ **Mitotane** is predicted to slightly decrease the exposure to **delamanid**. Avoid. [Moderate] Study
- ▶ **Mitotane** is predicted to markedly decrease the exposure to **dienogest**. [Severe] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **dipeptidylpeptidase-4 inhibitors (linagliptin)**. [Moderate] Study
- ▶ **Mitotane** is predicted to moderately decrease the exposure to **dipeptidylpeptidase-4 inhibitors (saxagliptin)**. [Moderate] Study
- ▶ **Mitotane** decreases the exposure to **dolutegravir**. Adjust dose. [Severe] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **dronabinol**. Avoid or adjust dose. [Mild] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **elbasvir**. Avoid. [Severe] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **elexacaftor**. Avoid. [Severe] Theoretical
- ▶ **Mitotane** is predicted to decrease the exposure to **eliglustat**. Avoid. [Severe] Study
- ▶ **Mitotane** is predicted to decrease the concentration of **elvitegravir**. Avoid. [Severe] Theoretical

Mitotane (continued)

- ▶ Mitotane is predicted to decrease the exposure to **encorafenib**. [\[Severe\]](#) Theoretical
- ▶ Mitotane affects the exposure to **endothelin receptor antagonists (bosentan)**. Avoid. [\[Severe\]](#) Study
- ▶ Mitotane is predicted to decrease the exposure to **endothelin receptor antagonists (macitentan)**. Avoid. [\[Severe\]](#) Study
- ▶ Mitotane is predicted to decrease the exposure to **entrectinib**. Avoid. [\[Severe\]](#) Study
- ▶ Mitotane is predicted to decrease the effects of **ergotamine**. [\[Moderate\]](#) Theoretical
- ▶ Mitotane is predicted to decrease the exposure to **erlotinib**. Avoid or adjust **erlotinib** dose, p. 1030. [\[Severe\]](#) Study
- ▶ Mitotane is predicted to decrease the exposure to **esketamine**. Adjust dose. [\[Moderate\]](#) Theoretical
- ▶ Mitotane is predicted to decrease the concentration of **everolimus**. Avoid or adjust dose. [\[Severe\]](#) Study
- ▶ Mitotane moderately decreases the exposure to **exemestane**. [\[Moderate\]](#) Study
- ▶ Mitotane is predicted to decrease the exposure to **factor XA inhibitors (apixaban)**. [\[Moderate\]](#) Study
- ▶ Mitotane is predicted to decrease the exposure to **factor XA inhibitors (rivaroxaban)**. Avoid unless patient can be monitored for signs of thrombosis. [\[Severe\]](#) Study
- ▶ Mitotane is predicted to decrease the exposure to **fesoterodine**. Avoid. [\[Moderate\]](#) Study
- ▶ Mitotane is predicted to decrease the exposure to **fostamatinib**. Avoid. [\[Severe\]](#) Study
- ▶ Mitotane is predicted to decrease the exposure to **gefitinib**. Avoid. [\[Severe\]](#) Study
- ▶ Mitotane is predicted to moderately decrease the exposure to **glisdegib**. Avoid. [\[Severe\]](#) Study
- ▶ Mitotane is predicted to greatly decrease the concentration of **glecaprevir**. Avoid. [\[Severe\]](#) Study
- ▶ Mitotane is predicted to decrease the exposure to **grazoprevir**. Avoid. [\[Severe\]](#) Study
- ▶ Mitotane is predicted to decrease the concentration of **guanfacine**. Adjust **guanfacine** dose, p. 375. [\[Moderate\]](#) Study
- ▶ Mitotane decreases the concentration of **haloperidol**. Adjust dose. [\[Moderate\]](#) Study
- ▶ Mitotane is predicted to decrease the exposure to **ibrutinib**. Avoid or monitor. [\[Severe\]](#) Study → Also see TABLE 15 p. 1450
- ▶ Mitotane is predicted to decrease the exposure to **idelalisib**. Avoid. [\[Severe\]](#) Study
- ▶ Mitotane is predicted to decrease the exposure to **imatatinib**. Avoid. [\[Moderate\]](#) Study → Also see TABLE 15 p. 1450
- ▶ Mitotane is predicted to decrease the exposure to **irinotecan**. Avoid. [\[Severe\]](#) Study → Also see TABLE 15 p. 1450
- ▶ Mitotane is predicted to decrease the exposure to **ivabradine**. Adjust dose. [\[Moderate\]](#) Theoretical
- ▶ Mitotane is predicted to decrease the exposure to **ivacaftor**. Avoid. [\[Severe\]](#) Study
- ▶ Mitotane is predicted to decrease the exposure to **ixazomib**. Avoid. [\[Severe\]](#) Study
- ▶ Mitotane is predicted to decrease the exposure to **lapatinib**. Avoid. [\[Severe\]](#) Study
- ▶ Mitotane is predicted to moderately decrease the exposure to **larotrectinib**. Avoid. [\[Moderate\]](#) Study
- ▶ Mitotane is predicted to decrease the exposure to **lomitapide**. Monitor and adjust dose. [\[Moderate\]](#) Theoretical
- ▶ Mitotane is predicted to decrease the exposure to **lortlatinib**. Avoid. [\[Severe\]](#) Study
- ▶ Mitotane is predicted to decrease the exposure to **maraviroc**. Adjust dose. [\[Severe\]](#) Study
- ▶ Mitotane is predicted to decrease the exposure to **meglitinides (repaglinide)**. Monitor blood glucose and adjust dose. [\[Moderate\]](#) Study
- ▶ Mitotane is predicted to decrease the exposure to **midostaurin**. Avoid. [\[Severe\]](#) Study
- ▶ Mitotane is predicted to decrease the exposure to **mirtazapine**. Adjust dose. [\[Moderate\]](#) Study
- ▶ Mitotane is predicted to decrease the exposure to **monoclonal antibodies (polatuzumab vedotin)**. [\[Moderate\]](#) Theoretical
- ▶ Mitotane is predicted to decrease the exposure to **montelukast**. [\[Mild\]](#) Study
- ▶ Mitotane is predicted to markedly decrease the exposure to **naldemedine**. Avoid. [\[Severe\]](#) Study
- ▶ Mitotane is predicted to markedly decrease the exposure to **naloxegol**. Avoid. [\[Moderate\]](#) Study
- ▶ Mitotane is predicted to decrease the exposure to **neratinib**. Avoid. [\[Severe\]](#) Study
- ▶ Mitotane is predicted to markedly decrease the exposure to **neurokinin-1 receptor antagonists (aprepitant)**. Avoid. [\[Moderate\]](#) Study
- ▶ Mitotane is predicted to decrease the exposure to **neurokinin-1 receptor antagonists (fosaprepitant)**. Avoid. [\[Moderate\]](#) Theoretical
- ▶ Mitotane is predicted to decrease the exposure to **neurokinin-1 receptor antagonists (netupitant)**. Avoid. [\[Severe\]](#) Study
- ▶ Mitotane is predicted to moderately decrease the exposure to **nilotinib**. Avoid. [\[Severe\]](#) Study → Also see TABLE 15 p. 1450
- ▶ Mitotane is predicted to decrease the exposure to **nilotinone**. Adjust dose. [\[Moderate\]](#) Theoretical
- ▶ Mitotane is predicted to decrease the exposure to **NNRTIs (doravirine)**. Avoid. [\[Severe\]](#) Study
- ▶ Mitotane is predicted to decrease the exposure to **NNRTIs (etravirine)**. Avoid. [\[Severe\]](#) Theoretical
- ▶ Mitotane is predicted to decrease the exposure to **NNRTIs (nevirapine)**. [\[Severe\]](#) Theoretical
- ▶ Mitotane markedly decreases the exposure to **NNRTIs (rilpivirine)**. Avoid. [\[Severe\]](#) Study
- ▶ Mitotane is predicted to decrease the exposure to **olaparib**. Avoid. [\[Moderate\]](#) Theoretical → Also see TABLE 15 p. 1450
- ▶ Mitotane is predicted to decrease the exposure to **opioids (alfentanil, fentanyl)**. [\[Moderate\]](#) Study
- ▶ Mitotane is predicted to decrease the exposure to **opioids (buprenorphine)**. Monitor and adjust dose. [\[Moderate\]](#) Theoretical
- ▶ Mitotane decreases the exposure to **opioids (methadone)**. Monitor and adjust dose. [\[Severe\]](#) Study
- ▶ Mitotane is predicted to decrease the exposure to **opioids (oxycodone)**. Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ Mitotane is predicted to moderately decrease the exposure to **osimertinib**. Avoid. [\[Moderate\]](#) Study
- ▶ Mitotane is predicted to moderately decrease the exposure to **ospemifene**. [\[Moderate\]](#) Study
- ▶ Mitotane is predicted to decrease the exposure to **palbociclib**. Avoid. [\[Severe\]](#) Study → Also see TABLE 15 p. 1450
- ▶ Mitotane is predicted to decrease the exposure to **panobinostat**. Avoid. [\[Moderate\]](#) Theoretical → Also see TABLE 15 p. 1450
- ▶ Mitotane is predicted to decrease the exposure to **pazopanib**. Avoid. [\[Severe\]](#) Theoretical
- ▶ Mitotane moderately decreases the exposure to **phosphodiesterase type-4 inhibitors (apremilast)**. Avoid. [\[Severe\]](#) Study
- ▶ Mitotane is predicted to decrease the exposure to **phosphodiesterase type-4 inhibitors (roflumilast)**. Avoid. [\[Moderate\]](#) Study
- ▶ Mitotane is predicted to decrease the exposure to **phosphodiesterase type-5 inhibitors (avanafil, tadalafil)**. Avoid. [\[Severe\]](#) Study
- ▶ Mitotane is predicted to decrease the exposure to **phosphodiesterase type-5 inhibitors (sildenafil, vardenafil)**. [\[Moderate\]](#) Theoretical
- ▶ Mitotane is predicted to moderately to markedly decrease the exposure to **pibrentasvir**. Avoid. [\[Severe\]](#) Study
- ▶ Mitotane is predicted to moderately decrease the exposure to **pitolisant**. [\[Moderate\]](#) Study
- ▶ Mitotane is predicted to decrease the exposure to **ponatinib**. Avoid. [\[Moderate\]](#) Theoretical
- ▶ Mitotane is predicted to markedly decrease the exposure to **praziquantel**. Avoid. [\[Moderate\]](#) Study
- ▶ Mitotane is predicted to decrease the exposure to **ranolazine**. Avoid. [\[Severe\]](#) Study
- ▶ Mitotane is predicted to decrease the exposure to **reboxetine**. [\[Moderate\]](#) Anecdotal
- ▶ Mitotane is predicted to decrease the exposure to **regorafenib**. Avoid. [\[Moderate\]](#) Study → Also see TABLE 15 p. 1450
- ▶ Mitotane potentially decreases the exposure to **remdesivir**. Avoid. [\[Moderate\]](#) Theoretical

- ▶ **Mitotane** is predicted to markedly decrease the exposure to **ribociclib**. Avoid. [Severe] Study → Also see TABLE 15 p. 1450
 - ▶ **Mitotane** is predicted to decrease the exposure to **roxolitinib**. Monitor and adjust dose. [Moderate] Study → Also see TABLE 15 p. 1450
 - ▶ **Mitotane** is predicted to decrease the exposure to **siponimod**. [Severe] Study
 - ▶ **Mitotane** is predicted to decrease the concentration of **sirolimus**. Avoid. [Severe] Study
 - ▶ **Mitotane** is predicted to decrease the exposure to **solifenacin**. [Moderate] Theoretical
 - ▶ **Mitotane** is predicted to decrease the exposure to **sorafenib**. [Moderate] Theoretical → Also see TABLE 15 p. 1450
 - ▶ **Mitotane** is predicted to decrease the exposure to **statins (atorvastatin, simvastatin)**. [Moderate] Study
 - ▶ **Mitotane** is predicted to decrease the exposure to **sunitinib**. Avoid or adjust **sunitinib** dose, p. 1051. [Moderate] Study → Also see TABLE 15 p. 1450
 - ▶ **Mitotane** decreases the concentration of **tacrolimus**. Monitor and adjust dose. [Severe] Study
 - ▶ **Mitotane** is predicted to decrease the exposure to **taxanes (cabazitaxel, paclitaxel)**. Avoid. [Severe] Study → Also see TABLE 15 p. 1450
 - ▶ **Mitotane** is predicted to decrease the exposure to **taxanes (docetaxel)**. [Severe] Theoretical → Also see TABLE 15 p. 1450
 - ▶ **Mitotane** is predicted to decrease the concentration of **temsirolimus**. Avoid. [Severe] Study → Also see TABLE 15 p. 1450
 - ▶ **Mitotane** is predicted to decrease the exposure to **tezacaftor**. Avoid. [Severe] Theoretical
 - ▶ **Mitotane** is predicted to markedly decrease the exposure to **ticagrelor**. Avoid. [Severe] Study
 - ▶ **Mitotane** is predicted to decrease the exposure to **tivozanib**. [Severe] Study
 - ▶ **Mitotane** is predicted to decrease the exposure to **tofacinib**. Avoid. [Severe] Study
 - ▶ **Mitotane** is predicted to decrease the exposure to **tolvaptan**. Use with caution or avoid depending on indication. [Severe] Study
 - ▶ **Mitotane** is predicted to decrease the exposure to **toremifene**. Adjust dose. [Moderate] Study
 - ▶ **Mitotane** is predicted to decrease the exposure to **trabectedin**. Avoid. [Severe] Theoretical → Also see TABLE 15 p. 1450
 - ▶ **Mitotane** is predicted to decrease the exposure to **upadacitinib**. [Moderate] Study
 - ▶ **Mitotane** is predicted to decrease the exposure to **vandetanib**. Avoid. [Moderate] Study
 - ▶ **Mitotane** is predicted to moderately decrease the exposure to **velpatasvir**. Avoid. [Severe] Study
 - ▶ **Mitotane** is predicted to decrease the exposure to **vemurafenib**. Avoid. [Severe] Study
 - ▶ **Mitotane** is predicted to decrease the exposure to **venetoclax**. Avoid. [Severe] Study
 - ▶ **Mitotane** is predicted to decrease the exposure to **vinca alkaloids (vinblastine, vincristine, vindesine)**. [Severe] Theoretical → Also see TABLE 15 p. 1450
 - ▶ **Mitotane** is predicted to decrease the exposure to **vinca alkaloids (vinflunine)**. Avoid. [Severe] Theoretical → Also see TABLE 15 p. 1450
 - ▶ **Mitotane** is predicted to decrease the exposure to **vinca alkaloids (vinorelbine)**. Use with caution or avoid. [Severe] Theoretical → Also see TABLE 15 p. 1450
 - ▶ **Mitotane** is predicted to decrease the exposure to **vismodegib**. Avoid. [Moderate] Theoretical
 - ▶ **Mitotane** is predicted to decrease the exposure to **vortioxetine**. Monitor and adjust dose. [Moderate] Study
 - ▶ **Mitotane** is predicted to decrease the concentration of **voxilaprevir**. Avoid. [Severe] Study
 - ▶ **Mitotane** is predicted to decrease the exposure to **zopiclone**. Adjust dose. [Moderate] Study
- Mitoxantrone** → see anthracyclines
- Mivacurium** → see neuromuscular blocking drugs, non-depolarising
- Mizolastine** → see antihistamines, non-sedating
- Moclobemide** → see TABLE 13 p. 1450 (serotonin syndrome)

FOOD AND LIFESTYLE Moclobemide is claimed to cause less potentiation of the pressor effect of tyramine than the

traditional (irreversible) MAOIs, but patients should avoid consuming large amounts of tyramine-rich foods (such as mature cheese, salami, pickled herring, Bovril[®], Oxo[®], Marmite[®] or any similar meat or yeast extract or fermented soya bean extract, and some beers, lagers or wines).

- ▶ **Amfetamines** are predicted to increase the risk of a hypertensive crisis when given with **moclobemide**. Avoid. [Severe] Theoretical → Also see TABLE 13 p. 1450
- ▶ **Anti-androgens (apalutamide)** are predicted to decrease the exposure to **moclobemide**. Avoid or monitor. [Mild] Study
- ▶ **Moclobemide** potentially increases the exposure to **benzodiazepines (clobazam)**. Adjust dose. [Moderate] Theoretical
- ▶ **Bupropion** is predicted to increase the risk of severe hypertension when given with **moclobemide**. Avoid. [Severe] Theoretical
- ▶ **Moclobemide** is predicted to increase the exposure to **cannabidiol**. [Moderate] Theoretical
- ▶ **Moclobemide** is predicted to increase the exposure to **cilostazol**. [Moderate] Theoretical
- ▶ **Moclobemide** is predicted to decrease the efficacy of **clopidogrel**. Avoid. [Moderate] Study
- ▶ **Moclobemide** is predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [Severe] Theoretical
- ▶ **H₂ receptor antagonists (cimetidine)** increase the exposure to **moclobemide**. Adjust **moclobemide** dose, p. 386. [Mild] Study
- ▶ **Levodopa** increases the risk of adverse effects when given with **moclobemide**. [Moderate] Study
- ▶ **Moclobemide** is predicted to increase the risk of adverse effects when given with **linezolid**. Avoid and for 14 days after stopping **moclobemide**. [Severe] Theoretical → Also see TABLE 13 p. 1450
- ▶ **Moclobemide** is predicted to increase the effects of **MAO-B inhibitors (rasagiline, selegiline)**. Avoid. [Severe] Theoretical → Also see TABLE 13 p. 1450
- ▶ **Moclobemide** is predicted to increase the risk of adverse effects when given with **MAO-B inhibitors (safinamide)**. Avoid and for 1 week after stopping **safinamide**. [Severe] Theoretical → Also see TABLE 13 p. 1450
- ▶ **Methyphenidate** is predicted to increase the risk of a hypertensive crisis when given with **moclobemide**. [Severe] Theoretical
- ▶ **Mianserin** is predicted to increase the risk of toxicity when given with **moclobemide**. Avoid and for 1 week after stopping **mianserin**. [Severe] Theoretical
- ▶ **Opicapone** is predicted to increase the risk of elevated blood pressure when given with **moclobemide**. Avoid. [Severe] Theoretical
- ▶ **Ozanimod** might increase the risk of a hypertensive crisis when given with **moclobemide**. Avoid. [Severe] Theoretical
- ▶ **Moclobemide** increases the risk of adverse effects when given with **phenothiazines (levomepromazine)**. [Moderate] Study
- ▶ **Reboxetine** is predicted to increase the risk of a hypertensive crisis when given with **moclobemide**. Avoid. [Severe] Theoretical
- ▶ **Moclobemide** is predicted to increase the exposure to **SSRIs (escitalopram)**. Use with caution and adjust dose. [Severe] Study → Also see TABLE 13 p. 1450
- ▶ **Sympathomimetics, vasoconstrictor (ephedrine, isometheptene, phenylephrine, pseudoephedrine)** are predicted to increase the risk of a hypertensive crisis when given with **moclobemide**. Avoid. [Severe] Study
- ▶ **Tetrabenazine** potentially increases the risk of CNS excitation and hypertension when given with **moclobemide**. [Severe] Theoretical
- ▶ **Tricyclic antidepressants** are predicted to increase the risk of severe toxic reaction when given with **moclobemide**. Avoid. [Severe] Theoretical → Also see TABLE 13 p. 1450
- ▶ **Moclobemide** moderately increases the exposure to **triptans (rizatriptan, sumatriptan)**. Avoid. [Moderate] Study → Also see TABLE 13 p. 1450
- ▶ **Moclobemide** slightly increases the exposure to **triptans (zolmitriptan)**. Adjust **zolmitriptan** dose, p. 507. [Moderate] Study → Also see TABLE 13 p. 1450

Modafinil

- ▶ **Antiepileptics (carbamazepine, phenobarbital, primidone)** are predicted to decrease the exposure to **modafinil**. [Mild] Theoretical
 - ▶ **Antiepileptics (fosphenytoin, phenytoin)** are predicted to decrease the exposure to **modafinil** and **modafinil** is predicted to increase the concentration of **antiepileptics (fosphenytoin, phenytoin)**. Monitor concentration and adjust dose. [Moderate] Theoretical
 - ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **modafinil**. [Mild] Theoretical
 - ▶ **Modafinil** is predicted to decrease the exposure to **bosutinib**. Avoid. [Severe] Theoretical
 - ▶ **Cobicistat** is predicted to increase the exposure to **modafinil**. [Mild] Theoretical
 - ▶ **Modafinil** is predicted to decrease the efficacy of **combined hormonal contraceptives**. For FSRH guidance, see Contraceptives, interactions p. 843. [Severe] Study
 - ▶ **Modafinil** is predicted to decrease the efficacy of **desogestrel**. For FSRH guidance, see Contraceptives, interactions p. 843. [Severe] Theoretical
 - ▶ **Modafinil** is predicted to decrease the exposure to **elbasvir**. Avoid. [Unknown] Theoretical
 - ▶ **Modafinil** is predicted to decrease the efficacy of **etonogestrel**. For FSRH guidance, see Contraceptives, interactions p. 843. [Severe] Theoretical
 - ▶ **Modafinil** is predicted to decrease the exposure to **glasdegib**. Avoid or adjust **glasdegib** dose, p. 1056. [Moderate] Theoretical
 - ▶ **Modafinil** is predicted to decrease the exposure to **grazoprevir**. Avoid. [Severe] Theoretical
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **modafinil**. [Mild] Theoretical
 - ▶ **Modafinil** is predicted to decrease the effects of **hormone replacement therapy**. [Moderate] Anecdotal
 - ▶ **Idelalisib** is predicted to increase the exposure to **modafinil**. [Mild] Theoretical
 - ▶ **Modafinil** is predicted to decrease the concentration of **letemovir**. [Moderate] Theoretical
 - ▶ **Modafinil** is predicted to decrease the efficacy of **levonorgestrel**. For FSRH guidance, see Contraceptives, interactions p. 843. [Severe] Theoretical
 - ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **modafinil**. [Mild] Theoretical
 - ▶ **Modafinil** is predicted to decrease the exposure to **NNRTIs (doravirine)**. Avoid or adjust doravirine p. 686 or lamivudine with tenofovir disoproxil and doravirine p. 696 dose. [Severe] Theoretical
 - ▶ **Modafinil** is predicted to decrease the efficacy of **norethisterone**. For FSRH guidance, see Contraceptives, interactions p. 843. [Severe] Anecdotal
 - ▶ **Modafinil** is predicted to decrease the exposure to **osimertinib**. Use with caution or avoid. [Severe] Theoretical
 - ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **modafinil**. [Moderate] Theoretical
 - ▶ **Modafinil** is predicted to decrease the exposure to **sofosbuvir**. Avoid. [Severe] Theoretical
 - ▶ **Modafinil** decreases the efficacy of **ulipristal**. For FSRH guidance, see Contraceptives, interactions p. 843. [Severe] Anecdotal
 - ▶ **Modafinil** is predicted to decrease the exposure to **velpatasvir**. Avoid. [Severe] Theoretical
 - ▶ **Modafinil** is predicted to decrease the concentration of **voxilaprevir**. Avoid. [Severe] Theoretical
- Mogamulizumab** → see monoclonal antibodies
Mometasone → see corticosteroids
Monoclonal antibodies → see TABLE 15 p. 1450 (myelosuppression), TABLE 12 p. 1450 (peripheral neuropathy), TABLE 9 p. 1449 (QT-interval prolongation), TABLE 4 p. 1447 (antiplatelet effects)

adalimumab · alemtuzumab · atezolizumab · avelumab · basiliximab · belimumab · bevacizumab · binatumomab · brentuximab vedotin · brodalumab · canakinumab · cemiplimab · certolizumab pegol · cetuximab · daratumumab · dinutuximab · dupilumab · durvalumab · eculizumab · elotuzumab · golimumab · guselkumab · infliximab · inotuzumab · ozogamicin · ipilimumab · ixekizumab · mogamulizumab · natalizumab · nivolumab · obinutuzumab ·

- ▶ **Abatacept** is predicted to increase the risk of generalised infection (possibly life-threatening) when given with **golimumab**. Avoid. [Severe] Theoretical
- ▶ **Binatumomab** is predicted to transiently increase the exposure to **aminophylline**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Sarilumab** potentially affects the exposure to **aminophylline**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Tocilizumab** is predicted to decrease the exposure to **aminophylline**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Anakinra** is predicted to increase the risk of generalised infection (possibly life-threatening) when given with **golimumab**. Avoid. [Severe] Theoretical
- ▶ **Anthracyclines** are predicted to increase the risk of cardiotoxicity when given with monoclonal antibodies (**trastuzumab**, **trastuzumab emtansine**). Avoid. [Severe] Theoretical → Also see TABLE 15 p. 1450
- ▶ **Anthracyclines** are predicted to increase the risk of cardiotoxicity when given with **trastuzumab deruxtecan**. [Severe] Theoretical → Also see TABLE 15 p. 1450
- ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to **polatuzumab vedotin**. [Moderate] Theoretical
- ▶ **Antiarrhythmics (dronedaron)** increase the risk of neutropenia when given with **brentuximab vedotin**. Monitor and adjust dose. [Severe] Theoretical
- ▶ **Antiepileptics (carbamazepine)** are predicted to decrease the effects of **brentuximab vedotin**. [Severe] Theoretical
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **polatuzumab vedotin**. [Moderate] Theoretical
- ▶ **Tocilizumab** is predicted to decrease the exposure to **antiepileptics (fosphenytoin, phenytoin)**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Antifungals, azoles (itraconazole, ketoconazole)** increase the risk of neutropenia when given with **brentuximab vedotin**. Monitor and adjust dose. [Severe] Study
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **polatuzumab vedotin**. [Moderate] Theoretical
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **trastuzumab emtansine**. Avoid. [Severe] Theoretical
- ▶ **Tocilizumab** is predicted to decrease the exposure to **benzodiazepines (alprazolam, diazepam, midazolam)**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Brentuximab vedotin** increases the risk of pulmonary toxicity when given with **bleomycin**. Avoid. [Severe] Study → Also see TABLE 15 p. 1450
- ▶ **Tocilizumab** is predicted to decrease the exposure to **calcium channel blockers**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Binatumomab** is predicted to transiently increase the exposure to **ciclosporin**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Sarilumab** potentially affects the exposure to **ciclosporin**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Tocilizumab** is predicted to decrease the exposure to **ciclosporin**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Cobicistat** is predicted to increase the exposure to **polatuzumab vedotin**. [Moderate] Theoretical
- ▶ **Cobicistat** is predicted to increase the exposure to **trastuzumab emtansine**. Avoid. [Severe] Theoretical
- ▶ **Sarilumab** potentially decreases the exposure to **combined hormonal contraceptives**. [Severe] Theoretical
- ▶ **Corticosteroids** are predicted to increase the risk of immunosuppression when given with **dinutuximab**. Avoid except in life-threatening situations. [Severe] Theoretical
- ▶ **Corticosteroids (betamethasone, deflazacort, dexamethasone, hydrocortisone, methylprednisolone, prednisolone)** are predicted to decrease the efficacy of monoclonal antibodies

- (atezolizumab, ipilimumab, nivolumab, pembrolizumab). Use with caution or avoid. [Severe] Theoretical
- ▶ **Tocilizumab** is predicted to decrease the exposure to **corticosteroids (dexamethasone, methylprednisolone)**. Monitor and adjust dose. [Moderate] Theoretical
 - ▶ **Blinatumomab** is predicted to transiently increase the exposure to **coumarins (warfarin)**. Monitor and adjust dose. [Moderate] Theoretical
 - ▶ **Sarilumab** potentially affects the exposure to **coumarins (warfarin)**. Monitor and adjust dose. [Severe] Theoretical
 - ▶ **Tocilizumab** is predicted to decrease the exposure to **coumarins (warfarin)**. Monitor and adjust dose. [Moderate] Theoretical
 - ▶ **Filgotinib** is predicted to increase the risk of immunosuppression when given with monoclonal antibodies (adalimumab, certolizumab pegol, golimumab, infliximab, rituximab, sarilumab, secukinumab, tocilizumab). Avoid. [Severe] Theoretical
 - ▶ **Alemtuzumab** is predicted to increase the risk of generalised infection (possibly life-threatening) when given with **fungolimid**. Avoid. [Severe] Theoretical
 - ▶ **HIV-protease inhibitors (lopinavir, ritonavir)** are predicted to increase the risk of neutropenia when given with **brentuximab vedotin**. Monitor and adjust dose. [Severe] Study
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **polatuzumab vedotin**. [Moderate] Theoretical
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **trastuzumab emtansine**. Avoid. [Severe] Theoretical
 - ▶ **Idelalisib** is predicted to increase the exposure to **polatuzumab vedotin**. [Moderate] Theoretical
 - ▶ **Idelalisib** is predicted to increase the exposure to **trastuzumab emtansine**. Avoid. [Severe] Theoretical
 - ▶ **Immunoglobulins (normal immunoglobulin)** are predicted to alter the effects of **dinutuximab**. Avoid. [Severe] Theoretical
 - ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **monoclonal antibodies**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
 - ▶ **Macrolides (clarithromycin)** increase the risk of neutropenia when given with **brentuximab vedotin**. Monitor and adjust dose. [Severe] Theoretical
 - ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **polatuzumab vedotin**. [Moderate] Theoretical
 - ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **trastuzumab emtansine**. Avoid. [Severe] Theoretical
 - ▶ **Mitotane** is predicted to decrease the exposure to **polatuzumab vedotin**. [Moderate] Theoretical
 - ▶ **Alemtuzumab** is predicted to increase the risk of generalised infection (possibly life-threatening) when given with **ozanimod**. Avoid. [Severe] Theoretical
 - ▶ **Rifamycins (rifampicin)** decrease the effects of **brentuximab vedotin**. [Severe] Study
 - ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **polatuzumab vedotin**. [Moderate] Theoretical
 - ▶ **Alemtuzumab** is predicted to increase the risk of generalised infection (possibly life-threatening) when given with **siponimod**. Avoid. [Severe] Theoretical
 - ▶ **Sarilumab** potentially affects the exposure to **sirrolimus**. Monitor and adjust dose. [Moderate] Theoretical
 - ▶ **Sarilumab** is predicted to decrease the exposure to **statins (atorvastatin, simvastatin)**. [Moderate] Study
 - ▶ **Tocilizumab** is predicted to decrease the exposure to **statins (atorvastatin, simvastatin)**. Monitor and adjust dose. [Moderate] Study
 - ▶ **Sarilumab** potentially affects the exposure to **tacrolimus**. Monitor and adjust dose. [Moderate] Theoretical
 - ▶ **Blinatumomab** is predicted to transiently increase the exposure to **theophylline**. Monitor and adjust dose. [Moderate] Theoretical
 - ▶ **Sarilumab** potentially affects the exposure to **theophylline**. Monitor and adjust dose. [Moderate] Theoretical
 - ▶ **Tocilizumab** is predicted to decrease the exposure to **theophylline**. Monitor and adjust dose. [Moderate] Theoretical
 - ▶ **Ipilimumab** might increase the risk of hepatotoxicity when given with **vemurafenib**. Avoid. [Severe] Study

Montelukast

- ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to **montelukast**. [Mid] Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **montelukast**. [Mid] Study
- ▶ **Clopidogrel** is predicted to moderately increase the exposure to **montelukast**. [Moderate] Study
- ▶ **Fibrates (gemfibrozil)** are predicted to moderately increase the exposure to **montelukast**. [Moderate] Study
- ▶ **Iron chelators (deferasirox)** are predicted to increase the exposure to **montelukast**. [Moderate] Theoretical
- ▶ **Leflunomide** is predicted to increase the exposure to **montelukast**. [Moderate] Theoretical
- ▶ **Mitotane** is predicted to decrease the exposure to **montelukast**. [Mid] Study
- ▶ **Opicapone** is predicted to increase the exposure to **montelukast**. Avoid. [Moderate] Study
- ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **montelukast**. [Mid] Study
- ▶ **Terflunomide** is predicted to increase the exposure to **montelukast**. [Moderate] Theoretical

Morphine → see opioids

Moxifloxacin → see quinolones

Moxisylyte → see TABLE 8 p. 1448 (hypotension)

Moxonidine → see TABLE 8 p. 1448 (hypotension), TABLE 11 p. 1449 (CNS depressant effects)

- ▶ **Tricyclic antidepressants** are predicted to decrease the effects of **moxonidine**. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 1448 → Also see TABLE 11 p. 1449

Mycophenolate

- ▶ **Mycophenolate** is predicted to increase the risk of haematological toxicity when given with **aciclovir**. [Moderate] Theoretical
- ▶ Oral **antacids** decrease the exposure to oral **mycophenolate**. [Moderate] Study
- ▶ **Antifungals, azoles (isavuconazole)** increase the exposure to **mycophenolate**. [Moderate] Study
- ▶ **Mycophenolate** is predicted to increase the risk of haematological toxicity when given with **ganciclovir**. [Moderate] Theoretical
- ▶ **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **mycophenolate**. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- ▶ **Rifamycins (rifampicin)** decrease the concentration of **mycophenolate**. Monitor and adjust dose. [Severe] Study
- ▶ **Mycophenolate** is predicted to increase the risk of haematological toxicity when given with **valaciclovir**. [Moderate] Theoretical
- ▶ **Mycophenolate** is predicted to increase the risk of haematological toxicity when given with **valganciclovir**. [Moderate] Theoretical
- ▶ **Nabilone** → see TABLE 11 p. 1449 (CNS depressant effects)
- ▶ **Nabilone** is predicted to increase the risk of cardiovascular adverse effects when given with **amfetamines**. [Severe] Theoretical
- ▶ **Nabumetone** → see NSAIDs
- ▶ **Nadolol** → see beta blockers, non-selective
- ▶ **Naldemedine**
 - ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to markedly decrease the exposure to **naldemedine**. Avoid. [Severe] Study
 - ▶ **Antiarrhythmics (amiodarone, dronedarone)** are predicted to increase the exposure to **naldemedine**. [Moderate] Study
 - ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to markedly decrease the exposure to **naldemedine**. Avoid. [Severe] Study
 - ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **naldemedine**. [Moderate] Study
 - ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **naldemedine**. Avoid or monitor. [Moderate] Study

Naldemedine (continued)

- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **naldemedine**. [Moderate] Study
- ▶ **Ciclosporin** is predicted to increase the exposure to **naldemedine**. [Moderate] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **naldemedine**. Avoid or monitor. [Moderate] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **naldemedine**. [Moderate] Study
- ▶ **Grapefruit juice** is predicted to increase the exposure to **naldemedine**. Avoid or monitor. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **naldemedine**. Avoid or monitor. [Moderate] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **naldemedine**. Avoid or monitor. [Moderate] Study
- ▶ **Imatinib** is predicted to increase the exposure to **naldemedine**. [Moderate] Study
- ▶ **Letermovir** is predicted to increase the exposure to **naldemedine**. [Moderate] Study
- ▶ **Macrolides (azithromycin, erythromycin)** are predicted to increase the exposure to **naldemedine**. [Moderate] Study
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **naldemedine**. Avoid or monitor. [Moderate] Study
- ▶ **Mitotane** is predicted to markedly decrease the exposure to **naldemedine**. Avoid. [Severe] Study
- ▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to increase the exposure to **naldemedine**. [Moderate] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **naldemedine**. [Moderate] Study
- ▶ **Ranolazine** is predicted to increase the exposure to **naldemedine**. [Moderate] Study
- ▶ **Rifamycins (rifampicin)** are predicted to markedly decrease the exposure to **naldemedine**. Avoid. [Severe] Study
- ▶ **St John's wort** is predicted to decrease the exposure to **naldemedine**. Avoid. [Severe] Study
- ▶ **Vemurafenib** is predicted to increase the exposure to **naldemedine**. [Moderate] Study

Nalmefene

GENERAL INFORMATION Discontinue treatment 1 week before anticipated use of opioids; if emergency analgesia is required during treatment, an increased dose of opioid analgesic might be necessary (monitor for opioid intoxication).

- ▶ **Nalmefene** is predicted to decrease the efficacy of **opioids**. Avoid. [Severe] Theoretical

Naloxegol

- ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to markedly decrease the exposure to **naloxegol**. Avoid. [Moderate] Study
- ▶ **Antiarrhythmics (dronedaron)** are predicted to increase the exposure to **naloxegol**. Adjust **naloxegol** dose and monitor adverse effects, p. 71. [Moderate] Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to markedly decrease the exposure to **naloxegol**. Avoid. [Moderate] Study
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **naloxegol**. Adjust **naloxegol** dose and monitor adverse effects, p. 71. [Moderate] Study
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to markedly increase the exposure to **naloxegol**. Avoid. [Severe] Study
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **naloxegol**. Adjust **naloxegol** dose and monitor adverse effects, p. 71. [Moderate] Study
- ▶ **Cobicistat** is predicted to markedly increase the exposure to **naloxegol**. Avoid. [Severe] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **naloxegol**. Adjust **naloxegol** dose and monitor adverse effects, p. 71. [Moderate] Study
- ▶ **Grapefruit juice** is predicted to increase the exposure to **naloxegol**. Avoid. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to markedly increase the exposure to **naloxegol**. Avoid. [Severe] Study

- ▶ **Idelalisib** is predicted to markedly increase the exposure to **naloxegol**. Avoid. [Severe] Study
- ▶ **Imatinib** is predicted to increase the exposure to **naloxegol**. Adjust **naloxegol** dose and monitor adverse effects, p. 71. [Moderate] Study
- ▶ **Letermovir** is predicted to increase the exposure to **naloxegol**. Adjust **naloxegol** dose and monitor adverse effects, p. 71. [Moderate] Study
- ▶ **Macrolides (clarithromycin)** are predicted to markedly increase the exposure to **naloxegol**. Avoid. [Severe] Study
- ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **naloxegol**. Adjust **naloxegol** dose and monitor adverse effects, p. 71. [Moderate] Study
- ▶ **Mitotane** is predicted to markedly decrease the exposure to **naloxegol**. Avoid. [Moderate] Study
- ▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to increase the exposure to **naloxegol**. Adjust **naloxegol** dose and monitor adverse effects, p. 71. [Moderate] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **naloxegol**. Adjust **naloxegol** dose and monitor adverse effects, p. 71. [Moderate] Study
- ▶ **Rifamycins (rifampicin)** are predicted to markedly decrease the exposure to **naloxegol**. Avoid. [Moderate] Study
- ▶ **St John's wort** is predicted to decrease the exposure to **naloxegol**. Avoid. [Moderate] Theoretical

Nandrolone

- ▶ **Nandrolone** is predicted to increase the anticoagulant effect of **coumarins**. Monitor and adjust dose. [Severe] Theoretical
- ▶ **Nandrolone** is predicted to increase the anticoagulant effect of **phenindione**. Monitor and adjust dose. [Severe] Theoretical

Naproxen → see NSAIDs

Naratriptan → see triptans

Natalizumab → see monoclonal antibodies

Nebivolol → see beta blockers, selective

Nefopam → see TABLE 10 p. 1449 (antimuscarinics)

▶ **Nefopam** is predicted to increase the risk of serious elevations in blood pressure when given with **MAOIs, irreversible**. Avoid. [Severe] Theoretical

Nelarabine → see TABLE 15 p. 1450 (myelosuppression)

Neomycin → see TABLE 2 p. 1447 (nephrotoxicity), TABLE 19 p. 1451 (ototoxicity), TABLE 20 p. 1451 (neuromuscular blocking effects)

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application of **neomycin**, the possibility of interactions should be borne in mind.

▶ **Neomycin** decreases the absorption of **digoxin**. [Moderate] Study

▶ **Neomycin** moderately decreases the exposure to **sorafenib**.

[Moderate] Study

Neostigmine → see TABLE 6 p. 1448 (bradycardia)

▶ **Aminoglycosides** are predicted to decrease the effects of **neostigmine**. [Moderate] Theoretical

Nepafenac → see NSAIDs

Neratinib → see TABLE 1 p. 1447 (hepatotoxicity)

FOOD AND LIFESTYLE Avoid pomegranate, and pomegranate juice, as it might increase the concentration of neratinib.

▶ **Neratinib** is predicted to increase the exposure to **afatinib**.

Separate administration by 12 hours. [Moderate] Study

▶ **Neratinib** is predicted to increase the exposure to **aliskiren**. [Moderate] Study

▶ **Oral antacids** are predicted to decrease the exposure to oral **neratinib**. Separate administration by at least 3 hours. [Mid] Theoretical

▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to **neratinib**. Avoid. [Severe] Study

▶ **Antiarrhythmics (dronedaron)** are predicted to increase the exposure to **neratinib**. Avoid moderate CYP3A4 inhibitors or adjust **neratinib** dose and monitor for gastrointestinal adverse effects, p. 1041. [Severe] Study

▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **neratinib**. Avoid. [Severe] Study → Also see TABLE 1 p. 1447

▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **neratinib**. Avoid

- moderate CYP3A4 inhibitors or adjust **neratinib** dose and monitor for gastrointestinal adverse effects, p. 1041. [\[Severe\]](#) Study → Also see TABLE 1 p. 1447
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **neratinib**. Avoid potent CYP3A4 inhibitors or adjust **neratinib** dose, p. 1041. [\[Severe\]](#) Study → Also see TABLE 1 p. 1447
 - ▶ **Neratinib** is predicted to increase the exposure to **antihistamines, non-sedating (fexofenadine)**. [\[Moderate\]](#) Study
 - ▶ **Neratinib** is predicted to increase the exposure to **bictegravir**. Use with caution or avoid. [\[Moderate\]](#) Theoretical
 - ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **neratinib**. Avoid moderate CYP3A4 inhibitors or adjust **neratinib** dose and monitor for gastrointestinal adverse effects, p. 1041. [\[Severe\]](#) Study
 - ▶ Oral **calcium salts (calcium carbonate)** -containing antacids are predicted to decrease the exposure to oral **neratinib**. Separate administration by at least 3 hours. [\[Mild\]](#) Theoretical
 - ▶ **Ciclosporin** is predicted to increase the exposure to **neratinib**. Avoid or adjust **neratinib** dose and monitor for gastrointestinal adverse effects, p. 1041. [\[Severe\]](#) Theoretical
 - ▶ **Cobicistat** is predicted to increase the exposure to **neratinib**. Avoid potent CYP3A4 inhibitors or adjust **neratinib** dose, p. 1041. [\[Severe\]](#) Study
 - ▶ **Neratinib** is predicted to increase the exposure to **colchicine**. [\[Moderate\]](#) Study
 - ▶ **Crizotinib** is predicted to increase the exposure to **neratinib**. Avoid moderate CYP3A4 inhibitors or adjust **neratinib** dose and monitor for gastrointestinal adverse effects, p. 1041. [\[Severe\]](#) Study
 - ▶ **Neratinib** slightly increases the exposure to **digoxin**. [\[Moderate\]](#) Study
 - ▶ **Endothelin receptor antagonists (bosentan)** are predicted to decrease the exposure to **neratinib**. [\[Severe\]](#) Study
 - ▶ **Neratinib** is predicted to increase the exposure to **erlotinib**. [\[Moderate\]](#) Theoretical
 - ▶ **Neratinib** is predicted to increase the exposure to **everolimus**. [\[Moderate\]](#) Study
 - ▶ **Neratinib** is predicted to increase the exposure to **factor XA inhibitors (apixaban)**. [\[Moderate\]](#) Theoretical
 - ▶ **Neratinib** is predicted to increase the exposure to **factor XA inhibitors (edoxaban, rivaroxaban)**. [\[Moderate\]](#) Study
 - ▶ **Neratinib** is predicted to increase the exposure to **fidaxomicin**. Avoid. [\[Moderate\]](#) Study
 - ▶ **Neratinib** is predicted to increase the exposure to **gilteritinib**. [\[Moderate\]](#) Theoretical
 - ▶ **Grapefruit** juice is predicted to increase the exposure to **neratinib**. Avoid. [\[Severe\]](#) Theoretical
 - ▶ **H₂ receptor antagonists** are predicted to decrease the exposure to **neratinib**. Avoid. [\[Severe\]](#) Theoretical
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **neratinib**. Avoid potent CYP3A4 inhibitors or adjust **neratinib** dose, p. 1041. [\[Severe\]](#) Study
 - ▶ **Idelalisib** is predicted to increase the exposure to **neratinib**. Avoid potent CYP3A4 inhibitors or adjust **neratinib** dose, p. 1041. [\[Severe\]](#) Study
 - ▶ **Imatinib** is predicted to increase the exposure to **neratinib**. Avoid moderate CYP3A4 inhibitors or adjust **neratinib** dose and monitor for gastrointestinal adverse effects, p. 1041. [\[Severe\]](#) Study
 - ▶ **Letermovir** is predicted to increase the exposure to **neratinib**. Avoid moderate CYP3A4 inhibitors or adjust **neratinib** dose and monitor for gastrointestinal adverse effects, p. 1041. [\[Severe\]](#) Study
 - ▶ **Neratinib** is predicted to increase the exposure to **loperamide**. [\[Moderate\]](#) Study
 - ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **neratinib**. Avoid potent CYP3A4 inhibitors or adjust **neratinib** dose, p. 1041. [\[Severe\]](#) Study
 - ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **neratinib**. Avoid moderate CYP3A4 inhibitors or adjust **neratinib** dose and monitor for gastrointestinal adverse effects, p. 1041. [\[Severe\]](#) Study
 - ▶ **Mitotane** is predicted to decrease the exposure to **neratinib**. Avoid. [\[Severe\]](#) Study
 - ▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to increase the exposure to **neratinib**. Avoid moderate CYP3A4 inhibitors or adjust **neratinib** dose and monitor for gastrointestinal adverse effects, p. 1041. [\[Severe\]](#) Study
 - ▶ **Nilotinib** is predicted to increase the exposure to **neratinib**. Avoid moderate CYP3A4 inhibitors or adjust **neratinib** dose and monitor for gastrointestinal adverse effects, p. 1041. [\[Severe\]](#) Study
 - ▶ **Neratinib** is predicted to increase the exposure to **nintedanib**. [\[Moderate\]](#) Study
 - ▶ **NNRTIs (efavirenz, nevirapine)** are predicted to decrease the exposure to **neratinib**. [\[Severe\]](#) Study
 - ▶ **Proton pump inhibitors** are predicted to decrease the exposure to **neratinib**. Avoid. [\[Severe\]](#) Study
 - ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **neratinib**. Avoid. [\[Severe\]](#) Study
 - ▶ **Neratinib** is predicted to increase the exposure to **sirolimus**. [\[Moderate\]](#) Study
 - ▶ Oral **sodium bicarbonate** -containing antacids are predicted to decrease the exposure to oral **neratinib**. Separate administration by at least 3 hours. [\[Mild\]](#) Theoretical
 - ▶ **St John's wort** is predicted to decrease the exposure to **neratinib**. Avoid. [\[Severe\]](#) Theoretical
 - ▶ **Neratinib** is predicted to slightly increase the exposure to **talazoparib**. Avoid or adjust **talazoparib** dose, p. 1059. [\[Severe\]](#) Study
 - ▶ **Neratinib** is predicted to increase the exposure to **taxanes (paclitaxel)**. [\[Moderate\]](#) Study
 - ▶ **Neratinib** is predicted to increase the exposure to **thrombin inhibitors (dabigatran)**. [\[Moderate\]](#) Study
 - ▶ **Neratinib** might increase the exposure to **tigecycline**. [\[Mild\]](#) Anecdotal → Also see TABLE 1 p. 1447
 - ▶ **Neratinib** is predicted to increase the exposure to **topotecan**. [\[Severe\]](#) Study
 - ▶ **Neratinib** is predicted to increase the concentration of **trametinib**. [\[Moderate\]](#) Theoretical
 - ▶ **Neratinib** might increase the exposure to **vinca alkaloids**. [\[Severe\]](#) Theoretical → Also see TABLE 1 p. 1447
- Netupitant** → see neurokinin-1 receptor antagonists
- Neurokinin-1 receptor antagonists**
- aprepitant · fosaprepitant · netupitant
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **abemaciclib**. [\[Moderate\]](#) Study
 - ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **acalabrutinib**. Avoid or monitor. [\[Severe\]](#) Study
 - ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **aldosterone antagonists (eplerenone)**. Adjust **eplerenone** dose, p. 209. [\[Severe\]](#) Study
 - ▶ **Netupitant** very slightly increases the exposure to **alkylating agents (cyclophosphamide)**. [\[Moderate\]](#) Study
 - ▶ **Netupitant** is predicted to increase the exposure to **alkylating agents (ifosfamide)**. [\[Moderate\]](#) Study
 - ▶ Neurokinin-1 receptor antagonists (**aprepitant, fosaprepitant**) are predicted to increase the exposure to **alkylating agents (ifosfamide)**. [\[Severe\]](#) Theoretical
 - ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **alpha blockers (tamsulosin)**. [\[Moderate\]](#) Theoretical
 - ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to markedly decrease the exposure to **aprepitant**. Avoid. [\[Moderate\]](#) Study
 - ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to **fosaprepitant**. Avoid. [\[Moderate\]](#) Theoretical
 - ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to **netupitant**. Avoid. [\[Severe\]](#) Study
 - ▶ **Aprepitant** increases the exposure to **antiarrhythmics (dronedaron)**. [\[Severe\]](#) Theoretical
 - ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **antiarrhythmics (propafenone)**. Monitor and adjust dose. [\[Moderate\]](#) Study

Neurokinin-1 receptor antagonists (continued)

- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to markedly decrease the exposure to **aprepitant**. Avoid. [\[Moderate\]](#) Study
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **fosaprepitant**. Avoid. [\[Moderate\]](#) Theoretical
- ▶ Antiepileptics (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **netupitant**. Avoid. [\[Severe\]](#) Study
- ▶ Antifungals, azoles (**flucanazole**) are predicted to increase the exposure to **aprepitant**. [\[Moderate\]](#) Theoretical
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to markedly increase the exposure to **aprepitant**. [\[Moderate\]](#) Study
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to increase the exposure to **fosaprepitant**. [\[Moderate\]](#) Theoretical
- ▶ Antifungals, azoles (**itraconazole, ketoconazole, voriconazole**) are predicted to increase the exposure to **netupitant**. [\[Moderate\]](#) Study
- ▶ Antifungals, azoles (**posaconazole**) are predicted to increase the exposure to neurokinin-1 receptor antagonists (**aprepitant, fosaprepitant**). [\[Moderate\]](#) Study
- ▶ **Aprepitant** is predicted to increase the exposure to **antifungals, azoles (isavuconazole)**. [\[Moderate\]](#) Theoretical
- ▶ **Netupitant** is predicted to decrease the exposure to **antifungals, azoles (isavuconazole)**. [\[Moderate\]](#) Theoretical
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **antihistamines, non-sedating (mizolastine)**. [\[Severe\]](#) Theoretical
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **antihistamines, non-sedating (rupatadine)**. Avoid. [\[Moderate\]](#) Study
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the concentration of **antimalarials (piperazine)**. [\[Severe\]](#) Theoretical
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **antipsychotics, second generation (cariprazine)**. Avoid. [\[Severe\]](#) Study
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **antipsychotics, second generation (lurasidone)**. Adjust lurasidone dose. [\[Moderate\]](#) Study
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **antipsychotics, second generation (quetiapine)**. Avoid. [\[Moderate\]](#) Study
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **avapritinib**. Avoid or adjust **avapritinib** dose, p. 1019. [\[Moderate\]](#) Study
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **axitinib**. [\[Moderate\]](#) Study
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **bedaquiline**. Avoid prolonged use. [\[Mild\]](#) Theoretical
- ▶ **Fosaprepitant** is predicted to increase the exposure to **benzodiazepines (alprazolam)**. [\[Moderate\]](#) Study
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **benzodiazepines (alprazolam)**. [\[Severe\]](#) Study
- ▶ **Fosaprepitant** slightly increases the exposure to **benzodiazepines (midazolam)**. [\[Moderate\]](#) Study
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **benzodiazepines (midazolam)**. Monitor adverse effects and adjust dose. [\[Severe\]](#) Study
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **beta₂ agonists (salmeterol)**. [\[Moderate\]](#) Study
- ▶ **Fosaprepitant** is predicted to increase the exposure to **bosutinib**. [\[Severe\]](#) Theoretical
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **bosutinib**. Avoid or adjust dose. [\[Severe\]](#) Study
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **brigatinib**. [\[Moderate\]](#) Study
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **buspirone**. Use with caution and adjust dose. [\[Moderate\]](#) Study
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **cabozantinib**. [\[Moderate\]](#) Study
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **aprepitant** and **aprepitant** is predicted to increase the exposure to **calcium channel blockers (diltiazem, verapamil)**. [\[Moderate\]](#) Study
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine)**. Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ **Fosaprepitant** is predicted to increase the exposure to **ceritinib**. [\[Severe\]](#) Theoretical
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **ceritinib**. [\[Moderate\]](#) Study
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the concentration of **ciclosporin**. [\[Severe\]](#) Study
- ▶ **Cobicistat** is predicted to markedly increase the exposure to **aprepitant**. [\[Moderate\]](#) Study
- ▶ **Cobicistat** is predicted to increase the exposure to **fosaprepitant**. [\[Moderate\]](#) Theoretical
- ▶ **Cobicistat** is predicted to increase the exposure to **netupitant**. [\[Moderate\]](#) Study
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **cobimetinib**. [\[Severe\]](#) Study
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **colchicine**. Adjust **colchicine** dose with moderate CYP3A4 inhibitors, p. 1175. [\[Severe\]](#) Study
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, fosaprepitant**) are predicted to decrease the efficacy of **combined hormonal contraceptives**. For FSRH guidance, see Contraceptives, interactions p. 843. [\[Severe\]](#) Study
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to oral **corticosteroids (budesonide)**. [\[Moderate\]](#) Study
- ▶ **Aprepitant** moderately increases the exposure to **corticosteroids (dexamethasone)**. Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ **Netupitant** is predicted to increase the exposure to **corticosteroids (dexamethasone)**. Adjust dose. [\[Moderate\]](#) Study
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **corticosteroids (fluticasone)**. [\[Moderate\]](#) Study
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **corticosteroids (methylprednisolone)**. Monitor and adjust dose. [\[Moderate\]](#) Study
- ▶ **Aprepitant** decreases the anticoagulant effect of **coumarins**. [\[Moderate\]](#) Study
- ▶ **Fosaprepitant** is predicted to decrease the anticoagulant effect of **coumarins**. [\[Moderate\]](#) Theoretical
- ▶ **Netupitant** is predicted to increase the exposure to **crizotinib**. [\[Moderate\]](#) Study
- ▶ **Dabrafenib** is predicted to decrease the exposure to **netupitant**. [\[Moderate\]](#) Theoretical
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **dabrafenib**. [\[Moderate\]](#) Study
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **darifenacin**. [\[Moderate\]](#) Study
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **dasatinib**. [\[Severe\]](#) Study
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, fosaprepitant**) are predicted to decrease the efficacy of **desogestrel**. For FSRH guidance, see Contraceptives, interactions p. 843. [\[Severe\]](#) Theoretical

- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to slightly increase the exposure to **dienogest**. [\[Moderate\]](#) Study
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **dipeptidylpeptidase-4 inhibitors (saxagliptin)**. [\[Mild\]](#) Study
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **domperidone**. Avoid. [\[Severe\]](#) Study
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **dopamine receptor agonists (bromocriptine)**. [\[Severe\]](#) Theoretical
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the concentration of **dopamine receptor agonists (cabergoline)**. [\[Moderate\]](#) Anecdotal
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to moderately increase the exposure to **dutasteride**. [\[Mild\]](#) Study
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **eluxacafor**. Adjust tezacaftor with ivacaftor and eluxacafor p. 314 dose with moderate CYP3A4 inhibitors. [\[Severe\]](#) Theoretical
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [\[Severe\]](#) Study
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to moderately increase the exposure to **encorafenib**. [\[Moderate\]](#) Study
- ▶ **Endothelin receptor antagonists (bosentan)** are predicted to decrease the exposure to **aprepitant**. [\[Moderate\]](#) Study
- ▶ **Endothelin receptor antagonists (bosentan)** are predicted to decrease the exposure to neurokinin-1 receptor antagonists (**fosaprepitant, netupitant**). [\[Moderate\]](#) Theoretical
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **entrectinib**. Avoid moderate CYP3A4 inhibitors or adjust **entrectinib** dose, p. 1030. [\[Severe\]](#) Theoretical
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the risk of ergotism when given with **ergometrine**. [\[Severe\]](#) Theoretical
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the risk of ergotism when given with **ergotamine**. [\[Severe\]](#) Theoretical
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **erlotinib**. [\[Moderate\]](#) Study
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, fosaprepitant**) are predicted to decrease the efficacy of **etonogestrel**. For FSRH guidance, see Contraceptives, interactions p. 843. [\[Severe\]](#) Theoretical
- ▶ **Netupitant** slightly increases the exposure to **etoposide**. [\[Moderate\]](#) Study
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the concentration of **everolimus**. Avoid or adjust dose. [\[Moderate\]](#) Study
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **fesoterodine**. Adjust **fesoterodine** dose with moderate CYP3A4 inhibitors in hepatic and renal impairment, p. 824. [\[Mild\]](#) Study
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **gefitinib**. [\[Moderate\]](#) Study
- ▶ **Fosaprepitant** is predicted to increase the concentration of **guanfacine**. [\[Moderate\]](#) Theoretical
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the concentration of **guanfacine**. Adjust **guanfacine** dose, p. 375. [\[Moderate\]](#) Theoretical
- ▶ **HIV-protease inhibitors** are predicted to markedly increase the exposure to **aprepitant**. [\[Moderate\]](#) Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **fosaprepitant**. [\[Moderate\]](#) Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **netupitant**. [\[Moderate\]](#) Study
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, fosaprepitant**) are predicted to decrease the effects of **hormone replacement therapy**. [\[Moderate\]](#) Anecdotal
- ▶ **Fosaprepitant** is predicted to slightly increase the exposure to **ibrutinib**. [\[Moderate\]](#) Theoretical
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **ibrutinib**. Adjust **ibrutinib** dose with moderate CYP3A4 inhibitors, p. 1034. [\[Severe\]](#) Study
- ▶ **Idelalisib** is predicted to markedly increase the exposure to **aprepitant**. [\[Moderate\]](#) Study
- ▶ **Idelalisib** is predicted to increase the exposure to **fosaprepitant**. [\[Moderate\]](#) Theoretical
- ▶ **Idelalisib** is predicted to increase the exposure to **netupitant**. [\[Moderate\]](#) Study
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **imatinib**. [\[Moderate\]](#) Theoretical
- ▶ **Netupitant** is predicted to increase the exposure to **irinotecan**. [\[Moderate\]](#) Study
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, fosaprepitant**) are predicted to increase the exposure to intravenous **irinotecan**. [\[Severe\]](#) Theoretical
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **ivabradine**. Adjust **ivabradine** dose, p. 228. [\[Severe\]](#) Theoretical
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **ivacaftor**. Adjust dose with moderate CYP3A4 inhibitors, see ivacaftor p. 312, tezacaftor with ivacaftor p. 314, and tezacaftor with ivacaftor and eluxacafor p. 314. [\[Moderate\]](#) Study
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **lapatinib**. [\[Moderate\]](#) Study
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, fosaprepitant**) are predicted to decrease the efficacy of **levonorgestrel**. For FSRH guidance, see Contraceptives, interactions p. 843. [\[Severe\]](#) Theoretical
- ▶ **Fosaprepitant** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [\[Mild\]](#) Theoretical
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **lomitapide**. Avoid. [\[Moderate\]](#) Theoretical
- ▶ **Macrolides (clarithromycin)** are predicted to markedly increase the exposure to **aprepitant**. [\[Moderate\]](#) Study
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **fosaprepitant**. [\[Moderate\]](#) Theoretical
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **netupitant**. [\[Moderate\]](#) Study
- ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **aprepitant**. [\[Moderate\]](#) Study
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **maraviroc**. [\[Moderate\]](#) Study
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **midostaurin**. [\[Moderate\]](#) Theoretical
- ▶ **Mitotane** is predicted to markedly decrease the exposure to **aprepitant**. Avoid. [\[Moderate\]](#) Study
- ▶ **Mitotane** is predicted to decrease the exposure to **fosaprepitant**. Avoid. [\[Moderate\]](#) Theoretical
- ▶ **Mitotane** is predicted to decrease the exposure to **netupitant**. Avoid. [\[Severe\]](#) Study
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **naldemedine**. [\[Moderate\]](#) Study
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **naloxegol**. Adjust **naloxegol** dose and monitor adverse effects, p. 71. [\[Moderate\]](#) Study
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **neratinib**. Avoid moderate CYP3A4 inhibitors or adjust **neratinib** dose and monitor for gastrointestinal adverse effects, p. 1041. [\[Severe\]](#) Study
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **nilotinib**. [\[Moderate\]](#) Study

Neurokinin-1 receptor antagonists (continued)

- ▶ **NNRTIs (efavirenz, nevirapine)** are predicted to decrease the exposure to **aprepitant**. [Moderate] Study
- ▶ **NNRTIs (efavirenz, nevirapine)** are predicted to decrease the exposure to neurokinin-1 receptor antagonists (**fosaprepitant, netupitant**). [Moderate] Theoretical
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, fosaprepitant**) are predicted to decrease the efficacy of **norethisterone**. For FSRH guidance, see Contraceptives, interactions p. 843. [Severe] Anecdotal
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **olaparib**. Avoid moderate CYP3A4 inhibitors or adjust **olaparib** dose, p. 1057. [Moderate] Theoretical
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **opioids (alfentanil, buprenorphine, fentanyl, oxycodone)**. Monitor and adjust dose. [Moderate] Study
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **opioids (methadone)**. [Moderate] Theoretical
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **pazopanib**. [Moderate] Study
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (avanafil)**. Adjust **avanafil** dose, p. 862. [Moderate] Theoretical
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (sildenafil)**. Monitor or adjust **sildenafil** dose with moderate CYP3A4 inhibitors, p. 863. [Moderate] Study
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (tadalafil)**. [Severe] Theoretical
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (vardenafil)**. Adjust dose. [Severe] Theoretical
- ▶ Neurokinin-1 receptor antagonists are predicted to increase the exposure to **pimozide**. Avoid. [Severe] Theoretical
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **ponatinib**. [Moderate] Study
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **ranolazine**. [Severe] Study
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **regorafenib**. [Moderate] Study
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **ribociclib**. [Moderate] Study
- ▶ **Rifamycins (rifampicin)** are predicted to markedly decrease the exposure to **aprepitant**. Avoid. [Moderate] Study
- ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **fosaprepitant**. Avoid. [Moderate] Theoretical
- ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **netupitant**. Avoid. [Severe] Study
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **roxolitinib**. [Moderate] Study
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **siponimod**. Avoid depending on other drugs taken—consult product literature. [Severe] Study
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) increase the concentration of **sirolimus**. Monitor and adjust dose. [Moderate] Study
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **SSRIs (dapoxetine)**. Adjust **dapoxetine** dose with moderate CYP3A4 inhibitors, p. 870. [Moderate] Theoretical
- ▶ **St John's wort** is predicted to decrease the exposure to **netupitant**. [Moderate] Theoretical
- ▶ **St John's wort** is predicted to decrease the exposure to neurokinin-1 receptor antagonists (**aprepitant, fosaprepitant**). Avoid. [Moderate] Theoretical
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **statins (atorvastatin, simvastatin)**. Monitor and adjust dose. [Severe] Theoretical
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **sunitinib**. [Moderate] Study
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the concentration of **tacrolimus**. [Severe] Study
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **taxanes (cabazitaxel)**. [Moderate] Theoretical
- ▶ **Netupitant** slightly increases the exposure to **taxanes (docetaxel)**. [Moderate] Study
- ▶ **Netupitant** is predicted to increase the exposure to **taxanes (paclitaxel)**. [Moderate] Study
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the concentration of **temsirolimus**. Use with caution or avoid. [Moderate] Theoretical
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **tezacaftor**. Adjust dose with moderate CYP3A4 inhibitors, see tezacaftor with ivacaftor p. 314 and tezacaftor with ivacaftor and elexacaftor p. 314. [Severe] Study
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) given with a potent CYP2C19 inhibitor are predicted to increase the exposure to **tofacitinib**. Adjust **tofacitinib** dose, p. 1163. [Moderate] Study
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **tolvaptan**. Manufacturer advises caution or adjust **tolvaptan** dose with moderate CYP3A4 inhibitors, p. 711. [Moderate] Study
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **trazodone**. [Moderate] Theoretical
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **triptans (eletriptan)**. [Moderate] Study
- ▶ **Netupitant** is predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [Moderate] Study
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, fosaprepitant**) decrease the efficacy of **ulipristal**. For FSRH guidance, see Contraceptives, interactions p. 843. [Severe] Anecdotal
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **vemurafenib**. [Severe] Theoretical
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **triptans (eletriptan)**. [Moderate] Study
- ▶ **Netupitant** is predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [Moderate] Study
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, fosaprepitant**) decrease the efficacy of **ulipristal**. For FSRH guidance, see Contraceptives, interactions p. 843. [Severe] Anecdotal
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **vemurafenib**. [Severe] Theoretical
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **venetoclax**. Avoid or adjust dose—consult product literature. [Severe] Study
- ▶ Neurokinin-1 receptor antagonists are predicted to increase the exposure to **vinca alkaloids**. [Severe] Theoretical
- ▶ Neurokinin-1 receptor antagonists (**aprepitant, netupitant**) are predicted to increase the exposure to **zopiclone**. Adjust dose. [Moderate] Study

Neuromuscular blocking drugs, non-depolarising → see TABLE 6 p. 1448 (bradycardia), TABLE 20 p. 1451 (neuromuscular blocking effects)

atracurium · cisatracurium · mivacurium · pancuronium · rocuronium · vecuronium

- ▶ **Anticholinesterases, centrally acting** are predicted to decrease the effects of neuromuscular blocking drugs, non-depolarising. [Moderate] Theoretical → Also see TABLE 6 p. 1448
- ▶ **Antiepileptics (carbamazepine)** are predicted to decrease the effects of (but acute use increases the effects of) neuromuscular blocking drugs, non-depolarising (atracurium, cisatracurium, pancuronium, rocuronium, vecuronium). Monitor and adjust dose. [Moderate] Study
- ▶ **Antiepileptics (fosphenytoin, phenytoin)** decrease the effects of (but acute use increases the effects of) neuromuscular blocking drugs, non-depolarising (atracurium, cisatracurium, pancuronium, rocuronium, vecuronium). [Moderate] Study
- ▶ **Clindamycin** increases the effects of neuromuscular blocking drugs, non-depolarising. [Severe] Anecdotal
- ▶ **Corticosteroids** are predicted to decrease the effects of neuromuscular blocking drugs, non-depolarising. [Severe] Anecdotal

- ▶ **Pancuronium** is predicted to increase the risk of cardiovascular adverse effects when given with **digoxin**. [Severe] Anecdotal
- ▶ **Irinotecan** is predicted to decrease the effects of neuromuscular blocking drugs, non-depolarising. [Moderate] Theoretical
- ▶ Intravenous **magnesium** increases the effects of neuromuscular blocking drugs, non-depolarising. [Moderate] Study
- ▶ **Metoclopramide** is predicted to increase the effects of neuromuscular blocking drugs, non-depolarising. [Moderate] Theoretical
- ▶ **Penicillins (piperacillin)** increase the effects of neuromuscular blocking drugs, non-depolarising. [Moderate] Study
- ▶ **SSRIs** potentially increase the risk of prolonged neuromuscular blockade when given with mivacurium. [Unknown] Theoretical
- Nevirapine** → see NNRTIs
- Nicardipine** → see calcium channel blockers
- Nicorandil** → see TABLE 8 p. 1448 (hypotension)
- ▶ **Aspirin** is predicted to increase the risk of gastrointestinal perforation when given with nicorandil. [Severe] Theoretical
- ▶ **Corticosteroids** increase the risk of gastrointestinal perforation when given with nicorandil. [Severe] Anecdotal
- ▶ **Nicorandil** is predicted to increase the risk of gastrointestinal perforation when given with **NSAIDs**. [Severe] Theoretical
- ▶ **Nicorandil** is predicted to increase the risk of hypotension when given with **phosphodiesterase type-5 inhibitors**. Avoid. [Severe] Theoretical → Also see TABLE 8 p. 1448
- Nicotinic acid** → see TABLE 3 p. 1447 (anticoagulant effects)
- ▶ **Nicotinic acid** might increase the risk of rhabdomyolysis when given with **statins**. Use with caution or avoid. [Severe] Theoretical
- Nifedipine** → see calcium channel blockers
- Nilotinib** → see TABLE 15 p. 1450 (myelosuppression), TABLE 9 p. 1449 (QT-interval prolongation)
- ▶ **Nilotinib** is predicted to increase the exposure to **abemaciclib**. [Moderate] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **acalabrutinib**. Avoid or monitor. [Severe] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **aldosterone antagonists (eplerenone)**. Adjust eplerenone dose, p. 209. [Severe] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **alpha blockers (tamsulosin)**. [Moderate] Theoretical
- ▶ Oral **antacids** might affect the absorption of oral **nilotinib**. Separate administration by at least 2 hours. [Moderate] Theoretical
- ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to moderately decrease the exposure to **nilotinib**. Avoid. [Severe] Study → Also see TABLE 9 p. 1449
- ▶ **Nilotinib** is predicted to increase the exposure to **antiarrhythmics (propafenone)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to moderately decrease the exposure to **nilotinib**. Avoid. [Severe] Study
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **nilotinib**. [Moderate] Study → Also see TABLE 9 p. 1449
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **nilotinib**. Avoid. [Severe] Study → Also see TABLE 9 p. 1449
- ▶ **Nilotinib** is predicted to increase the exposure to antihistamines, non-sedating (**mizolastine**). [Severe] Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to antihistamines, non-sedating (**rupatadine**). Avoid. [Moderate] Study
- ▶ **Nilotinib** is predicted to increase the concentration of antimalarials (**piperaquine**). [Severe] Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to antipsychotics, second generation (**cariprazine**). Avoid. [Severe] Study
- ▶ **Nilotinib** is predicted to increase the exposure to antipsychotics, second generation (**lurasidone**). Adjust lurasidone dose. [Moderate] Study
- ▶ **Nilotinib** is predicted to increase the exposure to antipsychotics, second generation (**quetiapine**). Avoid. [Moderate] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **avapritinib**. Avoid or adjust avapritinib dose, p. 1019. [Moderate] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **axitinib**. [Moderate] Study → Also see TABLE 15 p. 1450
- ▶ **Nilotinib** is predicted to increase the exposure to **bedaquiline**. Avoid prolonged use. [Mild] Theoretical → Also see TABLE 9 p. 1449
- ▶ **Nilotinib** is predicted to increase the exposure to **benzodiazepines (alprazolam)**. [Severe] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **benzodiazepines (midazolam)**. Monitor adverse effects and adjust dose. [Severe] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **bosutinib**. Avoid or adjust dose. [Severe] Study → Also see TABLE 15 p. 1450 → Also see TABLE 9 p. 1449
- ▶ **Nilotinib** is predicted to increase the exposure to **brigatinib**. [Moderate] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **buspirone**. Use with caution and adjust dose. [Moderate] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **cabozantinib**. [Moderate] Study → Also see TABLE 15 p. 1450 → Also see TABLE 9 p. 1449
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **nilotinib**. [Moderate] Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to **calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine)**. Monitor and adjust dose. [Moderate] Study
- ▶ Oral **calcium salts (calcium carbonate)** –containing antacids might affect the exposure to oral **nilotinib**. Separate administration by at least 2 hours. [Moderate] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **ceritinib**. [Moderate] Study → Also see TABLE 15 p. 1450 → Also see TABLE 9 p. 1449
- ▶ **Nilotinib** is predicted to increase the concentration of **ciclosporin**. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **nilotinib**. Avoid. [Severe] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **cobimetinib**. [Severe] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **colchicine**. Adjust colchicine dose with moderate CYP3A4 inhibitors, p. 1175. [Severe] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **corticosteroids (methylprednisolone)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Nilotinib** is predicted to increase the risk of bleeding events when given with **coumarins**. [Severe] Theoretical
- ▶ **Dabrafenib** is predicted to decrease the exposure to **nilotinib**. Avoid. [Severe] Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to **dabrafenib**. [Moderate] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **darifenacin**. [Moderate] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **dasatinib**. [Severe] Study → Also see TABLE 15 p. 1450 → Also see TABLE 9 p. 1449
- ▶ **Nilotinib** is predicted to slightly increase the exposure to **domegest**. [Moderate] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **dipeptidylpeptidase-4 inhibitors (saxagliptin)**. [Mild] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **domperidone**. Avoid. [Severe] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **dopamine receptor agonists (bromocriptine)**. [Severe] Theoretical
- ▶ **Nilotinib** is predicted to increase the concentration of dopamine receptor agonists (**cabergoline**). [Moderate] Anecdotal
- ▶ **Nilotinib** is predicted to moderately increase the exposure to **dutasteride**. [Mild] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **elxacaftor**. Adjust tezacaftor with ivacaftor and elxacaftor p. 314 dose with moderate CYP3A4 inhibitors. [Severe] Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to **eliglustat**. Avoid or adjust dose—consult product literature. [Severe] Study
- ▶ **Nilotinib** is predicted to moderately increase the exposure to **encorafenib**. [Moderate] Study → Also see TABLE 9 p. 1449
- ▶ **Endothelin receptor antagonists (bosentan)** are predicted to decrease the exposure to **nilotinib**. Avoid. [Severe] Theoretical

Nilotinib (continued)

- ▶ **Nilotinib** is predicted to increase the exposure to **entrectinib**. Avoid moderate CYP3A4 inhibitors or adjust **entrectinib** dose, p. 1030. [Severe] Theoretical → Also see TABLE 9 p. 1449
- ▶ **Nilotinib** is predicted to increase the risk of ergotism when given with **ergometrine**. [Severe] Theoretical
- ▶ **Nilotinib** is predicted to increase the risk of ergotism when given with **ergotamine**. [Severe] Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to **erlotinib**. [Moderate] Study
- ▶ **Nilotinib** is predicted to increase the concentration of **everolimus**. Avoid or adjust dose. [Moderate] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **fesoterodine**. Adjust **fesoterodine** dose with moderate CYP3A4 inhibitors in hepatic and renal impairment, p. 824. [Mild] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **gefinitib**. [Moderate] Study
- ▶ **Grapefruit** juice is predicted to increase the exposure to **nilotinib**. Avoid. [Severe] Theoretical
- ▶ **Nilotinib** is predicted to increase the concentration of **guanfacine**. Adjust **guanfacine** dose, p. 375. [Moderate] Theoretical
- ▶ **H₂ receptor antagonists** might affect the absorption of **nilotinib**. **H₂ receptor antagonists** should be taken 10 hours before or 2 hours after **nilotinib**. [Mild] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **nilotinib**. Avoid. [Severe] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **ibrutinib**. Adjust **ibrutinib** dose with moderate CYP3A4 inhibitors, p. 1034. [Severe] Study → Also see TABLE 15 p. 1450
- ▶ **Idelalisib** is predicted to increase the exposure to **nilotinib**. Avoid. [Severe] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **imatinib**. [Moderate] Study → Also see TABLE 15 p. 1450
- ▶ **Nilotinib** is predicted to increase the exposure to **ivabradine**. Adjust **ivabradine** dose, p. 228. [Severe] Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to **ivacaftor**. Adjust dose with moderate CYP3A4 inhibitors, see **ivacaftor** p. 312, **tezacaftor** with **ivacaftor** p. 314, and **tezacaftor** with **ivacaftor** and **elxacaftor** p. 314. [Moderate] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **lapatinib**. [Moderate] Study → Also see TABLE 9 p. 1449
- ▶ **Letermovir** is predicted to increase the exposure to **nilotinib**. [Moderate] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **lomitapide**. Avoid. [Moderate] Theoretical
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **nilotinib**. Avoid. [Severe] Study → Also see TABLE 9 p. 1449
- ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **nilotinib**. [Moderate] Study → Also see TABLE 9 p. 1449
- ▶ **Nilotinib** is predicted to increase the exposure to **midostaurin**. [Moderate] Theoretical
- ▶ **Mitotane** is predicted to moderately decrease the exposure to **nilotinib**. Avoid. [Severe] Study → Also see TABLE 15 p. 1450
- ▶ **Nilotinib** is predicted to increase the exposure to **naldemedine**. [Moderate] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **naloxegol**. Adjust **naloxegol** dose and monitor adverse effects, p. 71. [Moderate] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **neratinib**. Avoid moderate CYP3A4 inhibitors or adjust **neratinib** dose and monitor for gastrointestinal adverse effects, p. 1041. [Severe] Study
- ▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to increase the exposure to **nilotinib**. [Moderate] Study
- ▶ **NNTs (efavirenz, nevirapine)** are predicted to decrease the exposure to **nilotinib**. Avoid. [Severe] Theoretical → Also see TABLE 9 p. 1449
- ▶ **Nilotinib** is predicted to increase the exposure to **olaparib**. Avoid moderate CYP3A4 inhibitors or adjust **olaparib** dose, p. 1057. [Moderate] Theoretical → Also see TABLE 15 p. 1450
- ▶ **Nilotinib** is predicted to increase the exposure to **opioids (alfentanil, buprenorphine, fentanyl, oxycodone)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **opioids (methadone)**. [Moderate] Theoretical → Also see TABLE 9 p. 1449
- ▶ **Nilotinib** is predicted to increase the exposure to **pazopanib**. [Moderate] Study → Also see TABLE 9 p. 1449
- ▶ **Nilotinib** is predicted to increase the risk of bleeding events when given with **phenindione**. [Severe] Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (avanafil)**. Adjust **avanafil** dose, p. 862. [Moderate] Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (sildenafil)**. Monitor or adjust **sildenafil** dose with moderate CYP3A4 inhibitors, p. 863. [Moderate] Study → Also see TABLE 9 p. 1449
- ▶ **Nilotinib** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (tadalafil)**. [Severe] Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (vardenafil)**. Adjust dose. [Severe] Theoretical → Also see TABLE 9 p. 1449
- ▶ **Nilotinib** is predicted to increase the exposure to **pimozide**. Avoid. [Severe] Theoretical → Also see TABLE 9 p. 1449
- ▶ **Pitolisant** is predicted to decrease the exposure to **nilotinib**. Avoid. [Severe] Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to **ponatinib**. [Moderate] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **ranolazine**. [Severe] Study → Also see TABLE 9 p. 1449
- ▶ **Nilotinib** is predicted to increase the exposure to **regorafenib**. [Moderate] Study → Also see TABLE 15 p. 1450
- ▶ **Nilotinib** is predicted to increase the exposure to **ribociclib**. [Moderate] Study → Also see TABLE 15 p. 1450 → Also see TABLE 9 p. 1449
- ▶ **Rifamycins (rifampicin)** are predicted to moderately decrease the exposure to **nilotinib**. Avoid. [Severe] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **ruxolitinib**. [Moderate] Study → Also see TABLE 15 p. 1450
- ▶ **Nilotinib** is predicted to increase the exposure to **siponimod**. Avoid depending on other drugs taken – consult product literature. [Severe] Study
- ▶ **Nilotinib** increases the concentration of **sirolimus**. Monitor and adjust dose. [Moderate] Study
- ▶ Oral **sodium bicarbonate** – containing antacids might affect the exposure to oral **nilotinib**. Separate administration by at least 2 hours. [Moderate] Study
- ▶ **Sodium zirconium cyclosilicate** is predicted to decrease the exposure to **nilotinib**. Separate administration by at least 2 hours. [Moderate] Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to **SSRIs (dapoxetine)**. Adjust **dapoxetine** dose with moderate CYP3A4 inhibitors, p. 870. [Moderate] Theoretical
- ▶ **St John's wort** is predicted to decrease the exposure to **nilotinib**. Avoid. [Severe] Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to **statins (atorvastatin)**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to **statins (simvastatin)**. Monitor and adjust dose. [Severe] Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to **sunitinib**. [Moderate] Study → Also see TABLE 15 p. 1450 → Also see TABLE 9 p. 1449
- ▶ **Nilotinib** is predicted to increase the concentration of **tacrolimus**. [Severe] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **taxanes (cabazitaxel)**. [Moderate] Theoretical → Also see TABLE 15 p. 1450
- ▶ **Nilotinib** is predicted to increase the concentration of **temsirolimus**. Use with caution or avoid. [Moderate] Theoretical → Also see TABLE 15 p. 1450
- ▶ **Nilotinib** is predicted to increase the exposure to **tezacaftor**. Adjust dose with moderate CYP3A4 inhibitors, see **tezacaftor** with **ivacaftor** p. 314 and **tezacaftor** with **ivacaftor** and **elxacaftor** p. 314. [Severe] Study
- ▶ **Nilotinib** given with a potent CYP2C19 inhibitor is predicted to increase the exposure to **tofacitinib**. Adjust **tofacitinib** dose, p. 1163. [Moderate] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **tolvaptan**. Manufacturer advises caution or adjust **tolvaptan** dose with moderate CYP3A4 inhibitors, p. 711. [Moderate] Study

- ▶ **Nilotinib** is predicted to increase the exposure to **trazodone**. [Moderate] Theoretical
 - ▶ **Nilotinib** is predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [Moderate] Study
 - ▶ **Nilotinib** is predicted to increase the exposure to **vemurafenib**. [Severe] Theoretical → Also see TABLE 9 p. 1449
 - ▶ **Nilotinib** is predicted to increase the exposure to **venetoclax**. Avoid or adjust dose—consult product literature. [Severe] Study
 - ▶ **Nilotinib** is predicted to increase the exposure to **vinca alkaloids**. [Severe] Theoretical → Also see TABLE 15 p. 1450 → Also see TABLE 9 p. 1449
 - ▶ **Nilotinib** is predicted to increase the exposure to **zopiclone**. Adjust dose. [Moderate] Study
 - Nimodipine** → see calcium channel blockers
 - Nintedanib** → see TABLE 4 p. 1447 (antiplatelet effects)
 - ▶ **Antiarrhythmics (amiodarone, dronedarone)** are predicted to increase the exposure to **nintedanib**. [Moderate] Study
 - ▶ **Antiepileptics (carbamazepine)** are predicted to decrease the exposure to **nintedanib**. [Moderate] Study
 - ▶ **Antiepileptics (phenobarbital, phenytoin)** are predicted to decrease the exposure to **nintedanib**. [Severe] Theoretical
 - ▶ **Antifungals, azoles (itraconazole, ketoconazole)** are predicted to increase the exposure to **nintedanib**. [Moderate] Study
 - ▶ **Antifungals, azoles (voriconazole)** are predicted to increase the exposure to **nintedanib**. [Moderate] Theoretical
 - ▶ **Calcium channel blockers (verapamil)** are predicted to increase the exposure to **nintedanib**. [Moderate] Study
 - ▶ **Ciclosporin** is predicted to increase the exposure to **nintedanib**. [Moderate] Study
 - ▶ **Cobicistat** is predicted to increase the exposure to **nintedanib**. [Moderate] Theoretical
 - ▶ **HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, tipranavir)** boosted with ritonavir are predicted to increase the exposure to **nintedanib**. [Moderate] Theoretical
 - ▶ **HIV-protease inhibitors (lopinavir, ritonavir)** are predicted to increase the exposure to **nintedanib**. [Moderate] Study
 - ▶ **Ivacaftor** is predicted to increase the exposure to **nintedanib**. [Moderate] Study
 - ▶ **Lapatinib** is predicted to increase the exposure to **nintedanib**. [Moderate] Study
 - ▶ **Macrolides** are predicted to increase the exposure to **nintedanib**. [Moderate] Study
 - ▶ **Neratinib** is predicted to increase the exposure to **nintedanib**. [Moderate] Study
 - ▶ **Ranolazine** is predicted to increase the exposure to **nintedanib**. [Moderate] Study
 - ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **nintedanib**. [Moderate] Study
 - ▶ **Rucaparib** is predicted to increase the exposure to **nintedanib**. [Moderate] Study
 - ▶ **St John's wort** is predicted to decrease the exposure to **nintedanib**. [Moderate] Study
 - ▶ **Vandetanib** is predicted to increase the exposure to **nintedanib**. [Moderate] Study → Also see TABLE 4 p. 1447
 - ▶ **Vemurafenib** is predicted to increase the exposure to **nintedanib**. [Moderate] Study
 - Niraparib** → see TABLE 15 p. 1450 (myelosuppression)
 - Nitisinone**
 - ▶ **Nitisinone** is predicted to increase the exposure to **adefovir**. [Moderate] Study
 - ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to **nitisinone**. Adjust dose. [Moderate] Theoretical
 - ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **nitisinone**. Adjust dose. [Moderate] Theoretical
 - ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **nitisinone**. Adjust dose. [Moderate] Theoretical
 - ▶ **Nitisinone** is predicted to increase the exposure to **cephalosporins (cefactor)**. [Moderate] Study
 - ▶ **Cobicistat** is predicted to increase the exposure to **nitisinone**. Adjust dose. [Moderate] Theoretical
 - ▶ **Nitisinone** is predicted to increase the exposure to **coumarins (warfarin)**. [Moderate] Study
 - ▶ **Nitisinone** is predicted to increase the exposure to **ganciclovir**. [Moderate] Study
 - ▶ **Nitisinone** is predicted to increase the exposure to **H₂ receptor antagonists (cimetidine, famotidine)**. [Moderate] Study
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **nitisinone**. Adjust dose. [Moderate] Theoretical
 - ▶ **Idelalisib** is predicted to increase the exposure to **nitisinone**. Adjust dose. [Moderate] Theoretical
 - ▶ **Nitisinone** is predicted to increase the exposure to **loop diuretics (furosemide)**. [Moderate] Study
 - ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **nitisinone**. Adjust dose. [Moderate] Theoretical
 - ▶ **Nitisinone** is predicted to increase the exposure to **methotrexate**. [Moderate] Study
 - ▶ **Mitotane** is predicted to decrease the exposure to **nitisinone**. Adjust dose. [Moderate] Theoretical
 - ▶ **Nitisinone** is predicted to increase the exposure to **NSAIDs (celecoxib)**. [Moderate] Study
 - ▶ **Nitisinone** is predicted to increase the exposure to **oseltamivir**. [Moderate] Study
 - ▶ **Nitisinone** is predicted to increase the exposure to **penicillins (benzylpenicillin)**. [Moderate] Study
 - ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **nitisinone**. Adjust dose. [Moderate] Theoretical
 - ▶ **Nitisinone** is predicted to increase the exposure to **sulfonylureas (glimperide, tolbutamide)**. [Moderate] Study
- Nitrates** → see TABLE 7 p. 1448 (first-dose hypotension), TABLE 8 p. 1448 (hypotension)
- glyceryl trinitrate · isosorbide dinitrate · isosorbide mononitrate
- PHARMACOLOGY** Drugs with antimuscarinic effects can cause dry mouth, which can reduce the effectiveness of sublingual glyceryl trinitrate tablets.
- ▶ **Nitrates** are predicted to increase the risk of methaemoglobinemia when given with topical **anaesthetics, local (prilocaine)**. Avoid. [Severe] Theoretical
 - ▶ **Nitrates** are predicted to increase the risk of methaemoglobinemia when given with **dapsone**. [Severe] Theoretical
 - ▶ **Nitrates** potentially increase the risk of hypotension when given with **phosphodiesterase type-5 inhibitors**. Avoid. [Severe] Study → Also see TABLE 8 p. 1448
- Nitrazepam** → see benzodiazepines
- Nitrofurantoin** → see TABLE 12 p. 1450 (peripheral neuropathy)
- ▶ **Nitrofurantoin** is predicted to increase the risk of methaemoglobinemia when given with topical **anaesthetics, local (prilocaine)**. Use with caution or avoid. [Severe] Theoretical
 - ▶ **Nitrofurantoin** is predicted to increase the risk of methaemoglobinemia when given with **dapsone**. [Severe] Theoretical
 - ▶ Oral **magnesium trisilicate** decreases the absorption of oral **nitrofurantoin**. [Moderate] Study
- Nitroprusside** → see TABLE 8 p. 1448 (hypotension)
- ▶ **Nitroprusside** is predicted to increase the risk of methaemoglobinemia when given with **anaesthetics, local (prilocaine)**. [Severe] Theoretical
 - ▶ **Nitroprusside** is predicted to increase the risk of methaemoglobinemia when given with **dapsone**. [Severe] Theoretical
- Nitrous oxide** → see TABLE 8 p. 1448 (hypotension), TABLE 11 p. 1449 (CNS depressant effects)
- ▶ **Nitrous oxide** potentially increases the risk of methotrexate toxicity when given with **methotrexate**. Avoid. [Severe] Study
- Nivolumab** → see monoclonal antibodies
- Nizatidine** → see H₂ receptor antagonists
- NNRTIs** → see TABLE 9 p. 1449 (QT-interval prolongation)
- doravirine · efavirenz · etravirine · nevirapine · rilpivirine
- ▶ **NNRTIs (efavirenz, nevirapine)** are predicted to decrease the exposure to **acalabrutinib**. [Severe] Study
 - ▶ Oral **antacids** are predicted to decrease the exposure to oral **rilpivirine**. Rilpivirine should be taken 4 hours before or 2 hours after antacids. [Severe] Theoretical
 - ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to **doravirine**. Avoid. [Severe] Study

NNRTIs (continued)

- ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to **etravirine**. Avoid. [Severe] Theoretical
- ▶ **Anti-androgens (apalutamide, enzalutamide)** markedly decrease the exposure to **rilpivirine**. Avoid. [Severe] Study
- ▶ **Anti-androgens (enzalutamide)** are predicted to decrease the exposure to **nevirapine**. [Severe] Theoretical
- ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the exposure to **anti-androgens (darolutamide)**. Avoid. [Moderate] Theoretical
- ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the exposure to **antiarrhythmics (dronedarone)**. [Severe] Theoretical → Also see TABLE 9 p. 1449
- ▶ **Antiepileptics (carbamazepine)** slightly decrease the exposure to **efavirenz** and **efavirenz** slightly decreases the exposure to **antiepileptics (carbamazepine)**. [Severe] Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **doravirine**. Avoid. [Severe] Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **etravirine**. Avoid. [Severe] Theoretical
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** markedly decrease the exposure to **rilpivirine**. Avoid. [Severe] Study
- ▶ **Antiepileptics (fosphenytoin, phenytoin)** slightly decrease the exposure to **efavirenz** and **efavirenz** affects the concentration of **antiepileptics (fosphenytoin, phenytoin)**. [Severe] Theoretical
- ▶ **Antiepileptics (oxcarbazepine)** are predicted to decrease the exposure to **doravirine**. Avoid. [Severe] Theoretical
- ▶ **Antiepileptics (oxcarbazepine)** are predicted to decrease the concentration of **rilpivirine**. Avoid. [Severe] Theoretical
- ▶ **Antiepileptics (phenobarbital)** are predicted to decrease the exposure to **efavirenz** and **efavirenz** affects the concentration of **antiepileptics (phenobarbital)**. [Severe] Theoretical
- ▶ **Nevirapine** is predicted to decrease the concentration of **antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** and **antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the concentration of **nevirapine**. [Severe] Study
- ▶ **Efavirenz** is predicted to affect the efficacy of **antiepileptics (primidone)** and **antiepileptics (primidone)** are predicted to slightly decrease the exposure to **efavirenz**. [Severe] Theoretical
- ▶ **Antifungals, azoles (fluconazole)** slightly to moderately increase the exposure to **nevirapine**. [Moderate] Study
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **doravirine**. [Mild] Study
- ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the exposure to **antifungals, azoles (isavuconazole)**. Avoid. [Severe] Theoretical
- ▶ **Efavirenz** slightly decreases the exposure to **antifungals, azoles (itraconazole)**. Avoid and for 14 days after stopping **efavirenz**. [Moderate] Study
- ▶ **Nevirapine** moderately decreases the exposure to **antifungals, azoles (itraconazole)**. Avoid and for 14 days after stopping **nevirapine**. [Moderate] Study
- ▶ **Efavirenz** moderately decreases the exposure to **antifungals, azoles (ketoconazole)**. [Severe] Study
- ▶ **Nevirapine** moderately decreases the exposure to **antifungals, azoles (ketoconazole)**. Avoid. [Severe] Study
- ▶ **Efavirenz** slightly decreases the exposure to **antifungals, azoles (posaconazole)**. Avoid. [Moderate] Study
- ▶ **Efavirenz** moderately decreases the exposure to **antifungals, azoles (voriconazole)** and **antifungals, azoles (voriconazole)** slightly increase the exposure to **efavirenz**. Adjust dose. [Severe] Study → Also see TABLE 9 p. 1449
- ▶ **Nevirapine** is predicted to decrease the exposure to **antifungals, azoles (voriconazole)** and **antifungals, azoles (voriconazole)** increase the exposure to **nevirapine**. Monitor and adjust dose. [Severe] Theoretical
- ▶ **Efavirenz** decreases the concentration of **antimalarials (artemether)**. [Severe] Study → Also see TABLE 9 p. 1449
- ▶ **Etravirine** decreases the exposure to **antimalarials (artemether)**. [Moderate] Study
- ▶ **Efavirenz** moderately decreases the exposure to **antimalarials (atovaquone)**. Avoid. [Moderate] Study
- ▶ **Efavirenz** affects the exposure to **antimalarials (proguanil)**. Avoid. [Moderate] Study
- ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the exposure to **antipsychotics, second generation (cariprazine)**. Avoid. [Severe] Theoretical
- ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the exposure to **antipsychotics, second generation (lurasidone)**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the exposure to **antipsychotics, second generation (quetiapine)**. [Moderate] Study
- ▶ **Etravirine** is predicted to decrease the exposure to **avapritinib**. Avoid. [Severe] Theoretical
- ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the exposure to **avapritinib**. Avoid. [Severe] Study
- ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the exposure to **axitinib**. [Moderate] Study
- ▶ **Etravirine** is predicted to decrease the exposure to **bedaquiline**. Avoid. [Severe] Theoretical
- ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the exposure to **bedaquiline**. Avoid. [Severe] Study → Also see TABLE 9 p. 1449
- ▶ **Efavirenz** is predicted to alter the effects of **benzodiazepines (midazolam)**. Avoid. [Moderate] Theoretical
- ▶ **Nevirapine** decreases the concentration of **benzodiazepines (midazolam)**. Monitor and adjust dose. [Moderate] Study
- ▶ **Etravirine** is predicted to decrease the exposure to **bosutinib**. Avoid. [Severe] Theoretical
- ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the exposure to **bosutinib**. Avoid. [Severe] Study → Also see TABLE 9 p. 1449
- ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the exposure to **brigatinib**. Avoid. [Moderate] Study
- ▶ **Efavirenz** is predicted to decrease the exposure to **bupropion**. [Moderate] Study
- ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the exposure to **cabozantinib**. [Moderate] Study → Also see TABLE 9 p. 1449
- ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the exposure to **calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine)**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the exposure to **calcium channel blockers (diltiazem, verapamil)**. [Moderate] Theoretical
- ▶ **Calcium salts (calcium carbonate)** are predicted to slightly decrease the exposure to **rilpivirine**. Calcium carbonate should be taken 2 hours before or 4 hours after **rilpivirine**. [Severe] Theoretical
- ▶ **Efavirenz** is predicted to decrease the concentration of **caspofungin**. Adjust dose. [Moderate] Study
- ▶ **Nevirapine** is predicted to decrease the concentration of **caspofungin**. Adjust dose. [Moderate] Theoretical
- ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the exposure to **certinib**. [Severe] Study → Also see TABLE 9 p. 1449
- ▶ **Efavirenz** decreases the concentration of **ciclosporin**. Monitor concentration and adjust dose. [Moderate] Study
- ▶ **Nevirapine** is predicted to decrease the concentration of **ciclosporin**. [Moderate] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **doravirine**. [Mild] Study
- ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the exposure to **cobicistat**. Avoid. [Severe] Theoretical
- ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the exposure to **cobimetinib**. Avoid. [Severe] Theoretical
- ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the efficacy of **combined hormonal contraceptives**. For FSRH guidance, see Contraceptives, interactions p. 843. [Severe] Study
- ▶ **Corticosteroids (dexamethasone)** are predicted to decrease the concentration of **rilpivirine**. Avoid multiple-dose dexamethasone. [Severe] Theoretical
- ▶ **Efavirenz** is predicted to affect the concentration of **coumarins**. Adjust dose. [Moderate] Theoretical

- ▶ **Etravirine** increases the anticoagulant effect of **coumarins**. [\[Moderate\]](#) Theoretical
- ▶ **Nevirapine** potentially alters the anticoagulant effect of **coumarins**. [\[Severe\]](#) Anecdotal
- ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the exposure to **crizotinib**. Avoid. [\[Severe\]](#) Study → Also see TABLE 9 p. 1449
- ▶ **Dabrafenib** is predicted to decrease the exposure to **doravirine**. Avoid or adjust doravirine p. 686 or lamivudine with tenofovir disoproxil and doravirine p. 696 dose. [\[Severe\]](#) Theoretical
- ▶ **Dabrafenib** is predicted to decrease the exposure to **etravirine**. Avoid. [\[Severe\]](#) Study
- ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the exposure to **dabrafenib**. [\[Moderate\]](#) Study
- ▶ **Dabrafenib** is predicted to decrease the exposure to rilpivirine. Avoid. [\[Severe\]](#) Theoretical
- ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the exposure to **dasatinib**. [\[Severe\]](#) Study → Also see TABLE 9 p. 1449
- ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the efficacy of **desogestrel**. For FSRH guidance, see Contraceptives, interactions p. 843. [\[Severe\]](#) Theoretical
- ▶ **Etravirine** moderately decreases the exposure to **dolutegravir**. Avoid unless given with atazanavir, darunavir, or lopinavir (all boosted with ritonavir). [\[Severe\]](#) Study
- ▶ NNRTIs (**efavirenz, nevirapine**) decrease the exposure to **dolutegravir**. Adjust dose. [\[Severe\]](#) Study
- ▶ **Etravirine** is predicted to decrease the exposure to **elbasvir**. Avoid. [\[Unknown\]](#) Theoretical
- ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to moderately decrease the exposure to **elbasvir**. Avoid. [\[Severe\]](#) Study
- ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the exposure to **eliglustat**. [\[Moderate\]](#) Theoretical
- ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the concentration of **elvitegravir**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Endothelin receptor antagonists (bosentan)** are predicted to decrease the exposure to **doravirine**. Avoid or adjust doravirine p. 686 or lamivudine with tenofovir disoproxil and doravirine p. 696 dose. [\[Severe\]](#) Theoretical
- ▶ **Endothelin receptor antagonists (bosentan)** are predicted to decrease the exposure to **etravirine**. Avoid. [\[Severe\]](#) Study
- ▶ **Endothelin receptor antagonists (bosentan)** are predicted to decrease the exposure to **nevirapine**. [\[Severe\]](#) Theoretical
- ▶ **Endothelin receptor antagonists (bosentan)** are predicted to decrease the exposure to rilpivirine. Avoid. [\[Severe\]](#) Theoretical
- ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the exposure to **entrectinib**. Avoid. [\[Severe\]](#) Theoretical → Also see TABLE 9 p. 1449
- ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the effects of **ergotamine**. [\[Moderate\]](#) Theoretical
- ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the exposure to **erlotinib**. [\[Severe\]](#) Study
- ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the efficacy of **etonogestrel**. For FSRH guidance, see Contraceptives, interactions p. 843. [\[Severe\]](#) Theoretical
- ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the concentration of **everolimus**. Avoid or adjust dose. [\[Severe\]](#) Study
- ▶ **Nevirapine** is predicted to decrease the exposure to **factor XA inhibitors (rivaroxaban)**. [\[Severe\]](#) Anecdotal
- ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the exposure to **gefitinib**. Avoid. [\[Severe\]](#) Study
- ▶ **Etravirine** is predicted to decrease the exposure to **glasdegib**. Avoid or adjust **glasdegib** dose, p. 1056. [\[Moderate\]](#) Theoretical
- ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the exposure to **glasdegib**. Avoid or adjust **glasdegib** dose, p. 1056. [\[Severe\]](#) Theoretical → Also see TABLE 9 p. 1449
- ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the exposure to **glecaprevir**. Avoid. [\[Severe\]](#) Study
- ▶ **Etravirine** is predicted to decrease the exposure to **grazoprevir**. Avoid. [\[Mild\]](#) Theoretical
- ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to markedly decrease the exposure to **grazoprevir**. Avoid. [\[Severe\]](#) Study
- ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the concentration of **guanfacine**. Adjust dose. [\[Moderate\]](#) Theoretical
- ▶ **H₂ receptor antagonists** are predicted to decrease the exposure to rilpivirine. **H₂ receptor antagonists** should be taken 12 hours before or 4 hours after rilpivirine. [\[Severe\]](#) Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **doravirine**. [\[Mild\]](#) Study
- ▶ **Efavirenz** decreases the exposure to **HIV-protease inhibitors**. Refer to specialist literature. [\[Severe\]](#) Study
- ▶ **HIV-protease inhibitors (tipranavir)** decrease the exposure to **etravirine**. Avoid. [\[Severe\]](#) Study
- ▶ **Etravirine** increases the exposure to **HIV-protease inhibitors (fosamprenavir)** boosted with ritonavir. Refer to specialist literature. [\[Moderate\]](#) Study
- ▶ **Nevirapine** decreases the exposure to **HIV-protease inhibitors**. Refer to specialist literature. [\[Moderate\]](#) Study
- ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the effects of **hormone replacement therapy**. [\[Moderate\]](#) Anecdotal
- ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the exposure to **ibrutinib**. Avoid or monitor. [\[Severe\]](#) Study
- ▶ **Idelalisib** is predicted to increase the exposure to **doravirine**. [\[Mild\]](#) Study
- ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the exposure to **idelalisib**. Avoid. [\[Moderate\]](#) Theoretical
- ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the exposure to **imatinitib**. [\[Moderate\]](#) Study
- ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the exposure to **ivacaftor**. [\[Moderate\]](#) Study
- ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the exposure to **lapatinib**. Avoid. [\[Severe\]](#) Study → Also see TABLE 9 p. 1449
- ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the exposure to **larotrectinib**. Avoid. [\[Moderate\]](#) Study
- ▶ **Efavirenz** is predicted to decrease the concentration of **letemovir**. [\[Moderate\]](#) Theoretical
- ▶ **Etravirine** is predicted to decrease the exposure to **letemovir**. [\[Moderate\]](#) Theoretical
- ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the efficacy of **levonorgestrel**. For FSRH guidance, see Contraceptives, interactions p. 843. [\[Severe\]](#) Theoretical
- ▶ **Lumacaftor** is predicted to decrease the exposure to **doravirine**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **doravirine**. [\[Mild\]](#) Study
- ▶ **Etravirine** decreases the exposure to **macrolides (clarithromycin)** and **macrolides (clarithromycin)** slightly increase the exposure to **etravirine**. [\[Severe\]](#) Study
- ▶ NNRTIs (**efavirenz, nevirapine**) decrease the exposure to **macrolides (clarithromycin)**. [\[Moderate\]](#) Study → Also see TABLE 9 p. 1449
- ▶ **Efavirenz** decreases the exposure to **maraviroc**. Refer to specialist literature. [\[Severe\]](#) Theoretical
- ▶ **Etravirine** with a boosted HIV-protease inhibitor increases the exposure to **maraviroc**. Avoid or adjust dose. [\[Moderate\]](#) Study
- ▶ **Mitotane** is predicted to decrease the exposure to **doravirine**. Avoid. [\[Severe\]](#) Study
- ▶ **Mitotane** is predicted to decrease the exposure to **etravirine**. Avoid. [\[Severe\]](#) Theoretical
- ▶ **Mitotane** is predicted to decrease the exposure to **nevirapine**. [\[Severe\]](#) Theoretical
- ▶ **Mitotane** markedly decreases the exposure to rilpivirine. Avoid. [\[Severe\]](#) Study
- ▶ **Modafinil** is predicted to decrease the exposure to **doravirine**. Avoid or adjust doravirine p. 686 or lamivudine with tenofovir disoproxil and doravirine p. 696 dose. [\[Severe\]](#) Theoretical
- ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the exposure to **neratinib**. [\[Severe\]](#) Study
- ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the exposure to **neurokinin-1 receptor antagonists (aprepitant)**. [\[Moderate\]](#) Study
- ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the exposure to **neurokinin-1 receptor antagonists (fosaprepitant, netupitant)**. [\[Moderate\]](#) Theoretical
- ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the exposure to **nilotinib**. Avoid. [\[Severe\]](#) Theoretical → Also see TABLE 9 p. 1449

NNRTIs (continued)

- ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the exposure to NNRTIs (**doravirine**). Avoid or adjust doravirine p. 686 or lamivudine with tenofovir disoproxil and doravirine p. 696 dose. [\[Severe\]](#) Theoretical
 - ▶ NNRTIs (**nevirapine**) decrease the concentration of NNRTIs (**efavirenz**). Avoid. [\[Severe\]](#) Study
 - ▶ NNRTIs (**efavirenz**) are predicted to decrease the exposure to NNRTIs (**etravirine**). Avoid. [\[Severe\]](#) Study
 - ▶ NNRTIs (**nevirapine**) are predicted to decrease the exposure to NNRTIs (**etravirine**). Avoid. [\[Severe\]](#) Study
 - ▶ NNRTIs (**efavirenz, etravirine, nevirapine**) are predicted to decrease the exposure to NNRTIs (**rilpivirine**). Avoid. [\[Severe\]](#) Theoretical
 - ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the efficacy of **norethisterone**. For FSRH guidance, see Contraceptives, interactions p. 843. [\[Severe\]](#) Anecdotal
 - ▶ **Nevirapine** is predicted to decrease the concentration of NNRTIs (**zidovudine**). Refer to specialist literature. [\[Severe\]](#) Theoretical
 - ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the exposure to **olaparib**. Avoid. [\[Moderate\]](#) Theoretical
 - ▶ NNRTIs (**efavirenz, nevirapine**) decrease the exposure to **opioids (methadone)**. Monitor and adjust dose. [\[Severe\]](#) Study → Also see TABLE 9 p. 1449
 - ▶ **Etravirine** is predicted to decrease the exposure to **osimertinib**. Use with caution or avoid. [\[Severe\]](#) Theoretical
 - ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the exposure to **osimertinib**. Use with caution or avoid. [\[Severe\]](#) Study → Also see TABLE 9 p. 1449
 - ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the exposure to **ospemifene**. [\[Moderate\]](#) Study
 - ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the exposure to **pazopanib**. [\[Severe\]](#) Study → Also see TABLE 9 p. 1449
 - ▶ **Etravirine** moderately decreases the exposure to **phosphodiesterase type-5 inhibitors**. Adjust dose. [\[Moderate\]](#) Study
 - ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the exposure to **phosphodiesterase type-5 inhibitors**. [\[Moderate\]](#) Theoretical → Also see TABLE 9 p. 1449
 - ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the exposure to **pibrentasvir**. Avoid. [\[Severe\]](#) Study
 - ▶ **Pitolisant** is predicted to decrease the exposure to **efavirenz**. [\[Mild\]](#) Theoretical
 - ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the exposure to **ponatinib**. [\[Severe\]](#) Study
 - ▶ **Proton pump inhibitors** are predicted to decrease the exposure to **rilpivirine**. Avoid. [\[Severe\]](#) Study
 - ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the exposure to **regorafenib**. [\[Severe\]](#) Study
 - ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the exposure to **ribociclib**. [\[Moderate\]](#) Study → Also see TABLE 9 p. 1449
 - ▶ **Rifamycins (rifabutin)** moderately decrease the exposure to **doravirine**. Adjust doravirine p. 686 or lamivudine with tenofovir disoproxil and doravirine p. 696 dose. [\[Moderate\]](#) Study
 - ▶ **Rifamycins (rifabutin)** decrease the exposure to **etravirine**. [\[Moderate\]](#) Study
 - ▶ **Rifamycins (rifabutin)** slightly decrease the exposure to **rilpivirine**. Adjust dose. [\[Severe\]](#) Study
 - ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **doravirine**. Avoid. [\[Severe\]](#) Study
 - ▶ **Rifamycins (rifampicin)** slightly decrease the exposure to **efavirenz**. Adjust dose. [\[Severe\]](#) Study
 - ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **etravirine**. Avoid. [\[Severe\]](#) Theoretical
 - ▶ **Rifamycins (rifampicin)** decrease the concentration of **nevirapine**. Avoid. [\[Severe\]](#) Study
 - ▶ **Rifamycins (rifampicin)** markedly decrease the exposure to **rilpivirine**. Avoid. [\[Severe\]](#) Study
 - ▶ **Efavirenz** slightly decreases the exposure to **rifamycins (rifabutin)**. Adjust dose. [\[Severe\]](#) Study
 - ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the exposure to **ruxolitinib**. Monitor and adjust dose. [\[Moderate\]](#) Study
 - ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the exposure to **siponimod**. Manufacturer advises caution depending on genotype—consult product literature. [\[Severe\]](#) Theoretical
 - ▶ **Doravirine** is predicted to decrease the exposure to **sirolimus**. Monitor **sirolimus** concentration and adjust dose, p. 890. [\[Moderate\]](#) Theoretical
 - ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the concentration of **sirolimus**. Monitor and adjust dose. [\[Moderate\]](#) Theoretical
 - ▶ **Sodium zirconium cyclosilicate** is predicted to decrease the exposure to **rilpivirine**. Separate administration by at least 2 hours. [\[Moderate\]](#) Theoretical
 - ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the exposure to **sofenavir**. [\[Moderate\]](#) Study → Also see TABLE 9 p. 1449
 - ▶ **St John's wort** is predicted to decrease the exposure to **etravirine**. Avoid. [\[Severe\]](#) Study
 - ▶ **St John's wort** is predicted to decrease the exposure to NNRTIs (**doravirine, rilpivirine**). Avoid. [\[Severe\]](#) Theoretical
 - ▶ **St John's wort** is predicted to decrease the concentration of NNRTIs (**efavirenz, nevirapine**). Avoid. [\[Severe\]](#) Theoretical
 - ▶ **Etravirine** slightly decreases the exposure to **statins (atorvastatin)**. Monitor and adjust dose. [\[Moderate\]](#) Study
 - ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the exposure to **statins (atorvastatin, simvastatin)**. [\[Moderate\]](#) Study
 - ▶ **Etravirine** is predicted to increase the exposure to **statins (fluvastatin)**. Adjust dose. [\[Severe\]](#) Theoretical
 - ▶ **Etravirine** is predicted to decrease the exposure to **statins (simvastatin)**. Adjust dose. [\[Moderate\]](#) Theoretical
 - ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the exposure to **sunitinib**. [\[Moderate\]](#) Study → Also see TABLE 9 p. 1449
 - ▶ **Doravirine** is predicted to decrease the exposure to **tacrolimus**. Monitor **tacrolimus** concentration and adjust dose, p. 891. [\[Moderate\]](#) Theoretical
 - ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the concentration of **tacrolimus**. Monitor and adjust dose. [\[Moderate\]](#) Theoretical
 - ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the exposure to **taxanes (cabazitaxel)**. Avoid. [\[Severe\]](#) Study
 - ▶ **Telotristat ethyl** is predicted to decrease the exposure to **doravirine**. Avoid or adjust doravirine p. 686 or lamivudine with tenofovir disoproxil and doravirine p. 696 dose. [\[Severe\]](#) Theoretical
 - ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the concentration of **temsirolimus**. Avoid. [\[Severe\]](#) Theoretical
 - ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the exposure to **ticagrelor**. [\[Moderate\]](#) Theoretical
 - ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the exposure to **tofacitinib**. [\[Moderate\]](#) Study
 - ▶ NNRTIs (**efavirenz, nevirapine**) decrease the efficacy of **ulipristal**. For FSRH guidance, see Contraceptives, interactions p. 843. [\[Severe\]](#) Anecdotal
 - ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the exposure to **vandetanib**. [\[Moderate\]](#) Study → Also see TABLE 9 p. 1449
 - ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the exposure to **velpatasvir**. Avoid. [\[Moderate\]](#) Theoretical
 - ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the exposure to **vemurafenib**. [\[Severe\]](#) Study → Also see TABLE 9 p. 1449
 - ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the exposure to **venetoclax**. Avoid. [\[Severe\]](#) Study
 - ▶ NNRTIs (**efavirenz, nevirapine**) are predicted to decrease the concentration of **voxilaprevir**. Avoid. [\[Severe\]](#) Theoretical
- Noradrenaline/norepinephrine** → see sympathomimetics, vasoconstrictor
- Norethisterone**
- ▶ **Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate)** are predicted to decrease the efficacy of **norethisterone**. For FSRH guidance, see Contraceptives, interactions p. 843. [\[Severe\]](#) Anecdotal
 - ▶ **Endothelin receptor antagonists (bosentan)** are predicted to decrease the efficacy of **norethisterone**. For FSRH guidance, see Contraceptives, interactions p. 843. [\[Severe\]](#) Anecdotal
 - ▶ **Griseofulvin** potentially decreases the efficacy of **norethisterone**. For FSRH guidance, see Contraceptives, interactions p. 843. [\[Severe\]](#) Anecdotal

- ▶ **HIV-protease inhibitors (ritonavir)** are predicted to decrease the efficacy of **norethisterone**. For FSRH guidance, see Contraceptives, interactions p. 843. [\[Severe\]](#) Anecdotal
 - ▶ **Modafinil** is predicted to decrease the efficacy of **norethisterone**. For FSRH guidance, see Contraceptives, interactions p. 843. [\[Severe\]](#) Anecdotal
 - ▶ **Neurokinin-1 receptor antagonists (aprepitant, fosaprepitant)** are predicted to decrease the efficacy of **norethisterone**. For FSRH guidance, see Contraceptives, interactions p. 843. [\[Severe\]](#) Anecdotal
 - ▶ **NNRTIs (efavirenz, nevirapine)** are predicted to decrease the efficacy of **norethisterone**. For FSRH guidance, see Contraceptives, interactions p. 843. [\[Severe\]](#) Anecdotal
 - ▶ **Rifamycins** are predicted to decrease the efficacy of **norethisterone**. For FSRH guidance, see Contraceptives, interactions p. 843. [\[Severe\]](#) Anecdotal
 - ▶ **St John's wort** is predicted to decrease the efficacy of **norethisterone**. MHRA advises avoid. For FSRH guidance, see Contraceptives, interactions p. 843. [\[Severe\]](#) Anecdotal
 - ▶ **Sugammadex** is predicted to decrease the exposure to **norethisterone**. Use additional contraceptive precautions. [\[Severe\]](#) Theoretical
 - ▶ **Ulipristal** is predicted to decrease the efficacy of **norethisterone**. Avoid. [\[Severe\]](#) Theoretical
- Normal immunoglobulin** → see immunoglobulins
- Nortriptyline** → see tricyclic antidepressants
- NRTIs** → see TABLE 2 p. 1447 (nephrotoxicity), TABLE 12 p. 1450 (peripheral neuropathy)

abacavir · emtricitabine · lamivudine · zidovudine

- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **abacavir**. [\[Moderate\]](#) Theoretical
 - ▶ **Antiepileptics (valproate)** slightly increase the exposure to **zidovudine**. [\[Moderate\]](#) Study
 - ▶ **Antifungals, azoles (fluconazole)** slightly increase the exposure to **zidovudine**. [\[Moderate\]](#) Study
 - ▶ **Antimalarials (pyrimethamine)** are predicted to increase the risk of adverse effects when given with **zidovudine**. [\[Severe\]](#) Theoretical
 - ▶ **Zidovudine** increases the risk of haematological toxicity when given with **aspirin** (high-dose). [\[Severe\]](#) Study
 - ▶ **Zidovudine** increases the risk of haematological toxicity when given with **flucytosine**. Monitor and adjust dose. [\[Severe\]](#) Theoretical
 - ▶ **HIV-protease inhibitors (tipranavir)** slightly decrease the exposure to **abacavir**. Avoid. [\[Severe\]](#) Study
 - ▶ **HIV-protease inhibitors (tipranavir)** slightly decrease the exposure to **zidovudine**. Avoid. [\[Moderate\]](#) Study
 - ▶ **Lefunomide** is predicted to increase the exposure to **zidovudine**. [\[Moderate\]](#) Theoretical
 - ▶ **Macrolides (clarithromycin)** decrease the absorption of **zidovudine**. Separate administration by at least 2 hours. [\[Moderate\]](#) Study
 - ▶ **NNRTIs (nevirapine)** are predicted to decrease the concentration of **zidovudine**. Refer to specialist literature. [\[Severe\]](#) Theoretical
 - ▶ **NRTIs (zidovudine)** increase the risk of toxicity when given with NRTIs (lamivudine). [\[Severe\]](#) Anecdotal
 - ▶ **Zidovudine** increases the risk of haematological toxicity when given with **NSAIDs**. [\[Severe\]](#) Study → Also see TABLE 2 p. 1447
 - ▶ **Ribavirin** increases the risk of anaemia and/or leucopenia when given with **zidovudine**. Avoid. [\[Severe\]](#) Study
 - ▶ **Teriflunomide** is predicted to increase the exposure to **zidovudine**. [\[Moderate\]](#) Theoretical
 - ▶ **Trimethoprim** slightly increases the exposure to **lamivudine**. [\[Moderate\]](#) Study
- NSAIDs** → see TABLE 18 p. 1451 (hyponatraemia), TABLE 2 p. 1447 (nephrotoxicity), TABLE 16 p. 1451 (increased serum potassium), TABLE 4 p. 1447 (antiplatelet effects)
- acceflofenac · benzydamine · bromfenac · celecoxib · dexketoprofen · diclofenac · etodolac · etoricoxib · felbinac · flurbiprofen · ibuprofen · indometacin · ketoprofen · ketorolac · mefenamic acid · meloxicam · nabumetone · naproxen · nepafenac · parecoxib · phenazone · piroxicam · sulindac · tenoxicam · tiaprofenic acid ·

tolfenamic acid

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application of NSAIDs, the possibility of interactions should be borne in mind.

- ▶ **Celecoxib** is predicted to increase the exposure to **antiarrhythmics (flecainide, propafenone)**. Monitor and adjust dose. [\[Moderate\]](#) Theoretical
 - ▶ **Antifungals, azoles (fluconazole)** moderately increase the exposure to **celecoxib**. Adjust **celecoxib** dose, p. 1187. [\[Moderate\]](#) Study
 - ▶ **Antifungals, azoles (fluconazole)** increase the exposure to **parecoxib**. Monitor and adjust dose. [\[Moderate\]](#) Study
 - ▶ **Antifungals, azoles (voriconazole)** slightly increase the exposure to **diclofenac**. Monitor and adjust dose. [\[Moderate\]](#) Study
 - ▶ **Antifungals, azoles (voriconazole)** moderately increase the exposure to **ibuprofen**. Adjust dose. [\[Moderate\]](#) Study
 - ▶ **NSAIDs** are predicted to increase the risk of gastrointestinal irritation when given with **bisphosphonates (alendronate, ibandronate)**. [\[Moderate\]](#) Study
 - ▶ **NSAIDs** are predicted to increase the risk of renal impairment when given with **bisphosphonates (clodronate)**. [\[Moderate\]](#) Study
 - ▶ **Certinib** is predicted to increase the exposure to NSAIDs (celecoxib, diclofenac). Adjust dose. [\[Moderate\]](#) Theoretical
 - ▶ **Ciclosporin** increases the concentration of **diclofenac**. [\[Severe\]](#) Study → Also see TABLE 2 p. 1447 → Also see TABLE 16 p. 1451
 - ▶ **Etoricoxib** increases the exposure to **combined hormonal contraceptives**. [\[Moderate\]](#) Study
 - ▶ **NSAIDs** increase the risk of gastrointestinal bleeding when given with **corticosteroids**. [\[Severe\]](#) Study
 - ▶ **NSAIDs** increase the risk of renal impairment when given with **daptomycin**. [\[Moderate\]](#) Theoretical
 - ▶ **Indometacin** increases the concentration of **digoxin**. [\[Severe\]](#) Study
 - ▶ **Erlotinib** is predicted to increase the risk of gastrointestinal perforation when given with **NSAIDs**. [\[Severe\]](#) Theoretical
 - ▶ **Etoricoxib** increases the exposure to **hormone replacement therapy**. [\[Moderate\]](#) Study
 - ▶ **NSAIDs** are predicted to increase the risk of gastrointestinal bleeding when given with **iron chelators (deferaseri-ox)**. [\[Severe\]](#) Theoretical
 - ▶ **Diclofenac** is predicted to increase the exposure to **iron chelators (deferiprone)**. [\[Moderate\]](#) Theoretical
 - ▶ **Lefunomide** is predicted to increase the exposure to NSAIDs (indometacin, ketoprofen). [\[Moderate\]](#) Theoretical
 - ▶ **NSAIDs** increase the concentration of **lithium**. Monitor and adjust dose. [\[Severe\]](#) Study
 - ▶ **NSAIDs** are predicted to increase the risk of toxicity when given with **methotrexate**. [\[Severe\]](#) Study → Also see TABLE 2 p. 1447
 - ▶ **NSAIDs** (high-dose) are predicted to decrease the efficacy of **mifamurtide**. Avoid. [\[Severe\]](#) Theoretical
 - ▶ **Nicorandil** is predicted to increase the risk of gastrointestinal perforation when given with **NSAIDs**. [\[Severe\]](#) Theoretical
 - ▶ **Nitisinone** is predicted to increase the exposure to **celecoxib**. [\[Moderate\]](#) Study
 - ▶ **NRTIs (zidovudine)** increase the risk of haematological toxicity when given with NSAIDs. [\[Severe\]](#) Study → Also see TABLE 2 p. 1447
 - ▶ **NSAIDs** are predicted to increase the exposure to **pemetrexed**. Use with caution or avoid. [\[Severe\]](#) Theoretical → Also see TABLE 2 p. 1447
 - ▶ **NSAIDs** potentially increase the risk of seizures when given with **quinolones**. [\[Severe\]](#) Theoretical
 - ▶ **Mefenamic acid** is predicted to increase the exposure to **regorafenib**. Avoid. [\[Moderate\]](#) Theoretical → Also see TABLE 4 p. 1447
 - ▶ **Rifamycins (rifampicin)** moderately decrease the exposure to NSAIDs (celecoxib, diclofenac, etoricoxib). [\[Moderate\]](#) Study
 - ▶ **Teriflunomide** is predicted to increase the exposure to NSAIDs (indometacin, ketoprofen). [\[Moderate\]](#) Theoretical
 - ▶ **NSAIDs** increase the risk of acute renal failure when given with **thiazide diuretics**. [\[Severe\]](#) Theoretical → Also see TABLE 18 p. 1451
- Obeticholic acid**
- ▶ **Obeticholic acid** decreases the anticoagulant effect of **coumarins (warfarin)**. [\[Severe\]](#) Study

Obeticholic acid (continued)

- ▶ **Obeticholic acid** is predicted to increase the exposure to **theophylline**. [Severe] Theoretical
- ▶ **Obeticholic acid** is predicted to increase the exposure to **tizanidine**. [Severe] Theoretical
- Obinutuzumab** → see monoclonal antibodies
- Ocrelizumab** → see monoclonal antibodies
- Ocrotetide**
- ▶ **Ocrotetide** decreases the absorption of oral **ciclosporin**. Adjust **ciclosporin** dose, p. 888. [Severe] Anecdotal
- ▶ **Ocrotetide** (short-acting) decreases the exposure to **telotristat ethyl**. **Telotristat ethyl** should be taken at least 30 minutes before **ocrotetide**. [Moderate] Study
- Ofloxacin** → see quinolones
- Olanzapine** → see antipsychotics, second generation
- Olaparib** → see TABLE 15 p. 1450 (myelosuppression)

FOOD AND LIFESTYLE Bitter (Seville) orange is predicted to increase the exposure to olaparib.

- ▶ **Olaparib** might increase the exposure to **aliskiren**. [Moderate] Theoretical
- ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to **olaparib**. Avoid. [Moderate] Theoretical
- ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to **olaparib**. Avoid moderate CYP3A4 inhibitors or adjust **olaparib** dose, p. 1057. [Moderate] Theoretical
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **olaparib**. Avoid. [Moderate] Theoretical
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **olaparib**. Avoid moderate CYP3A4 inhibitors or adjust **olaparib** dose, p. 1057. [Moderate] Theoretical
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **olaparib**. Avoid potent CYP3A4 inhibitors or adjust **olaparib** dose, p. 1057. [Moderate] Study
- ▶ **Olaparib** might increase the exposure to **antihistamines, non-sedating (fexofenadine)**. [Moderate] Theoretical
- ▶ **Olaparib** might alter the exposure to **antipsychotics, second generation (quetiapine)**. [Moderate] Theoretical
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **olaparib**. Avoid moderate CYP3A4 inhibitors or adjust **olaparib** dose, p. 1057. [Moderate] Theoretical
- ▶ **Olaparib** might alter the exposure to **ciclosporin**. [Moderate] Theoretical
- ▶ **Cobicicstat** is predicted to increase the exposure to **olaparib**. Avoid potent CYP3A4 inhibitors or adjust **olaparib** dose, p. 1057. [Moderate] Study
- ▶ **Olaparib** might increase the exposure to **colchicine**. [Moderate] Theoretical
- ▶ **Olaparib** potentially affects the efficacy of **combined hormonal contraceptives**. Use additional contraceptive precautions. [Moderate] Theoretical
- ▶ **Crizotinib** is predicted to increase the exposure to **olaparib**. Avoid moderate CYP3A4 inhibitors or adjust **olaparib** dose, p. 1057. [Moderate] Theoretical
- ▶ **Dabrafenib** is predicted to decrease the exposure to **olaparib**. Avoid. [Moderate] Theoretical
- ▶ **Olaparib** might increase the exposure to **digoxin**. [Moderate] Theoretical
- ▶ **Endothelin receptor antagonists (bosentan)** are predicted to decrease the exposure to **olaparib**. Avoid. [Moderate] Theoretical
- ▶ **Olaparib** might alter the exposure to **ergometrine**. [Moderate] Theoretical
- ▶ **Olaparib** might alter the exposure to **ergotamine**. [Moderate] Theoretical
- ▶ **Olaparib** might increase the exposure to **everolimus**. [Moderate] Theoretical
- ▶ **Olaparib** might increase the exposure to **factor XA inhibitors (edoxaban, rivaroxaban)**. [Moderate] Theoretical
- ▶ **Grapefruit juice** is predicted to increase the exposure to **olaparib**. Avoid. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **olaparib**. Avoid potent CYP3A4 inhibitors or adjust **olaparib** dose, p. 1057. [Moderate] Study

- ▶ **Idelalisib** is predicted to increase the exposure to **olaparib**. Avoid potent CYP3A4 inhibitors or adjust **olaparib** dose, p. 1057. [Moderate] Study
- ▶ **Imatinib** is predicted to increase the exposure to **olaparib**. Avoid moderate CYP3A4 inhibitors or adjust **olaparib** dose, p. 1057. [Moderate] Theoretical → Also see TABLE 15 p. 1450
- ▶ **Letermovir** is predicted to increase the exposure to **olaparib**. Avoid moderate CYP3A4 inhibitors or adjust **olaparib** dose, p. 1057. [Moderate] Theoretical
- ▶ **Olaparib** might increase the exposure to **loperamide**. [Moderate] Theoretical
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **olaparib**. Avoid potent CYP3A4 inhibitors or adjust **olaparib** dose, p. 1057. [Moderate] Study
- ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **olaparib**. Avoid moderate CYP3A4 inhibitors or adjust **olaparib** dose, p. 1057. [Moderate] Theoretical
- ▶ **Mitotane** is predicted to decrease the exposure to **olaparib**. Avoid. [Moderate] Theoretical → Also see TABLE 15 p. 1450
- ▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to increase the exposure to **olaparib**. Avoid moderate CYP3A4 inhibitors or adjust **olaparib** dose, p. 1057. [Moderate] Theoretical
- ▶ **Nilotinib** is predicted to increase the exposure to **olaparib**. Avoid moderate CYP3A4 inhibitors or adjust **olaparib** dose, p. 1057. [Moderate] Theoretical → Also see TABLE 15 p. 1450
- ▶ **NNRTIs (efavirenz, nevirapine)** are predicted to decrease the exposure to **olaparib**. Avoid. [Moderate] Theoretical
- ▶ **Olaparib** might alter the exposure to **opioids (alfentanil)**. [Moderate] Theoretical
- ▶ **Olaparib** might alter the exposure to **pimozide**. [Moderate] Theoretical
- ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **olaparib**. Avoid. [Moderate] Theoretical
- ▶ **Olaparib** might increase the exposure to **sirolimus**. [Moderate] Theoretical
- ▶ **St John's wort** is predicted to decrease the exposure to **olaparib**. Avoid. [Moderate] Theoretical
- ▶ **Olaparib** is predicted to increase the exposure to **statins**. [Moderate] Theoretical
- ▶ **Olaparib** might alter the exposure to **tacrolimus**. [Moderate] Theoretical
- ▶ **Olaparib** might increase the exposure to **talazoparib**. [Moderate] Theoretical → Also see TABLE 15 p. 1450
- ▶ **Olaparib** might increase the exposure to **taxanes (paclitaxel)**. [Moderate] Theoretical → Also see TABLE 15 p. 1450
- ▶ **Olaparib** might alter the exposure to **temsirolimus**. [Moderate] Theoretical → Also see TABLE 15 p. 1450
- ▶ **Olaparib** might increase the exposure to **thrombin inhibitors (dabigatran)**. [Moderate] Theoretical
- ▶ **Olaparib** might increase the exposure to **topotecan**. [Moderate] Theoretical → Also see TABLE 15 p. 1450
- Olmesartan** → see angiotensin-II receptor antagonists
- Oladaterol** → see beta₂ agonists
- Omega-3-acid ethyl esters** → see TABLE 4 p. 1447 (antiplatelet effects)
- ▶ **Omega-3-acid ethyl esters** might enhance the blood pressure-lowering effects of **beta blockers, non-selective**. [Moderate] Study
- ▶ **Omega-3-acid ethyl esters** might enhance the blood pressure-lowering effects of **beta blockers, selective**. [Moderate] Study
- Omeprazole** → see proton pump inhibitors
- Ondansetron** → see 5-HT₃-receptor antagonists
- Opicapone**
- ▶ **Opicapone** increases the exposure to **levodopa**. Adjust dose. [Moderate] Study
- ▶ **Opicapone** is predicted to increase the exposure to **loperamide**. Avoid. [Moderate] Study
- ▶ **Opicapone** is predicted to increase the risk of elevated blood pressure when given with **MAOIs, irreversible**. Avoid. [Severe] Theoretical
- ▶ **Opicapone** is predicted to increase the exposure to **meglitinides (repaglinide)**. Avoid. [Moderate] Study
- ▶ **Opicapone** is predicted to increase the risk of elevated blood pressure when given with **moclobemide**. Avoid. [Severe] Theoretical

- ▶ **Opicapone** is predicted to increase the exposure to **montelukast**. Avoid. [Moderate] Study
 - ▶ **Opicapone** is predicted to increase the exposure to **pioglitazone**. Avoid. [Moderate] Study
 - ▶ **Opicapone** is predicted to increase the risk of cardiovascular adverse effects when given with **sympathomimetics, inotropic**. [Severe] Theoretical
 - ▶ **Opicapone** is predicted to increase the risk of cardiovascular adverse effects when given with **sympathomimetics, vasoconstrictor (adrenaline/epinephrine, noradrenaline/norepinephrine)**. [Severe] Theoretical
- Opioids** → see TABLE 6 p. 1448 (bradycardia), TABLE 13 p. 1450 (serotonin syndrome), TABLE 9 p. 1449 (QT-interval prolongation), TABLE 11 p. 1449 (CNS depressant effects)

alfentanil · buprenorphine · codeine · diamorphine · dihydrocodeine · diphenoxyolate · dipipanone · fentanyl · hydromorphone · meptazinol · methadone · morphine · oxycodone · pentazocine · pethidine · remifentanyl · tapentadol · tramadol

- ▶ **Alcohol** causes rapid release of opioids (**hydromorphone, morphine**) from extended-release preparations. Avoid. [Severe] Study → Also see TABLE 11 p. 1449
- ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to **buprenorphine**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Anti-androgens (apalutamide, enzalutamide)** decrease the exposure to **methadone**. Monitor and adjust dose. [Severe] Study → Also see TABLE 9 p. 1449
- ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to **oxycodone**. Monitor and adjust dose. [Moderate] Study
- ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to decrease the exposure to opioids (**alfentanil, fentanyl**). [Moderate] Study
- ▶ **Antiarrhythmics (amiodarone)** are predicted to increase the concentration of **fentanyl**. [Moderate] Theoretical → Also see TABLE 6 p. 1448
- ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to **methadone**. [Moderate] Theoretical → Also see TABLE 9 p. 1449
- ▶ **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to opioids (**alfentanil, buprenorphine, fentanyl, oxycodone**). Monitor and adjust dose. [Moderate] Study
- ▶ **Antiepileptics (carbamazepine)** decrease the concentration of **tramadol**. Adjust dose. [Severe] Study
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **buprenorphine**. Monitor and adjust dose. [Moderate] Theoretical → Also see TABLE 11 p. 1449
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** decrease the exposure to **methadone**. Monitor and adjust dose. [Severe] Study → Also see TABLE 11 p. 1449
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **oxycodone**. Monitor and adjust dose. [Moderate] Study → Also see TABLE 11 p. 1449
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to opioids (**alfentanil, fentanyl**). [Moderate] Study → Also see TABLE 11 p. 1449
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **methadone**. [Moderate] Theoretical → Also see TABLE 9 p. 1449
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **methadone**. Adjust dose. [Severe] Theoretical → Also see TABLE 9 p. 1449
- ▶ **Antifungals, azoles (miconazole)** are predicted to increase the exposure to **alfentanil**. Use with caution and adjust dose. [Moderate] Theoretical
- ▶ **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to opioids (**alfentanil, buprenorphine, fentanyl, oxycodone**). Monitor and adjust dose. [Moderate] Study
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to opioids (**alfentanil, buprenorphine, fentanyl, oxycodone**). Monitor and adjust dose.
- ▶ **buprenorphine, fentanyl, oxycodone**). Monitor and adjust dose. [Severe] Study
- ▶ **Bictegravir** is predicted to increase the exposure to **methadone**. [Moderate] Theoretical
- ▶ **Brigatinib** potentially decreases the concentration of opioids (**alfentanil, fentanyl**). Avoid. [Moderate] Theoretical
- ▶ **Bupropion** is predicted to decrease the efficacy of **codeine**. [Moderate] Theoretical
- ▶ **Bupropion** is predicted to decrease the efficacy of **tramadol**. [Severe] Study
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **methadone**. [Moderate] Theoretical → Also see TABLE 6 p. 1448
- ▶ **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to opioids (**alfentanil, buprenorphine, fentanyl, oxycodone**). Monitor and adjust dose. [Moderate] Study → Also see TABLE 6 p. 1448
- ▶ **Certinib** is predicted to increase the exposure to opioids (**alfentanil, fentanyl**). Avoid. [Severe] Theoretical → Also see TABLE 6 p. 1448
- ▶ **Cinacalcet** is predicted to decrease the efficacy of **codeine**. [Moderate] Theoretical
- ▶ **Cinacalcet** is predicted to decrease the efficacy of **tramadol**. [Severe] Study
- ▶ **Cobicistat** is predicted to increase the exposure to opioids (**alfentanil, buprenorphine, fentanyl, oxycodone**). Monitor and adjust dose. [Severe] Study
- ▶ **Crizotinib** is predicted to increase the exposure to **methadone**. [Moderate] Theoretical → Also see TABLE 6 p. 1448 → Also see TABLE 9 p. 1449
- ▶ **Crizotinib** is predicted to increase the exposure to opioids (**alfentanil, buprenorphine, fentanyl, oxycodone**). Monitor and adjust dose. [Moderate] Study → Also see TABLE 6 p. 1448
- ▶ **Dabrafenib** decreases the exposure to **methadone**. Monitor and adjust dose. [Severe] Study
- ▶ **Tapentadol** is predicted to increase the risk of serotonin syndrome when given with **drugs that cause serotonin syndrome** (see TABLE 13 p. 1450). [Severe] Theoretical
- ▶ **Endothelin receptor antagonists (bosentan)** decrease the exposure to **methadone**. Monitor and adjust dose. [Severe] Study
- ▶ **Entrectinib** is predicted to increase the exposure to opioids (**alfentanil, fentanyl**). [Mild] Theoretical
- ▶ **H₂ receptor antagonists (cimetidine)** increase the concentration of **alfentanil**. Use with caution and adjust dose. [Severe] Study
- ▶ **H₂ receptor antagonists (cimetidine)** increase the exposure to **fentanyl**. [Moderate] Study
- ▶ **HIV-protease inhibitors** boosted with **ritonavir** are predicted to decrease the exposure to **methadone**. [Moderate] Study
- ▶ **HIV-protease inhibitors (ritonavir)** are predicted to decrease the concentration of **morphine**. [Moderate] Theoretical
- ▶ **HIV-protease inhibitors (ritonavir)** increase the risk of CNS toxicity when given with **pethidine**. Avoid. [Severe] Study
- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to opioids (**alfentanil, buprenorphine, fentanyl, oxycodone**). Monitor and adjust dose. [Severe] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **methadone**. [Severe] Theoretical
- ▶ **Idelalisib** is predicted to increase the exposure to opioids (**alfentanil, buprenorphine, fentanyl, oxycodone**). Monitor and adjust dose. [Severe] Study
- ▶ **Imatinib** is predicted to increase the exposure to **methadone**. [Moderate] Theoretical
- ▶ **Imatinib** is predicted to increase the exposure to opioids (**alfentanil, buprenorphine, fentanyl, oxycodone**). Monitor and adjust dose. [Moderate] Study
- ▶ **Larotrectinib** is predicted to increase the exposure to opioids (**alfentanil, fentanyl**). Use with caution and adjust dose. [Mild] Theoretical
- ▶ **Letermovir** is predicted to increase the exposure to **methadone**. [Moderate] Theoretical
- ▶ **Letermovir** is predicted to increase the exposure to opioids (**alfentanil, buprenorphine, fentanyl, oxycodone**). Monitor and adjust dose. [Moderate] Study
- ▶ **Lorlatinib** is predicted to decrease the exposure to opioids (**alfentanil, fentanyl**). Avoid. [Moderate] Theoretical

Opioids (continued)

- ▶ **Macrolides (clarithromycin)** are predicted to increase the concentration of **methadone**. [Severe] Theoretical → Also see TABLE 9 p. 1449
- ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to **methadone**. [Moderate] Theoretical → Also see TABLE 9 p. 1449
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to opioids (**alfentanil, buprenorphine, fentanyl, oxycodone**). Monitor and adjust dose. [Severe] Study
- ▶ **Macrolides (erythromycin)** are predicted to increase the exposure to opioids (**alfentanil, buprenorphine, fentanyl, oxycodone**). Monitor and adjust dose. [Moderate] Study
- ▶ **MAO-B inhibitors (rasagiline)** are predicted to increase the risk of adverse effects when given with **methadone**. Avoid and for 14 days after stopping **rasagiline**. [Severe] Theoretical → Also see TABLE 13 p. 1450
- ▶ **MAO-B inhibitors (safinamide)** are predicted to increase the risk of adverse effects when given with **methadone**. Avoid and for 1 week after stopping **safinamide**. [Severe] Theoretical → Also see TABLE 13 p. 1450
- ▶ **MAO-B inhibitors (selegiline)** increase the risk of adverse effects when given with **methadone**. Avoid. [Severe] Anecdotal → Also see TABLE 13 p. 1450
- ▶ **Opioids** are predicted to increase the risk of CNS excitation or depression when given with **MAOIs, irreversible**. Avoid. [Severe] Study → Also see TABLE 13 p. 1450
- ▶ **Opioids** potentially decrease the absorption of oral **mexiletine**. [Moderate] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **buprenorphine**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Mitotane** decreases the exposure to **methadone**. Monitor and adjust dose. [Severe] Study
- ▶ **Mitotane** is predicted to decrease the exposure to opioids (**alfentanil, fentanyl**). [Moderate] Study
- ▶ **Mitotane** is predicted to decrease the exposure to **oxycodone**. Monitor and adjust dose. [Moderate] Study
- ▶ **Nalmefene** is predicted to decrease the efficacy of opioids. Avoid. [Severe] Theoretical
- ▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to increase the exposure to **methadone**. [Moderate] Theoretical
- ▶ **Neurokinin-1 receptor antagonists (aprepitant, netupitant)** are predicted to increase the exposure to opioids (**alfentanil, buprenorphine, fentanyl, oxycodone**). Monitor and adjust dose. [Moderate] Study
- ▶ **Nilotinib** is predicted to increase the exposure to **methadone**. [Moderate] Theoretical → Also see TABLE 9 p. 1449
- ▶ **Nilotinib** is predicted to increase the exposure to opioids (**alfentanil, buprenorphine, fentanyl, oxycodone**). Monitor and adjust dose. [Moderate] Study
- ▶ **NNRTIs (efavirenz, nevirapine)** decrease the exposure to **methadone**. Monitor and adjust dose. [Severe] Study → Also see TABLE 9 p. 1449
- ▶ **Olaparib** might alter the exposure to **alfentanil**. [Moderate] Theoretical
- ▶ Opioids (**buprenorphine**) are predicted to increase the risk of opiate withdrawal when given with opioids (**alfentanil**). [Severe] Theoretical → Also see TABLE 11 p. 1449
- ▶ Opioids (**pentazocine**) are predicted to increase the risk of opiate withdrawal when given with opioids (**alfentanil, codeine, diamorphine, dihydrocodeine, dipipanone, fentanyl, hydromorphone, meptazinol, methadone, morphine, oxycodone**). [Severe] Theoretical → Also see TABLE 13 p. 1450 → Also see TABLE 11 p. 1449
- ▶ Opioids (**buprenorphine**) are predicted to increase the risk of opiate withdrawal when given with opioids (**codeine, diamorphine, dihydrocodeine, dipipanone, fentanyl, hydromorphone, meptazinol, methadone, morphine, oxycodone, pentazocine, pethidine, remifentanyl, tapentadol, tramadol**). [Severe] Theoretical → Also see TABLE 11 p. 1449
- ▶ Opioids (**pentazocine**) are predicted to increase the risk of opiate withdrawal when given with opioids (**pethidine, remifentanyl, tapentadol, tramadol**). [Severe] Theoretical → Also see TABLE 13 p. 1450 → Also see TABLE 11 p. 1449

- ▶ **Opioids** might increase the risk of adverse effects when given with **ozanimod**. [Severe] Theoretical → Also see TABLE 6 p. 1448
- ▶ **Palbociclib** is predicted to increase the exposure to opioids (**alfentanil, fentanyl**). Adjust dose. [Moderate] Theoretical
- ▶ **Pitolisant** is predicted to decrease the exposure to **morphine**. [Mild] Theoretical
- ▶ **Ribociclib** is predicted to increase the exposure to opioids (**alfentanil, fentanyl**). Use with caution and adjust dose. [Moderate] Theoretical
- ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **buprenorphine**. Monitor and adjust dose. [Moderate] Theoretical
- ▶ **Rifamycins (rifampicin)** decrease the exposure to **methadone**. Monitor and adjust dose. [Severe] Study
- ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to **oxycodone**. Monitor and adjust dose. [Moderate] Study
- ▶ **Rifamycins (rifampicin)** are predicted to decrease the exposure to opioids (**alfentanil, fentanyl**). [Moderate] Study
- ▶ **Rifamycins (rifampicin)** decrease the exposure to opioids (**codeine, morphine**). [Moderate] Study
- ▶ **Rucaparib** is predicted to increase the exposure to opioids (**alfentanil, fentanyl**). Monitor and adjust dose. [Moderate] Study
- ▶ **SSRIs (fluoxetine, paroxetine)** are predicted to decrease the efficacy of **codeine**. [Moderate] Theoretical
- ▶ **SSRIs (fluoxetine, paroxetine)** are predicted to decrease the efficacy of **tramadol**. [Severe] Study → Also see TABLE 13 p. 1450
- ▶ **St John's wort** decreases the exposure to **methadone**. Monitor and adjust dose. [Severe] Study → Also see TABLE 13 p. 1450
- ▶ **St John's wort** moderately decreases the exposure to **oxycodone**. Adjust dose. [Moderate] Study
- ▶ **Terbinafine** is predicted to decrease the efficacy of **codeine**. [Moderate] Theoretical
- ▶ **Terbinafine** is predicted to decrease the efficacy of **tramadol**. [Severe] Study

Orlistat

SEPARATION OF ADMINISTRATION Orlistat might affect the absorption of concurrently administered drugs—consider separating administration. Particular care should be taken with antiepileptics, antiretrovirals, and drugs that have a narrow therapeutic index.

Orphenadrine → see TABLE 10 p. 1449 (antimuscarinics)

Osetamivir

- ▶ **Leflunomide** is predicted to increase the exposure to **oseltamivir**. [Moderate] Theoretical
- ▶ **Nitisinone** is predicted to increase the exposure to **oseltamivir**. [Moderate] Study
- ▶ **Teriflunomide** is predicted to increase the exposure to **oseltamivir**. [Moderate] Study
- Osimertinib** → see TABLE 9 p. 1449 (QT-interval prolongation)
- ▶ **Osimertinib** is predicted to increase the exposure to **aliskiren**. [Moderate] Study
- ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to moderately decrease the exposure to **osimertinib**. Avoid. [Moderate] Study → Also see TABLE 9 p. 1449
- ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to moderately decrease the exposure to **osimertinib**. Avoid. [Moderate] Study
- ▶ **Osimertinib** is predicted to increase the exposure to **antihistamines, non-sedating (fexofenadine)**. [Moderate] Study
- ▶ **Osimertinib** is predicted to increase the exposure to **colchicine**. [Moderate] Study
- ▶ **Dabrafenib** is predicted to decrease the exposure to **osimertinib**. Use with caution or avoid. [Severe] Study
- ▶ **Osimertinib** is predicted to increase the exposure to **digoxin**. [Moderate] Study
- ▶ **Endothelin receptor antagonists (bosentan)** are predicted to decrease the exposure to **osimertinib**. Use with caution or avoid. [Severe] Study
- ▶ **Osimertinib** is predicted to increase the exposure to **everolimus**. [Moderate] Study
- ▶ **Osimertinib** is predicted to increase the exposure to **factor XA inhibitors (edoxaban, rivaroxaban)**. [Moderate] Study
- ▶ **Osimertinib** is predicted to increase the exposure to **loperamide**. [Moderate] Study

- ▶ **Mitotane** is predicted to moderately decrease the exposure to **osimertinib**. Avoid. [Moderate] Study
- ▶ **Modafinil** is predicted to decrease the exposure to **osimertinib**. Use with caution or avoid. [Severe] Theoretical
- ▶ **NNRTIs (efavirenz, nevirapine)** are predicted to decrease the exposure to **osimertinib**. Use with caution or avoid. [Severe] Study → Also see TABLE 9 p. 1449
- ▶ **NNRTIs (etravirine)** are predicted to decrease the exposure to **osimertinib**. Use with caution or avoid. [Severe] Theoretical
- ▶ **Rifamycins (rifampicin)** are predicted to moderately decrease the exposure to **osimertinib**. Avoid. [Moderate] Study
- ▶ **Osimertinib** is predicted to increase the exposure to **sirolimus**. [Moderate] Study
- ▶ **St John's wort** is predicted to decrease the exposure to **osimertinib**. Avoid. [Severe] Study
- ▶ **Osimertinib** causes a small increase in the exposure to **statins (rosuvastatin)**. [Severe] Study
- ▶ **Osimertinib** is predicted to increase the exposure to **talazoparib**. [Moderate] Study
- ▶ **Osimertinib** is predicted to increase the exposure to **taxanes (paclitaxel)**. [Moderate] Study
- ▶ **Osimertinib** is predicted to increase the exposure to **thrombin inhibitors (dabigatran)**. [Moderate] Study
- ▶ **Osimertinib** is predicted to increase the exposure to **topotecan**. [Moderate] Study
- Ospemifene**
 - ▶ **Anti-androgens (apalutamide, enzalutamide)** are predicted to moderately decrease the exposure to **ospemifene**. [Moderate] Study
 - ▶ **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to moderately decrease the exposure to **ospemifene**. [Moderate] Study
 - ▶ **Antifungals, azoles (fluconazole)** increase the exposure to **ospemifene**. Use with caution or avoid. [Moderate] Study
 - ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **ospemifene**. Avoid in poor CYP2C9 metabolisers. [Moderate] Study
 - ▶ **Cobicistat** is predicted to increase the exposure to **ospemifene**. Avoid in poor CYP2C9 metabolisers. [Moderate] Study
 - ▶ **Combined hormonal contraceptives** potentially oppose the effects of **ospemifene**. Avoid. [Severe] Theoretical
 - ▶ **Dabrafenib** is predicted to decrease the exposure to **ospemifene**. [Moderate] Study
 - ▶ **Endothelin receptor antagonists (bosentan)** are predicted to decrease the exposure to **ospemifene**. [Moderate] Study
 - ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **ospemifene**. Avoid in poor CYP2C9 metabolisers. [Moderate] Study
 - ▶ **Hormone replacement therapy** potentially opposes the effects of **ospemifene**. Avoid. [Severe] Theoretical
 - ▶ **Idelalisib** is predicted to increase the exposure to **ospemifene**. Avoid in poor CYP2C9 metabolisers. [Moderate] Study
 - ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **ospemifene**. Avoid in poor CYP2C9 metabolisers. [Moderate] Study
 - ▶ **Mitotane** is predicted to moderately decrease the exposure to **ospemifene**. [Moderate] Study
 - ▶ **NNRTIs (efavirenz, nevirapine)** are predicted to decrease the exposure to **ospemifene**. [Moderate] Study
 - ▶ **Rifamycins (rifampicin)** are predicted to moderately decrease the exposure to **ospemifene**. [Moderate] Study
 - ▶ **St John's wort** is predicted to decrease the exposure to **ospemifene**. [Moderate] Study
- ▶ **Oxaliplatin** → see platinum compounds
- ▶ **Oxazepam** → see benzodiazepines
- ▶ **Oxcarbazepine** → see antiepileptics
- ▶ **Oxybutprocaine** → see anaesthetics, local
- ▶ **Oxybutynin** → see TABLE 10 p. 1449 (antimuscarinics)
- ▶ **Oxybutynin** potentially increases the risk of overheating and dehydration when given with **antiepileptics (zonisamide)**. Avoid in children. [Severe] Theoretical
- ▶ **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **oxybutynin**. [Mid] Study
- ▶ **Cobicistat** is predicted to increase the exposure to **oxybutynin**. [Mid] Study

- ▶ **HIV-protease inhibitors** are predicted to increase the exposure to **oxybutynin**. [Mid] Study
- ▶ **Idelalisib** is predicted to increase the exposure to **oxybutynin**. [Mid] Study
- ▶ **Macrolides (clarithromycin)** are predicted to increase the exposure to **oxybutynin**. [Mid] Study
- Oxycodone** → see opioids
- Oxymetholone**
 - ▶ **Oxymetholone** increases the anticoagulant effect of **coumarins**. [Severe] Anecdotal
 - ▶ **Oxymetholone** increases the anticoagulant effect of **phenindione**. [Severe] Anecdotal
- Oxytetracycline** → see tetracyclines
- Oxytocin**
 - ▶ **Misoprostol** can cause uterine contractions, as can **oxytocin**—these effects might be additive on concurrent use. Avoid and for 4 hours after stopping **misoprostol**. [Severe] Theoretical
- Ozanimod** → see TABLE 6 p. 1448 (bradycardia), TABLE 9 p. 1449 (QT-interval prolongation)

FOOD AND LIFESTYLE Tyramine-rich foods might increase the risk of hypertensive crisis when given ozanimod.

- ▶ **Ciclosporin** is predicted to increase the exposure to the active metabolites of **ozanimod**. Avoid. [Moderate] Study
- ▶ **Clopidogrel** is predicted to increase the exposure to the active metabolites of **ozanimod**. [Moderate] Study
- ▶ **Eltrombopag** is predicted to increase the exposure to the active metabolites of **ozanimod**. Avoid. [Moderate] Study
- ▶ **Fibrates (gemfibrozil)** are predicted to increase the exposure to the active metabolites of **ozanimod**. [Moderate] Study
- ▶ **Leflunomide** is predicted to increase the exposure to the active metabolites of **ozanimod**. Avoid. [Moderate] Study
- ▶ **Ozanimod** might increase the risk of a hypertensive crisis when given with **linezolid**. Avoid. [Severe] Theoretical
- ▶ **Live vaccines** might increase the risk of generalised infection (possibly life-threatening) when given with **ozanimod**. Avoid and for 3 months after stopping **ozanimod**. [Severe] Theoretical
- ▶ **Ozanimod** might increase the risk of a hypertensive crisis when given with **MAO-B inhibitors** and **MAO-B inhibitors** might decrease the exposure to the active metabolites of **ozanimod**. Avoid. [Severe] Theoretical → Also see TABLE 6 p. 1448
- ▶ **Ozanimod** might increase the risk of a hypertensive crisis when given with **MAOs, irreversible**. Avoid. [Severe] Theoretical
- ▶ **Methylphenidate** is predicted to increase the risk of a hypertensive crisis when given with **ozanimod**. [Severe] Theoretical
- ▶ **Ozanimod** might increase the risk of a hypertensive crisis when given with **moclobemide**. Avoid. [Severe] Theoretical
- ▶ **Monoclonal antibodies (alemtuzumab)** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **ozanimod**. Avoid. [Severe] Theoretical
- ▶ **Opioids** might increase the risk of adverse effects when given with **ozanimod**. [Severe] Theoretical → Also see TABLE 6 p. 1448
- ▶ **Rifamycins (rifampicin)** moderately decrease the exposure to the active metabolites of **ozanimod**. Avoid. [Moderate] Study
- ▶ **SSRIs** might increase the risk of adverse effects when given with **ozanimod**. [Severe] Theoretical
